

# The `flags` package

Heiko Oberdiek\*

2016/05/16 v0.5

## Abstract

Package `flags` allows the setting and clearing of flags in bit fields and converts the bit field into a decimal number. Currently the bit field is limited to 31 bits.

## 1 Documentation

A new powerful package `bitset` is written by me and supersedes this package:

- The bit range is not restricted to 31 bits, only index numbers are objected to  $\text{\TeX}$ 's number limit.
- Many more operations are available.
- No dependency of  $\varepsilon\text{-}\text{\TeX}$ .

Therefore I consider this package as obsolete and have stopped the development of this package.

---

\*Please report any issues at <https://github.com/ho-tex/oberdiek/issues>

## 1.1 User interface

Flag positions are one-based, thus the flag position must be a positive integer.  
Currently supported range: 1..31

```
\resetflags {\<fname>}
```

The bit field  $\langle fname \rangle$  is cleared. Currently is also used for initialization, because a `\newflags` macro is not implemented.

```
\setflag {\<fname>} {\<position>}
```

The flag at bit position  $\langle position \rangle$  is set in the bit field  $\langle fname \rangle$ .

```
\clearflag {\<fname>} {\<position>}
```

The flag at bit position  $\langle position \rangle$  is cleared in the bit field  $\langle fname \rangle$ .

```
\printflags {\<fname>}
```

The bit field  $\langle fname \rangle$  is converted to a decimal number. The macro is expandible.

```
\extractflag {\<fname>} {\<position>}
```

Extracts the flag setting at bit position  $\langle position \rangle$ . `\extractflag` expands to 1 if the flag is set and 0 otherwise.

```
\queryflag {\<fname>} {\<position>} {\<set part>} {\<clear part>}
```

It is a wrapper for `\extractflag`.  $\langle set part \rangle$  is called if `\extractflag` returns 1. Otherwise  $\langle clear part \rangle$  is executed.

**Example.** See package `bookmark`. It uses package flags for its font style options.

## 1.2 Requirements

- $\varepsilon$ -`TEX` (`\numexpr`)

## 1.3 ToDo

- Named positions.
- Setting positions by a key-value interface.
- Support for more than 31 bits while maintaining expandibility of `\printflags`.
- Eventually `\newflags`, `\newflagstype`.

## 2 Implementation

```

```

## 3 Installation

### 3.1 Download

**Package.** This package is available on CTAN<sup>1</sup>:

[CTAN:macros/latex/contrib/oberdiek/flags.dtx](#) The source file.

[CTAN:macros/latex/contrib/oberdiek/flags.pdf](#) Documentation.

**Bundle.** All the packages of the bundle ‘oberdiek’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/oberdiek.tds.zip](#)

TDS refers to the standard “A Directory Structure for TeX Files” ([CTAN:pkg/tds](#)). Directories with `texmf` in their name are usually organized this way.

### 3.2 Bundle installation

**Unpacking.** Unpack the `oberdiek.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

---

<sup>1</sup>[CTAN:pkg/flags](#)

```
unzip oberdiek.tds.zip -d ~/texmf
```

### 3.3 Package installation

**Unpacking.** The `.dtx` file is a self-extracting `docstrip` archive. The files are extracted by running the `.dtx` through plain `TeX`:

```
tex flags.dtx
```

**TDS.** Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

```
flags.sty → tex/latex/oberdiek/flags.sty  
flags.pdf → doc/latex/oberdiek/flags.pdf  
flags.dtx → source/latex/oberdiek/flags.dtx
```

If you have a `docstrip.cfg` that configures and enables `docstrip`'s TDS installing feature, then some files can already be in the right place, see the documentation of `docstrip`.

### 3.4 Refresh file name databases

If your `TeX` distribution (`TeX Live`, `MiKTeX`, ...) relies on file name databases, you must refresh these. For example, `TeX Live` users run `texhash` or `mktexlsr`.

### 3.5 Some details for the interested

**Unpacking with L<sup>A</sup>T<sub>E</sub>X.** The `.dtx` chooses its action depending on the format:

**plain TeX:** Run `docstrip` and extract the files.

**L<sup>A</sup>T<sub>E</sub>X:** Generate the documentation.

If you insist on using L<sup>A</sup>T<sub>E</sub>X for `docstrip` (really, `docstrip` does not need L<sup>A</sup>T<sub>E</sub>X), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{flags.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

**Generating the documentation.** You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfL<sup>A</sup>T<sub>E</sub>X:

```
pdflatex flags.dtx  
makeindex -s gind.ist flags.idx  
pdflatex flags.dtx  
makeindex -s gind.ist flags.idx  
pdflatex flags.dtx
```

## 4 History

[2007/02/18 v0.1]

- First version.

[2007/03/07 v0.2]

- Raise an error if  $\varepsilon$ -TeX is not detected.

[2007/03/31 v0.3]

- $\backslash$ queryflag and  $\backslash$ extractflag added.
- Raise an error if position is not positive in case of  $\backslash$ setflag and  $\backslash$ clearflag.

[2007/09/30 v0.4]

- Package is deprecated because of new more powerful package `bitset`.

[2016/05/16 v0.5]

- Documentation updates.

## 5 Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; plain numbers refer to the code lines where the entry is used.
