

The `latex-lab-math` code*

Frank Mittelbach, Joseph Wright, L^AT_EX Project

v0.5c 2023-09-11

Abstract

This is an experimental prototype. It captures math material (basically okay, but the interfaces for packages aren't yet there) and tags the material (which is not yet anywhere near the final state). That part is provided for experimentation and to gather feedback, etc.

1 Introduction

Todo: update all the documentation! Both here and (what little there is!) in the implementation section.

This file implements capture of all math mode material at the outer level, i.e., a formula is captured in its entirety with inner text blocks (possibly containing further math) absorbed as part of the formula. For example,

```
\[ a \in A \text{ for all } a < 5 \] \]
```

would only result in a single capture of the tokens “`a\in A\text{ for all }a<5`”.

1.1 Code level interfaces

```
\math_register_env:n \math_register_env:n {\env}
\math_register_env:nn \math_register_env:nn {\env} {\options}
```

Registers the `<env>` as a math environment which should be captured and made available. This is necessary for all top-level math mode environments: low-level errors may result if these are not correct set up. One or more key–value `<options>` may also be given:

arg–spec The argument specification taken by the beginning of the environment; this is used to remove non-mathematical material.

```
\math_processor:n \math_processor:n {\tokens}
```

Declares that the captured math content should be passed to the `<tokens>`, which will receive the environment type as #1 and the content as #2.

1.2 Document level interfaces

```
\RegisterMathEnvironment \RegisterMathEnvironment [{options}] {\env}
```

Registers the `<env>` as a math environment which should be captured and made available. This is necessary for all top-level math mode environments: low-level errors may result if these are not correct set up. One or more key–value `<options>` may also be given:

arg–spec The argument specification taken by the beginning of the environment; this is used to remove non-mathematical material.

2 Known current bugs, etc.

New Section, now with subsections.

As indicated, these lists are probably incomplete.

Some of these have been addressed in a more recent branch.

2.1 Capture/grabbing problems

1. Incorrect grabbing of \$-math when there is also explicit \$-math within a *text environment* that is itself within the math that should all be grabbed.
2. Similar incorrect grabbing with \$\$ also.
3. The grabbing, for all the display environments (and $\backslash\backslash$), needs to deal with nesting: `amsmath` contains code for this.
- 4.

2.2 Other problems

1. The presence of `\math@th` in association with `\ensuremath` does not necessarily indicate fakemath. This is because wanting `mathsurround` to be zero is very reasonable and common, *even when the math is genuine* (and hence needs to be collected).
2. User-defined environments can create problems; but this area, of new, copied and changed environments, has not yet been developed.

Joseph wrote, inter alia:

My thinking [regarding] `\RegisterMathEnvironment`

- (New) Math environments should not be created-then-patched, but only generated by a [(future)] dedicated command (`\DeclareMathEnvironment`, presumably)
- Math environments created with `\tcmd` [commands] should not be copied, . . .
- Package authors should be able to manually set up math environments with a public boolean.

2.3 Other ToDos

1. Add (some of) the math display commands that were “lifted from plain”, e.g., `\displaylines \eqalign(??).`
- 2.

`\MaybeStop` (temporarily) not executed, as it is unknown on Chris’ system.

3 The Implementation

1 `<@=math>`

2 `<*kernel>`

3.1 File declaration

```
Change description here? ↴  
3 \ProvidesFile{latex-lab-math.ltx}  
4 [ \ltlabmathdate \space  
5       v \ltlabmathversion \space  
6       Grab all the math(s) and tag it (experiments)]  
Temp loading ...  
7 \AddToHook{begindocument/before}{\RequirePackage{latex-lab-testphase-block}}  
8 \ExplSyntaxOn
```

3.2 Setup

Loading `amsmath` is an absolute requirement: this avoids needing to have conditional definitions and deals with how to define `\[/\]` neatly.

```
9 \tl_gput_right:Nn \@kernel@before@begindocument
10 { \RequirePackage { amsmath } }
```

3.3 Data structures

`\l__math_collected_bool` Tracks whether math mode material has been collected, which happens inside `amsmath` environments as well as those handled directly here.

Change first `tl` name below: ‘`env`’ => ‘`info`’?

Or do we need an extra

~~stop~~

~~g_math_grabbed_env_tl~~

~~\g_math_grabbed_math_tl~~

`\g__math_grabbed_env_tl` contains the name of the math environment (`math` in the case of inline math, `\g__math_grabbed_math_tl` the math content).

```
11 \bool_new:N \l__math_collected_bool
12 \tl_new:N \g__math_grabbed_env_tl
13 \tl_new:N \g__math_grabbed_math_tl
```

3.4 Interface commands

`__math_process:nn`
`__math_process:Vn`
`__math_process_auxi:nn`
`__math_process_auxii:nn` A no-op place-holder; the internal wrapper means that it does not need to be concerned with internals.

```
14 \cs_new_protected:Npn \__math_process:nn #1#2
15 {
16     \legacy_if:nF { measuring@ }
17     {
18         \tl_if_in:nnF {#2} { \m@th }
19         { \tl_trim_spaces_apply:nN {#2} \__math_process_auxi:nn {#1} }
20     }
21 }
22 \cs_generate_variant:Nn \__math_process:nn { V }
23 \cs_new_protected:Npn \__math_process_auxi:nn #1#2
24 {
25     \tl_gset:Nn \g__math_grabbed_env_tl {#2}
26     \tl_gset:Nn \g__math_grabbed_math_tl {#1}
27     \__math_process_auxii:nn {#2} {#1}
28 }
29 \cs_new_protected:Npn \__math_process_auxii:nn #1#2 { }
```

(End of definition for `__math_process:nn`, `__math_process_auxi:nn`, and `__math_process_auxii:nn`.)

`\math_processor:n` A simple installer

```
30 \cs_new_protected:Npn \math_processor:n #1
31 { \cs_set_protected:Npn \__math_process_auxii:nn ##1##2 {#1} }
```

(End of definition for `\math_processor:n`. This function is documented on page 2.)

3.5 Content grabbing

`__math_grab_dollar:w`
what's that test doing?

Grab up to a single \$, for inline math mode, suppressing any processing if the first token is `\m@th`.

It is some kind of fix, to avoid the remote possibility that the math is empty, making the code produce an unwanted \$\$.

cf. the code for this in `\@ensuredmath`

It is harmless but unnecessary in the dollardollar grabbing below.

what's that test doing?

```

32 \cs_new_protected:Npn \__math_grab_dollar:w % $
33   #1 $
34   {
35     \tl_if_blank:nF {#1}
36     {
37       \__math_process:nn { math } {#1} % $
38     % fairly simple this one

```

We do not want math tagging in fakemath or when measuring, so we imitate the test inside `__math_process:nn` for now, see <https://github.com/latex3/tagging-project/issues/5>
TODO: use socket to get more control about typesetting variants (tagged, drop etc)?

```

39   \legacy_if:nTF { measuring@ }
40     { #1 $ }
41     {
42       \tl_if_in:nnTF {#1} { \m@th }
43         { #1 $ }
44         {
45           \tagmcend %end P-chunk, in code: \tag_mc_end_push:
46           \kernel@math@begin
47           #1 $
48           \kernel@math@end
49           \tagmcbegin{} % restart P-chunk (whatsits in pdftex)
50         }
51       }
52     }
53   }

(End of definition for \__math_grab_dollar:w)
```

And for the classical TeX display structure.

```

54
55 \skip_new:N \l__math_tmpa_skip
56
57 \cs_new_protected:Npn \__math_grab_dollardollar:w % $$%
58   #1 $$%
59   {
60     \tl_if_blank:nF {#1}
61     {
62       \__math_tag_dollardollar_display:nn { equation* }{#1}
63       #1
64       $$%
65     }
66   }
```

To allow to use the code without tagging we guard. But probably tagpdf should provide some tools for such manual para-ends.

```

67 \cs_new_protected:Npn \kernel@close@P {
68   \tag_if_active:T
69   {
70     \tagmcend %end P-chunk, should perhaps be \tag_mc_end_push: ...
```

```

71      \int_gincr:N \g__tag_para_end_int
72      \bool_if:NT \l__tag_para_show_bool
73      { \tag_mc_begin:n{artifact}
74          \rlap{\color_select:n{red}\tiny\ \int_use:N\g__tag_para_end_int}
75          \tag_mc_end:
76      }
77      \tag_struct_end:
78  }
79 }

80
81
82
83 \cs_new_protected:Npn \__math_tag_dollardollar_display:nn #1#2 {
84     \__math_process:nn {#1} {#2}
85     @kernel@close@P
86     @kernel@math@begin
87     %           \skip_set:Nn \belowdisplayskip      {-\belowdisplayskip}
88     %           \skip_set:Nn \belowdisplayshortskip {-\belowdisplayshortskip}
89     %           \int_set:Nn \postdisplaypenalty {10000}
90     %%
91     %           \group_insert_after:N \__math_tag_dollardollar_display_end:
92 }
93
94 \cs_new_protected:Npn \__math_tag_dollardollar_display_end: {
95     % \typeout{== tag dollarldollar display end}
96     % \ShowTagging{struct-stack}
97     \tagpdfparaOff
98     \para_raw_end:
99     \tagpdfparaOn
100    \l__math_tmpa_skip \lastskip
101    @kernel@math@end
102    \penalty \postdisplaypenalty

```

This reinserts the below display skips. It must be doubled to get the right amount:

```

103     \skip_vertical:n { -\l__math_tmpa_skip * 2 }
104 %
105     \doendpe           % this has no \end{...} to take care of it
106 }
107

```

(End of definition for __math_grab_dollardollar:w.)

__math_grab_inline:w Collect inline math content and deal with the need to move to math mode.

```

108 \cs_new_protected:Npn \__math_grab_inline:w % \(
109     #1 \)
110     {
111         \tl_if_blank:nF {#1}
112         {
113             \__math_process:nn { math } {#1}
114             $ #1 $
115         }
116         \bool_set_false:N \l__math_collected_bool
117     }

```

(End of definition for __math_grab_inline:w.)

`__math_grab_eqn:w` For the most common use of `\[/\]`: turn into an environment.

```
118 \cs_new_protected:Npn \__math_grab_eqn:w % \[
119   #1 \]
120   {
121     % \typeout{collected? = \bool_if:NTF \l__math_collected_bool {true}{false}}
122     \begin{ { equation* } #1 \end { equation* }
123   }
```

(End of definition for `__math_grab_eqn:w`.)

3.6 Marking math environments

A general mechanism for math mode environments that do not grab their content (*cf.* most `amsmath` environments).

`\l__math_env_name_tl` To allow us to carry out “special effects”

```
124 \tl_new:N \l__math_env_name_tl
```

Here we set up specialised handling of environments. The idea for the `arg-spec` key is that if an environment takes arguments, we don’t worry during the main grabbing. Rather, we remove the arguments from the grabbed content and forward only the payload. That is done by (ab)using `lcmd`.

```
125 \keys_define:nn { __math }
126   {
127     arg-spec .code:n =
128     {
129       \ExpandArgs { c } \DeclareDocumentCommand
130         { __math_env \l__math_env_name_tl _aux: }
131         {#1}
132         { \__math_env_forward:w }
133     }
134 }
```

`\math_register_env:nn` Set up to capture environment content and make available.

```
135 \cs_new_protected:Npn \math_register_env:nn #1#2
136   {
137     \tl_set:Nn \l__math_env_name_tl {#1}
138     \keys_set:nn { __math } {#2}
139     \cs_gset_eq:cc { __math_env_ #1 _begin: } {#1}
140     \cs_gset_eq:cc { __math_env_ #1 _end: } { end #1 }
141     %
142     \ExpandArgs { nnx } \RenewDocumentEnvironment {#1} { b }
143     {
144       % \bool_set_true:N \exp_not:N \l__math_collected_bool
145       % \cs_if_exist:cTF { __math_env #1 _aux: }
146       %
147       % \exp_not:c { __math_env #1 _aux: }
148       % #####1 \exp_not:N \__math_env_end: {#1}
149       %
150       % { \exp_not:N \__math_process:nn {#1} {#####1} }
151       \exp_not:N \bool_if:NTF \exp_not:N \l__math_collected_bool
152       {
```

```

153 %           \typeout{==>B1}
154 }
155 {
156 %
157 \cs_if_exist:cTF { __math_env #1 _aux: }
158 {

366         { \@badmath }
367     }
368 }

```

(End of definition for `\[` and `\]`. These functions are documented on page ??.)

why does `ensuremath` need handling at all?

Indeed! Currently, this is setup to process the math that it has anyways already captured as its argument; thus it is more efficient than leaving the capture to be repeated by the `\everymath`

A bit of nesting fun to make sure we collect only if required.

```

369 \% \cs_gset_protected:Npn \ensuremath #1
370 %   {
371 %     \mode_if_math:TF
372 %     {#1}

3.9 Modifying kernel environments

We need to cover this even though it is, of course, not encouraged.

```

455 \math_register_env:n { eqnarray }
456 \math_register_env:n { eqnarray* }

```

Places where math mode is (ab)used.

```

457 \clist_map_inline:nn
458   { tabular }
459   {
460     \AddToHook{ env / #1 / begin }
461     { \bool_set_true:N \l__math_collected_bool }
462   }

```

__math_m@th: Handle non-math use of math mode. At present nesting isn't supported as \m@th pops \m@th up in a few places that *are* math mode!

```

463 \cs_new_eq:NN \__math_m@th: \m@th
464 \cs_gset_protected:Npn \m@th
465   {
466     \bool_set_true:N \l__math_collected_bool
467     \__math_m@th:
468   }

```

(End of definition for __math_m@th: and \m@th. This function is documented on page ??.)

3.10 Modifying `amsmath`

```
\_\_math_amsmath_align@:nn
\_\_math_amsmath_gather@:n
\_\_math_amsmath_multline@:n
    \align@%
    \gather@%
    \multline@%
```

Mark up all of the display environments as the content is captured anyway. We then use an internal macro in each environment type to insert the processing code. Each of these is slightly different, so we cannot use a simple loop here. The test for `\split@tag` is required as the `split` environment internally uses `gather` when not within an `amsmath` environment, for example inside `equation`. Without the precaution, we'd get two copies of the grabbed math, the second of which would start with `\split@tag`.

```
469
470
