

Test of ‘rotating’ package

Sebastian Rahtz and Leonor Barroca¹

November 19th 1994²

¹Now maintained as part of the L^AT_EX graphics bundle.

²Updated for graphics bundle 2016/05/22

'Rotating' provides a generalised rotation environment, where the text will be rotated (anti-clockwise) by the number of degrees specified as a parameter to the environment, but no special arrangement is made to find space for the result.

```
Start here
\begin{rotate}{-56}
Save whales
\end{rotate}
End here
```

A complete example of rotating text without leaving space would the 'Save the whale' text written at 10 degree intervals round the compass. We use 'rlap' to ensure that all the texts are printed at the same point. Just to show that L^AT_EX can handle PostScript muckings-about properly...

```
Start here \begin{turn}{56}
Save the whale
\end{turn} end here
\begin{array}{c}
\text{Save the whale} \\
\text{Save the whale}
\end{array}
```

```
Start here
\begin{rotate}{-56}
Save whales
\end{rotate}
End here
```

```
\begin{array}{l}
\newcount\wang
\newsavebox{\wangtext}
\newdimen\wangspace
\def\wheel{\#1{\savebox{\wangtext}{\#1}}%
{\newdimen\wangspace
\wd\wangtext
\advance\wangspace by 1cm%
\centerline{%
\rule{0pt}{\wangspace}%
\rule[-\wangspace]{0pt}{\wangspace}%
\ifnum\wang<180
\loop\ifnum\wang<180
\rlap{\begin{rotate}{\the\wang}}%
\rule{1cm}{0pt}\#1\end{rotate}}%
\advance\wang by 10\repeat}}
\wheel{Save the whale}
\end{array}
```

If the user desires L^AT_EX to leave space for the rotated box, then 'turn' is used:

```
Start here \begin{turn}{56}
Save the whale
\end{turn} end here
\begin{array}{c}
\text{Save the whale} \\
\text{Save the whale}
\end{array}
```

```
Start here
\begin{turn}{56}
Save the whale
\end{turn}
End here
```

The environment 'Sideways' is a special case, setting the rotation to -90° , and leaving the correct space for the rotated box.

```
Start here \begin{sideways}
Save the whale
\end{sideways} End here
\begin{array}{c}
\text{Save the whale} \\
\text{Save the whale}
\end{array}
```

```
Start here
\begin{sideways}
Save the whale
\end{sideways}
End here
```

If you deal with whole paragraphs of text, you realize that `TEX` boxes are not as simple as they sometimes look: they have a height *and* a depth. So when you rotate, you rotate about the point on the left-hand edge of the box that meets the baseline. The results can be unexpected, as shown in the full set of paragraph rotations in Figures 1 and 2. If you really want to turn a paragraph so that it appears to rotate about the *real* bottom of the `TEX` box, you have to adjust the box in the normal `LATEX` way:

<pre> Start Save the whales Save the whale Save the whale Save the whale Save the whale Save the whale End </pre>	<pre> \newsavebox{\foo} \savebox{\foo}{\parbox{1in}{Save the whales Save the whale Save the whale Save the whale}}% Start \begin{turn}{45}\usebox{\foo}\end{turn} End </pre>
<pre> Start Save the whales Save the whale Save the whale Save the whale Save the whale Save the whale End </pre>	<pre> \savebox{\foo}{\parbox[b]{1in}{Save the whales Save the whale Save the whale Save the whale}}% Start \begin{turn}{-45}\usebox{\foo}\end{turn} End </pre>

We can set tabular material in this way; at the same time, we demonstrate that the rotation can be nested:

Word	Occurrences
hello	33
goodbye	34

```

\begin{sideways}
\rule{1in}{0pt}
\begin{tabular}{|l r|}%
\em Word & \begin{rotate}{90}\%\\
Occurrences\end{rotate}\\
\hline
hello & 33\\
goodbye & 34\\
\hline
\end{tabular}
\end{sideways}

```

If you are interested in setting rotated material in tables or figures, this presents no problem. Figure 3 shows how PostScript files which are being incorporated using can be rotated at will, while Figure 4 shows, in contrast, how ‘includegraphics’ itself handles rotation. It is also possible to rotate the whole of the figure environment, including caption, by using the ‘sidewaysfigure’ and ‘sidewaystable’ environments in place of ‘figure’ and ‘table’.

Sideways figures and tables always take up the whole page. They can be rotated so that the bottom of the figures is on the left or the right; the default is to always turn to the right. If the ‘twoside’ option has been given to the main document class, this package then starts rotating sideways figures according to the page number (this requires two passes through L^AT_EX at least). If you want the ‘twoside’ option, but want the figures always in one direction, use the ‘figuresright’ or ‘figuresleft’ options to ‘rotating’.

The code used to produce figures 1–9 is as follows:

Figure 1 \begin{sidewaystable}

```

\centering
\caption{This is a narrow table, which should be centred vertically
on the final page.\label{rotfloat1}}
\begin{tabular}{|l l|}
\hline
a & b \\
c & d \\
e & f \\
g & h \\
i & j \\
\hline
\end{tabular}
\end{sidewaystable}

```

Figure 2 \begin{sidewaystable}

```
