

# The `latex-lab-table` package

## Changes related to the tagging of tables

Frank & Ulrike, L<sup>A</sup>T<sub>E</sub>X Project\*

v0.85d 2023-10-30

### Abstract

The following code implements a first draft for the tagging of tables. It still has a large number of limitations and restrictions!

# 1 Documentation

In L<sup>A</sup>T<sub>E</sub>X the word **table** is used as the name of the float environment that can contain a data table<sup>1</sup> along with a caption and some additional text. The environments for actual data tables have various names like **tabular**, **tabular\***, **tabularx** and **longtable**—the last should not be used inside a float and supports its own caption command.

In this documentation “table” always means such data tables and not the float environment.

Tagging of tables is on one side doesn’t look very difficult: one only has to surround rows and cells by TR and TH or TD structures. But there are difficulties:

- One is that over the years various packages related to tables have been written that all change some of the internals. Inserting the tagging commands and testing all the variants and various nestings is not trivial.
- The other difficulty is that most of the existing environments to create tables do not know the concept of headers as a semantic structures.
- Headers are only produced through visual formatting, e.g., by making them bold or by underlying some color. But accessible tables need headers (and the PDF/UA standards requires them) and this means that additional syntax to declare headers (when they can’t be guessed) must be developed. This is still an area for research.

Right now, this module therefore does implement only some basic support for the tagging of tables. A list of the known limitations is shown below.

The module is not loaded automatically (i.e., not yet integrated into any **phase-XX**) and by itself it doesn’t activate tagging. For experimenting with table tagging it is therefore best to load it in combination with phase-III in **\DocumentMetadata**, i.e.:

```
\DocumentMetadata{testphase={phase-III,table}}
```

It will then automatically tag all table environments it already supports with the exception of tables in the header and footer of the page (where tagging is disabled). Such tables can be nested.

If a table should not be tagged as table, for example because it is merely used to produce a layout or because it is a not yet (fully) supported table structure, the tagging can be disabled with **\tagpdfsetup{table-tagging=false}**.

Inside cells the automatic tagging of paragraphs is disabled with the exception of p/m/b-type cells.

Rows do not need to contain a full number of &, missing cells are automatically added with an empty TD-structure.

There is some basic support<sup>2</sup> for headers. With

```
\tagpdfsetup{table-header-rows={(list of row numbers)}}
```

you can declare which (absolute) row numbers should be tagged as header rows. It applies to all tables until it is changed to a different list of row numbers or undone by setting the key to *(empty)*. A row number can be negative, then the counting starts from the end of the table. There is no support for header columns yet. In a **longtable** the code will

---

<sup>1</sup>But it does not really have to, you can put other material into such environments.

<sup>2</sup>This is not meant to be the final interface, though.

currently use the `\endhead` or `\endfirsthead` rows as header if one of these commands has been used and in that case the code ignores a `table-header-rows` setting.

You should not insert meaningful text with `!{...}` or `@{...}` or `\noalign` between the rows or columns of the table. With pdflatex such text will be unmarked, with lualatex it will be marked as artifact. Either case means that it will be currently ignored in the structure.<sup>3</sup>

As mentioned below the `colortbl` doesn't yet work properly with the tagging, but once it does, then colors inside the table will probably be simply ignored (at least initially). If such a color has a semantic meaning (like "important value") this meaning will be lost.

Feedback and problems with the code can be reported at <https://github.com/latex3/tagging-project> either in form of explicit issues or as a "discussion topic", whatever works best.

## 2 Limitations

- The code loads the `array` package and so does not work without it (that is not really a limitation, but can affect existing tables).
- It supports only a restricted number of tables types. Currently `tabular`, `tabular*`, `tabularx`, and `longtable`.
- the `array` environment is assumed to be part of math and tagging as a table is disabled for it.
- Row spans are not yet supported (and the `multirow` package is untested).
- The `colortbl` package breaks tagging if there are nested tables. It also breaks the filling up of incomplete rows.
- The `tabulararray` package use a completed different method to create tables and will not be supported by this code.
- The `nicematrix` package is currently incompatible.
- Most other packages related to tables in L<sup>A</sup>T<sub>E</sub>X are not yet tested, that includes packages that change rules like `booktabs`, `hhline`, `arydshln`, `hvdashln`.
- `longtable` currently only works with lualatex. With other engines it breaks as its output routine clashes with the code which closes open MC-chunks at pagebreaks and if this is resolved there will probably be problems with the head and foot boxes (but this can't be tested currently).
- Not every table should be tagged as a Table structure, often they are only used as layout help, e.g. to align authors in a title pages. In such uses the tagging of the table must be deactivated with `\tagpdfsetup{table-tagging=false}`.
- Only simple header rows are currently supported. Columns and complex headers with subheaders will be handled later as that needs some syntax changes. Tables with more than one header row are probably not pdf/UA as the headers array in the cells is missing.

---

<sup>3</sup>While it is theoretically possible to collect such text and move it into a structure it would require manual markup from the author to clarify where this text belongs too.

- A `longtable` \caption is currently simply formatted as a multicolumn and not tagged as a `Caption` structure.
- The `caption` package will quite probably break the `longtable` caption.
- The setup for `longtable` requires lots of patches to internal `longtable` commands and so can easily break if other packages try to patch `longtable` too.
- The `longtable` environment supports footnotes in p-type columns, but it hasn't been tested yet if this works also with the tagging code.
- The code is quite noisy and fills the log with lots of messages.<sup>4</sup>

### 3 Introduction

### 4 Technical details and problems

The implementation has to take care of various details.

#### 4.1 TODOs

- Test `array-006-longtable.lvt` and `array-007-longtable.lvt` have errors with pdftex (para tagging)
- Instead of before/after hooks we should add sockets directly into the code.
- Debugging code and messages must be improved.
- Cells need an `Headers` array.
- Row spans should be supported (but perhaps need syntax support)
- Longtable captions should be properly supported.
- Handle p-cells better. para-tagging should probably be enabled, but Part can't be a child of TD, so this should probably be changed to Div here. Also there is a stray MC somewhere.
- More packages must be tested.

### 5 Implementation

```

1  <@@=tbl>
2  <*package>
3  \ProvidesExplPackage {latex-lab-testphase-table} {\ltlabtbldate} {\ltlabtblversion}
4    {Code related to the tagging of tables}

```

This builds on `array` so we load it by default:

```

5  \RequirePackage{array}

```

---

<sup>4</sup>Helpful for us at this stage.

## 5.1 Variables

```
\l__tbl_celltag_t1  
\l__tbl_rowtag_t1  
\l__tbl_cellattribute_t1  
\l__tbl_rowattribute_t1  
\g__tbl_missingcells_int  
\l__tbl_tmpa_clist  
\l__tbl_tmpa_seq  
\l__tbl_tmpa_t1
```

This is for the celltag, e.g. TD or TH:

```
6 \tl_new:N \l__tbl_celltag_t1  
7 \tl_set:Nn \l__tbl_celltag_t1 {TD}
```

For the rowtag, probably always TR:

```
8 \tl_new:N \l__tbl_rowtag_t1  
9 \tl_set:Nn \l__tbl_rowtag_t1 {TR}
```

And here cell and row attributes:

```
10 \tl_new:N \l__tbl_cellattribute_t1  
11 \tl_set:Nn \l__tbl_cellattribute_t1 {}  
12 \tl_new:N \l__tbl_rowattribute_t1  
13 \tl_set:Nn \l__tbl_rowattribute_t1 {}
```

This will contain the number of missing cells used:

```
14 \int_new:N \g__tbl_missing_cells_int
```

Temp variables

```
15 \clist_new:N \l__tbl_tmpa_clist  
16 \seq_new:N \l__tbl_tmpa_seq  
17 \tl_new:N \l__tbl_tmpa_t1
```

(End of definition for \l\_\_tbl\_celltag\_t1 and others.)

## 5.2 Sockets

The code uses a number of sockets to inject the tagging commands. These can be easily set to a noop-plug in case the automated tagging is not wanted. At first sockets for the begin and end of cells and rows

```
gsupport/tblcell	begin (socket)  
tagsupport/tblcell/end (socket) 18 \NewSocket{tagsupport/tblcell/begin}{0}  
agsupport/tblrow/begin (socket) 19 \NewSocket{tagsupport/tblcell/end}{0}  
tagsupport/tblrow/end (socket) 20 \NewSocket{tagsupport/tblrow/begin}{0}  
21 \NewSocket{tagsupport/tblrow/end}{0}
```

tagsupport/tbl/init (socket) This socket should be at the begin of the table, inside a group. It is meant for settings like disabling paratagging. This socket can perhaps be merged later into the begin-sockets when they are no longer added as hooks but in the environment definitions.

```
22 \NewSocket{tagsupport/tbl/init}{0}
```

```
:agsupport/tbl/finalize (socket) To fine tune the structure (change cells to header cells, remove unwanted structures, move a foot to the end, etc.) we also need a socket that is executed at the end of the table but before all the variables are restored to the outer or default values. The code in the socket can make assignments, but probably shouldn't do typesetting and not write whatsits.
```

```
23 \NewSocket{tagsupport/tbl/finalize}{0}
```

```
:tbl/finalize/longtable (socket) longtable needs its own socket to fine tune the structure. Simply switching the plug in the previous socket interferes with enabling/disabling the tagging.
```

```
24 \NewSocket{tagsupport/tbl/finalize/longtable}{0}
```

`tagsupport/tblhmode/begin (socket)` These sockets are used in the begin and end code of environments, to allow a fast enabling  
`tagsupport/tblhmode/end (socket)` and disabling of the tagging. We distinguish between tables that can be used inside  
`tagsupport/tblvmode/begin (socket)` paragraphs and standalone tables like longtable.  
`tagsupport/tblvmode/end (socket)`

```

25 \NewSocket{tagsupport/tblhmode/begin}{0}
26 \NewSocket{tagsupport/tblhmode/end}{0}
27 \NewSocket{tagsupport/tblvmode/begin}{0}
28 \NewSocket{tagsupport/tblvmode/end}{0}

```

This are the standard plugs for tagging of cells and rows.

`TD (plug)`

```

29 \NewSocketPlug{tagsupport/tblcell/begin}{TD}
30 {
31   \tag_struct_begin:n
32   {
33     tag          =\l__tbl_celltag_tl,
34     attribute-class =\l__tbl_cellattribute_tl
35   }
36 \seq_gput_right:Nn \g__tbl_struct_cur_seq { \tag_get:n {struct_num} }
we store the cells of multicolumns as negative number. This allow to skip them or to use
them as needed.
37 \int_step_inline:nn { \g__tbl_span_tl - 1 }
38 {
39   \seq_gput_right:Nn \g__tbl_struct_cur_seq { -\tag_get:n {struct_num} }
40 }
41 \tag_mc_begin:n{}
42 }

```

`TD (plug)`

```

43 \NewSocketPlug{tagsupport/tblcell/end}{TD}
44 {
45   \tag_mc_end:
46   \tag_struct_end:
47 }

```

In p-columns we need a slightly different plug which reactivates the paragraph tagging. tagging

`TD (plug)`

```

48 \NewSocketPlug{tagsupport/tblcell/begin}{TDPbox}
49 {
50   \tag_struct_begin:n
51   {
52     tag          =\l__tbl_celltag_tl,
53     attribute-class =\l__tbl_cellattribute_tl
54   }
55 \seq_gput_right:Nn \g__tbl_struct_cur_seq { \tag_get:n {struct_num} }
56 \int_step_inline:nn { \g__tbl_span_tl - 1 }
57 {
58   \seq_gput_right:Nn \g__tbl_struct_cur_seq { -\tag_get:n {struct_num} }
59 }
60 \tagpdfparaOn
61 \tl_set:Nn \l__tag_para_main_tag_tl {Div}
62 }

```

```

TD (plug)
63 \NewSocketPlug{tagsupport/tblcell/end}{TDpbox}
64 {
65     \tag_struct_end:
66 }

TR (plug)
67 \NewSocketPlug{tagsupport/tblrow/begin}{TR}
68 {
69     \seq_gclear:N \g__tbl_struct_cur_seq
70     \tag_struct_begin:n
71     {
72         tag          =\l__tbl_rowtag_tl,
73         attribute-class=\l__tbl_rowattribute_tl
74     }
75     \seq_gput_right:Ne \g__tbl_struct_rows_seq { \tag_get:n {struct_num} }
76 }

TR (plug)
77 \NewSocketPlug{tagsupport/tblrow/end}{TR}
78 {
79     \__tag_tbl_add_missing_cells:n { \g__tbl_missing_cells_int }
80     \seq_gput_right:Ne \g__tbl_struct_cells_seq
81     {
82         \seq_use:Nn \g__tbl_struct_cur_seq {,}
83     }
84     \int_compare:nNnTF { \g__tbl_row_int } = { \seq_count:N\g__tbl_struct_cells_seq }
85     {
86         \typeout
87         {==>~
88             stucture~stored~for~row~\int_use:N\g__tbl_row_int :~
89             \seq_use:Nn \g__tbl_struct_cur_seq {,}
90         }
91     }
92     { \ERROR } % should not happen ...
93     \tag_struct_end:
94 }

```

And the plugs for the table as whole. The code can be different for normal tables which can also be used inline and nested and “vmode” tables like longtable.

**Table** (*plug*) Inside a table we currently only disable paratagging. We assume that these sockets are in an environment group, so there is no need to reenable paratagging.

```

95 \NewSocketPlug{tagsupport/tbl/init}{Table}
96 {
97     \tag_if_active:T
98     {
99         \bool_set_false:N \l__tag_para_bool
100    }
101 }

```

**Table** (*plug*) This plug will fine tune the structure.

```

102 \NewSocketPlug{tagsupport/tbl/finalize}{Table}

```

```

103     {
104         \__tbl_set_header_rows:
105     }

```

**Table (plug)** This plug will fine tune the structure of longtable.

```

106 \NewSocketPlug{tagsupport/tbl/finalize/longtable}{Table}
107 {

```

If neither `\endhead` nor `\endfirsthead` has been used we use the standard header command:

```

108     \bool_lazy_and:nNTF
109     { \seq_if_empty_p:N \g__tbl_LT@head_rows_seq }
110     { \seq_if_empty_p:N \g__tbl_LT@firsthead_rows_seq }
111     { \__tbl_set_header_rows: }

```

Otherwise, if `firsthead` has not been used we use `head`. For this we simple retrieve the row numbers and then call the header command.

```

112 {
113     \seq_if_empty:NTF \g__tbl_LT@firsthead_rows_seq
114     {
115         \clist_set:Ne \l__tbl_header_rows_clist
116         { \seq_use:Nn \g__tbl_LT@head_rows_seq {,} }
117         \__tbl_set_header_rows:
118     }

```

In the other case we use `firsthead`.

```

119 {
120     \clist_set:Ne \l__tbl_header_rows_clist
121     { \seq_use:Nn \g__tbl_LT@firsthead_rows_seq {,} }
122     \__tbl_set_header_rows:

```

Additionally we have to remove the head to avoid duplication. The one option here is to remove the rows from the kid sequence of the table (which will lead to orphaned structure elements), the other to make them artifact. For now we use the first option for pdf 1.7 and the second for pdf 2.0.

```

123 \pdf_version_compare:NnTF < {2.0}
124 {
125     \seq_map_inline:Nn \g__tbl_LT@head_rows_seq
126     {
127         \seq_gset_item:cnn
128         { g__tag_struct_kids_ \g__tbl_struct_table_tl _seq }
129         { ##1 }
130     }

```

Not sure if needed, but if needed we can remove also the `P` tag. This is currently disabled as it produce warnings. TODO: This needs also a `tagpdf` command which takes care of debug code.

```

131 \tl_set:Ne \l__tbl_tmpa_tl
132     { \seq_item:Nn\g__tbl_struct_rows_seq {##1} }
133 \prop_if_exist:cT
134     { g__tag_struct_ \l__tbl_tmpa_tl _prop }
135     {
136         \%prop_gremove:cn {g__tag_struct_ \l__tbl_tmpa_tl _prop} {P}
137     }
138 }

```

```

139 }
140 {
141     \seq_map_inline:Nn \g__tbl_LT@head_rows_seq
142     {
143         \tl_set:Ne \l__tbl_tmpa_tl
144         { \seq_item:Nn\g__tbl_struct_rows_seq {##1} }
145         \prop_if_exist:cT
146         { g__tag_struct_ \l__tbl_tmpa_tl _prop }
147         {
148             \__tbl_struct_prop_gput:Vnn \l__tbl_tmpa_tl {S}{/Artifact}
149         }
150     }
151 }
152 }
153 }
```

The foot is handled similar, the difference is that we have to move it to the end one of them is not empty, but do nothing if they aren't there.

```

154     \bool_lazy_and:nnF
155     { \seq_if_empty_p:N \g__tbl_LT@foot_rows_seq }
156     { \seq_if_empty_p:N \g__tbl_LT@lastfoot_rows_seq }
157 }
```

If lastfoot is empty move foot to the end.

```

158     \seq_if_empty:NTF \g__tbl_LT@lastfoot_rows_seq
159     {
160         \seq_map_inline:Nn \g__tbl_LT@foot_rows_seq
161         {
162             \tl_set:Ne \l__tbl_tmpa_tl
163             {
164                 \seq_item:cn
165                 {g__tag_struct_kids_ \g__tbl_struct_table_tl _seq}
166                 {##1}
167             }
168             \seq_gset_item:cnn
169             {g__tag_struct_kids_ \g__tbl_struct_table_tl _seq}
170             { ##1 }
171             {}
172             \seq_gput_right:cV
173             {g__tag_struct_kids_ \g__tbl_struct_table_tl _seq}
174             \l__tbl_tmpa_tl
175         }
176     }
```

If lastfoot is not empty we move that.

```

177     {
178         \seq_map_inline:Nn \g__tbl_LT@lastfoot_rows_seq
179         {
180             \tl_set:Ne \l__tbl_tmpa_tl
181             {
182                 \seq_item:cn
183                 {g__tag_struct_kids_ \g__tbl_struct_table_tl _seq}
184                 {##1}
185             }
186             \seq_gset_item:cnn
```

```

187             {g__tag_struct_kids_ \g__tbl_struct_table_t1 _seq}
188             { ##1 }
189             {}
190             \seq_gput_right:cV
191             {g__tag_struct_kids_ \g__tbl_struct_table_t1 _seq}
192             \l__tbl_tmpa_t1
193         }

```

and we hide foot

```

194     \pdf_version_compare:NnTF < {2.0}
195     {
196         \seq_map_inline:Nn \g__tbl_LT@foot_rows_seq
197         {
198             \seq_gset_item:cnn
199                 {g__tag_struct_kids_ \g__tbl_struct_table_t1 _seq}
200                 { ##1 }
201             {}
202         }

```

Not sure if needed, but if needed we can remove also the P tag. This is currently disabled as it produce warnings. TODO: This needs also a tagpdf command which takes care of debug code.

```

203             { \seq_item:Nn\g__tbl_struct_rows_seq {##1} }
204             \prop_if_exist:cT
205                 { g__tag_struct_ \l__tbl_tmpa_t1 _prop }
206                 {
207                     \%prop_gremove:cn {g__tag_struct_ \l__tbl_tmpa_t1 _prop} {P}
208                 }
209             }
210         }
211         {
212             \seq_map_inline:Nn \g__tbl_LT@foot_rows_seq
213             {
214                 \tl_set:Ne \l__tbl_tmpa_t1
215                     { \seq_item:Nn\g__tbl_struct_rows_seq {##1} }
216                     \prop_if_exist:cT
217                         { g__tag_struct_ \l__tbl_tmpa_t1 _prop }
218                         {
219                             \tbl_struct_prop_gput:Vnn \l__tbl_tmpa_t1 {S}{/Artifact}
220                         }
221                     }
222                 }
223             }
224         }
225     }

```

243  }

```

**Table (plug)**

```

244  \NewSocketPlug{tagsupport/tblvemode/begin}{Table}
245  {
246      \tag_struct_begin:n {tag=Table}
247      \tl_gset:Ne \g__tbl_struct_table_tl { \tag_get:n {struct_num} }
248  }

```

**Table (plug)**

```

249  \NewSocketPlug{tagsupport/tblvemode/end}{Table}
250  {
251      \tag_struct_end:
252      \par
253  }

```

### 5.3 Environments

Currently only tabular, tabular\*, tabularx and longtable. We must use the `before` and `after` hooks as the `end` hook is executed before the end of the last row and then MC are messed up. This means that this sockets should only contain code that doesn't needs to be grouped!

```

254  \AddToHook{env/tabular/before}  {\UseSocket{tagsupport/tblhmode/begin}}
255  \AddToHook{env/tabular/after}    {\UseSocket{tagsupport/tblhmode/end}}
256  \AddToHook{env/tabular*/before} {\UseSocket{tagsupport/tblhmode/begin}}
257  \AddToHook{env/tabular*/after}  {\UseSocket{tagsupport/tblhmode/end}}
258  \AddToHook{env/tabularx/before}{\UseSocket{tagsupport/tblhmode/begin}}
259  \AddToHook{env/tabularx/after} {\UseSocket{tagsupport/tblhmode/end}}
260  \AddToHook{env/longtable/before}{\UseSocket{tagsupport/tblvemode/begin}}
261  \AddToHook{env/longtable/after} {\UseSocket{tagsupport/tblvemode/end}}

```

The `array` environment is math. So we disable table tagging for now.

```

262  \AddToHook{env/array/begin} {\l__tag_tbl_disable:}

```

## 5.4 Interfaces to tagging

### 5.4.1 Tagging helper commands

\\_\\_tbl\\_set\\_colspan:n This command takes a number, checks if it is larger than one, checks if the colspan attribute exists (we can't predefine an arbitrary number), and updates \l\\_\\_tbl\\_cellattribute\\_tl.

```
263 \tag_if_active:T
264   { \cs_generate_variant:Nn \_\_tag_attr_new_entry:nn {ee} }
265 \cs_new_protected:Npn \_\_tbl_set_colspan:n #1
266   {
267     \tag_if_active:T
268     {
269       \int_compare:nNnT {#1}>{1}
270       {
271         \prop_get:NeNF \g\_\_tag_attr_entries_prop
272           {colspan-\int_eval:n{#1}}
273         \l\_\_tbl_tmpa_tl
274         {
275           \_\_tag_attr_new_entry:ee
276             {colspan-\int_eval:n{#1}}
277             {/0 /Table /ColSpan-\int_eval:n{#1}}
278         }
279         \tl_set:Ne \l\_\_tbl_cellattribute_tl
280           {colspan-\int_eval:n{#1}}
281       }
282     }
283 }
```

(End of definition for \\_\\_tbl\\_set\\_colspan:n.)

### 5.4.2 Disabling/enabling

For now we have only the option true/false but this will probably be extended to allow different setups like first row header etc.

```
\_\_tag_tbl_disable:
284 \cs_new_protected:Npn \_\_tag_tbl_disable:
285   {
286     \AssignSocketPlug{tagsupport/tblcell/begin}{noop}
287     \AssignSocketPlug{tagsupport/tblcell/end}{noop}
288     \AssignSocketPlug{tagsupport/tblrow/begin}{noop}
289     \AssignSocketPlug{tagsupport/tblrow/end}{noop}
290     \AssignSocketPlug{tagsupport/tbl/init}{noop}
291     \AssignSocketPlug{tagsupport/tbl/finalize}{noop}
292     \AssignSocketPlug{tagsupport/tbl/finalize/longtable}{noop}
293     \AssignSocketPlug{tagsupport/tblhmode/begin}{noop}
294     \AssignSocketPlug{tagsupport/tblhmode/end}{noop}
295     \AssignSocketPlug{tagsupport/tblvemode/begin}{noop}
296     \AssignSocketPlug{tagsupport/tblvemode/end}{noop}
297 }
```

(End of definition for \\_\\_tag\\_tbl\\_disable:.)

```

\__tag_tbl_enable:
298 \cs_new_protected:Npn \__tag_tbl_enable:
299 {
300     \AssignSocketPlug{tagsupport/tblcell/begin}{TD}
301     \AssignSocketPlug{tagsupport/tblcell/end}{TD}
302     \AssignSocketPlug{tagsupport/tblrow/begin}{TR}
303     \AssignSocketPlug{tagsupport/tblrow/end}{TR}
304     \AssignSocketPlug{tagsupport/tbl/init}{Table}
305     \AssignSocketPlug{tagsupport/tbl/finalize}{Table}
306     \AssignSocketPlug{tagsupport/tbl/finalize/longtable}{Table}
307     \AssignSocketPlug{tagsupport/tblhmode/begin}{Table}
308     \AssignSocketPlug{tagsupport/tblhmode/end}{Table}
309     \AssignSocketPlug{tagsupport/tblvmode/begin}{Table}
310     \AssignSocketPlug{tagsupport/tblvmode/end}{Table}
311 }
312 % TODO decide about key name
313 \keys_define:nn { __tag / setup }
314 {
315     table-tagging .choices:nn = { true, on }
316     { \__tag_tbl_enable: },
317     table-tagging .choices:nn = { false, off }
318     { \__tag_tbl_disable: },
319     table-tagging .default:n = true,
320     table-tagging .initial:n = true
321 }
322 \AddToHook{begindocument}
323 {
324     \cs_if_exist:NT \@kernel@before@head
325     {
326         \tl_put_right:Nn \@kernel@before@head {\__tag_tbl_disable:}
327         \tl_put_right:Nn \@kernel@before@foot {\__tag_tbl_disable:}
328     }
329 }

```

### 5.4.3 Header support

Accessible table must have header cells declaring the meaning of the data in a row or column. To allow a data cell to find it header cell(s) a number of things must be done:

- every cell meant as a header should use the tag TH.
- header cells should have a **Scope** attribute with the value **Column**, **Row** or **Both**. This is not needed in the first row or column of a table.
- For more complex cases both TD and TH cell can contain a **Headers** attribute, that is an array of IDs of TH cell.

For now we support only header rows.

At first we define attributes for the three standard cases: We delay to begin document as we can't know if tagpdf is already loaded.

```

330 \AddToHook{begindocument}
331 {
332   \tag_if_active:T
333   {
334     \tagpdfsetup
335     {
336       newattribute =
337         {TH-col}{/0 /Table /Scope /Column},
338       newattribute =
339         {TH-row}{/0 /Table /Scope /Row},
340       newattribute =
341         {TH-both}{/0 /Table /Scope /Both},
342     }

```

And we put all three into the class map (perhaps the next tagpdf should do that directly with newattribute):

```

343   \seq_gput_left:N\g__tag_attr_class_used_seq
344     {\pdf_name_from_unicode:e:n{TH-col}}
345   \seq_gput_left:N\g__tag_attr_class_used_seq
346     {\pdf_name_from_unicode:e:n{TH-row}}
347   \seq_gput_left:N\g__tag_attr_class_used_seq
348     {\pdf_name_from_unicode:e:n{TH-both}}
349   }
350 }
351

```

---

**\l\_\_tbl\_header\_rows\_clist** This holds the numbers of the header rows. Negative numbers are possible and count from the back.

```
352 \clist_new:N \l__tbl_header_rows_clist
```

**\\_\_tbl\_set\_header\_rows:** TEMP: Next tagpdf will have the right command which also updates the debug info. For now a temporary command:

```

353 \cs_if_free:NTF \__tag_struct_prop_gput:nnn
354   {
355     \cs_new_protected:Npn \__tbl_struct_prop_gput:nnn #1#2#3
356       { \prop_gput:cnn { g__tag_struct_#1_prop }{#2}{#3} }
357   }
358   { \cs_new_protected:Npn \__tbl_struct_prop_gput:nnn #1#2#3
359     { \__tag_struct_prop_gput:nnn {#1}{#2}{#3} }
360   }
361 \cs_generate_variant:Nn \__tbl_struct_prop_gput:nnn {nne,Vnn}
362 \cs_new_protected:Npn \__tbl_set_header_rows:
363   {
364     \clist_map_inline:Nn \l__tbl_header_rows_clist
365     {
366       \clist_set:Ne\l__tbl_tmpa_clist
367         {
368           \seq_item:Nn \g__tbl_struct_cells_seq {##1}
369         }
370       \clist_map_inline:Nn \l__tbl_tmpa_clist
371         {

```

We can have negative numbers in the list from the multicolumn.

```
372     \prop_if_exist:cT { g__tag_struct_####1_prop }
373     {
374         \__tbl_struct_prop_gput:nnn{ ####1 }{S}{/TH}
```

This need refinement once row headers (and perhaps other attributes) are used too, but for now it should be ok.

```
375     \prop_get:cnNTF
376     { g__tag_struct_####1_prop }
377     { C }
378     \l__tbl_tmpa_tl
379     {\__tbl_struct_prop_gput:nne{ ####1 }{C}{[ /TH-col~\l__tbl_tmpa_tl ]} }
380     {\__tbl_struct_prop_gput:nnn{ ####1 }{C}{/TH-col}}
381     }
382     }
383     }
384 }
```

*(End of definition for \\_\_tbl\_set\_header\_rows:.)*

And some key support:

```
385 % TODO decide about key name
386 \keys_define:nn { __tag / setup }
387 {
388     table-header-rows .clist_set:N = \l__tbl_header_rows_clist
389 }
```

## 5.5 Changes to array commands

\\_\_tbl\_show\_curr\_cell\_data: Show the row/column index and span count for current table cell for debugging.

```
390 \cs_new_protected:Npn \__tbl_show_curr_cell_data: {
391     \typeout { ==>~ current-cell-data:-
392             \int_use:N \g__tbl_row_int ,
393             \int_use:N \g__tbl_col_int ,
394             \g__tbl_span_tl
395     }
396 }
```

*(End of definition for \\_\_tbl\_show\_curr\_cell\_data:.)*

\insert@column \insert@column is defined in array, here only the two sockets are inserted.

```
397 \def\insert@column{%
398     \__tbl_show_curr_cell_data:
399     \UseSocket{tagsupport/tblcell/begin}%
400     \the@toks \the \c@tempcnta
401     \ignorespaces \sharp \unskip
402     \the@toks \the \count@ \relax
403     \UseSocket{tagsupport/tblcell/end}%
404 }
```

*(End of definition for \insert@column. This function is documented on page ??.)*

```

\@classz

405 \def\@classz{\@classx
406   \@tempcnta \count@
407   \prepnext@tok
408   \@addtopreamble{\ifcase \@chnum
409     \hfil
410     \hskip1sp%
411     \d@llarbegin
412     \insert@column
413     \d@llarend \do@row@strut \hfil \or
414     \hskip1sp\d@llarbegin \insert@column \d@llarend \do@row@strut \hfil \or
415     \hfil\hskip1sp\d@llarbegin \insert@column \d@llarend \do@row@strut \or
416     \setbox\ar@mcellbox\vbox
417     \@startpbox{\@nextchar}
418     \AssignSocketPlug{tagsupport/tblcell/begin}{TDpbox}
419     \AssignSocketPlug{tagsupport/tblcell/end}{TDpbox}
420     \insert@column \@endpbox
421     \ar@align@mcell
422     \do@row@strut \or
423     \vtop \@startpbox{\@nextchar}
424     \AssignSocketPlug{tagsupport/tblcell/begin}{TDpbox}
425     \AssignSocketPlug{tagsupport/tblcell/end}{TDpbox}
426     \insert@column \@endpbox\do@row@strut \or
427     \vbox \@startpbox{\@nextchar}
428     \AssignSocketPlug{tagsupport/tblcell/begin}{TDpbox}
429     \AssignSocketPlug{tagsupport/tblcell/end}{TDpbox}
430     \insert@column \@endpbox\do@row@strut
431   \fi}\prepnext@tok}

```

(End of definition for \@classz. This function is documented on page ??.)

\@array We modificate the \@array from array.

```

\@array 432 \def\@array[#1]#2{%
433   \@tempdima \ht \strutbox
434   \advance \@tempdima by \extrarowheight
435   \setbox \arstrutbox \hbox{\vrule
436     \height \arraystretch \@tempdima
437     \depth \arraystretch \dp \strutbox
438     \width \z@}%

```

The total number of table columns of the current table is determined in \\_\\_tbl\\_determine\_table\_cols: but this is called in a group, so local settings do not survive. Thus, to save away the outer value of \g\\_\\_tbl\_table\_cols\_t1 we do it before the group.

```

439   \tl_set_eq:NN \l\_\_tbl_saved_table_cols_t1 \g\_\_tbl_table_cols_t1
440   \begingroup
441   \mkpream{#2}

```

Next call has to happen immediately after \mkpream because it uses implementation details from that.

```

442   \_\_tbl_determine_table_cols:
443   \xdef\@preamble{%
444     \noexpand

```

\ialign in the original definition is replaced by \ar@ialign defined below.

```
445     \ar@ialign
446     \@halignto
447     \bgroup \carstrut
```

A socket is inserted

```
448     \UseSocket{tagsupport/tblrow/begin}%
```

At the start of the preamble for the first column we set \g\_\_tbl\_col\_int to 1 as we are no longer at but in the first column. This is done in \\_\_tbl\_init\_cell\_data:. In later columns this data is updated via \\_\_tbl\_update\_cell\_data:.

```
449     \__tbl_init_cell_data:
450     \@preamble
451     \tabskip \z@ \cr}%
452   \endgroup
453   \arrayleft
```

Another socket for tagging. TODO: what about \arrayleft?

```
454     \UseSocket{tagsupport/tbl/init}
455     \if #1\vtop \else \if#1b\vbox \else \vcenter \fi \fi
456     \bgroup
457     \let \sharp ##\let \protect \relax
458     \lineskip \z@
459     \baselineskip \z@
460     \m@th
461     \let\\@\arraycr \let\tabularnewline\\let\par\empty
462     \%show\@preamble
463     \@preamble}
```

Finally, also set \@@array to the new definition:

```
464 \let\@@array\array
```

(End of definition for \@array and \@@array. These functions are documented on page ??.)

\\_\_tbl\_init\_cell\_data:

```
465 \cs_new_protected:Npn \__tbl_init_cell_data: {
466     \int_gset:Nn \g__tbl_col_int {1}
467     \tl_gset:Nn \g__tbl_span_tl {1}
468 }
```

(End of definition for \\_\_tbl\_init\_cell\_data:.)

\\_\_tbl\_update\_cell\_data: Updating cell data in columns after the first means we have to increment the \g\_\_tbl\_col\_int by the span count of the previous cell (in case it was a \multicolumn and then reset the \g\_\_tbl\_span\_tl to one (as the default).

```
469 \cs_new_protected:Npn \__tbl_update_cell_data: {
470     \int_gadd:Nn \g__tbl_col_int { \g__tbl_span_tl }
471     \tl_gset:Nn \g__tbl_span_tl {1}
472 }
```

(End of definition for \\_\_tbl\_update\_cell\_data:.)

`\__tbl_determine_table_cols:` Current implementation of `\@mkpream` uses the scratch counter `\count@` to keep track of the number of toks registers it needs (2 per column), but this can't be used as it counts also insertions made with `!{}` and `@{}`. So similar as does longtable for `\LT@cols` we count the numbers of ampersands instead.

```

473 \cs_new:Npn \__tbl_determine_table_cols: {
474   \seq_set_split:NnV\l__tbl_tmpa_seq {&}\@preamble
475   \tl_gset:Ne \g__tbl_table_cols_tl { \seq_count:N \l__tbl_tmpa_seq }
476   \typeout{ ==>~ Table~ has~ \g__tbl_table_cols_tl \space columns }
477 }
```

(End of definition for `\__tbl_determine_table_cols::`)

`\@arraycr` Add code that figures out if the current table row is incomplete (not enough &s). It can then do extra actions, such as inserting missing cell tags.

```

478 \protected\def\@arraycr{
479   \relax
480   \__tbl_store_missing_cells:n\@arraycr}
481 %
482 \iffalse{\fi\ifnum 0='}\fi
483 \@ifstar \xarraycr \xarraycr}
```

(End of definition for `\@arraycr`. This function is documented on page ??.)

`\__tbl_store_missing_cells:n`  
`\__tag_tbl_add_missing_cells:n` The storing and use of the number of missing cells must happen at different places as the testing happens at the end of the last cell of a row, but still inside that cell, so we use two commands. The second is used in the endrow socket.

```

484 \cs_new:Npn \__tbl_store_missing_cells:n #1 {
485   \int_compare:nNnT \g__tbl_col_int > 0
486   {
487     \int_gset:Nn \g__tbl_missing_cells_int
488     {
489       \g__tbl_table_cols_tl
490       - \g__tbl_col_int
491       - \g__tbl_span_tl
492       + 1
493     }
494     \int_compare:nNnT \g__tbl_missing_cells_int < 0 \ERROR % should not happen
495     \typeout{==>-
496             (#1)-
497             This~ row~ needs~
498             \int_use:N \g__tbl_missing_cells_int \space
499             additional~ cell(s)
500           }
501     }
502   }
503 \cs_new:Npn \__tag_tbl_add_missing_cells:n #1
504 {
```

The TD-socket messages are issued after the message about the end-row socket, but the structure is ok, so better issue a message for now to avoid confusion:

```

505 \int_compare:nNnT {#1}>{0}
506 {
507   \typeout{==>~
```

```

508           ~Inserting~\int_eval:n{#1}~additional~cell(s)~into~previous~row:}
509       }
510   \int_step_inline:nn { #1 }
511   {
512     \UseSocket{tagsupport/tblcell/begin}
513     \UseSocket{tagsupport/tblcell/end}
514   }
515 }

```

(End of definition for `\_tbl_store_missing_cells:n` and `\_tag_tbl_add_missing_cells:n`.)

`\endarray` If tables are nested into another then it is necessary to restore information about the cell the inner table started in. Otherwise, `\g__tbl_row_int`, `\g__tbl_col_int`, and `\g__tbl_span_tl` reflect the status in the outer table as they are globally manipulated. We restore in all cases even if we are not in a nesting situation as that makes the code simpler (and probably faster).

`\endtabular` and `\endtabular*` inherit from `\endarray` so we only need to change that. `tabularx` is handled below.

```

516 \def\endarray{
517   \_tbl_store_missing_cells:n\endarray}
518   \crrc \egroup
519   \UseSocket{tagsupport/tbl/finalize}

```
\g__tbl_col_int
\g__tbl_row_int
\g__tbl_span_tl
\g__tbl_table_cols_tl
```

`\g__tbl_row_int` holds the current row number in the table. The value 0 means we haven't yet processed the table preamble. It is incremented by every `\cr` including the one ending the table preamble.

`\g__tbl_col_int` holds the current column number. The value 0 means we have not yet started the table or just finished a table row (with `\`` typically); any other positive value means we are currently typesetting a cell in that column in some row (denoted by the `\g__tbl_row_int`).

In a `\multicolumn` it holds the column number of the first spanned column and `\g__tbl_span_tl` the info how many cells are spanned.

`\g__tbl_span_tl` is normally 1 except in a `\multicolumn` cell.

```

```

We need to store the structure numbers for the fine tuning in the finalize socket. For now we use a rather simple system: A sequence that hold the numbers for the row structures, and one that holds comma lists for the cells.

`\g__tbl_struct_table_tl` will hold the structure number of the table, `\g__tbl_struct_rows_seq` will hold at index i the structure number of row i, `\g__tbl_struct_cells_seq` will hold at index i a comma list of the cell structure numbers of row i. `\g__tbl_struct_cur_seq` is used as a temporary store for the cell structures of the current row. We need also local version to store and restore the values.

```

605   }%
606 }%
607 \tabskip\z@skip\halign{%

```

(End of definition for \ar@ialign. This function is documented on page ??.)

\multicolumn \multicolumn is also defined in array. The redefinition has to solve two problems: it must handle the row begin if it is used there, and it must save the numbers of cells it spans so that we can add a suitable ColSpan attribute.<sup>5</sup>

```

608 \long\def\multicolumn#1#2#3{%
609   % alternative: determine first col with vmode test ...
610   % \ifvmode
611   %   \multispan{#1}\typeout{A==> vmode}%
612   % \else
613   %   \multispan{#1}\typeout{A==> not vmode}
614   % \fi
615   % but this makes the \crr handling really complicated which would
616   % then need to become something like
617   % \ifvmode \expandafter \@gobble
618   % \else \expandafter \ciden \fi {\cr\noalign{do something}}%
619   % so not used.
620   % Instead:
621   \multispan{#1}\begingroup

```

Insert rowbegin socket only if this multicolumn replaces the preamble of the first column. In that case we have to set \g\_\_tbl\_col\_int to 1 since this is no longer done in the preamble for the cell.

```

622 \int_compare:nNnTF \g__tbl_col_int = 0
623 {
624   \UseSocket{tagsupport/tblrow/begin}
625   \int_gset:Nn \g__tbl_col_int {1}
626 }

```

If we are in a later column we use \g\_\_tbl\_span\_t1 from the previous column to update.

```

627 {
628   \int_gadd:Nn \g__tbl_col_int { \g__tbl_span_t1 }
629 }

```

Then we set the span value so that it can be use in the next column.

```

630 \tl_gset:Nn \g__tbl_span_t1 {#1}
631 \def\@addamp{\if@firstamp\@firstampfalse \else
632   \g@preamerr 5\fi}%
633 \mkpream{#2}\@addtopreamble\empty
634 \endgroup

```

Now we update the colspan attribute. This needs setting after the group as it is hidden inside the plug in \insert@column.

```

635 \__tbl_set_colspan:n {#1}
636 \def\@sharp{#3}%
637 \carstrut \preamble
638 \null
639 \ignorespaces

```

(End of definition for \multicolumn. This function is documented on page ??.)

---

<sup>5</sup>FMi: This can now perhaps cleaned up somewhat

## 5.6 longtable

Longtable is complicated. When at the begin the `\endhead`, `\endfirsthead`, `\endfoot` and `\endlastfoot` are used to setup head and foot they create each a structure subtree with one or more rows. From this structures we want to keep at most two (head and foot) and move the foot to the end of the table. When the head and foot boxes are (re)inserted on following pages we want to mark them up as artifact with the exception of the head at the begin and the foot box at the end.

TODO: When a line is killed the structure subtree is there already too and must be removed.

Hyperref patches longtable. This must be disabled and replace with genuine code

```

640 \let\@kernel@refstepcounter\refstepcounter
641 \def\hyper@nopatch@longtable{}
642 \def\__tbl_patch_LT@array[#1]#2{%

```

`\LT@array` is executed in a group, so we can disable para-tagging here.

```

643 \UseSocket{tagsupport/tbl/init}%
644 \@kernel@refstepcounter{table}\stepcounter{LT@tables}%

```

The target is created rather late and a `\label` can come earlier, so we have to define `\@currentHref` explicitly. We can't currently assume that `\theHtable` is defined always.

820     \ifdim\pageshrink>\z@\pageshrink\z@\fi
821 \fi
822     \global\colroom\colht
823 \ifvoid\LT@foot\else
824     \global\advance\vsizet\ht\LT@foot
825     \global\advance\colroom-\ht\LT@foot
826     \dimen@\pagegoal\advance\dimen@-\ht\LT@foot\pagegoal\dimen@
827     \maxdepth\z@
828 \fi
829 \MakeLinkTarget{table}
830 \ifvoid\LT@firsthead\copy\LT@head\else\box\LT@firsthead\fi\nobreak

```

Avoid that following uses of the box add content:

```

831 \tagmcbegin{artifact}
832   \tag_mc_reset_box:N\LT@head
833 \tagmcend
834 \output{\LT@output}

```

(End of definition for `\_tbl_patch_LT@start.`)

`\_tbl_patch_LT@output` We must also avoid that the reuse of the foot box leads to duplicated content:

```

835 \def\_\_tbl\_patch\_LT@output{%
836   \ifnum\outputpenalty <-\@Mi
837     \ifnum\outputpenalty > -\LT@end@open
838       \LT@err{floats and marginpars not allowed in a longtable}\@ehc
839   \else
840     \setbox\z@\vbox{\unvbox\@cclv}%
841     \ifdim \ht\LT@lastfoot>\ht\LT@foot
842       \dimen@\pagegoal
843       \advance\dimen@\ht\LT@foot
844       \advance\dimen@-\ht\LT@lastfoot
845       \ifdim\dimen@<\ht\z@
846         \setbox\@cclv\vbox{\unvbox\z@\copy\LT@foot\vss}%
847         \makecol
848         \outputpage
849         \global\vsizet\colroom
850         \setbox\z@\vbox{\box\LT@head}%
851     \fi
852   \fi
853   \unvbox\z@\box\ifvoid\LT@lastfoot\LT@foot\else\LT@lastfoot\fi

```

Reset attribute of foot box:

```
854      \tagmcbegin{artifact}
855      \tag_mc_reset_box:N \LT@foot
856      \tagmcend
857      \fi
858  \else
859      \setbox\@cclv\vbox{\unvbox\@cclv\copy\LT@foot\vss}%

```

Reset attribute of foot box:

```
860      \tagmcbegin{artifact}
861      \tag_mc_reset_box:N \LT@foot
862      \tagmcend
863      \makecol
864      \outputpage
865      \global\vsizet\@colroom
866      \copy\LT@head\nobreak
867  \fi}
```

(End of definition for `\_tbl_patch_LT@output`.)

This patch is quite similar to the one for LaTeX's `\makecaption` we also have to change the parbox sockets.

```
868 \def\_\_tbl\_patch\_LT@makecaption#1#2#3{%
869   \LT@mcoll\LT@cols c{%
870     % test can go after merge
871     \str_if_exist:cT { l\_socket_tagsupport/parbox/before_plug_str } {
872       \AssignSocketPlug{tagsupport/parbox/before}{noop}
873       \AssignSocketPlug{tagsupport/parbox/after}{noop}
874     }
875     \hbox to\z@\{\hss\parbox[t]\LTcapwidth\%
876     \reset@font
877     \tag_stop:n{caption}
878     \sbox\@tempboxa{\#1\#2:\#3}\%
879     \tag_start:n{caption}
880     \ifdim\wd\@tempboxa>\hsize
881       \#1\#2:\#3%
882     \else
883       \hbox to\hsize{\hfil\#1\#2:\#3\hfil}%
884     \fi
885     \endgraf\vskip\baselineskip\%
886   }\hss\}}\hss}}
```

(End of definition for `\_tbl_patch_LT@makecaption`.)

Overwrite the longtable definition. That will probably break somewhere as they are various package which patch too.

```
888 \AddToHook{package/longtable/after}
889 {
890   \seq_new:N \g__tbl_LT@firsthead_rows_seq
891   \seq_new:N \g__tbl_LT@head_rows_seq
892   \seq_new:N \g__tbl_LT@lastfoot_rows_seq
893   \seq_new:N \g__tbl_LT@foot_rows_seq
894   \cs_set_eq:NN \LT@array\_\_tbl_patch_LT@array
895   \cs_set_eq:NN \endlongtable\_\_tbl_patch_endlongtable
```

```

896   \cs_set_eq:NN \LT@start\__tbl_patch_LT@start
897   \cs_set_eq:NN \LT@output\__tbl_patch_LT@output
898   \cs_set_eq:NN \LT@t@bularcr\__tbl_patch_LT@t@bularcr
899   \cs_set_eq:NN \LT@end@hd@ft\__tbl_patch_LT@end@hd@ft
900   \cs_set_eq:NN \LT@makecaption\__tbl_patch_LT@makecaption
901 }

```

## 5.7 tabularx

In tabularx we mainly need to ensure that no tagging is done during the trial.

```

902 \def\__tbl_patch_TX@endtabularx{%
903   \expandafter\expandafter\expandafter
904     \TX@find@endtabularxa\csname end\TX@\endcsname
905     \endtabularx\TX@\endtabularx\TX@find@endtabularxa
906   \expandafter\TX@newcol\expandafter{\tabularxcolumn{\TX@col@width}}%
907   \let\verb|\TX@verb
908   \def@elt##1{\global\value{##1}\the\value{##1}\relax}%
909   \edef\TX@ckpt{\cl@ckpt}%
910   \let@\elt\relax
911   \TX@old@table\maxdimen
912   \TX@col@width\TX@target
913   \global\TX@cols\@ne
914   \TX@typeout@
915   {\@spaces Table Width\@spaces Column Width\@spaces X Columns}%

```

Here we stop tagging:

```

916 \tag_stop:n{tabularx}
917 \TX@trial{\def\NC@rewrite@X{%
918   \global\advance\TX@cols\@ne\NC@find p{\TX@col@width}}%
919 \loop
920   \TX@arith
921   \ifTX@
922   \TX@trial{}%
923 \repeat

```

And now we restart it again.

```

924 \tag_start:n{tabularx}
925 {\let\@footnotetext\TX@ftntext\let\@xfootnotenext\TX@xftntext
926   \csname tabular*\expandafter\endcsname\expandafter\TX@target
927   \the\toks@
928   \csname endtabular*\endcsname}%
929 \global\TX@ftn\expandafter{\expandafter}\the\TX@ftn
930 \ifnum0='{\fi}%
931 \expandafter\expandafter\expandafter
932 \TX@find@endtabularxbb
933 \expandafter\end\expandafter{\TX@}%
934 \endtabularx\TX@\endtabularx\TX@find@endtabularxb
935 }
936
937 \AddToHook{package/tabularx/after}
938 {\cs_set_eq:NN \TX@endtabularx\__tbl_patch_TX@endtabularx }
939 
```

```
