

# The L<sup>A</sup>T<sub>E</sub>X3 Sources

The L<sup>A</sup>T<sub>E</sub>X Project\*

Released 2023-12-08

## Abstract

This is the typset sources for the `expl3` programming environment; see the matching `interface3` PDF for the API reference manual. The `expl3` modules set up a naming scheme for L<sup>A</sup>T<sub>E</sub>X commands, which allow the L<sup>A</sup>T<sub>E</sub>X programmer to systematically name functions and variables, and specify the argument types of functions.

The T<sub>E</sub>X and  $\varepsilon$ -T<sub>E</sub>X primitives are all given a new name according to these conventions. However, in the main direct use of the primitives is not required or encouraged: the `expl3` modules define an independent low-level L<sup>A</sup>T<sub>E</sub>X3 programming language.

The `expl3` modules are designed to be loaded on top of L<sup>A</sup>T<sub>E</sub>X 2 $\varepsilon$ . With an up-to-date L<sup>A</sup>T<sub>E</sub>X 2 $\varepsilon$  kernel, this material is loaded as part of the format. The fundamental programming code can also be loaded with other T<sub>E</sub>X formats, subject to restrictions on the full range of functionality.

# Contents

<b>I Introduction</b>	<b>1</b>
<b>1 Introduction to <code>expl3</code> and this document</b>	<b>2</b>
1.1 Naming functions and variables . . . . .	2
1.1.1 Scratch variables . . . . .	5
1.1.2 Terminological inexactitude . . . . .	5
1.2 Documentation conventions . . . . .	5
1.3 Formal language conventions which apply generally . . . . .	7
1.4 $\text{\LaTeX}$ concepts not supported by $\text{\LaTeX3}$ . . . . .	7
<b>II Bootstrapping</b>	<b>8</b>
<b>2 The <code>l3bootstrap</code> module: Bootstrap code</b>	<b>9</b>
2.1 Using the $\text{\LaTeX3}$ modules . . . . .	9
<b>3 The <code>l3names</code> module: Namespace for primitives</b>	<b>11</b>
3.1 Setting up the $\text{\LaTeX3}$ programming language . . . . .	11
<b>III Programming Flow</b>	<b>12</b>
<b>4 The <code>l3basics</code> module: Basic definitions</b>	<b>13</b>
4.1 No operation functions . . . . .	13
4.2 Grouping material . . . . .	13
4.3 Control sequences and functions . . . . .	14
4.3.1 Defining functions . . . . .	14
4.3.2 Defining new functions using parameter text . . . . .	15
4.3.3 Defining new functions using the signature . . . . .	17
4.3.4 Copying control sequences . . . . .	19
4.3.5 Deleting control sequences . . . . .	20
4.3.6 Showing control sequences . . . . .	20
4.3.7 Converting to and from control sequences . . . . .	21
4.4 Analysing control sequences . . . . .	22
4.5 Using or removing tokens and arguments . . . . .	23
4.5.1 Selecting tokens from delimited arguments . . . . .	26
4.6 Predicates and conditionals . . . . .	27
4.6.1 Tests on control sequences . . . . .	28
4.6.2 Primitive conditionals . . . . .	28
4.7 Starting a paragraph . . . . .	29
4.8 Debugging support . . . . .	30

<b>5 The <code>I3expn</code> module: Argument expansion</b>	<b>31</b>
5.1 Defining new variants . . . . .	31
5.2 Methods for defining variants . . . . .	32
5.3 Introducing the variants . . . . .	34
5.4 Manipulating the first argument . . . . .	35
5.5 Manipulating two arguments . . . . .	37
5.6 Manipulating three arguments . . . . .	37
5.7 Unbraced expansion . . . . .	38
5.8 Preventing expansion . . . . .	39
5.9 Controlled expansion . . . . .	40
5.10 Internal functions . . . . .	43
<b>6 The <code>I3sort</code> module: Sorting functions</b>	<b>44</b>
6.1 Controlling sorting . . . . .	44
<b>7 The <code>I3tl-analysis</code> module: Analysing token lists</b>	<b>46</b>
<b>8 The <code>I3regex</code> module: Regular expressions in <code>TEX</code></b>	<b>47</b>
8.1 Syntax of regular expressions . . . . .	48
8.1.1 Regular expression examples . . . . .	48
8.1.2 Characters in regular expressions . . . . .	49
8.1.3 Characters classes . . . . .	49
8.1.4 Structure: alternatives, groups, repetitions . . . . .	50
8.1.5 Matching exact tokens . . . . .	51
8.1.6 Miscellaneous . . . . .	53
8.2 Syntax of the replacement text . . . . .	53
8.3 Pre-compiling regular expressions . . . . .	55
8.4 Matching . . . . .	56
8.5 Submatch extraction . . . . .	57
8.6 Replacement . . . . .	58
8.7 Scratch regular expressions . . . . .	60
8.8 Bugs, misfeatures, future work, and other possibilities . . . . .	60
<b>9 The <code>I3prg</code> module: Control structures</b>	<b>63</b>
9.1 Defining a set of conditional functions . . . . .	63
9.2 The boolean data type . . . . .	65
9.2.1 Constant and scratch booleans . . . . .	67
9.3 Boolean expressions . . . . .	68
9.4 Logical loops . . . . .	70
9.5 Producing multiple copies . . . . .	71
9.6 Detecting <code>TEX</code> 's mode . . . . .	71
9.7 Primitive conditionals . . . . .	72
9.8 Nestable recursions and mappings . . . . .	72
9.8.1 Simple mappings . . . . .	73
9.9 Internal programming functions . . . . .	73

<b>10 The <code>I3sys</code> module: System/runtime functions</b>	<b>74</b>
10.1 The name of the job . . . . .	74
10.2 Date and time . . . . .	74
10.3 Engine . . . . .	75
10.4 Output format . . . . .	76
10.5 Platform . . . . .	76
10.6 Random numbers . . . . .	76
10.7 Access to the shell . . . . .	77
10.8 Loading configuration data . . . . .	78
10.8.1 Final settings . . . . .	79
<b>11 The <code>I3msg</code> module: Messages</b>	<b>80</b>
11.1 Creating new messages . . . . .	80
11.2 Customizable information for message modules . . . . .	81
11.3 Contextual information for messages . . . . .	82
11.4 Issuing messages . . . . .	83
11.4.1 Messages for showing material . . . . .	87
11.4.2 Expandable error messages . . . . .	87
11.5 Redirecting messages . . . . .	88
<b>12 The <code>I3file</code> module: File and I/O operations</b>	<b>90</b>
12.1 Input–output stream management . . . . .	90
12.1.1 Reading from files . . . . .	92
12.1.2 Reading from the terminal . . . . .	95
12.1.3 Writing to files . . . . .	95
12.1.4 Wrapping lines in output . . . . .	97
12.1.5 Constant input–output streams, and variables . . . . .	98
12.1.6 Primitive conditionals . . . . .	98
12.2 File operations . . . . .	98
12.2.1 Basic file operations . . . . .	98
12.2.2 Information about files and file contents . . . . .	99
12.2.3 Accessing file contents . . . . .	102
<b>13 The <code>I3luatex</code> module: LuaTeX-specific functions</b>	<b>104</b>
13.1 Breaking out to Lua . . . . .	104
13.2 Lua interfaces . . . . .	105
<b>14 The <code>I3legacy</code> module: Interfaces to legacy concepts</b>	<b>107</b>
<b>IV Data types</b>	<b>108</b>

<b>15 The <code>I3tl</code> module: Token lists</b>	<b>109</b>
15.1 Creating and initialising token list variables . . . . .	109
15.2 Adding data to token list variables . . . . .	110
15.3 Token list conditionals . . . . .	111
15.3.1 Testing the first token . . . . .	113
15.4 Working with token lists as a whole . . . . .	114
15.4.1 Using token lists . . . . .	114
15.4.2 Counting and reversing token lists . . . . .	115
15.4.3 Viewing token lists . . . . .	116
15.5 Manipulating items in token lists . . . . .	117
15.5.1 Mapping over token lists . . . . .	117
15.5.2 Head and tail of token lists . . . . .	118
15.5.3 Items and ranges in token lists . . . . .	120
15.5.4 Sorting token lists . . . . .	122
15.6 Manipulating tokens in token lists . . . . .	122
15.6.1 Replacing tokens . . . . .	122
15.6.2 Reassigning category codes . . . . .	123
15.7 Constant token lists . . . . .	124
15.8 Scratch token lists . . . . .	125
<b>16 The <code>I3tl-build</code> module: Piecewise <code>t1</code> constructions</b>	<b>126</b>
16.1 Constructing $\langle tl\ var \rangle$ by accumulation . . . . .	126
<b>17 The <code>I3str</code> module: Strings</b>	<b>128</b>
17.1 Creating and initialising string variables . . . . .	129
17.2 Adding data to string variables . . . . .	130
17.3 String conditionals . . . . .	130
17.4 Mapping over strings . . . . .	132
17.5 Working with the content of strings . . . . .	134
17.6 Modifying string variables . . . . .	137
17.7 String manipulation . . . . .	138
17.8 Viewing strings . . . . .	139
17.9 Constant strings . . . . .	140
17.10 Scratch strings . . . . .	140
<b>18 The <code>I3str-convert</code> module: String encoding conversions</b>	<b>141</b>
18.1 Encoding and escaping schemes . . . . .	141
18.2 Conversion functions . . . . .	143
18.3 Conversion by expansion (for PDF contexts) . . . . .	143
18.4 Possibilities, and things to do . . . . .	143
<b>19 The <code>I3quark</code> module: Quarks and scan marks</b>	<b>145</b>
19.1 Quarks . . . . .	145
19.2 Defining quarks . . . . .	146
19.3 Quark tests . . . . .	146
19.4 Recursion . . . . .	147
19.4.1 An example of recursion with quarks . . . . .	148
19.5 Scan marks . . . . .	149

<b>20 The l3seq module: Sequences and stacks</b>	<b>150</b>
20.1 Creating and initialising sequences . . . . .	150
20.2 Appending data to sequences . . . . .	152
20.3 Recovering items from sequences . . . . .	152
20.4 Recovering values from sequences with branching . . . . .	154
20.5 Modifying sequences . . . . .	155
20.6 Sequence conditionals . . . . .	156
20.7 Mapping over sequences . . . . .	156
20.8 Using the content of sequences directly . . . . .	159
20.9 Sequences as stacks . . . . .	160
20.10 Sequences as sets . . . . .	161
20.11 Constant and scratch sequences . . . . .	162
20.12 Viewing sequences . . . . .	163
<b>21 The l3int module: Integers</b>	<b>164</b>
21.1 Integer expressions . . . . .	164
21.2 Creating and initialising integers . . . . .	167
21.3 Setting and incrementing integers . . . . .	168
21.4 Using integers . . . . .	169
21.5 Integer expression conditionals . . . . .	169
21.6 Integer expression loops . . . . .	171
21.7 Integer step functions . . . . .	173
21.8 Formatting integers . . . . .	174
21.9 Converting from other formats to integers . . . . .	175
21.10 Random integers . . . . .	176
21.11 Viewing integers . . . . .	176
21.12 Constant integers . . . . .	177
21.13 Scratch integers . . . . .	177
21.14 Direct number expansion . . . . .	178
21.15 Primitive conditionals . . . . .	178
<b>22 The l3flag module: Expandable flags</b>	<b>180</b>
22.1 Setting up flags . . . . .	180
22.2 Expandable flag commands . . . . .	181
<b>23 The l3clist module: Comma separated lists</b>	<b>183</b>
23.1 Creating and initialising comma lists . . . . .	184
23.2 Adding data to comma lists . . . . .	185
23.3 Modifying comma lists . . . . .	186
23.4 Comma list conditionals . . . . .	187
23.5 Mapping over comma lists . . . . .	187
23.6 Using the content of comma lists directly . . . . .	189
23.7 Comma lists as stacks . . . . .	190
23.8 Using a single item . . . . .	191
23.9 Viewing comma lists . . . . .	192
23.10 Constant and scratch comma lists . . . . .	192

<b>24 The <code>I3token</code> module: Token manipulation</b>	<b>193</b>
24.1 Creating character tokens . . . . .	194
24.2 Manipulating and interrogating character tokens . . . . .	195
24.3 Generic tokens . . . . .	198
24.4 Converting tokens . . . . .	199
24.5 Token conditionals . . . . .	199
24.6 Peeking ahead at the next token . . . . .	203
24.7 Description of all possible tokens . . . . .	208
<b>25 The <code>I3prop</code> module: Property lists</b>	<b>211</b>
25.1 Creating and initialising property lists . . . . .	211
25.2 Adding and updating property list entries . . . . .	213
25.3 Recovering values from property lists . . . . .	214
25.4 Modifying property lists . . . . .	215
25.5 Property list conditionals . . . . .	215
25.6 Recovering values from property lists with branching . . . . .	216
25.7 Mapping over property lists . . . . .	217
25.8 Viewing property lists . . . . .	218
25.9 Scratch property lists . . . . .	219
25.10 Constants . . . . .	219
<b>26 The <code>I3skip</code> module: Dimensions and skips</b>	<b>220</b>
26.1 Creating and initialising <code>dim</code> variables . . . . .	220
26.2 Setting <code>dim</code> variables . . . . .	221
26.3 Utilities for dimension calculations . . . . .	221
26.4 Dimension expression conditionals . . . . .	222
26.5 Dimension expression loops . . . . .	224
26.6 Dimension step functions . . . . .	225
26.7 Using <code>dim</code> expressions and variables . . . . .	226
26.8 Viewing <code>dim</code> variables . . . . .	228
26.9 Constant dimensions . . . . .	229
26.10 Scratch dimensions . . . . .	229
26.11 Creating and initialising <code>skip</code> variables . . . . .	229
26.12 Setting <code>skip</code> variables . . . . .	230
26.13 Skip expression conditionals . . . . .	231
26.14 Using <code>skip</code> expressions and variables . . . . .	231
26.15 Viewing <code>skip</code> variables . . . . .	231
26.16 Constant skips . . . . .	232
26.17 Scratch skips . . . . .	232
26.18 Inserting skips into the output . . . . .	232
26.19 Creating and initialising <code>muskip</code> variables . . . . .	233
26.20 Setting <code>muskip</code> variables . . . . .	233
26.21 Using <code>muskip</code> expressions and variables . . . . .	234
26.22 Viewing <code>muskip</code> variables . . . . .	234
26.23 Constant muskips . . . . .	235
26.24 Scratch muskips . . . . .	235
26.25 Primitive conditional . . . . .	235

<b>27 The l3keys module: Key–value interfaces</b>	<b>236</b>
27.1 Creating keys . . . . .	237
27.2 Sub-dividing keys . . . . .	242
27.3 Choice and multiple choice keys . . . . .	243
27.4 Key usage scope . . . . .	245
27.5 Setting keys . . . . .	245
27.6 Handling of unknown keys . . . . .	246
27.7 Selective key setting . . . . .	247
27.8 Digesting keys . . . . .	248
27.9 Utility functions for keys . . . . .	248
27.10 Low-level interface for parsing key–val lists . . . . .	249

**Part I**  
**Introduction**

# Chapter 1

## Introduction to `expl3` and this document

This document is intended to act as a comprehensive reference manual for the `expl3` language. A general guide to the L<sup>A</sup>T<sub>E</sub>X3 programming language is found in [expl3.pdf](#).

### 1.1 Naming functions and variables

L<sup>A</sup>T<sub>E</sub>X3 does not use @ as a “letter” for defining internal macros. Instead, the symbols \_ and : are used in internal macro names to provide structure. The name of each *function* is divided into logical units using \_, while : separates the *name* of the function from the *argument specifier* (“arg-spec”). This describes the arguments expected by the function. In most cases, each argument is represented by a single letter. The complete list of arg-spec letters for a function is referred to as the *signature* of the function.

Each function name starts with the *module* to which it belongs. Thus apart from a small number of very basic functions, all `expl3` function names contain at least one underscore to divide the module name from the descriptive name of the function. For example, all functions concerned with comma lists are in module `clist` and begin `\clist_`.

Every function must include an argument specifier. For functions which take no arguments, this will be blank and the function name will end :. Most functions take one or more arguments, and use the following argument specifiers:

**N** and **n** These mean *no manipulation*, of a single token for N and of a set of tokens given in braces for n. Both pass the argument through exactly as given. Usually, if you use a single token for an n argument, all will be well.

**c** This means *csname*, and indicates that the argument will be turned into a csname before being used. So `\foo:c {ArgumentOne}` will act in the same way as `\foo:N \ArgumentOne`. All macros that appear in the argument are expanded. An internal error will occur if the result of expansion inside a c-type argument is not a series of character tokens.

**V** and **v** These mean *value of variable*. The V and v specifiers are used to get the content of a variable without needing to worry about the underlying T<sub>E</sub>X structure containing the data. A V argument will be a single token (similar to N), for example

`\foo:V \MyVariable`; on the other hand, using v a csname is constructed first, and then the value is recovered, for example `\foo:v {MyVariable}`.

- o This means *expansion once*. In general, the V and v specifiers are favoured over o for recovering stored information. However, o is useful for correctly processing information with delimited arguments.
- x The x specifier stands for *exhaustive expansion*: every token in the argument is fully expanded until only unexpandable ones remain. The `\edef` primitive carries out this type of expansion. Functions which feature an x-type argument are *not* expandable.
- e The e specifier is in many respects identical to x, but uses `\expanded` primitive. Parameter character (usually #) in the argument need not be doubled. Functions which feature an e-type argument may be expandable.
- f The f specifier stands for *full expansion*, and in contrast to x stops at the first non-expandable token (reading the argument from left to right) without trying to expand it. If this token is a *<space token>*, it is gobbled, and thus won't be part of the resulting argument. For example, when setting a token list variable (a macro used for storage), the sequence

```
\tl_set:Nn \l_mya_tl { A }
\tl_set:Nn \l_myb_t1 { B }
\tl_set:Nf \l_mya_t1 { \l_mya_t1 \l_myb_t1 }
```

will leave `\l_mya_t1` with the content `A\l_myb_t1`, as A cannot be expanded and so terminates expansion before `\l_myb_t1` is considered.

**T and F** For logic tests, there are the branch specifiers T (*true*) and F (*false*). Both specifiers treat the input in the same way as n (no change), but make the logic much easier to see.

- p The letter p indicates `\TeX parameters`. Normally this will be used for delimited functions as `expl3` provides better methods for creating simple sequential arguments.
- w Finally, there is the w specifier for *weird* arguments. This covers everything else, but mainly applies to delimited values (where the argument must be terminated by some specified string).
- D The D stands for **Do not use**. All of the `\TeX` primitives are initially `\let` to a D name, and some are then given a second name. These functions have no standardized syntax, they are engine dependent and their name can change without warning, thus their use is *strongly discouraged* in package code: programmers should instead use the interfaces documented in [interface3.pdf](#).

Notice that the argument specifier describes how the argument is processed prior to being passed to the underlying function. For example, `\foo:c` will take its argument, convert it to a control sequence and pass it to `\foo:N`.

Variables are named in a similar manner to functions, but begin with a single letter to define the type of variable:

- c Constant: global parameters whose value should not be changed.

**g** Parameters whose value should only be set globally.

**l** Parameters whose value should only be set locally.

Each variable name is then build up in a similar way to that of a function, typically starting with the module<sup>1</sup> name and then a descriptive part. Variables end with a short identifier to show the variable type:

**bitset** a set of bits (a string made up of a series of 0 and 1 tokens that are accessed by position).

**clist** Comma separated list.

**dim** “Rigid” lengths.

**fp** Floating-point values;

**int** Integer-valued count register.

**muskip** “Rubber” lengths for use in mathematics.

**seq** “Sequence”: a data-type used to implement lists (with access at both ends) and stacks.

**skip** “Rubber” lengths.

**str** String variables: contain character data.

**t1** Token list variables: placeholder for a token list.

Applying V-type or v-type expansion to variables of one of the above types is supported, while it is not supported for the following variable types:

**bool** Either true or false.

**box** Box register.

**coffin** A “box with handles” — a higher-level data type for carrying out **box** alignment operations.

**flag** Non-negative integer that can be incremented expandably.

**farray** Fixed-size array of floating point values.

**intarray** Fixed-size array of integers.

**ior/iow** An input or output stream, for reading from or writing to, respectively.

**prop** Property list: analogue of dictionary or associative arrays in other languages.

**regex** Regular expression.

---

<sup>1</sup>The module names are not used in case of generic scratch registers defined in the data type modules, e.g., the **int** module contains some scratch variables called **\l\_tmpa\_int**, **\l\_tmpb\_int**, and so on. In such a case adding the module name up front to denote the module and in the back to indicate the type, as in **\l\_int\_tmpa\_int** would be very unreadable.

### 1.1.1 Scratch variables

Modules focussed on variable usage typically provide four scratch variables, two local and two global, with names of the form  $\backslash\langle scope\rangle\_tmpa\_<type>/\backslash\langle scope\rangle\_tmpb\_<type>$ . These are never used by the core code. The nature of TeX grouping means that as with any other scratch variable, these should only be set and used with no intervening third-party code.

### 1.1.2 Terminological inexactitude

A word of warning. In this document, and others referring to the `expl3` programming modules, we often refer to “variables” and “functions” as if they were actual constructs from a real programming language. In truth, TeX is a macro processor, and functions are simply macros that may or may not take arguments and expand to their replacement text. Many of the common variables are *also* macros, and if placed into the input stream will simply expand to their definition as well — a “function” with no arguments and a “token list variable” are almost the same.<sup>2</sup> On the other hand, some “variables” are actually registers that must be initialised and their values set and retrieved with specific functions.

The conventions of the `expl3` code are designed to clearly separate the ideas of “macros that contain data” and “macros that contain code”, and a consistent wrapper is applied to all forms of “data” whether they be macros or actually registers. This means that sometimes we will use phrases like “the function returns a value”, when actually we just mean “the macro expands to something”. Similarly, the term “execute” might be used in place of “expand” or it might refer to the more specific case of “processing in TeX’s stomach” (if you are familiar with the TeXbook parlance).

If in doubt, please ask; chances are we’ve been hasty in writing certain definitions and need to be told to tighten up our terminology.

## 1.2 Documentation conventions

This document is typeset with the experimental `l3doc` class; several conventions are used to help describe the features of the code. A number of conventions are used here to make the documentation clearer.

Each group of related functions is given in a box. For a function with a “user” name, this might read:

---

`\ExplSyntaxOn` `\ExplSyntaxOn ... \ExplSyntaxOff`  
`\ExplSyntaxOff`

The textual description of how the function works would appear here. The syntax of the function is shown in mono-spaced text to the right of the box. In this example, the function takes no arguments and so the name of the function is simply reprinted.

For programming functions, which use `_` and `:` in their name there are a few additional conventions: If two related functions are given with identical names but different argument specifiers, these are termed *variants* of each other, and the latter functions are printed in grey to show this more clearly. They will carry out the same function but will take different types of argument:

---

<sup>2</sup>TeXnically, functions with no arguments are `\long` while token list variables are not.

---

`\seq_new:N \seq_new:N <sequence>`

`\seq_new:c`

When a number of variants are described, the arguments are usually illustrated only for the base function. Here, *<sequence>* indicates that `\seq_new:N` expects the name of a sequence. From the argument specifier, `\seq_new:c` also expects a sequence name, but as a name rather than as a control sequence. Each argument given in the illustration should be described in the following text.

**Fully expandable functions** Some functions are fully expandable, which allows them to be used within an x-type or e-type argument (in plain TeX terms, inside an `\edef` or `\expanded`), as well as within an f-type argument. These fully expandable functions are indicated in the documentation by a star:

---

`\cs_to_str:N ∗ \cs_to_str:N <cs>`

As with other functions, some text should follow which explains how the function works. Usually, only the star will indicate that the function is expandable. In this case, the function expects a *<cs>*, shorthand for a *<control sequence>*.

**Restricted expandable functions** A few functions are fully expandable but cannot be fully expanded within an f-type argument. In this case a hollow star is used to indicate this:

---

`\seq_map_function:NN ∗ \seq_map_function:NN <seq> <function>`

**Conditional functions** Conditional (*if*) functions are normally defined in three variants, with T, F and TF argument specifiers. This allows them to be used for different “true”/“false” branches, depending on which outcome the conditional is being used to test. To indicate this without repetition, this information is given in a shortened form:

---

`\sys_if_engine_xetex:TF ∗ \sys_if_engine_xetex:TF {<true code>} {<false code>}`

The underlining and italic of TF indicates that three functions are available:

- `\sys_if_engine_xetex:T`
- `\sys_if_engine_xetex:F`
- `\sys_if_engine_xetex:TF`

Usually, the illustration will use the TF variant, and so both *<true code>* and *<false code>* will be shown. The two variant forms T and F take only *<true code>* and *<false code>*, respectively. Here, the star also shows that this function is expandable. With some minor exceptions, *all* conditional functions in the `expl3` modules should be defined in this way.

Variables, constants and so on are described in a similar manner:

---

`\l_tmpa_t1` A short piece of text will describe the variable: there is no syntax illustration in this case.

In some cases, the function is similar to one in L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> or plain TeX. In these cases, the text will include an extra “**TeXhackers note**” section:

---

`\token_to_str:N`  $\star$  `\token_to_str:N`  $\langle token \rangle$

---

The normal description text.

**TeXhackers note:** Detail for the experienced TeX or L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  programmer. In this case, it would point out that this function is the TeX primitive `\string`.

**Changes to behaviour** When new functions are added to expl3, the date of first inclusion is given in the documentation. Where the documented behaviour of a function changes after it is first introduced, the date of the update will also be given. This means that the programmer can be sure that any release of expl3 after the date given will contain the function of interest with expected behaviour as described. Note that changes to code internals, including bug fixes, are not recorded in this way *unless* they impact on the expected behaviour.

### 1.3 Formal language conventions which apply generally

As this is a formal reference guide for L<sup>A</sup>T<sub>E</sub>X3 programming, the descriptions of functions are intended to be reasonably “complete”. However, there is also a need to avoid repetition. Formal ideas which apply to general classes of function are therefore summarised here.

For tests which have a TF argument specification, the test if evaluated to give a logically TRUE or FALSE result. Depending on this result, either the  $\langle true\ code \rangle$  or the  $\langle false\ code \rangle$  will be left in the input stream. In the case where the test is expandable, and a predicate (\_p) variant is available, the logical value determined by the test is left in the input stream: this will typically be part of a larger logical construct.

### 1.4 TeX concepts not supported by L<sup>A</sup>T<sub>E</sub>X3

The TeX concept of an “\outer” macro is *not supported* at all by L<sup>A</sup>T<sub>E</sub>X3. As such, the functions provided here may break when used on top of L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  if \outer tokens are used in the arguments.

**Part II**  
**Bootstrapping**

## Chapter 2

# The `I3bootstrap` module Bootstrap code

### 2.1 Using the `LATEX3` modules

The modules documented in `interface3` (and this file) are designed to be used on top of  $\text{\LaTeX} 2_{\varepsilon}$  and are already pre-loaded since  $\text{\LaTeX} 2_{\varepsilon}$  2020-02-02. To support older formats, the `\usepackage{expl3}` or `\RequirePackage{expl3}` instructions are still available to load them all as one.

As the modules use a coding syntax different from standard  $\text{\LaTeX} 2_{\varepsilon}$  it provides a few functions for setting it up.

---

`\ExplSyntaxOn`    `\ExplSyntaxOn <code>` `\ExplSyntaxOff`  
`\ExplSyntaxOff`

Updated: 2011-08-13

The `\ExplSyntaxOn` function switches to a category code regime in which spaces and new lines are ignored, and in which the colon (`:`) and underscore (`_`) are treated as “letters”, thus allowing access to the names of code functions and variables. Within this environment, `~` is used to input a space. The `\ExplSyntaxOff` reverts to the document category code regime.

**TEXhackers note:** Spaces introduced by `~` behave much in the same way as normal space characters in the standard category code regime: they are ignored after a control word or at the start of a line, and multiple consecutive `~` are equivalent to a single one. However, `~` is *not* ignored at the end of a line.

---

`\ProvidesExplPackage {<package>} {<date>} {<version>} {<description>}`

`\ProvidesExplClass`  
`\ProvidesExplFile`

Updated: 2023-08-03

These functions act broadly in the same way as the corresponding  $\text{\LaTeX} 2_{\varepsilon}$  kernel functions `\ProvidesPackage`, `\ProvidesClass` and `\ProvidesFile`. However, they also implicitly switch `\ExplSyntaxOn` for the remainder of the code with the file. At the end of the file, `\ExplSyntaxOff` will be called to reverse this. (This is the same concept as  $\text{\LaTeX} 2_{\varepsilon}$  provides in turning on `\makeatletter` within package and class code.) The `<date>` should be given in the format `<year>/<month>/<day>` or in the ISO date format `<year>-<month>-<day>`. If the `<version>` is given then a leading `v` is optional: if given as a “pure” version string, a `v` will be prepended.

---

```
\GetIdInfo      \GetIdInfo $Id: <SVN info field> $ {\<description>}
```

Updated: 2012-06-04

Extracts all information from a SVN field. Spaces are not ignored in these fields. The information pieces are stored in separate control sequences with `\ExplFileName` for the part of the file name leading up to the period, `\ExplFileDate` for date, `\ExplFileVersion` for version and `\ExplFileDescription` for the description.

To summarize: Every single package using this syntax should identify itself using one of the above methods. Special care is taken so that every package or class file loaded with `\RequirePackage` or similar are loaded with usual L<sup>A</sup>T<sub>E</sub>X 2<sub><</sub> category codes and the L<sup>A</sup>T<sub>E</sub>X3 category code scheme is reloaded when needed afterwards. See implementation for details. If you use the `\GetIdInfo` command you can use the information when loading a package with

```
\ProvidesExplPackage{\ExplFileName}
{\ExplFileDate}{\ExplFileVersion}{\ExplFileDescription}
```

## Chapter 3

# The `I3names` module Namespace for primitives

### 3.1 Setting up the L<sup>A</sup>T<sub>E</sub>X3 programming language

This module is at the core of the L<sup>A</sup>T<sub>E</sub>X3 programming language. It performs the following tasks:

- defines new names for all T<sub>E</sub>X primitives;
- emulate required primitives not provided by default in LuaT<sub>E</sub>X;
- switches to the category code régime for programming;

This module is entirely dedicated to primitives (and emulations of these), which should not be used directly within L<sup>A</sup>T<sub>E</sub>X3 code (outside of “kernel-level” code). As such, the primitives are not documented here: *The T<sub>E</sub>Xbook*, *T<sub>E</sub>X by Topic* and the manuals for pdfT<sub>E</sub>X, X<sub>E</sub>T<sub>E</sub>X, LuaT<sub>E</sub>X, pT<sub>E</sub>X and upT<sub>E</sub>X should be consulted for details of the primitives. These are named `\tex_{name}:D`, typically based on the primitive’s `{name}` in pdfT<sub>E</sub>X and omitting a leading pdf when the primitive is not related to pdf output.

**Part III**  
**Programming Flow**

# Chapter 4

## The **I3basics** module Basic definitions

As the name suggests, this module holds some basic definitions which are needed by most or all other modules in this set.

Here we describe those functions that are used all over the place. By that, we mean functions dealing with the construction and testing of control sequences. Furthermore the basic parts of conditional processing are covered; conditional processing dealing with specific data types is described in the modules specific for the respective data types.

### 4.1 No operation functions

---

`\prg_do_nothing: * \prg_do_nothing:`

An expandable function which does nothing at all: leaves nothing in the input stream after a single expansion.

---

`\scan_stop: \scan_stop:`

A non-expandable function which does nothing. Does not vanish on expansion but produces no typeset output.

### 4.2 Grouping material

---

`\group_begin: \group_begin:  
\group_end: \group_end:`

These functions begin and end a group for definition purposes. Assignments are local to groups unless carried out in a global manner. (A small number of exceptions to this rule will be noted as necessary elsewhere in this document.) Each `\group_begin:` must be matched by a `\group_end:,` although this does not have to occur within the same function. Indeed, it is often necessary to start a group within one function and finish it within another, for example when seeking to use non-standard category codes.

---

```
\group_insert_after:N \group_insert_after:N <token>
```

Adds *<token>* to the list of *<tokens>* to be inserted when the current group level ends. The list of *<tokens>* to be inserted is empty at the beginning of a group: multiple applications of `\group_insert_after:N` may be used to build the inserted list one *<token>* at a time. The current group level may be closed by a `\group_end:` function or by a token with category code 2 (close-group), namely a `}` if standard category codes apply.

**TeXhackers note:** This is the TeX primitive `\aftergroup`.

---

```
\group_show_list: \group_show_list:  
\group_log_list: \group_log_list:
```

New: 2021-05-11 Display (to the terminal or log file) a list of the groups that are currently opened. This is intended for tracking down problems.

**TeXhackers note:** This is a wrapper around the ε-TEx primitive `\showgroups`.

## 4.3 Control sequences and functions

As TeX is a macro language, creating new functions means creating macros. At point of use, a function is replaced by the replacement text (“code”) in which each parameter in the code (#1, #2, etc.) is replaced the appropriate arguments absorbed by the function. In the following, *<code>* is therefore used as a shorthand for “replacement text”.

Functions which are not “protected” are fully expanded inside an e-type or x-type expansion. In contrast, “protected” functions are not expanded within e and x expansions.

### 4.3.1 Defining functions

Functions can be created with no requirement that they are declared first (in contrast to variables, which must always be declared). Declaring a function before setting up the code means that the name chosen is checked and an error raised if it is already in use. The name of a function can be checked at the point of definition using the `\cs_new...` functions: this is recommended for all functions which are defined for the first time.

There are three ways to define new functions. All classes define a function to expand to the substitution text. Within the substitution text the actual parameters are substituted for the formal parameters (#1, #2, ...).

**new** Create a new function with the `new` scope, such as `\cs_new:Npn`. The definition is global and results in an error if it is already defined.

**set** Create a new function with the `set` scope, such as `\cs_set:Npn`. The definition is restricted to the current TeX group and does not result in an error if the function is already defined.

**gset** Create a new function with the `gset` scope, such as `\cs_gset:Npn`. The definition is global and does not result in an error if the function is already defined.

Within each set of scope there are different ways to define a function. The differences depend on restrictions on the actual parameters and the expandability of the resulting function.

**nopar** Create a new function with the **nopar** restriction, such as `\cs_set_nopar:Npn`. The parameter may not contain `\par` tokens.

**protected** Create a new function with the **protected** restriction, such as `\cs_set_protected:Npn`. The parameter may contain `\par` tokens but the function will not expand within an e-type or x-type expansion.

Finally, the functions in Subsections 4.3.2 and 4.3.3 are primarily meant to define *base functions* only. Base functions can only have the following argument specifiers:

**N** and **n** No manipulation.

**T** and **F** Functionally equivalent to **n** (you are actually encouraged to use the family of `\prg_new_conditional:` functions described in Section 9.1).

**p** and **w** These are special cases.

The `\cs_new:` functions below (and friends) do not stop you from using other argument specifiers in your function names, but they do not handle expansion for you. You should define the base function and then use `\cs_generate_variant:Nn` to generate custom variants as described in Section 5.2.

### 4.3.2 Defining new functions using parameter text

---

`\cs_new:Npn` `\cs_new:Npn <function> <parameters> {<code>}`  
`\cs_new:cpn`  
`\cs_new:Npe`  
`\cs_new:cpe`  
`\cs_new:Npx`  
`\cs_new:cpx`

Creates `<function>` to expand to `<code>` as replacement text. Within the `<code>`, the `<parameters>` (#1, #2, etc.) will be replaced by those absorbed by the function. The definition is global and an error results if the `<function>` is already defined.

---

`\cs_new_nopar:Npn` `\cs_new_nopar:Npn <function> <parameters> {<code>}`  
`\cs_new_nopar:cpn`  
`\cs_new_nopar:Npe`  
`\cs_new_nopar:cpe`  
`\cs_new_nopar:Npx`  
`\cs_new_nopar:cpx`

Creates `<function>` to expand to `<code>` as replacement text. Within the `<code>`, the `<parameters>` (#1, #2, etc.) will be replaced by those absorbed by the function. When the `<function>` is used the `<parameters>` absorbed cannot contain `\par` tokens. The definition is global and an error results if the `<function>` is already defined.

---

`\cs_new_protected:Npn` `\cs_new_protected:Npn <function> <parameters> {<code>}`  
`\cs_new_protected:cpn`  
`\cs_new_protected:Npe`  
`\cs_new_protected:cpe`  
`\cs_new_protected:Npx`  
`\cs_new_protected:cpx`

Creates `<function>` to expand to `<code>` as replacement text. Within the `<code>`, the `<parameters>` (#1, #2, etc.) will be replaced by those absorbed by the function. The `<function>` will not expand within an e-type or or x-type argument. The definition is global and an error results if the `<function>` is already defined.

---

```
\cs_new_protected_nopar:Npn \cs_new_protected_nopar:Npn <function> <parameters> {<code>}
\cs_new_protected_nopar:cpn
\cs_new_protected_nopar:Npe
\cs_new_protected_nopar:cpe
\cs_new_protected_nopar:Npx
\cs_new_protected_nopar:cpx
```

---

Creates *<function>* to expand to *<code>* as replacement text. Within the *<code>*, the *<parameters>* (#1, #2, etc.) will be replaced by those absorbed by the function. When the *<function>* is used the *<parameters>* absorbed cannot contain \par tokens. The *<function>* will not expand within an e-type or x-type argument. The definition is global and an error results if the *<function>* is already defined.

---

```
\cs_set:Npn \cs_set:Npn <function> <parameters> {<code>}
\cs_set:cpn
\cs_set:Npe
\cs_set:cpe
\cs_set:Npx
\cs_set:cpx
```

---

```
\cs_set_nopar:Npn \cs_set_nopar:Npn <function> <parameters> {<code>}
```

Sets *<function>* to expand to *<code>* as replacement text. Within the *<code>*, the *<parameters>* (#1, #2, etc.) will be replaced by those absorbed by the function. When the *<function>* is used the *<parameters>* absorbed cannot contain \par tokens. The assignment of a meaning to the *<function>* is restricted to the current TeX group level.

---

```
\cs_set_protected:Npn \cs_set_protected:Npn <function> <parameters> {<code>}
```

Sets *<function>* to expand to *<code>* as replacement text. Within the *<code>*, the *<parameters>* (#1, #2, etc.) will be replaced by those absorbed by the function. The assignment of a meaning to the *<function>* is restricted to the current TeX group level. The *<function>* will not expand within an e-type or x-type argument.

---

```
\cs_set_protected_nopar:Npn \cs_set_protected_nopar:Npn <function> <parameters> {<code>}
\cs_set_protected_nopar:cpn
\cs_set_protected_nopar:Npe
\cs_set_protected_nopar:cpe
\cs_set_protected_nopar:Npx
\cs_set_protected_nopar:cpx
```

---

Sets *<function>* to expand to *<code>* as replacement text. Within the *<code>*, the *<parameters>* (#1, #2, etc.) will be replaced by those absorbed by the function. When the *<function>* is used the *<parameters>* absorbed cannot contain \par tokens. The assignment of a meaning to the *<function>* is restricted to the current TeX group level. The *<function>* will not expand within an e-type or x-type argument.

---

`\cs_gset:Npn` `\cs_gset:Npn <function> <parameters> {<code>}`  
`\cs_gset:cpn`  
`\cs_gset:Npe`  
`\cs_gset:cpe`  
`\cs_gset:Npx`  
`\cs_gset:cpx`

Globally sets *<function>* to expand to *<code>* as replacement text. Within the *<code>*, the *<parameters>* (#1, #2, etc.) will be replaced by those absorbed by the function. The assignment of a meaning to the *<function>* is *not* restricted to the current TeX group level: the assignment is global.

---

`\cs_gset_nopar:Npn` `\cs_gset_nopar:Npn <function> <parameters> {<code>}`  
`\cs_gset_nopar:cpn`  
`\cs_gset_nopar:Npe`  
`\cs_gset_nopar:cpe`  
`\cs_gset_nopar:Npx`  
`\cs_gset_nopar:cpx`

Globally sets *<function>* to expand to *<code>* as replacement text. Within the *<code>*, the *<parameters>* (#1, #2, etc.) will be replaced by those absorbed by the function. When the *<function>* is used the *<parameters>* absorbed cannot contain \par tokens. The assignment of a meaning to the *<function>* is *not* restricted to the current TeX group level: the assignment is global.

---

`\cs_gset_protected:Npn` `\cs_gset_protected:Npn <function> <parameters> {<code>}`  
`\cs_gset_protected:cpn`  
`\cs_gset_protected:Npe`  
`\cs_gset_protected:cpe`  
`\cs_gset_protected:Npx`  
`\cs_gset_protected:cpx`

Globally sets *<function>* to expand to *<code>* as replacement text. Within the *<code>*, the *<parameters>* (#1, #2, etc.) will be replaced by those absorbed by the function. The assignment of a meaning to the *<function>* is *not* restricted to the current TeX group level: the assignment is global. The *<function>* will not expand within an e-type or x-type argument.

---

`\cs_gset_protected_nopar:Npn` `\cs_gset_protected_nopar:Npn <function> <parameters> {<code>}`  
`\cs_gset_protected_nopar:cpn`  
`\cs_gset_protected_nopar:Npe`  
`\cs_gset_protected_nopar:cpe`  
`\cs_gset_protected_nopar:Npx`  
`\cs_gset_protected_nopar:cpx`

Globally sets *<function>* to expand to *<code>* as replacement text. Within the *<code>*, the *<parameters>* (#1, #2, etc.) will be replaced by those absorbed by the function. When the *<function>* is used the *<parameters>* absorbed cannot contain \par tokens. The assignment of a meaning to the *<function>* is *not* restricted to the current TeX group level: the assignment is global. The *<function>* will not expand within an e-type or x-type argument.

### 4.3.3 Defining new functions using the signature

---

`\cs_new:Nn` `\cs_new:Nn <function> {<code>}`  
`\cs_new:(cn|Ne|ce)`

Creates *<function>* to expand to *<code>* as replacement text. Within the *<code>*, the number of *<parameters>* is detected automatically from the function signature. These *<parameters>* (#1, #2, etc.) will be replaced by those absorbed by the function. The definition is global and an error results if the *<function>* is already defined.

---

`\cs_new_nopar:Nn` `\cs_new_nopar:Nn <function> {<code>}`  
`\cs_new_nopar:(cn|Ne|ce)`

Creates *<function>* to expand to *<code>* as replacement text. Within the *<code>*, the number of *<parameters>* is detected automatically from the function signature. These *<parameters>* (#1, #2, etc.) will be replaced by those absorbed by the function. When the *<function>* is used the *<parameters>* absorbed cannot contain \par tokens. The definition is global and an error results if the *<function>* is already defined.

<code>\cs_new_protected:Nn</code>	<code>\cs_new_protected:Nn &lt;function&gt; {&lt;code&gt;}</code>
<code>\cs_new_protected:(cn Ne ce)</code>	Creates <i>&lt;function&gt;</i> to expand to <i>&lt;code&gt;</i> as replacement text. Within the <i>&lt;code&gt;</i> , the number of <i>&lt;parameters&gt;</i> is detected automatically from the function signature. These <i>&lt;parameters&gt;</i> (#1, #2, etc.) will be replaced by those absorbed by the function. The <i>&lt;function&gt;</i> will not expand within an e-type or x-type argument. The definition is global and an error results if the <i>&lt;function&gt;</i> is already defined.
<code>\cs_new_protected_nopar:Nn</code>	<code>\cs_new_protected_nopar:Nn &lt;function&gt; {&lt;code&gt;}</code>
<code>\cs_new_protected_nopar:(cn Ne ce)</code>	Creates <i>&lt;function&gt;</i> to expand to <i>&lt;code&gt;</i> as replacement text. Within the <i>&lt;code&gt;</i> , the number of <i>&lt;parameters&gt;</i> is detected automatically from the function signature. These <i>&lt;parameters&gt;</i> (#1, #2, etc.) will be replaced by those absorbed by the function. When the <i>&lt;function&gt;</i> is used the <i>&lt;parameters&gt;</i> absorbed cannot contain \par tokens. The <i>&lt;function&gt;</i> will not expand within an e-type or x-type argument. The definition is global and an error results if the <i>&lt;function&gt;</i> is already defined.
<code>\cs_set:Nn</code>	<code>\cs_set:Nn &lt;function&gt; {&lt;code&gt;}</code>
<code>\cs_set:(cn Ne ce)</code>	Sets <i>&lt;function&gt;</i> to expand to <i>&lt;code&gt;</i> as replacement text. Within the <i>&lt;code&gt;</i> , the number of <i>&lt;parameters&gt;</i> is detected automatically from the function signature. These <i>&lt;parameters&gt;</i> (#1, #2, etc.) will be replaced by those absorbed by the function. The assignment of a meaning to the <i>&lt;function&gt;</i> is restricted to the current T <sub>E</sub> X group level.
<code>\cs_set_nopar:Nn</code>	<code>\cs_set_nopar:Nn &lt;function&gt; {&lt;code&gt;}</code>
<code>\cs_set_nopar:(cn Ne ce)</code>	Sets <i>&lt;function&gt;</i> to expand to <i>&lt;code&gt;</i> as replacement text. Within the <i>&lt;code&gt;</i> , the number of <i>&lt;parameters&gt;</i> is detected automatically from the function signature. These <i>&lt;parameters&gt;</i> (#1, #2, etc.) will be replaced by those absorbed by the function. When the <i>&lt;function&gt;</i> is used the <i>&lt;parameters&gt;</i> absorbed cannot contain \par tokens. The assignment of a meaning to the <i>&lt;function&gt;</i> is restricted to the current T <sub>E</sub> X group level.
<code>\cs_set_protected:Nn</code>	<code>\cs_set_protected:Nn &lt;function&gt; {&lt;code&gt;}</code>
<code>\cs_set_protected:(cn Ne ce)</code>	Sets <i>&lt;function&gt;</i> to expand to <i>&lt;code&gt;</i> as replacement text. Within the <i>&lt;code&gt;</i> , the number of <i>&lt;parameters&gt;</i> is detected automatically from the function signature. These <i>&lt;parameters&gt;</i> (#1, #2, etc.) will be replaced by those absorbed by the function. The <i>&lt;function&gt;</i> will not expand within an e-type or x-type argument. The assignment of a meaning to the <i>&lt;function&gt;</i> is restricted to the current T <sub>E</sub> X group level.
<code>\cs_set_protected_nopar:Nn</code>	<code>\cs_set_protected_nopar:Nn &lt;function&gt; {&lt;code&gt;}</code>
<code>\cs_set_protected_nopar:(cn Ne ce)</code>	Sets <i>&lt;function&gt;</i> to expand to <i>&lt;code&gt;</i> as replacement text. Within the <i>&lt;code&gt;</i> , the number of <i>&lt;parameters&gt;</i> is detected automatically from the function signature. These <i>&lt;parameters&gt;</i> (#1, #2, etc.) will be replaced by those absorbed by the function. When the <i>&lt;function&gt;</i> is used the <i>&lt;parameters&gt;</i> absorbed cannot contain \par tokens. The <i>&lt;function&gt;</i> will not expand within an e-type or x-type argument. The assignment of a meaning to the <i>&lt;function&gt;</i> is restricted to the current T <sub>E</sub> X group level.

---

`\cs_gset:Nn` `\cs_gset:(cn|Ne|ce)` `\cs_gset:Nn <function> {<code>}`

Sets *<function>* to expand to *<code>* as replacement text. Within the *<code>*, the number of *<parameters>* is detected automatically from the function signature. These *<parameters>* (#1, #2, etc.) will be replaced by those absorbed by the function. The assignment of a meaning to the *<function>* is global.

---

`\cs_gset_nopar:Nn` `\cs_gset_nopar:(cn|Ne|ce)` `\cs_gset_nopar:Nn <function> {<code>}`

Sets *<function>* to expand to *<code>* as replacement text. Within the *<code>*, the number of *<parameters>* is detected automatically from the function signature. These *<parameters>* (#1, #2, etc.) will be replaced by those absorbed by the function. When the *<function>* is used the *<parameters>* absorbed cannot contain \par tokens. The assignment of a meaning to the *<function>* is global.

---

`\cs_gset_protected:Nn` `\cs_gset_protected:(cn|Ne|ce)` `\cs_gset_protected:Nn <function> {<code>}`

Sets *<function>* to expand to *<code>* as replacement text. Within the *<code>*, the number of *<parameters>* is detected automatically from the function signature. These *<parameters>* (#1, #2, etc.) will be replaced by those absorbed by the function. The *<function>* will not expand within an e-type or x-type argument. The assignment of a meaning to the *<function>* is global.

---

`\cs_gset_protected_nopar:Nn` `\cs_gset_protected_nopar:(cn|Ne|ce)` `\cs_gset_protected_nopar:Nn <function> {<code>}`

Sets *<function>* to expand to *<code>* as replacement text. Within the *<code>*, the number of *<parameters>* is detected automatically from the function signature. These *<parameters>* (#1, #2, etc.) will be replaced by those absorbed by the function. When the *<function>* is used the *<parameters>* absorbed cannot contain \par tokens. The *<function>* will not expand within an e-type or x-type argument. The assignment of a meaning to the *<function>* is global.

---

`\cs_generate_from_arg_count>NNnn` `\cs_generate_from_arg_count:(NNno|cNnn|Ncnn)` `\cs_generate_from_arg_count:NNnn <function> <creator> {<number>} {<code>}`

Updated: 2012-01-14

Uses the *<creator>* function (which should have signature Npn, for example `\cs_new:Npn`) to define a *<function>* which takes *<number>* arguments and has *<code>* as replacement text. The *<number>* of arguments is an integer expression, evaluated as detailed for `\int_eval:n`.

#### 4.3.4 Copying control sequences

Control sequences (not just functions as defined above) can be set to have the same meaning using the functions described here. Making two control sequences equivalent means that the second control sequence is a *copy* of the first (rather than a pointer to it). Thus the old and new control sequence are not tied together: changes to one are not reflected in the other.

In the following text “cs” is used as an abbreviation for “control sequence”.

---

<code>\cs_new_eq:NN</code>	<code>\cs_new_eq:NN</code> $\langle cs_1 \rangle$ $\langle cs_2 \rangle$
<code>\cs_new_eq:(Nc cN cc)</code>	<code>\cs_new_eq:NN</code> $\langle cs_1 \rangle$ $\langle token \rangle$

Globally creates  $\langle control\ sequence_1 \rangle$  and sets it to have the same meaning as  $\langle control\ sequence_2 \rangle$  or  $\langle token \rangle$ . The second control sequence may subsequently be altered without affecting the copy.

---

<code>\cs_set_eq:NN</code>	<code>\cs_set_eq:NN</code> $\langle cs_1 \rangle$ $\langle cs_2 \rangle$
<code>\cs_set_eq:(Nc cN cc)</code>	<code>\cs_set_eq:NN</code> $\langle cs_1 \rangle$ $\langle token \rangle$

Sets  $\langle control\ sequence_1 \rangle$  to have the same meaning as  $\langle control\ sequence_2 \rangle$  (or  $\langle token \rangle$ ). The second control sequence may subsequently be altered without affecting the copy. The assignment of a meaning to the  $\langle control\ sequence_1 \rangle$  is restricted to the current TeX group level.

---

<code>\cs_gset_eq:NN</code>	<code>\cs_gset_eq:NN</code> $\langle cs_1 \rangle$ $\langle cs_2 \rangle$
<code>\cs_gset_eq:(Nc cN cc)</code>	<code>\cs_gset_eq:NN</code> $\langle cs_1 \rangle$ $\langle token \rangle$

Globally sets  $\langle control\ sequence_1 \rangle$  to have the same meaning as  $\langle control\ sequence_2 \rangle$  (or  $\langle token \rangle$ ). The second control sequence may subsequently be altered without affecting the copy. The assignment of a meaning to the  $\langle control\ sequence_1 \rangle$  is *not* restricted to the current TeX group level: the assignment is global.

### 4.3.5 Deleting control sequences

There are occasions where control sequences need to be deleted. This is handled in a very simple manner.

---

<code>\cs_undefine:N</code>	<code>\cs_undefine:N</code> $\langle control\ sequence \rangle$
<code>\cs_undefine:c</code>	Sets $\langle control\ sequence \rangle$ to be globally undefined.

Updated: 2011-09-15

### 4.3.6 Showing control sequences

---

<code>\cs_meaning:N</code> *	<code>\cs_meaning:N</code> $\langle control\ sequence \rangle$
<code>\cs_meaning:c</code> *	This function expands to the <i>meaning</i> of the $\langle control\ sequence \rangle$ control sequence. For a macro, this includes the $\langle replacement\ text \rangle$ .

Updated: 2011-12-22

**TeXhackers note:** This is the TeX primitive `\meaning`. For tokens that are not control sequences, it is more logical to use `\token_to_meaning:N`. The `c` variant correctly reports undefined arguments.

---

<code>\cs_show:N</code>	<code>\cs_show:N</code> $\langle control\ sequence \rangle$
<code>\cs_show:c</code>	Displays the definition of the $\langle control\ sequence \rangle$ on the terminal.

Updated: 2017-02-14

**TeXhackers note:** This is similar to the TeX primitive `\show`, wrapped to a fixed number of characters per line.

---

`\cs_log:N`    `\cs_log:N` (*control sequence*)  
`\cs_log:c`    Writes the definition of the *(control sequence)* in the log file. See also `\cs_show:N` which  
 New: 2014-08-22    displays the result in the terminal.  
 Updated: 2017-02-14

---

#### 4.3.7 Converting to and from control sequences

---

`\use:c * \use:c {<control sequence name>}`

---

Expands the *(control sequence name)* until only characters remain, and then converts this into a control sequence. This process requires two expansions. As in other c-type arguments the *(control sequence name)* must, when fully expanded, consist of character tokens, typically a mixture of category code 10 (space), 11 (letter) and 12 (other).

As an example of the `\use:c` function, both

`\use:c { a b c }`

and

```
\tl_new:N \l_my_tl
\tl_set:Nn \l_my_tl { a b c }
\use:c { \tl_use:N \l_my_tl }
```

would be equivalent to

`\abc`

after two expansions of `\use:c`.

---

`\cs_if_exist_use:N`    \* `\cs_if_exist_use:N` (*control sequence*)  
`\cs_if_exist_use:c`    \* `\cs_if_exist_use:NTF` (*control sequence*) {*true code*} {*false code*}  
`\cs_if_exist_use:NTF`    \* Tests whether the *(control sequence)* is currently defined according to the conditional  
`\cs_if_exist_use:cTF`    \* `\cs_if_exist:NTF` (whether as a function or another control sequence type), and if it is  
 New: 2012-11-10    inserts the *(control sequence)* into the input stream followed by the *(true code)*. Otherwise  
 the *(false code)* is used.

---

---

`\cs:w * \cs:w <control sequence name> \cs_end:`

---

`\cs_end:`    \* Converts the given *(control sequence name)* into a single control sequence token. This process requires one expansion. The content for *(control sequence name)* may be literal material or from other expandable functions. The *(control sequence name)* must, when fully expanded, consist of character tokens which are not active: typically of category code 10 (space), 11 (letter) or 12 (other), or a mixture of these.

**TEXhackers note:** These are the TEX primitives `\csname` and `\endcsname`.

As an example of the `\cs:w` and `\cs_end:` functions, both

`\cs:w a b c \cs_end:`

and

```
\tl_new:N \l_my_tl
\tl_set:Nn \l_my_tl { a b c }
\cs:w \tl_use:N \l_my_tl \cs_end:
```

would be equivalent to

```
\abc
```

after one expansion of `\cs:w`.

---

```
\cs_to_str:N * \cs_to_str:N <control sequence>
```

Converts the given *<control sequence>* into a series of characters with category code 12 (other), except spaces, of category code 10. The result does *not* include the current escape token, contrarily to `\token_to_str:N`. Full expansion of this function requires exactly 2 expansion steps, and so an e-type or x-type expansion, or two o-type expansions are required to convert the *<control sequence>* to a sequence of characters in the input stream. In most cases, an f-expansion is correct as well, but this loses a space at the start of the result.

## 4.4 Analysing control sequences

---

```
\cs_split_function:N * \cs_split_function:N <function>
```

New: 2018-04-06 Splits the *<function>* into the *<name>* (*i.e.* the part before the colon) and the *<signature>* (*i.e.* after the colon). This information is then placed in the input stream in three parts: the *<name>*, the *<signature>* and a logic token indicating if a colon was found (to differentiate variables from function names). The *<name>* does not include the escape character, and both the *<name>* and *<signature>* are made up of tokens with category code 12 (other).

The next three functions decompose TeX macros into their constituent parts: if the *<token>* passed is not a macro then no decomposition can occur. In the latter case, all three functions leave `\scan_stop:` in the input stream.

---

```
\cs_prefix_spec:N * \cs_prefix_spec:N <token>
```

New: 2019-02-27 If the *<token>* is a macro, this function leaves the applicable TeX prefixes in input stream as a string of tokens of category code 12 (with spaces having category code 10). Thus for example

```
\cs_set:Npn \next:nn #1#2 { x #1~y #2 }
\cs_prefix_spec:N \next:nn
```

leaves `\long` in the input stream. If the *<token>* is not a macro then `\scan_stop:` is left in the input stream.

**TeXhackers note:** The prefix can be empty, `\long`, `\protected` or `\protected\long` with backslash replaced by the current escape character.

---

```
\cs_parameter_spec:N ∗ \cs_parameter_spec:N ⟨token⟩
```

New: 2022-06-24 If the ⟨token⟩ is a macro, this function leaves the primitive TeX parameter specification in input stream as a string of character tokens of category code 12 (with spaces having category code 10). Thus for example

```
\cs_set:Npn \next:nn #1#2 { x #1 y #2 }
\cs_parameter_spec:N \next:nn
```

leaves #1#2 in the input stream. If the ⟨token⟩ is not a macro then \scan\_stop: is left in the input stream.

**TeXhackers note:** If the parameter specification contains the string ->, then the function produces incorrect results.

---

```
\cs_replacement_spec:N ∗ \cs_replacement_spec:N ⟨token⟩
```

\cs\_replacement\_spec:c ∗ New: 2019-02-27 If the ⟨token⟩ is a macro, this function leaves the replacement text in input stream as a string of character tokens of category code 12 (with spaces having category code 10). Thus for example

```
\cs_set:Npn \next:nn #1#2 { x #1~y #2 }
\cs_replacement_spec:N \next:nn
```

leaves x#1~y#2 in the input stream. If the ⟨token⟩ is not a macro then \scan\_stop: is left in the input stream.

**TeXhackers note:** If the parameter specification contains the string ->, then the function produces incorrect results.

## 4.5 Using or removing tokens and arguments

Tokens in the input can be read and used or read and discarded. If one or more tokens are wrapped in braces then when absorbing them the outer set is removed. At the same time, the category code of each token is set when the token is read by a function (if it is read more than once, the category code is determined by the situation in force when first function absorbs the token).

---

```
\use:n    * \use:n    {{group1}}
\use:nn   * \use:nn   {{group1}} {{group2}}
\use:nnn  * \use:nnn  {{group1}} {{group2}} {{group3}}
\use:nnnn * \use:nnnn {{group1}} {{group2}} {{group3}} {{group4}}
```

---

As illustrated, these functions absorb between one and four arguments, as indicated by the argument specifier. The braces surrounding each argument are removed and the remaining tokens are left in the input stream. The category code of these tokens is also fixed by this process (if it has not already been by some other absorption). All of these functions require only a single expansion to operate, so that one expansion of

```
\use:nn { abc } { { def } }
```

results in the input stream containing

```
abc { def }
```

*i.e.* only the outer braces are removed.

**TeXhackers note:** The `\use:n` function is equivalent to L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>'s `\@firstofone`.

---

```

\use_i:nn          * \use_i:nn {{arg1}} {{arg2}}
\use_ii:nn         * \use_i:nnn {{arg1}} {{arg2}} {{arg3}}
\use_i:nnn         * \use_i:nnnn {{arg1}} {{arg2}} {{arg3}} {{arg4}}
\use_ii:nnn        * \use_i:nnnnn {{arg1}} {{arg2}} {{arg3}} {{arg4}} {{arg5}}
\use_iii:nnn       * \use_i:nnnnnn {{arg1}} {{arg2}} {{arg3}} {{arg4}} {{arg5}} {{arg6}}
\use_i:nnnn        * \use_i:nnnnnn {{arg1}} {{arg2}} {{arg3}} {{arg4}} {{arg5}} {{arg6}} {{arg7}}
\use_ii:nnnn       * \use_i:nnnnnnn {{arg1}} {{arg2}} {{arg3}} {{arg4}} {{arg5}} {{arg6}} {{arg7}} {{arg8}}
\use_iii:nnnn      * \use_i:nnnnnnnn {{arg1}} {{arg2}} {{arg3}} {{arg4}} {{arg5}} {{arg6}} {{arg7}} {{arg8}} {{arg9}}
\use_iv:nnnn       *
\use_i:nnnnn       *
\use_ii:nnnnn      *
\use_iii:nnnnn     *
\use_iv:nnnnn      *
\use_v:nnnnn       *
\use_i:nnnnnn      *
\use_ii:nnnnnn     *
\use_iii:nnnnnn    *
\use_iv:nnnnnn     *
\use_v:nnnnnn      *
\use_vi:nnnnnn     *
\use_i:nnnnnnn     *
\use_ii:nnnnnnn    *
\use_iii:nnnnnnn   *
\use_iv:nnnnnnn    *
\use_v:nnnnnnn     *
\use_vi:nnnnnnn    *
\use_vii:nnnnnnn   *
\use_i:nnnnnnnn    *
\use_ii:nnnnnnnn   *
\use_iii:nnnnnnnn  *
\use_iv:nnnnnnnn   *
\use_v:nnnnnnnn    *
\use_vi:nnnnnnnn   *
\use_vii:nnnnnnnn  *
\use_viii:nnnnnnnn *
\use_ix:nnnnnnnn   *

```

---

---

`\use_i_ii:nnn` \* `\use_i_ii:nnn {⟨arg1⟩} {⟨arg2⟩} {⟨arg3⟩}`

This function absorbs three arguments and leaves the content of the first and second in the input stream. The category code of these tokens is also fixed (if it has not already been by some other absorption). A single expansion is needed for the function to take effect. An example:

```
\use_i_ii:nnn { abc } { { def } } { ghi }
```

results in the input stream containing

```
abc { def }
```

*i.e.* the outer braces are removed and the third group is removed.

---

`\use_ii_i:nn` \* `\use_ii_i:nn {⟨arg1⟩} {⟨arg2⟩}`

New: 2019-06-02 This function absorbs two arguments and leaves the content of the second and first in the input stream. The category code of these tokens is also fixed (if it has not already been by some other absorption). A single expansion is needed for the function to take effect.

---

`\use_none:n` \* `\use_none:n {⟨group1⟩}`  
`\use_none:nn` \* These functions absorb between one and nine groups from the input stream, leaving  
`\use_none:nnn` \* nothing on the resulting input stream. These functions work after a single expansion.  
`\use_none:nnnn` \* One or more of the `n` arguments may be an unbraced single token (*i.e.* an `N` argument).  
`\use_none:nnnnn` \* **TEXhackers note:** These are equivalent to L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub> 's `\@gobble`, `\@gobbletwo`, *etc.*  
`\use_none:nnnnnn` \*  
`\use_none:nnnnnnn` \*  
`\use_none:nnnnnnnn` \*

---

`\use:e` \* `\use:e {⟨expandable tokens⟩}`

New: 2018-06-18 Fully expands the *⟨token list⟩* in an `e`-type manner, in which parameter character (usually `#`) need not be doubled, *and* the function remains fully expandable.  
Updated: 2023-07-05

**TEXhackers note:** `\use:e` is a wrapper around the primitive `\expanded`. It requires two expansions to complete its action.

#### 4.5.1 Selecting tokens from delimited arguments

A different kind of function for selecting tokens from the token stream are those that use delimited arguments.

---

`\use_none_delimit_by_q_nil:w` \* `\use_none_delimit_by_q_nil:w {balanced text} \q_nil`  
`\use_none_delimit_by_q_stop:w` \* `\use_none_delimit_by_q_stop:w {balanced text} \q_stop`  
`\use_none_delimit_by_q_recursion_stop:w` \* `\use_none_delimit_by_q_recursion_stop:w {balanced text} \q_recursion_stop`

Absorb the *⟨balanced text⟩* from the input stream delimited by the marker given in the function name, leaving nothing in the input stream.

---

```
\use_i_delimit_by_q_nil:nw      * \use_i_delimit_by_q_nil:nw {\langle inserted tokens\rangle} {balanced text}
\use_i_delimit_by_q_stop:nw    * \q_nil
\use_i_delimit_by_q_recursion_stop:nw * \use_i_delimit_by_q_stop:nw {\langle inserted tokens\rangle} {balanced
                                         text} \q_stop
                                         \use_i_delimit_by_q_recursion_stop:nw {\langle inserted tokens\rangle}
                                         {balanced text} \q_recursion_stop
```

Absorb the *{balanced text}* from the input stream delimited by the marker given in the function name, leaving *{inserted tokens}* in the input stream for further processing.

## 4.6 Predicates and conditionals

LATEX3 has three concepts for conditional flow processing:

**Branching conditionals** Functions that carry out a test and then execute, depending on its result, either the code supplied as the *{true code}* or the *{false code}*. These arguments are denoted with T and F, respectively. An example would be

```
\cs_if_free:cTF {abc} {\langle true code\rangle} {\langle false code\rangle}
```

a function that turns the first argument into a control sequence (since it's marked as c) then checks whether this control sequence is still free and then depending on the result carries out the code in the second argument (true case) or in the third argument (false case).

These type of functions are known as “conditionals”; whenever a TF function is defined it is usually accompanied by T and F functions as well. These are provided for convenience when the branch only needs to go a single way. Package writers are free to choose which types to define but the kernel definitions always provide all three versions.

Important to note is that these branching conditionals with *{true code}* and/or *{false code}* are always defined in a way that the code of the chosen alternative can operate on following tokens in the input stream.

These conditional functions may or may not be fully expandable, but if they are expandable they are accompanied by a “predicate” for the same test as described below.

**Predicates** “Predicates” are functions that return a special type of boolean value which can be tested by the boolean expression parser. All functions of this type are expandable and have names that end with \_p in the description part. For example,

```
\cs_if_free_p:N
```

would be a predicate function for the same type of test as the conditional described above. It would return “true” if its argument (a single token denoted by N) is still free for definition. It would be used in constructions like

```
\bool_if:nTF {
    \cs_if_free_p:N \l_tmpz_t1 || \cs_if_free_p:N \g_tmpz_t1
} {\langle true code\rangle} {\langle false code\rangle}
```

For each predicate defined, a “branching conditional” also exists that behaves like a conditional described above.

**Primitive conditionals** There is a third variety of conditional, which is the original concept used in plain TeX and L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub> . Their use is discouraged in `expl3` (although still used in low-level definitions) because they are more fragile and in many cases require more expansion control (hence more code) than the two types of conditionals described above.

#### 4.6.1 Tests on control sequences

---

```
\cs_if_eq_p:N * \cs_if_eq_p:NN <cs1> <cs2>
\cs_if_eq:NNTF * \cs_if_eq:NNTF <cs1> <cs2> {<true code>} {<false code>}
```

---

Compares the definition of two *<control sequences>* and is logically `true` if they are the same, *i.e.* if they have exactly the same definition when examined with `\cs_show:N`.

---

```
\cs_if_exist_p:N * \cs_if_exist_p:N <control sequence>
\cs_if_exist_p:c * \cs_if_exist:NTF <control sequence> {<true code>} {<false code>}
\cs_if_exist:NNTF * Tests whether the <control sequence> is currently defined (whether as a function or another
\cs_if_exist:cTF * control sequence type). Any definition of <control sequence> other than \relax evaluates as true.
```

---

---

```
\cs_if_free_p:N * \cs_if_free_p:N <control sequence>
\cs_if_free_p:c * \cs_if_free:NTF <control sequence> {<true code>} {<false code>}
\cs_if_free:NNTF * Tests whether the <control sequence> is currently free to be defined. This test is false if
\cs_if_free:cTF * the <control sequence> currently exists (as defined by \cs_if_exist:NTF).
```

---

#### 4.6.2 Primitive conditionals

The  $\varepsilon$ -TeX engine itself provides many different conditionals. Some expand whatever comes after them and others don't. Hence the names for these underlying functions often contains a `:w` part but higher level functions are often available. See for instance `\int_compare_p:nNn` which is a wrapper for `\if_int_compare:w`.

Certain conditionals deal with specific data types like boxes and fonts and are described there. The ones described below are either the universal conditionals or deal with control sequences. We prefix primitive conditionals with `\if_`, except for `\if:w`.

---

```
\if_true:    * \if_true: <true code> \else: <false code> \fi:
\if_false:   * \if_false: <true code> \else: <false code> \fi:
\else:       * \reverse_if:N <primitive conditional>
\fi:         * \if_true: always executes <true code>, while \if_false: always executes <false code>.
\reverse_if:N * \reverse_if:N reverses any two-way primitive conditional. \else: and \fi: delimit the branches of the conditional. The function \or: is documented in l3int and used in case switches.
```

---

**TeXhackers note:** `\if_true:` and `\if_false:` are equivalent to their corresponding TeX primitive conditionals `\iftrue` and `\iffalse`; `\else:` and `\fi:` are the TeX primitives `\else` and `\fi`; `\reverse_if:N` is the  $\varepsilon$ -TeX primitive `\unless`.

---

```
\if_meaning:w * \if_meaning:w <arg1> <arg2> <true code> \else: <false code> \fi:
```

`\if_meaning:w` executes `<true code>` when `<arg1>` and `<arg2>` are the same, otherwise it executes `<false code>`. `<arg1>` and `<arg2>` could be functions, variables, tokens; in all cases the *unexpanded* definitions are compared.

**TeXhackers note:** This is the TeX primitive `\ifx`.

---

```
\if:w * \if:w <token1> <token2> <true code> \else: <false code> \fi:  
\if_charcode:w * \if_catcode:w <token1> <token2> <true code> \else: <false code> \fi:
```

`\if:w` tests if the character codes of the two tokens are the same whereas `\if_catcode:w` tests if the category codes are identical. `\if_charcode:w` is an alternative name for `\if:w`.

**TeXhackers note:** `\if:w` and `\if_charcode:w` are both the TeX primitive `\if`. `\if_catcode:w` is the TeX primitive `\ifcat`.

---

```
\if_cs_exist:N * \if_cs_exist:N <cs> <true code> \else: <false code> \fi:  
\if_cs_exist:w * \if_cs_exist:w <tokes> \cs_end: <true code> \else: <false code> \fi:
```

Check if `<cs>` appears in the hash table or if the control sequence that can be formed from `<tokes>` appears in the hash table. The latter function does not turn the control sequence in question into `\scan_stop!` This can be useful when dealing with control sequences which cannot be entered as a single token.

**TeXhackers note:** These are the TeX primitives `\ifdefined` and `\ifcsname`.

---

```
\if_mode_horizontal: * \if_mode_horizontal: <true code> \else: <false code> \fi:  
\if_mode_vertical: * Execute <true code> if currently in horizontal mode, otherwise execute <false code>. Similar for the other functions.
```

**TeXhackers note:** These are the TeX primitives `\ifhmode`, `\ifvmode`, `\ifmmode`, and `\ifinner`.

## 4.7 Starting a paragraph

---

```
\mode_leave_vertical: \mode_leave_vertical:
```

New: 2017-07-04

Ensures that TeX is not in vertical (inter-paragraph) mode. In horizontal or math mode this command has no effect, in vertical mode it switches to horizontal mode, and inserts a box of width `\parindent`, followed by the `\everypar` token list.

**TeXhackers note:** This results in the contents of the `\everypar` token register being inserted, after `\mode_leave_vertical:` is complete. Notice that in contrast to the L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> `\leavevmode` approach, no box is used by the method implemented here.

## 4.8 Debugging support

---

```
\debug_on:n  \debug_on:n { <comma-separated list> }
\debug_off:n \debug_off:n { <comma-separated list> }
```

New: 2017-07-16 Turn on and off within a group various debugging code, some of which is also available  
Updated: 2023-05-23 as `expl3` load-time options. The items that can be used in the `<list>` are

- `check-declarations` that checks all `expl3` variables used were previously declared and that local/global variables (based on their name or on their first assignment) are only locally/globally assigned;
- `check-expressions` that checks integer, dimension, skip, and muskip expressions are not terminated prematurely;
- `deprecation` that makes soon-to-be-deprecated commands produce errors;
- `log-functions` that logs function definitions;
- `all` that does all of the above.

Providing these as switches rather than options allows testing code even if it relies on other packages: load all other packages, call `\debug_on:n`, and load the code that one is interested in testing.

---

```
\debug_suspend: \debug_suspend: ... \debug_resume:
```

`\debug_resume:` Suppress (locally) errors and logging from `debug` commands, except for the `deprecation` errors or warnings. These pairs of commands can be nested. This can be used around pieces of code that are known to fail checks, if such failures should be ignored. See for instance `l3coffins`.

## Chapter 5

# The `\3exp` module Argument expansion

This module provides generic methods for expanding TeX arguments in a systematic manner. The functions in this module all have prefix `exp`.

Not all possible variations are implemented for every base function. Instead only those that are used within the L<sup>A</sup>T<sub>E</sub>X3 kernel or otherwise seem to be of general interest are implemented. Consult the module description to find out which functions are actually defined. The next section explains how to define missing variants.

### 5.1 Defining new variants

The definition of variant forms for base functions may be necessary when writing new functions or when applying a kernel function in a situation that we haven't thought of before.

Internally preprocessing of arguments is done with functions of the form `\exp_...`. They all look alike, an example would be `\exp_args:NNo`. This function has three arguments, the first and the second are a single tokens, while the third argument should be given in braces. Applying `\exp_args:NNo` expands the content of third argument once before any expansion of the first and second arguments. If `\seq_gpush:N` was not defined it could be coded in the following way:

```
\exp_args:NNo \seq_gpush:Nn
  \g_file_name_stack
  { \l_tmpa_t1 }
```

In other words, the first argument to `\exp_args:NNo` is the base function and the other arguments are preprocessed and then passed to this base function. In the example the first argument to the base function should be a single token which is left unchanged while the second argument is expanded once. From this example we can also see how the variants are defined. They just expand into the appropriate `\exp_` function followed by the desired base function, *e.g.*

```
\cs_generate_variant:Nn \seq_gpush:Nn { No }
```

results in the definition of `\seq_gpush:N`

```
\cs_new:Npn \seq_gpush:No { \exp_args:NNo \seq_gpush:Nn }
```

Providing variants in this way in style files is safe as the `\cs_generate_variant:Nn` function will only create new definitions if there is not already one available. Therefore adding such definition to later releases of the kernel will not make such style files obsolete.

The steps above may be automated by using the function `\cs_generate_variant:Nn`, described next.

## 5.2 Methods for defining variants

We recall the set of available argument specifiers.

- `N` is used for single-token arguments while `c` constructs a control sequence from its name and passes it to a parent function as an `N`-type argument.
- Many argument types extract or expand some tokens and provide it as an `n`-type argument, namely a braced multiple-token argument: `V` extracts the value of a variable, `v` extracts the value from the name of a variable, `n` uses the argument as it is, `o` expands once, `f` expands fully the front of the token list, `e` and `x` expand fully all tokens (differences are explained later).
- A few odd argument types remain: `T` and `F` for conditional processing, otherwise identical to `n`-type arguments, `p` for the parameter text in definitions, `w` for arguments with a specific syntax, and `D` to denote primitives that should not be used directly.

---

```
\cs_generate_variant:Nn \cs_generate_variant:Nn <parent control sequence> {<variant argument specifiers>}
```

---

Updated: 2017-11-28

This function is used to define argument-specifier variants of the *<parent control sequence>* for L<sup>A</sup>T<sub>E</sub>X3 code-level macros. The *<parent control sequence>* is first separated into the *<base name>* and *<original argument specifier>*. The comma-separated list of *<variant argument specifiers>* is then used to define variants of the *<original argument specifier>* if these are not already defined; entries which correspond to existing functions are silently ignored. For each *<variant>* given, a function is created that expands its arguments as detailed and passes them to the *<parent control sequence>*. So for example

```
\cs_set:Npn \foo:Nn #1#2 { code here }
\cs_generate_variant:Nn \foo:Nn { c }
```

creates a new function `\foo:cn` which expands its first argument into a control sequence name and passes the result to `\foo:Nn`. Similarly

```
\cs_generate_variant:Nn \foo:Nn { NV , cV }
```

generates the functions `\foo:NV` and `\foo:cV` in the same way. The `\cs_generate_variant:Nn` function should only be applied if the *<parent control sequence>* is already defined. (This is only enforced if debugging support `check-declarations` is enabled.) If the *<parent control sequence>* is protected or if the *<variant>* involves any `x` argument, then the *<variant control sequence>* is also protected. The *<variant>* is created globally, as is any `\exp_args:N<variant>` function needed to carry out the expansion. There is no need to re-apply `\cs_generate_variant:Nn` after changing the definition of the parent function: the variant will always use the current definition of the parent. Providing variants repeatedly is safe as `\cs_generate_variant:Nn` will only create new definitions if there is not already one available.

Only `n` and `N` arguments can be changed to other types. The only allowed changes are

- `c` variant of an `N` parent;
- `o, V, v, f, e, or x` variant of an `n` parent;
- `N, n, T, F, or p` argument unchanged.

This means the *<parent>* of a *<variant>* form is always unambiguous, even in cases where both an `n`-type parent and an `N`-type parent exist, such as for `\tl_count:n` and `\tl_count:N`.

When creating variants for conditional functions, `\prg_generate_conditional_variant:Nnn` provides a convenient way of handling the related function set.

For backward compatibility it is currently possible to make `n, o, V, v, f, e, or x`-type variants of an `N`-type argument or `N` or `c`-type variants of an `n`-type argument. Both are deprecated. The first because passing more than one token to an `N`-type argument will typically break the parent function's code. The second because programmers who use that most often want to access the value of a variable given its name, hence should use a `V`-type or `v`-type variant instead of `c`-type. In those cases, using the lower-level `\exp_args:No` or `\exp_args:Nc` functions explicitly is preferred to defining confusing variants.

---

```
\exp_args_generate:n \exp_args_generate:n {variant argument specifiers}
```

New: 2018-04-04 Defines `\exp_args:N` functions for each *variant* given in the comma list  
Updated: 2019-02-08 *{variant argument specifiers}*. Each *variant* should consist of the letters N, c, n, V, v, o, f, e, x, p and the resulting function is protected if the letter x appears in the *variant*. This is only useful for cases where `\cs_generate_variant:Nn` is not applicable.

---

### 5.3 Introducing the variants

The V type returns the value of a register, which can be one of `t1`, `clist`, `int`, `skip`, `dim`, `muskip`, or built-in TeX registers. The v type is the same except it first creates a control sequence out of its argument before returning the value.

In general, the programmer should not need to be concerned with expansion control. When simply using the content of a variable, functions with a V specifier should be used. For those referred to by (cs)name, the v specifier is available for the same purpose. Only when specific expansion steps are needed, such as when using delimited arguments, should the lower-level functions with o specifiers be employed.

The e type expands all tokens fully, starting from the first. More precisely the expansion is identical to that of TeX's `\message` (in particular # needs not be doubled). It relies on the primitive `\expanded` hence is fast.

The x type expands all tokens fully, starting from the first. In contrast to e, all macro parameter characters # must be doubled, and omitting this leads to low-level errors. In addition this type of expansion is not expandable, namely functions that have x in their signature do not themselves expand when appearing inside e or x expansion.

The f type is so special that it deserves an example. It is typically used in contexts where only expandable commands are allowed. Then x-expansion cannot be used, and f-expansion provides an alternative that expands the front of the token list as much as can be done in such contexts. For instance, say that we want to evaluate the integer expression `3 + 4` and pass the result 7 as an argument to an expandable function `\example:n`. For this, one should define a variant using `\cs_generate_variant:Nn` `\example:n { f }`, then do

```
\example:f { \int_eval:n { 3 + 4 } }
```

Note that x-expansion would also expand `\int_eval:n` fully to its result 7, but the variant `\example:x` cannot be expandable. Note also that o-expansion would not expand `\int_eval:n` fully to its result since that function requires several expansions. Besides the fact that x-expansion is protected rather than expandable, another difference between f-expansion and x-expansion is that f-expansion expands tokens from the beginning and stops as soon as a non-expandable token is encountered, while x-expansion continues expanding further tokens. Thus, for instance

```
\example:f { \int_eval:n { 1 + 2 } , \int_eval:n { 3 + 4 } }
```

results in the call

```
\example:n { 3 , \int_eval:n { 3 + 4 } }
```

while using `\example:x` or `\example:e` instead results in

```
\example:n { 3 , 7 }
```

at the cost of being protected for `x`-type. If you use `f` type expansion in conditional processing then you should stick to using `TF` type functions only as the expansion does not finish any `\if... \fi:` itself!

It is important to note that both `f`- and `o`-type expansion are concerned with the expansion of tokens from left to right in their arguments. In particular, `o`-type expansion applies to the first *token* in the argument it receives: it is conceptually similar to

```
\exp_after:wN <base function> \exp_after:wN { <argument> }
```

At the same time, `f`-type expansion stops at the *first* non-expandable token. This means for example that both

```
\tl_set:Nn \l_tmpa_t1 { { \g_tmpb_t1 } }
```

and

```
\tl_set:Nf \l_tmpa_t1 { { \g_tmpb_t1 } }
```

leave `\g_tmpb_t1` unchanged: `{` is the first token in the argument and is non-expandable.

It is usually best to keep the following in mind when using variant forms.

- Variants with `x`-type arguments (that are fully expanded before being passed to the `n`-type base function) are never expandable even when the base function is. Such variants cannot work correctly in arguments that are themselves subject to expansion. Consider using `f` or `e` expansion.
- In contrast, `e` expansion (full expansion, almost like `x` except for the treatment of `#`) does not prevent variants from being expandable (if the base function is).
- Finally `f` expansion only expands the front of the token list, stopping at the first non-expandable token. This may fail to fully expand the argument.

When speed is essential (for functions that do very little work and whose variants are used numerous times in a document) the following considerations apply because the speed of internal functions that expand the arguments of a base function depend on what needs doing with each argument and where this happens in the list of arguments:

- for fastest processing any `c`-type arguments should come first followed by all other modified arguments;
- unchanged `N`-type args that appear before modified ones have a small performance hit;
- unchanged `n`-type args that appear before modified ones have a relative larger performance hit.

## 5.4 Manipulating the first argument

These functions are described in detail: expansion of multiple tokens follows the same rules but is described in a shorter fashion.

---

```
\exp_args:Nc * \exp_args:Nc <function> {<tokens>}
```

**\exp\_args:cc** \* This function absorbs two arguments (the *<function>* name and the *<tokens>*). The *<tokens>* are expanded until only characters remain, and are then turned into a control sequence. The result is inserted into the input stream *after* reinsertion of the *<function>*. Thus the *<function>* may take more than one argument: all others are left unchanged.

The :cc variant constructs the *<function>* name in the same manner as described for the *<tokens>*.

---

```
\exp_args:No * \exp_args:No <function> {<tokens>} ...
```

This function absorbs two arguments (the *<function>* name and the *<tokens>*). The *<tokens>* are expanded once, and the result is inserted in braces into the input stream *after* reinsertion of the *<function>*. Thus the *<function>* may take more than one argument: all others are left unchanged.

---

```
\exp_args:NV * \exp_args:NV <function> <variable>
```

This function absorbs two arguments (the names of the *<function>* and the *<variable>*). The content of the *<variable>* are recovered and placed inside braces into the input stream *after* reinsertion of the *<function>*. Thus the *<function>* may take more than one argument: all others are left unchanged.

---

```
\exp_args:Nv * \exp_args:Nv <function> {<tokens>}
```

This function absorbs two arguments (the *<function>* name and the *<tokens>*). The *<tokens>* are expanded until only characters remain, and are then turned into a control sequence. This control sequence should be the name of a *<variable>*. The content of the *<variable>* are recovered and placed inside braces into the input stream *after* reinsertion of the *<function>*. Thus the *<function>* may take more than one argument: all others are left unchanged.

---

```
\exp_args:Ne * \exp_args:Ne <function> {<tokens>}
```

**New: 2018-05-15** This function absorbs two arguments (the *<function>* name and the *<tokens>*) and exhaustively expands the *<tokens>*. The result is inserted in braces into the input stream *after* reinsertion of the *<function>*. Thus the *<function>* may take more than one argument: all others are left unchanged.

---

```
\exp_args:Nf * \exp_args:Nf <function> {<tokens>}
```

This function absorbs two arguments (the *<function>* name and the *<tokens>*). The *<tokens>* are fully expanded until the first non-expandable token is found (if that is a space it is removed), and the result is inserted in braces into the input stream *after* reinsertion of the *<function>*. Thus the *<function>* may take more than one argument: all others are left unchanged.

---

```
\exp_args:Nx \exp_args:Nx <function> {<tokens>}
```

This function absorbs two arguments (the *<function>* name and the *<tokens>*) and exhaustively expands the *<tokens>*. The result is inserted in braces into the input stream *after* reinsertion of the *<function>*. Thus the *<function>* may take more than one argument: all others are left unchanged.

## 5.5 Manipulating two arguments

---

```
\exp_args:Nnc * \exp_args:NNc <token1> <token2> {<tokens>}
\exp_args:Nno * These optimized functions absorb three arguments and expand the second and third as
\exp_args:NNV * detailed by their argument specifier. The first argument of the function is then the next
\exp_args:NNv * item on the input stream, followed by the expansion of the second and third arguments.
\exp_args:Nne *
```

```
\exp_args:Nnf *
\exp_args:Ncc *
\exp_args:Nco *
\exp_args:Ncv *
\exp_args:Ncv *
\exp_args:Ncf *
\exp_args:NVV *
```

---

Updated: 2018-05-15

---

```
\exp_args:Nnc * \exp_args:Noo <token> {<tokens1>} {<tokens2>}
\exp_args:Nno * These functions absorb three arguments and expand the second and third as detailed by
\exp_args:NnV * their argument specifier. The first argument of the function is then the next item on the
\exp_args:Nnv * input stream, followed by the expansion of the second and third arguments.
\exp_args:Nne *
```

```
\exp_args:Nnf *
\exp_args:Noc *
\exp_args:Noo *
\exp_args:Nof *
\exp_args:NVo *
\exp_args:Nfo *
\exp_args:Nff *
\exp_args:Nee *
```

---

Updated: 2018-05-15

---

```
\exp_args:NNx \exp_args:NNx <token1> <token2> {<tokens>}
```

These functions absorb three arguments and expand the second and third as detailed by their argument specifier. The first argument of the function is then the next item on the input stream, followed by the expansion of the second and third arguments. These functions are not expandable due to their x-type argument.

## 5.6 Manipulating three arguments

---

```
\exp_args>NNNo * \exp_args:NNNNo <token1> <token2> <token3> {<tokens>}
\exp_args:NNNV * These optimized functions absorb four arguments and expand the second, third and
\exp_args:NNNv * fourth as detailed by their argument specifier. The first argument of the function is then
\exp_args:NNNe * the next item on the input stream, followed by the expansion of the second argument,
\exp_args:Nccc * etc.
\exp_args:NcNc *
\exp_args:NcNo *
\exp_args:Ncco *
```

---

```
\exp_args:NNcf * \exp_args:NNoo <token1> <token2> {<token3>} {<tokens>}
\exp_args:NNno * These functions absorb four arguments and expand the second, third and fourth as de-
\exp_args:NNnV * tailed by their argument specifier. The first argument of the function is then the next
\exp_args:NNoo * item on the input stream, followed by the expansion of the second argument, etc.
\exp_args:NNV * 
```

```
\exp_args:Ncno *
\exp_args:NcnV *
\exp_args:Ncoo *
\exp_args:NcVV *
\exp_args:Nnnnc *
\exp_args:Nnno *
\exp_args:Nnnf *
\exp_args:Nnff *
\exp_args:Nooo *
\exp_args:Noof *
\exp_args:Nffo *
\exp_args:Neee *
```

---

```
\exp_args:NNNx \exp_args:NNnx <token1> <token2> {<tokens1>} {<tokens2>}
```

```
\exp_args:NNnx
\exp_args:NNox
\exp_args:Nccx
\exp_args:Ncnx
\exp_args:Nnnx
\exp_args:Nnox
\exp_args:Noox
```

---

New: 2015-08-12

---

## 5.7 Unbraced expansion

---

```
\exp_last_unbraced:No * \exp_last_unbraced:Nno <token> {<tokens1>} {<tokens2>}
\exp_last_unbraced:NV * These functions absorb the number of arguments given by their specification, carry out
\exp_last_unbraced:Nv * the expansion indicated and leave the results in the input stream, with the last argument
\exp_last_unbraced:Ne * not surrounded by the usual braces. Of these, the :Nno, :Noo, :Nfo and :NnNo variants
\exp_last_unbraced:Nf * need slower processing.
\exp_last_unbraced:NNo *
\exp_last_unbraced:NNV *
\exp_last_unbraced:NNf *
\exp_last_unbraced:Nco *
\exp_last_unbraced:Ncv *
\exp_last_unbraced:Nno *
\exp_last_unbraced:Noo *
\exp_last_unbraced:Nfo *
\exp_last_unbraced:NNNo *
\exp_last_unbraced:NNNV *
\exp_last_unbraced:NNNf *
\exp_last_unbraced:NnNo *
\exp_last_unbraced:NNNNo *
\exp_last_unbraced:NNNNf *
```

---

Updated: 2018-05-15

---

---

```
\exp_last_unbraced:Nx \exp_last_unbraced:Nx <function> {<tokens>}
```

This function fully expands the  $\langle tokens \rangle$  and leaves the result in the input stream after reinsertion of the  $\langle function \rangle$ . This function is not expandable.

---

```
\exp_last_two_unbraced:Noo * \exp_last_two_unbraced:Noo <token> {<tokens1>} {<tokens2>}
```

This function absorbs three arguments and expands the second and third once. The first argument of the function is then the next item on the input stream, followed by the expansion of the second and third arguments, which are not wrapped in braces. This function needs special (slower) processing.

---

```
\exp_after:wN * \exp_after:wN <token1> <token2>
```

Carries out a single expansion of  $\langle token_2 \rangle$  (which may consume arguments) prior to the expansion of  $\langle token_1 \rangle$ . If  $\langle token_2 \rangle$  has no expansion (for example, if it is a character) then it is left unchanged. It is important to notice that  $\langle token_1 \rangle$  may be *any* single token, including group-opening and -closing tokens ({ or }) assuming normal TeX category codes). Unless specifically required this should be avoided: expansion should be carried out using an appropriate argument specifier variant or the appropriate  $\exp_args:N\langle variant \rangle$  function.

**TeXhackers note:** This is the TeX primitive `\expandafter`.

## 5.8 Preventing expansion

Despite the fact that the following functions are all about preventing expansion, they're designed to be used in an expandable context and hence are all marked as being 'expandable' since they themselves disappear after the expansion has completed.

---

```
\exp_not:N * \exp_not:N <token>
```

Prevents expansion of the  $\langle token \rangle$  in a context where it would otherwise be expanded, for example an e-type or x-type argument or the first token in an o-type or f-type argument.

**TeXhackers note:** This is the TeX primitive `\noexpand`. It only prevents expansion. At the beginning of an f-type argument, a space  $\langle token \rangle$  is removed even if it appears as  $\exp_not:N \c_space_token$ . In an e-expanding definition ( $\cs_new:Npe$ ), a macro parameter introduces an argument even if it appears as  $\exp_not:N \# 1$ . This differs from  $\exp_not:n$ .

---

```
\exp_not:c * \exp_not:c {<tokens>}
```

Expands the  $\langle tokens \rangle$  until only characters remain, and then converts this into a control sequence. Further expansion of this control sequence is then inhibited using  $\exp_not:N$ .

---

`\exp_not:n * \exp_not:n {⟨tokens⟩}`

Prevents expansion of the  $\langle tokens \rangle$  in an **e**-type or **x**-type argument. In all other cases the  $\langle tokens \rangle$  continue to be expanded, for example in the input stream or in other types of arguments such as **c**, **f**, **v**. The argument of `\exp_not:n` *must* be surrounded by braces.

**TeXhackers note:** This is the  $\varepsilon$ -**TeX** primitive `\unexpanded`. In an **e**-expanding definition (`\cs_new:Npe`), `\exp_not:n {#1}` is equivalent to `#1` rather than to `#1`, namely it inserts the two characters `#` and `1`, and `\exp_not:n {#}` is equivalent to `#`, namely it inserts the character `#`.

---

`\exp_not:o * \exp_not:o {⟨tokens⟩}`

Expands the  $\langle tokens \rangle$  once, then prevents any further expansion in **e**-type or **x**-type arguments using `\exp_not:n`.

---

`\exp_not:V * \exp_not:V {⟨variable⟩}`

Recovers the content of the  $\langle variable \rangle$ , then prevents expansion of this material in **e**-type or **x**-type arguments using `\exp_not:n`.

---

`\exp_not:v * \exp_not:v {⟨tokens⟩}`

Expands the  $\langle tokens \rangle$  until only characters remains, and then converts this into a control sequence which should be a  $\langle variable \rangle$  name. The content of the  $\langle variable \rangle$  is recovered, and further expansion in **e**-type or **x**-type arguments is prevented using `\exp_not:n`.

---

`\exp_not:e * \exp_not:e {⟨tokens⟩}`

Expands  $\langle tokens \rangle$  exhaustively, then protects the result of the expansion (including any tokens which were not expanded) from further expansion in **e**-type or **x**-type arguments using `\exp_not:n`. This is very rarely useful but is provided for consistency.

---

`\exp_not:f * \exp_not:f {⟨tokens⟩}`

Expands  $\langle tokens \rangle$  fully until the first unexpandable token is found (if it is a space it is removed). Expansion then stops, and the result of the expansion (including any tokens which were not expanded) is protected from further expansion in **e**-type or **x**-type arguments using `\exp_not:n`.

---

`\exp_stop_f: * \foo_bar:f { ⟨tokens⟩ \exp_stop_f: {⟨more tokens⟩} }`

Updated: 2011-06-03 This function terminates an **f**-type expansion. Thus if a function `\foo_bar:f` starts an **f**-type expansion and all of  $\langle tokens \rangle$  are expandable `\exp_stop_f:` terminates the expansion of tokens even if  $\langle more tokens \rangle$  are also expandable. The function itself is an implicit space token. Inside an **e**-type or **x**-type expansion, it retains its form, but when typeset it produces the underlying space ( $\sqcup$ ).

## 5.9 Controlled expansion

The `expl3` language makes all efforts to hide the complexity of **TeX** expansion from the programmer by providing concepts that evaluate/expand arguments of functions prior to

calling the “base” functions. Thus, instead of using many `\expandafter` calls and other trickery it is usually a matter of choosing the right variant of a function to achieve a desired result.

Of course, deep down TeX is using expansion as always and there are cases where a programmer needs to control that expansion directly; typical situations are basic data manipulation tools. This section documents the functions for that level. These commands are used throughout the kernel code, but we hope that outside the kernel there will be little need to resort to them. Instead the argument manipulation methods document above should usually be sufficient.

While `\exp_after:wN` expands one token (out of order) it is sometimes necessary to expand several tokens in one go. The next set of commands provide this functionality. Be aware that it is absolutely required that the programmer has full control over the tokens to be expanded, i.e., it is not possible to use these functions to expand unknown input as part of *<expandable-tokens>* as that will break badly if unexpandable tokens are encountered in that place!

---

`\exp:w` \* `\exp:w <expandable tokens> \exp_end:`

`\exp_end:` \*  
Expands *<expandable-tokens>* until reaching `\exp_end:` at which point expansion stops.  
The full expansion of *<expandable tokens>* has to be empty. If any token in *<expandable tokens>* or any token generated by expanding the tokens therein is not expandable the expansion will end prematurely and as a result `\exp_end:` will be misinterpreted later on.<sup>3</sup>

In typical use cases the `\exp_end:` is hidden somewhere in the replacement text of *<expandable-tokens>* rather than being on the same expansion level than `\exp:w`, e.g., you may see code such as

```
\exp:w \@@_case:NnTF #1 {#2} {} {}
```

where somewhere during the expansion of `\@@_case:NnTF` the `\exp_end:` gets generated.

**TeXhackers note:** The current implementation uses `\romannumeral` hence ignores space tokens and explicit signs + and - in the expansion of the *<expandable tokens>*, but this should not be relied upon.

---

<sup>3</sup>Due to the implementation you might get the character in position 0 in the current font (typically ‘‘’’) in the output without any error message!

---

`\exp:w` \* `\exp:w <expandable-tokens> \exp_end_continue_f:w <further-tokens>`  
`\exp_end_continue_f:w` \* Expands *<expandable-tokens>* until reaching `\exp_end_continue_f:w` at which point expansion continues as an f-type expansion expanding *<further-tokens>* until an unexpandable token is encountered (or the f-type expansion is explicitly terminated by `\exp_stop_f:`). As with all f-type expansions a space ending the expansion gets removed.

---

New: 2015-08-23

The full expansion of *<expandable-tokens>* has to be empty. If any token in *<expandable-tokens>* or any token generated by expanding the tokens therein is not expandable the expansion will end prematurely and as a result `\exp_end_continue_f:w` will be misinterpreted later on.<sup>4</sup>

In typical use cases *<expandable-tokens>* contains no tokens at all, e.g., you will see code such as

```
\exp_after:wN { \exp:w \exp_end_continue_f:w #2 }
```

where the `\exp_after:wN` triggers an f-expansion of the tokens in `#2`. For technical reasons this has to happen using two tokens (if they would be hidden inside another command `\exp_after:wN` would only expand the command but not trigger any additional f-expansion).

You might wonder why there are two different approaches available, after all the effect of

```
\exp:w <expandable-tokens> \exp_end:
```

can be alternatively achieved through an f-type expansion by using `\exp_stop_f:`, i.e.

```
\exp:w \exp_end_continue_f:w <expandable-tokens> \exp_stop_f:
```

The reason is simply that the first approach is slightly faster (one less token to parse and less expansion internally) so in places where such performance really matters and where we want to explicitly stop the expansion at a defined point the first form is preferable.

---

`\exp:w` \* `\exp:w <expandable-tokens> \exp_end_continue_f:nw <further-tokens>`  
`\exp_end_continue_f:nw` \* The difference to `\exp_end_continue_f:w` is that we first we pick up an argument which is then returned to the input stream. If *<further-tokens>* starts with space tokens then these space tokens are removed while searching for the argument. If it starts with a brace group then the braces are removed. Thus such spaces or braces will not terminate the f-type expansion.

---

<sup>4</sup>In this particular case you may get a character into the output as well as an error message.

## 5.10 Internal functions

---

```
\:::n \cs_new:Npn \exp_args:Ncof { ::c ::o ::f ::: }
```

\:::N Internal forms for the base expansion types. These names do *not* conform to the general L<sup>A</sup>T<sub>E</sub>X3 approach as this makes them more readily visible in the log and so forth. They \:::o should not be used outside this module.

```
\:::e
```

```
\:::f
```

```
\:::x
```

```
\:::v
```

```
\:::V
```

```
\:::
```

---

```
\:::o_unbraced \cs_new:Npn \exp_last_unbraced:Nno { ::n ::o_unbraced ::: }
```

\:::e\_unbraced Internal forms for the expansion types which leave the terminal argument unbraced.

\:::f\_unbraced These names do *not* conform to the general L<sup>A</sup>T<sub>E</sub>X3 approach as this makes them more readily visible in the log and so forth. They should not be used outside this module.

```
\:::v_unbraced
```

```
\:::V_unbraced
```

# Chapter 6

## The `l3sort` module

### Sorting functions

#### 6.1 Controlling sorting

L<sup>A</sup>T<sub>E</sub>X3 comes with a facility to sort list variables (sequences, token lists, or comma-lists) according to some user-defined comparison. For instance,

```
\clist_set:Nn \l_foo_clist { 3 , 01 , -2 , 5 , +1 }
\clist_sort:Nn \l_foo_clist
{
    \int_compare:nNnTF { #1 } > { #2 }
        { \sort_return_swapped: }
        { \sort_return_same: }
}
```

results in `\l_foo_clist` holding the values `{ -2 , 01 , +1 , 3 , 5 }` sorted in non-decreasing order.

The code defining the comparison should call `\sort_return_swapped:` if the two items given as `#1` and `#2` are not in the correct order, and otherwise it should call `\sort_return_same:` to indicate that the order of this pair of items should not be changed.

For instance, a `<comparison code>` consisting only of `\sort_return_same:` with no test yields a trivial sort: the final order is identical to the original order. Conversely, using a `<comparison code>` consisting only of `\sort_return_swapped:` reverses the list (in a fairly inefficient way).

**TeXhackers note:** The current implementation is limited to sorting approximately 20000 items (40000 in LuaT<sub>E</sub>X), depending on what other packages are loaded.

Internally, the code from `l3sort` stores items in `\toks` registers allocated locally. Thus, the `<comparison code>` should not call `\newtoks` or other commands that allocate new `\toks` registers. On the other hand, altering the value of a previously allocated `\toks` register is not a problem.

---

```
\sort_return_same: \seq_sort:Nn seq var
\sort_return_swapped: { ... \sort_return_same: or \sort_return_swapped: ... }
```

---

New: 2017-02-06 Indicates whether to keep the order or swap the order of two items that are compared in the sorting code. Only one of the `\sort_return_...` functions should be used by the code, according to the results of some tests on the items #1 and #2 to be compared.

## Chapter 7

# The l3tl-analysis module

## Analysing token lists

This module provides functions that are particularly useful in the l3regex module for mapping through a token list one  $\langle token \rangle$  at a time (including begin-group/end-group tokens). For `\tl_analysis_map_inline:Nn` or `\tl_analysis_map_inline:nn`, the token list is given as an argument; the analogous function `\peek_analysis_map_inline:n` documented in l3token finds tokens in the input stream instead. In both cases the user provides  $\langle inline\ code \rangle$  that receives three arguments for each  $\langle token \rangle$ :

- $\langle tokens \rangle$ , which both o-expand and e/x-expand to the  $\langle token \rangle$ . The detailed form of  $\langle tokens \rangle$  may change in later releases.
- $\langle char\ code \rangle$ , a decimal representation of the character code of the  $\langle token \rangle$ , -1 if it is a control sequence.
- $\langle catcode \rangle$ , a capital hexadecimal digit which denotes the category code of the  $\langle token \rangle$  (0: control sequence, 1: begin-group, 2: end-group, 3: math shift, 4: alignment tab, 6: parameter, 7: superscript, 8: subscript, A: space, B: letter, C: other, D: active). This can be converted to an integer by writing " $\langle catcode \rangle$ ".

In addition, there is a debugging function `\tl_analysis_show:n`, very similar to the `\ShowTokens` macro from the ted package.

---

`\tl_analysis_show:N` `\tl_analysis_show:n`  $\{ \langle token\ list \rangle \}$   
`\tl_analysis_show:n` `\tl_analysis_log:n`  $\{ \langle token\ list \rangle \}$

`\tl_analysis_log:N` `\tl_analysis_log:n` Displays to the terminal (or log) the detailed decomposition of the  $\langle token\ list \rangle$  into tokens, showing the category code of each character token, the meaning of control sequences and active characters, and the value of registers.

---

`\tl_analysis_map_inline:nn` `\tl_analysis_map_inline:nn`  $\{ \langle token\ list \rangle \} \{ \langle inline\ function \rangle \}$

`\tl_analysis_map_inline:Nn` Applies the  $\langle inline\ function \rangle$  to each individual  $\langle token \rangle$  in the  $\langle token\ list \rangle$ . The  $\langle inline\ function \rangle$  receives three arguments as explained above. As all other mappings the mapping is done at the current group level, i.e. any local assignments made by the  $\langle inline\ function \rangle$  remain in effect after the loop.

## Chapter 8

# The `\3regex` module Regular expressions in `TEX`

The `\3regex` module provides regular expression testing, extraction of submatches, splitting, and replacement, all acting on token lists. The syntax of regular expressions is mostly a subset of the PCRE syntax (and very close to POSIX), with some additions due to the fact that `TEX` manipulates tokens rather than characters. For performance reasons, only a limited set of features are implemented. Notably, back-references are not supported.

Let us give a few examples. After

```
\tl_set:Nn \l_my_tl { That~cat. }
\regex_replace_once:nnN { at } { is } \l_my_tl
```

the token list variable `\l_my_tl` holds the text “This cat.”, where the first occurrence of “at” was replaced by “is”. A more complicated example is a pattern to emphasize each word and add a comma after it:

```
\regex_replace_all:nnN { \w+ } { \c{emph}\cB{\0 }\cE\, } \l_my_tl
```

The `\w` sequence represents any “word” character, and `+` indicates that the `\w` sequence should be repeated as many times as possible (at least once), hence matching a word in the input token list. In the replacement text, `\0` denotes the full match (here, a word). The command `\emph` is inserted using `\c{emph}`, and its argument `\0` is put between braces `\cB\{` and `\cE\}`.

If a regular expression is to be used several times, it can be compiled once, and stored in a regex variable using `\regex_set:Nn`. For example,

```
\regex_new:N \l_foo_regex
\regex_set:Nn \l_foo_regex { \c{begin} \cB. (\c[^BE].*) \cE. }
```

stores in `\l_foo_regex` a regular expression which matches the starting marker for an environment: `\begin`, followed by a begin-group token (`\cB.`), then any number of tokens which are neither begin-group nor end-group character tokens (`\c[^BE].*`), ending with an end-group token (`\cE.`). As explained in the next section, the parentheses “capture” the result of `\c[^BE].*`, giving us access to the name of the environment when doing replacements.

## 8.1 Syntax of regular expressions

### 8.1.1 Regular expression examples

We start with a few examples, and encourage the reader to apply `\regex_show:n` to these regular expressions.

- `Cat` matches the word “Cat” capitalized in this way, but also matches the beginning of the word “Cattle”: use `\bCat\b` to match a complete word only.
- `[abc]` matches one letter among “a”, “b”, “c”; the pattern `(a|b|c)` matches the same three possible letters (but see the discussion of submatches below).
- `[A-Za-z]*` matches any number (due to the quantifier `*`) of Latin letters (not accented).
- `\c{[A-Za-z]*}` matches a control sequence made of Latin letters.
- `\_[^\_]*\_` matches an underscore, any number of characters other than underscore, and another underscore; it is equivalent to `\_.*?\_` where `.` matches arbitrary characters and the lazy quantifier `*?` means to match as few characters as possible, thus avoiding matching underscores.
- `[\+\\-]?\d+` matches an explicit integer with at most one sign.
- `[\+\\-\\_]*\d+\_*` matches an explicit integer with any number of `+` and `-` signs, with spaces allowed except within the mantissa, and surrounded by spaces.
- `[\+\\-\\_]*(\d+|\d*\.\d+)\_*` matches an explicit integer or decimal number; using `[.,]` instead of `\.` would allow the comma as a decimal marker.
- `[\+\\-\\_]*(\d+|\d*\.\d+)\_*((?i)pt|in|[cm]m|ex|[bs]p|[dn]d|[pcn]c)\_*` matches an explicit dimension with any unit that `TeX` knows, where `(?i)` means to treat lowercase and uppercase letters identically.
- `[\+\\-\\_]*((?i)nan|inf|(\d+|\d*\.\d+)(\_*e[\+\\-\\_]*\d+)?)\_*` matches an explicit floating point number or the special values `nan` and `inf` (with signs and spaces allowed).
- `[\+\\-\\_]*(\d+|\c{C.})\_*` matches an explicit integer or control sequence (without checking whether it is an integer variable).
- `\G.*?\K` at the beginning of a regular expression matches and discards (due to `\K`) everything between the end of the previous match (`\G`) and what is matched by the rest of the regular expression; this is useful in `\regex_replace_all:nnN` when the goal is to extract matches or submatches in a finer way than with `\regex_extract_all:nnN`.

While it is impossible for a regular expression to match only integer expressions, `[\+\\-\\_]*\d+\_*(\[\+\\-*\]/[\+\\-\\_]*\d+\_*)*` matches among other things all valid integer expressions (made only with explicit integers). One should follow it with further testing.

### 8.1.2 Characters in regular expressions

Most characters match exactly themselves, with an arbitrary category code. Some characters are special and must be escaped with a backslash (*e.g.*, `\*` matches a star character). Some escape sequences of the form backslash–letter also have a special meaning (for instance `\d` matches any digit). As a rule,

- every alphanumeric character (`A–Z`, `a–z`, `0–9`) matches exactly itself, and should not be escaped, because `\A`, `\B`, ... have special meanings;
- non-alphanumeric printable ascii characters can (and should) always be escaped: many of them have special meanings (*e.g.*, use `\(`, `\)`, `\?`, `\.`, `\^`);
- spaces should always be escaped (even in character classes);
- any other character may be escaped or not, without any effect: both versions match exactly that character.

Note that these rules play nicely with the fact that many non-alphanumeric characters are difficult to input into TeX under normal category codes. For instance, `\abc\%` matches the characters `\abc%` (with arbitrary category codes), but does not match the control sequence `\abc` followed by a percent character. Matching control sequences can be done using the `\c{\langle regex\rangle}` syntax (see below).

Any special character which appears at a place where its special behaviour cannot apply matches itself instead (for instance, a quantifier appearing at the beginning of a string), after raising a warning.

Characters.

`\x{hh...}` Character with hex code `hh...`

`\xhh` Character with hex code `hh`.

`\a` Alarm (hex 07).

`\e` Escape (hex 1B).

`\f` Form-feed (hex 0C).

`\n` New line (hex 0A).

`\r` Carriage return (hex 0D).

`\t` Horizontal tab (hex 09).

### 8.1.3 Characters classes

Character properties.

. A single period matches any token.

`\d` Any decimal digit.

`\h` Any horizontal space character, equivalent to `[\ \^\^I]`: space and tab.

`\s` Any space character, equivalent to `[\ \^\^I\^\^J\^\^L\^\^M]`.

\v Any vertical space character, equivalent to `[\^J\^K\^L\^M]`. Note that `\^K` is a vertical space, but not a space, for compatibility with Perl.

\w Any word character, *i.e.*, alphanumerics and underscore, equivalent to the explicit class `[A-Za-z0-9\_]`.

\D Any token not matched by \d.

\H Any token not matched by \h.

\N Any token other than the \n character (hex 0A).

\S Any token not matched by \s.

\V Any token not matched by \v.

\W Any token not matched by \w.

Of those, ., \D, \H, \N, \S, \V, and \W match arbitrary control sequences.

Character classes match exactly one token in the subject.

[...] Positive character class. Matches any of the specified tokens.

[^...] Negative character class. Matches any token other than the specified characters.

[x-y] Within a character class, this denotes a range (can be used with escaped characters).

[:(name):] Within a character class (one more set of brackets), this denotes the POSIX character class `<name>`, which can be `alnum`, `alpha`, `ascii`, `blank`, `cntrl`, `digit`, `graph`, `lower`, `print`, `punct`, `space`, `upper`, `word`, or `xdigit`.

[:^(name):] Negative POSIX character class.

For instance, `[a-oq-z\cC.]` matches any lowercase latin letter except p, as well as control sequences (see below for a description of \c).

In character classes, only [, ^, -, ], \ and spaces are special, and should be escaped. Other non-alphanumeric characters can still be escaped without harm. Any escape sequence which matches a single character (\d, \D, etc.) is supported in character classes. If the first character is ^, then the meaning of the character class is inverted; ^ appearing anywhere else in the range is not special. If the first character (possibly following a leading ^) is ] then it does not need to be escaped since ending the range there would make it empty. Ranges of characters can be expressed using -, for instance, [\D 0-5] and [^6-9] are equivalent.

#### 8.1.4 Structure: alternatives, groups, repetitions

Quantifiers (repetition).

? 0 or 1, greedy.

?? 0 or 1, lazy.

\* 0 or more, greedy.

\*? 0 or more, lazy.

+ 1 or more, greedy.

$+?$  1 or more, lazy.

$\{n\}$  Exactly  $n$ .

$\{n,\}$   $n$  or more, greedy.

$\{n,\}?$   $n$  or more, lazy.

$\{n,m\}$  At least  $n$ , no more than  $m$ , greedy.

$\{n,m\}?$  At least  $n$ , no more than  $m$ , lazy.

For greedy quantifiers the regex code will first investigate matches that involve as many repetitions as possible, while for lazy quantifiers it investigates matches with as few repetitions as possible first.

Alternation and capturing groups.

$A|B|C$  Either one of A, B, or C, investigating A first.

$(\dots)$  Capturing group.

$(?:\dots)$  Non-capturing group.

$(?| \dots)$  Non-capturing group which resets the group number for capturing groups in each alternative. The following group is numbered with the first unused group number.

Capturing groups are a means of extracting information about the match. Parenthesized groups are labelled in the order of their opening parenthesis, starting at 1. The contents of those groups corresponding to the “best” match (leftmost longest) can be extracted and stored in a sequence of token lists using for instance `\regex_extract_once:nnNTF`.

The `\K` escape sequence resets the beginning of the match to the current position in the token list. This only affects what is reported as the full match. For instance,

```
\regex_extract_all:nnN { a \K . } { a123aaxyz } \l_foo_seq
```

results in `\l_foo_seq` containing the items `{1}` and `{a}`: the true matches are `{a1}` and `{aa}`, but they are trimmed by the use of `\K`. The `\K` command does not affect capturing groups: for instance,

```
\regex_extract_once:nnN { (. \K c)+ \d } { acbc3 } \l_foo_seq
```

results in `\l_foo_seq` containing the items `{c3}` and `{bc}`: the true match is `{acbc3}`, with first submatch `{bc}`, but `\K` resets the beginning of the match to the last position where it appears.

### 8.1.5 Matching exact tokens

The `\c` escape sequence allows to test the category code of tokens, and match control sequences. Each character category is represented by a single uppercase letter:

- `C` for control sequences;
- `B` for begin-group tokens;
- `E` for end-group tokens;

- M for math shift;
- T for alignment tab tokens;
- P for macro parameter tokens;
- U for superscript tokens (up);
- D for subscript tokens (down);
- S for spaces;
- L for letters;
- O for others; and
- A for active characters.

The `\c` escape sequence is used as follows.

`\c{<regex>}` A control sequence whose csname matches the `<regex>`, anchored at the beginning and end, so that `\c{begin}` matches exactly `\begin`, and nothing else.

`\cX` Applies to the next object, which can be a character, escape character sequence such as `\x{0A}`, character class, or group, and forces this object to only match tokens with category X (any of CBEMTPUDSLOA). For instance, `\cL[A-Z\d]` matches uppercase letters and digits of category code letter, `\cC.` matches any control sequence, and `\cO(abc)` matches abc where each character has category other.<sup>5</sup>

`\c[XYZ]` Applies to the next object, and forces it to only match tokens with category X, Y, or Z (each being any of CBEMTPUDSLOA). For instance, `\c[LSO](..)` matches two tokens of category letter, space, or other.

`\c[^XYZ]` Applies to the next object and prevents it from matching any token with category X, Y, or Z (each being any of CBEMTPUDSLOA). For instance, `\c[^O]\d` matches digits which have any category different from other.

The category code tests can be used inside classes; for instance, `[\cO\d \c[LO][A-F]]` matches what TeX considers as hexadecimal digits, namely digits with category other, or uppercase letters from A to F with category either letter or other. Within a group affected by a category code test, the outer test can be overridden by a nested test: for instance, `\cL(ab\cO*cd)` matches ab\*cd where all characters are of category letter, except \* which has category other.

The `\u` escape sequence allows to insert the contents of a token list directly into a regular expression or a replacement, avoiding the need to escape special characters. Namely, `\u{<var name>}` matches the exact contents (both character codes and category codes) of the variable `\<var name>`, which are obtained by applying `\exp_not:v {<var name>}` at the time the regular expression is compiled. Within a `\c{...}` control sequence matching, the `\u` escape sequence only expands its argument once, in effect performing `\t1_to_str:v`. Quantifiers are supported.

The `\ur` escape sequence allows to insert the contents of a `regex` variable into a larger regular expression. For instance, `A\ur{l_tmpa_regex}D` matches the tokens A and

---

<sup>5</sup>This last example also captures “abc” as a regex group; to avoid this use a non-capturing group `\cO(?:abc)`.

D separated by something that matches the regular expression `\l_tmpa_regex`. This behaves as if a non-capturing group were surrounding `\l_tmpa_regex`, and any group contained in `\l_tmpa_regex` is converted to a non-capturing group. Quantifiers are supported.

For instance, if `\l_tmpa_regex` has value `B|C`, then `A\ur{\l_tmpa_regex}D` is equivalent to `A(?:B|C)D` (matching `ABD` or `ACD`) and not to `AB|CD` (matching `AB` or `CD`). To get the latter effect, it is simplest to use TeX's expansion machinery directly: if `\l_mymodule_BC_t1` contains `B|C` then the following two lines show the same result:

```
\regex_show:n { A \u{l_mymodule_BC_t1} D }
\regex_show:n { A B | C D }
```

### 8.1.6 Miscellaneous

Anchors and simple assertions.

`\b` Word boundary: either the previous token is matched by `\w` and the next by `\W`, or the opposite. For this purpose, the ends of the token list are considered as `\W`.

`\B` Not a word boundary: between two `\w` tokens or two `\W` tokens (including the boundary).

`^` or `\A` Start of the subject token list.

`$`, `\Z` or `\z` End of the subject token list.

`\G` Start of the current match. This is only different from `^` in the case of multiple matches: for instance `\regex_count:nnN { \G a } { aaba } \l_tmpa_int` yields 2, but replacing `\G` by `^` would result in `\l_tmpa_int` holding the value 1.

The option `(?i)` makes the match case insensitive (treating `A-Z` and `a-z` as equivalent, with no support yet for Unicode case changing). This applies until the end of the group in which it appears, and can be reverted using `(?-i)`. For instance, in `(?i)(a(?-i)b|c)d`, the letters `a` and `d` are affected by the `i` option. Characters within ranges and classes are affected individually: `(?i)[\?-B]` is equivalent to `[\?@ABab]` (and differs from the much larger class `[\?-b]`), and `(?i)[^aeiou]` matches any character which is not a vowel. The `i` option has no effect on `\c{...}`, on `\u{...}`, on character properties, or on character classes, for instance it has no effect at all in `(?i)\u{l_foo_t1}\d\d[:lower:]`.

## 8.2 Syntax of the replacement text

Most of the features described in regular expressions do not make sense within the replacement text. Backslash introduces various special constructions, described further below:

- `\0` is the whole match;
- `\1` is the submatch that was matched by the first (capturing) group `(...)`; similarly for `\2, ..., \9` and `\g{<number>}`;
- `\u` inserts a space (spaces are ignored when not escaped);

- `\a`, `\e`, `\f`, `\n`, `\r`, `\t`, `\x{hhh}` correspond to single characters as in regular expressions;
- `\c{(cs name)}` inserts a control sequence;
- `\c{category}{character}` (see below);
- `\u{(tl var name)}` inserts the contents of the `{tl var}` (see below).

Characters other than backslash and space are simply inserted in the result (but since the replacement text is first converted to a string, one should also escape characters that are special for T<sub>E</sub>X, for instance use `\#`). Non-alphanumeric characters can always be safely escaped with a backslash.

For instance,

```
\tl_set:Nn \l_my_t1 { Hello,\~world! }
\regex_replace_all:nnN { ([er]?1|o) . } { (\O--\1) } \l_my_t1
```

results in `\l_my_t1` holding `H(e11--e1)(o,--o) w(or--o)(1d--1)`.

The submatches are numbered according to the order in which the opening parenthesis of capturing groups appear in the regular expression to match. The  $n$ -th submatch is empty if there are fewer than  $n$  capturing groups or for capturing groups that appear in alternatives that were not used for the match. In case a capturing group matches several times during a match (due to quantifiers) only the last match is used in the replacement text. Submatches always keep the same category codes as in the original token list.

By default, the category code of characters inserted by the replacement are determined by the prevailing category code regime at the time where the replacement is made, with two exceptions:

- space characters (with character code 32) inserted with `\u` or `\x20` or `\x{20}` have category code 10 regardless of the prevailing category code regime;
- if the category code would be 0 (escape), 5 (newline), 9 (ignore), 14 (comment) or 15 (invalid), it is replaced by 12 (other) instead.

The escape sequence `\c` allows to insert characters with arbitrary category codes, as well as control sequences.

`\cX(...)` Produces the characters “...” with category `X`, which must be one of CBEMTPUDSLOA as in regular expressions. Parentheses are optional for a single character (which can be an escape sequence). When nested, the innermost category code applies, for instance `\cL(Hello\cS\ world)`! gives this text with standard category codes.

`\c{(text)}` Produces the control sequence with csname `(text)`. The `(text)` may contain references to the submatches `\0`, `\1`, and so on, as in the example for `\u` below.

The escape sequence `\u{(var name)}` allows to insert the contents of the variable with name `(var name)` directly into the replacement, giving an easier control of category codes. When nested in `\c{...}` and `\u{...}` constructions, the `\u` and `\c` escape sequences perform `\tl_to_str:v`, namely extract the value of the control sequence and turn it into a string. Matches can also be used within the arguments of `\c` and `\u`. For instance,

```
\tl_set:Nn \l_my_one_t1 { first }
\tl_set:Nn \l_my_two_t1 { \emph{second} }
\tl_set:Nn \l_my_t1 { one , two , one , one }
\regex_replace_all:nnN { [^,]+ } { \u{\l_my_\0_t1} } \l_my_t1
```

results in `\l_my_t1` holding `first,\emph{second},first,first`.

Regex replacement is also a convenient way to produce token lists with arbitrary category codes. For instance

```
\tl_clear:N \l_tmpa_tl  
\regex_replace_all:nnN { } { \cU\% \cA\~ } \l_tmpa_tl
```

results in `\l_tmpa_tl` containing the percent character with category code 7 (superscript) and an active tilde character.

## 8.3 Pre-compiling regular expressions

If a regular expression is to be used several times, it is better to compile it once rather than doing it each time the regular expression is used. The compiled regular expression is stored in a variable. All of the `\l3regex` module's functions can be given their regular expression argument either as an explicit string or as a compiled regular expression.

---

```
\regex_new:N \regex_new:N <regex var>
```

New: 2017-05-26 Creates a new `<regex var>` or raises an error if the name is already taken. The declaration is global. The `<regex var>` is initially such that it never matches.

---

```
\regex_set:Nn \regex_set:Nn <regex var> {<regex>}
```

New: 2017-05-26 Stores a compiled version of the `<regular expression>` in the `<regex var>`. The assignment is local for `\regex_set:Nn` and global for `\regex_gset:Nn`. For instance, this function can be used as

```
\regex_new:N \l_my_regex  
\regex_set:Nn \l_my_regex { my\ (simple\ )? reg(ex|ular\ expression) }
```

---

```
\regex_const:Nn \regex_const:Nn <regex var> {<regex>}
```

New: 2017-05-26 Creates a new constant `<regex var>` or raises an error if the name is already taken. The value of the `<regex var>` is set globally to the compiled version of the `<regular expression>`.

---

```
\regex_show:N \regex_show:n {<regex>}  
\regex_show:n \regex_log:n {<regex>}
```

New: 2021-04-26 Updated: 2021-04-29 Displays in the terminal or writes in the log file (respectively) how `\l3regex` interprets the `<regex>`. For instance, `\regex_show:n {\A X|Y}` shows

```
+--branch  
    anchor at start (\A)  
    char code 88 (X)  
+--branch  
    char code 89 (Y)
```

indicating that the anchor `\A` only applies to the first branch: the second branch is not anchored to the beginning of the match.

## 8.4 Matching

All regular expression functions are available in both :n and :N variants. The former require a “standard” regular expression, while the later require a compiled expression as generated by \regex\_set:Nn.

---

\regex\_match:nnTF \regex\_match:nnTF {⟨regex⟩} {⟨token list⟩} {⟨true code⟩} {⟨false code⟩}

\regex\_match:nVTF Tests whether the ⟨regular expression⟩ matches any part of the ⟨token list⟩. For instance,

\regex\_match:NnTF \regex\_match:nnTF { b [cde]\* } { abecdex } { TRUE } { FALSE }

\regex\_match:NVTF \regex\_match:nnTF { [b-dq-w] } { example } { TRUE } { FALSE }

---

New: 2017-05-26

leaves TRUE then FALSE in the input stream.

---

\regex\_count:nnN \regex\_count:nnN {⟨regex⟩} {⟨token list⟩} ⟨int var⟩

Sets ⟨int var⟩ within the current T<sub>E</sub>X group level equal to the number of times ⟨regular expression⟩ appears in ⟨token list⟩. The search starts by finding the left-most longest match, respecting greedy and lazy (non-greedy) operators. Then the search starts again from the character following the last character of the previous match, until reaching the end of the token list. Infinite loops are prevented in the case where the regular expression can match an empty token list: then we count one match between each pair of characters. For instance,

```
\int_new:N \l_foo_int
\regex_count:nnN { (b+|c) } { abbababcbb } \l_foo_int
```

results in \l\_foo\_int taking the value 5.

---

\regex\_match\_case:nn \regex\_match\_case:nnTF

---

New: 2022-01-10

```
{ {⟨regex1⟩} {⟨code case1⟩}
 {⟨regex2⟩} {⟨code case2⟩}
 ...
 {⟨regexn⟩} {⟨code casen⟩}
 } {⟨token list⟩}
 {⟨true code⟩} {⟨false code⟩}
```

Determines which of the ⟨regular expressions⟩ matches at the earliest point in the ⟨token list⟩, and leaves the corresponding ⟨code<sub>i</sub>⟩ followed by the ⟨true code⟩ in the input stream. If several ⟨regex⟩ match starting at the same point, then the first one in the list is selected and the others are discarded. If none of the ⟨regex⟩ match, the ⟨false code⟩ is left in the input stream. Each ⟨regex⟩ can either be given as a regex variable or as an explicit regular expression.

In detail, for each starting position in the ⟨token list⟩, each of the ⟨regex⟩ is searched in turn. If one of them matches then the corresponding ⟨code⟩ is used and everything else is discarded, while if none of the ⟨regex⟩ match at a given position then the next starting position is attempted. If none of the ⟨regex⟩ match anywhere in the ⟨token list⟩ then nothing is left in the input stream. Note that this differs from nested \regex\_match:nnTF statements since all ⟨regex⟩ are attempted at each position rather than attempting to match ⟨regex<sub>1</sub>⟩ at every position before moving on to ⟨regex<sub>2</sub>⟩.

## 8.5 Submatch extraction

<code>\regex_extract_once:nnN</code>	<code>\regex_extract_once:nnN {⟨regex⟩} {⟨token list⟩} {seq var}</code>
<code>\regex_extract_once:nVN</code>	<code>\regex_extract_once:nnNTF {⟨regex⟩} {⟨token list⟩} {seq var} {⟨true code⟩} {⟨false code⟩}</code>
<code>\regex_extract_once:nnNTF</code>	
<code>\regex_extract_once:nVNTF</code>	Finds the first match of the <i>regular expression</i> in the <i>token list</i> . If it exists, the match is stored as the first item of the <i>seq var</i> , and further items are the contents of capturing groups, in the order of their opening parenthesis. The <i>seq var</i> is assigned locally. If there is no match, the <i>seq var</i> is cleared. The testing versions insert the <i>true code</i> into the input stream if a match was found, and the <i>false code</i> otherwise.
<code>\regex_extract_once:NnN</code>	
<code>\regex_extract_once:NVN</code>	
<code>\regex_extract_once:NnNTF</code>	
<code>\regex_extract_once:NVNTF</code>	

New: 2017-05-26

For instance, assume that you type

```
\regex_extract_once:nnNTF { \A(La)?TeX(!*)\Z } { LaTeX!!! } \l_foo_seq
{ true } { false }
```

Then the regular expression (anchored at the start with `\A` and at the end with `\Z`) must match the whole token list. The first capturing group, `(La)?`, matches `La`, and the second capturing group, `(!*)`, matches `!!!`. Thus, `\l_foo_seq` contains as a result the items `{LaTeX!!!}`, `{La}`, and `{!!!}`, and the `true` branch is left in the input stream. Note that the *n*-th item of `\l_foo_seq`, as obtained using `\seq_item:Nn`, correspond to the submatch numbered  $(n - 1)$  in functions such as `\regex_replace_once:nnN`.

<code>\regex_extract_all:nnN</code>	<code>\regex_extract_all:nnN {⟨regex⟩} {⟨token list⟩} {seq var}</code>
<code>\regex_extract_all:nVN</code>	<code>\regex_extract_all:nnNTF {⟨regex⟩} {⟨token list⟩} {seq var} {⟨true code⟩} {⟨false code⟩}</code>
<code>\regex_extract_all:nnNTF</code>	
<code>\regex_extract_all:nVNTF</code>	Finds all matches of the <i>regular expression</i> in the <i>token list</i> , and stores all the submatch information in a single sequence (concatenating the results of multiple <code>\regex_extract_once:nnN</code> calls). The <i>seq var</i> is assigned locally. If there is no match, the <i>seq var</i> is cleared. The testing versions insert the <i>true code</i> into the input stream if a match was found, and the <i>false code</i> otherwise. For instance, assume that you type
<code>\regex_extract_all:NnN</code>	
<code>\regex_extract_all:NVN</code>	
<code>\regex_extract_all:NnNTF</code>	
<code>\regex_extract_all:NVNTF</code>	

New: 2017-05-26

```
\regex_extract_all:nnNTF { \w+ } { Hello,~world! } \l_foo_seq
{ true } { false }
```

Then the regular expression matches twice, the resulting sequence contains the two items `{Hello}` and `{world}`, and the `true` branch is left in the input stream.

---

<code>\regex_split:nnN</code> <code>\regex_split:nVN</code> <code>\regex_split:nnNTF</code> <code>\regex_split:nVNNTF</code> <code>\regex_split:Nnn</code> <code>\regex_split:NVN</code> <code>\regex_split:NnNTF</code> <code>\regex_split:NVNTF</code>	<code>\regex_split:nnN {&lt;regular expression&gt;} {&lt;token list&gt;} &lt;seq var&gt;</code> <code>\regex_split:nnNTF {&lt;regular expression&gt;} {&lt;token list&gt;} &lt;seq var&gt; {&lt;true code&gt;}</code> <code>{&lt;false code&gt;}</code>
---	---

`\regex_split:nVNNTF` Splits the `<token list>` into a sequence of parts, delimited by matches of the `<regular expression>`. If the `<regular expression>` has capturing groups, then the token lists that they match are stored as items of the sequence as well. The assignment to `<seq var>` is local. If no match is found the resulting `<seq var>` has the `<token list>` as its sole item. If the `<regular expression>` matches the empty token list, then the `<token list>` is split into single tokens. The testing versions insert the `<true code>` into the input stream if a match was found, and the `<false code>` otherwise. For example, after

New: 2017-05-26

```
\seq_new:N \l_path_seq
\regex_split:nnNTF { / } { the/path/for/this/file.tex } \l_path_seq
{ true } { false }
```

the sequence `\l_path_seq` contains the items `{the}`, `{path}`, `{for}`, `{this}`, and `{file.tex}`, and the `true` branch is left in the input stream.

## 8.6 Replacement

---

<code>\regex_replace_once:nnN</code> <code>\regex_replace_once:nVN</code> <code>\regex_replace_once:nnNTF</code> <code>\regex_replace_once:nVNNTF</code> <code>\regex_replace_once:Nnn</code> <code>\regex_replace_once:NVN</code> <code>\regex_replace_once:NnNTF</code> <code>\regex_replace_once:NVNTF</code>	<code>\regex_replace_once:nnN {&lt;regular expression&gt;} {&lt;replacement&gt;} &lt;tl var&gt;</code> <code>\regex_replace_once:nnNTF {&lt;regular expression&gt;} {&lt;replacement&gt;} &lt;tl var&gt; {&lt;true code&gt;}</code> <code>{&lt;false code&gt;}</code>
---	---

`\regex_replace_once:nVNNTF` Searches for the `<regular expression>` in the contents of the `<tl var>` and replaces the first match with the `<replacement>`. In the `<replacement>`, `\0` represents the full match, `\1` represent the contents of the first capturing group, `\2` of the second, *etc.* The result is assigned locally to `<tl var>`.

New: 2017-05-26

---

<code>\regex_replace_all:nnN</code> <code>\regex_replace_all:nVN</code> <code>\regex_replace_all:nnNTF</code> <code>\regex_replace_all:nVNNTF</code> <code>\regex_replace_all:Nnn</code> <code>\regex_replace_all:NVN</code> <code>\regex_replace_all:NnNTF</code> <code>\regex_replace_all:NVNTF</code>	<code>\regex_replace_all:nnN {&lt;regular expression&gt;} {&lt;replacement&gt;} &lt;tl var&gt;</code> <code>\regex_replace_all:nnNTF {&lt;regular expression&gt;} {&lt;replacement&gt;} &lt;tl var&gt; {&lt;true code&gt;}</code> <code>{&lt;false code&gt;}</code>
---	---

`\regex_replace_all:nVNNTF` Replaces all occurrences of the `<regular expression>` in the contents of the `<tl var>` by the `<replacement>`, where `\0` represents the full match, `\1` represent the contents of the first capturing group, `\2` of the second, *etc.* Every match is treated independently, and matches cannot overlap. The result is assigned locally to `<tl var>`.

New: 2017-05-26

---

```
\regex_replace_case_once:nN  \regex_replace_case_once:nNTF
\regex_replace_case_once:nNTF {
  New: 2022-01-10
  {<regex1>} {<replacement1>}
  {<regex2>} {<replacement2>}
  ...
  {<regexn>} {<replacementn>}
} <tl var>
{<true code>} {<false code>}
```

---

Replaces the earliest match of the regular expression  $(?|<regex_1>|\dots|<regex_n>)$  in the  $\langle token\ list\ variable\rangle$  by the  $\langle replacement\rangle$  corresponding to which  $\langle regex_i\rangle$  matched, then leaves the  $\langle true\ code\rangle$  in the input stream. If none of the  $\langle regex\rangle$  match, then the  $\langle tl\ var\rangle$  is not modified, and the  $\langle false\ code\rangle$  is left in the input stream. Each  $\langle regex\rangle$  can either be given as a regex variable or as an explicit regular expression.

In detail, for each starting position in the  $\langle token\ list\rangle$ , each of the  $\langle regex\rangle$  is searched in turn. If one of them matches then it is replaced by the corresponding  $\langle replacement\rangle$  as described for  $\backslash\text{regex\_replace\_once:nnN}$ . This is equivalent to checking with  $\backslash\text{regex\_match\_case:nn}$  which  $\langle regex\rangle$  matches, then performing the replacement with  $\backslash\text{regex\_replace\_once:nnN}$ .

---

```
\regex_replace_case_all:nN  \regex_replace_case_all:nNTF
\regex_replace_case_all:nNTF {
  New: 2022-01-10
  {<regex1>} {<replacement1>}
  {<regex2>} {<replacement2>}
  ...
  {<regexn>} {<replacementn>}
} <tl var>
{<true code>} {<false code>}
```

---

Replaces all occurrences of all  $\langle regex\rangle$  in the  $\langle token\ list\rangle$  by the corresponding  $\langle replacement\rangle$ . Every match is treated independently, and matches cannot overlap. The result is assigned locally to  $\langle tl\ var\rangle$ , and the  $\langle true\ code\rangle$  or  $\langle false\ code\rangle$  is left in the input stream depending on whether any replacement was made or not.

In detail, for each starting position in the  $\langle token\ list\rangle$ , each of the  $\langle regex\rangle$  is searched in turn. If one of them matches then it is replaced by the corresponding  $\langle replacement\rangle$ , and the search resumes at the position that follows this match (and replacement). For instance

```
\tl_set:Nn \l_tmpa_tl { Hello,~world! }
\regex_replace_case_all:nN
{
  { [A-Za-z]+ } { ``\0'' }
  { \b } { --- }
  { . } { [\0] }
} \l_tmpa_tl
```

results in  $\backslash l\_tmpa\_tl$  having the contents ‘‘Hello’’---[,] [!] ‘‘world’’---[!]. Note in particular that the word-boundary assertion  $\backslash b$  did not match at the start of words because the case  $[A-Za-z]^+$  matched at these positions. To change this, one could simply swap the order of the two cases in the argument of  $\backslash\text{regex\_replace\_case\_all:nn}$ .

## 8.7 Scratch regular expressions

---

`\l_tmpa_regex` Scratch regex for local assignment. These are never used by the kernel code, and so are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

---

`\g_tmpa_regex` Scratch regex for global assignment. These are never used by the kernel code, and so are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

## 8.8 Bugs, misfeatures, future work, and other possibilities

The following need to be done now.

- Rewrite the documentation in a more ordered way, perhaps add a BNF?
  - Additional error-checking to come.
- Clean up the use of messages.
- Cleaner error reporting in the replacement phase.
- Add tracing information.
- Detect attempts to use back-references and other non-implemented syntax.
- Test for the maximum register `\c_max_register_int`.
- Find out whether the fact that `\W` and friends match the end-marker leads to bugs.  
Possibly update `\__regex_item_reverse:n`.
- The empty cs should be matched by `\c{}`, not by `\c{csname.?endcsname\s?}`.
- Code improvements to come.
  - Shift arrays so that the useful information starts at position 1.
  - Only build `\c{...}` once.
  - Use arrays for the left and right state stacks when compiling a regex.
  - Should `\__regex_action_free_group:n` only be used for greedy `{n,}` quantifier?  
(I think not.)
  - Quantifiers for `\u` and assertions.
  - When matching, keep track of an explicit stack of `curr_state` and `curr_submatches`.
  - If possible, when a state is reused by the same thread, kill other subthreads.

- Use an array rather than `\g__regex_balance_t1` to build the function `\__regex-replacement_balance_one_match:n`.
- Reduce the number of epsilon-transitions in alternatives.
- Optimize simple strings: use less states (`abcade` should give two states, for `abc` and `ade`). [Does that really make sense?]
- Optimize groups with no alternative.
- Optimize states with a single `\__regex_action_free:n`.
- Optimize the use of `\__regex_action_success`: by inserting it in state 2 directly instead of having an extra transition.
- Optimize the use of `\int_step_...` functions.
- Groups don't capture within regexes for csnames; optimize and document.
- Better "show" for anchors, properties, and catcode tests.
- Does `\K` really need a new state for itself?
- When compiling, use a boolean `in_cs` and less magic numbers.

The following features are likely to be implemented at some point in the future.

- General look-ahead/behind assertions.
- Regex matching on external files.
- Conditional subpatterns with look ahead/behind: "if what follows is [...], then [...]".
- `(*..)` and `(?..)` sequences to set some options.
- UTF-8 mode for pdfTEX.
- Newline conventions are not done. In particular, we should have an option for `.` not to match newlines. Also, `\A` should differ from `^`, and `\Z`, `\z` and `$` should differ.
- Unicode properties: `\p{..}` and `\P{..}`; `\X` which should match any "extended" Unicode sequence. This requires to manipulate a lot of data, probably using tree-boxes.

The following features of PCRE or Perl may or may not be implemented.

- Callout with `(?C...)` or other syntax: some internal code changes make that possible, and it can be useful for instance in the replacement code to stop a regex replacement when some marker has been found; this raises the question of a potential `\regex_break`: and then of playing well with `\t1_map_break`: called from within the code in a regex. It also raises the question of nested calls to the regex machinery, which is a problem since `\fontdimen` are global.
- Conditional subpatterns (other than with a look-ahead or look-behind condition): this is non-regular, isn't it?

- Named subpatterns:  $\text{\TeX}$  programmers have lived so far without any need for named macro parameters.

The following features of PCRE or Perl will definitely not be implemented.

- Back-references: non-regular feature, this requires backtracking, which is prohibitively slow.
- Recursion: this is a non-regular feature.
- Atomic grouping, possessive quantifiers: those tools, mostly meant to fix catastrophic backtracking, are unnecessary in a non-backtracking algorithm, and difficult to implement.
- Subroutine calls: this syntactic sugar is difficult to include in a non-backtracking algorithm, in particular because the corresponding group should be treated as atomic.
- Backtracking control verbs: intrinsically tied to backtracking.
- $\backslash\text{ddd}$ , matching the character with octal code ddd: we already have  $\backslash\text{x}\{\dots\}$  and the syntax is confusingly close to what we could have used for backreferences ( $\backslash 1$ ,  $\backslash 2$ ,  $\dots$ ), making it harder to produce useful error message.
- $\backslash\text{cx}$ , similar to  $\text{\TeX}$ 's own  $\backslash\text{^^x}$ .
- Comments:  $\text{\TeX}$  already has its own system for comments.
- $\backslash\text{Q}\dots\backslash\text{E}$  escaping: this would require to read the argument verbatim, which is not in the scope of this module.
- $\backslash\text{C}$  single byte in UTF-8 mode: Xe $\text{\TeX}$  and Lua $\text{\TeX}$  serve us characters directly, and splitting those into bytes is tricky, encoding dependent, and most likely not useful anyways.

# Chapter 9

## The `\3prg` module Control structures

Conditional processing in L<sup>A</sup>T<sub>E</sub>X3 is defined as something that performs a series of tests, possibly involving assignments and calling other functions that do not read further ahead in the input stream. After processing the input, a *state* is returned. The states returned are `\true` and `\false`.

L<sup>A</sup>T<sub>E</sub>X3 has two forms of conditional flow processing based on these states. The first form is predicate functions that turn the returned state into a boolean `\true` or `\false`. For example, the function `\cs_if_free_p:N` checks whether the control sequence given as its argument is free and then returns the boolean `\true` or `\false` values to be used in testing with `\if_predicate:w` or in functions to be described below. The second form is the kind of functions choosing a particular argument from the input stream based on the result of the testing as in `\cs_if_free:NTF` which also takes one argument (the `N`) and then executes either `true` or `false` depending on the result.

**TEXhackers note:** The arguments are executed after exiting the underlying `\if... \fi:` structure.

### 9.1 Defining a set of conditional functions

<code>\prg_new_conditional:Npnn</code>	<code>\prg_new_conditional:Npnn \⟨name⟩:\⟨arg spec⟩ ⟨parameters⟩ {⟨conditions⟩} {⟨code⟩}</code>
<code>\prg_set_conditional:Npnn</code>	<code>\prg_new_conditional:Nn \⟨name⟩:\⟨arg spec⟩ {⟨conditions⟩} {⟨code⟩}</code>
<code>\prg_gset_conditional:Npnn</code>	
<code>\prg_new_conditional:Nnn</code>	
<code>\prg_set_conditional:Nnn</code>	
<code>\prg_gset_conditional:Nnn</code>	

These functions create a family of conditionals using the same `{⟨code⟩}` to perform the test created. Those conditionals are expandable if `{⟨code⟩}` is. The `new` versions check for existing definitions and perform assignments globally (*cf.* `\cs_new:Npn`) whereas the `set` versions do no check and perform assignments locally (*cf.* `\cs_set:Npn`). The conditionals created are dependent on the comma-separated list of `{⟨conditions⟩}`, which should be one or more of p, T, F and TF.

Updated: 2022-11-01

---

```
\prg_new_protected_conditional:Npnn \prg_new_protected_conditional:Npnn \langle name\rangle:\langle arg spec\rangle
\prg_set_protected_conditional:Npnn <parameters> {\{conditions\}} {\{code\}}
\prg_gset_protected_conditional:Npnn \prg_new_protected_conditional:Nnn \langle name\rangle:\langle arg spec\rangle
\prg_new_protected_conditional:Nnn {\{conditions\}} {\{code\}}
\prg_set_protected_conditional:Nnn
\prg_gset_protected_conditional:Nnn
```

---

Updated: 2012-02-06

---

These functions create a family of protected conditionals using the same  $\{\langle code \rangle\}$  to perform the test created. The  $\langle code \rangle$  does not need to be expandable. The **new** version check for existing definitions and perform assignments globally (*cf.* `\cs_new:Npn`) whereas the **set** version do not (*cf.* `\cs_set:Npn`). The conditionals created are depended on the comma-separated list of  $\langle conditions \rangle$ , which should be one or more of T, F and TF (not p).

The conditionals are defined by `\prg_new_conditional:Npnn` and friends as:

- $\langle name \rangle\_p:\langle arg spec \rangle$  — a predicate function which will supply either a logical **true** or logical **false**. This function is intended for use in cases where one or more logical tests are combined to lead to a final outcome. This function cannot be defined for **protected** conditionals.
- $\langle name \rangle:\langle arg spec \rangle T$  — a function with one more argument than the original  $\langle arg spec \rangle$  demands. The  $\langle true branch \rangle$  code in this additional argument will be left on the input stream only if the test is **true**.
- $\langle name \rangle:\langle arg spec \rangle F$  — a function with one more argument than the original  $\langle arg spec \rangle$  demands. The  $\langle false branch \rangle$  code in this additional argument will be left on the input stream only if the test is **false**.
- $\langle name \rangle:\langle arg spec \rangle TF$  — a function with two more arguments than the original  $\langle arg spec \rangle$  demands. The  $\langle true branch \rangle$  code in the first additional argument will be left on the input stream if the test is **true**, while the  $\langle false branch \rangle$  code in the second argument will be left on the input stream if the test is **false**.

The  $\langle code \rangle$  of the test may use  $\langle parameters \rangle$  as specified by the second argument to `\prg_set_conditional:Npnn`: this should match the  $\langle argument specification \rangle$  but this is not enforced. The Nnn versions infer the number of arguments from the argument specification given (*cf.* `\cs_new:Nn`, etc.). Within the  $\langle code \rangle$ , the functions `\prg_return_true:` and `\prg_return_false:` are used to indicate the logical outcomes of the test.

An example can easily clarify matters here:

```
\prg_set_conditional:Npnn \foo_if_bar:NN #1#2 { p , T , TF }
{
  \if_meaning:w \l_tmpa_tl #1
    \prg_return_true:
  \else:
    \if_meaning:w \l_tmpa_tl #2
      \prg_return_true:
    \else:
      \prg_return_false:
    \fi:
  \fi:
}
```

This defines the function `\foo_if_bar_p:NN`, `\foo_if_bar:NNTF` and `\foo_if_bar:NNT` but not `\foo_if_bar:NNF` (because F is missing from the *(conditions)* list). The return statements take care of resolving the remaining `\else:` and `\fi:` before returning the state. There must be a return statement for each branch; failing to do so will result in erroneous output if that branch is executed.

The special case where the code of a conditional ends with `\prg_return_true:` `\else:` `\prg_return_false:` `\fi:` is optimized.

---

```
\prg_new_eq_conditional:Nnn \prg_new_eq_conditional:Nnn \langle name_1\rangle:\langle arg spec_1\rangle \langle name_2\rangle:\langle arg spec_2\rangle
\prg_set_eq_conditional:Nnn {⟨conditions⟩}
\prg_gset_eq_conditional:Nnn
```

---

Updated: 2023-05-26

These functions copy a family of conditionals. The **new** version checks for existing definitions (*cf.* `\cs_new_eq:NN`) whereas the **set** version does not (*cf.* `\cs_set_eq:NN`). The conditionals copied are depended on the comma-separated list of *(conditions)*, which should be one or more of p, T, F and TF.

---

```
\prg_return_true: * \prg_return_true:
\prg_return_false: * \prg_return_false:
```

---

These “return” functions define the logical state of a conditional statement. They appear within the code for a conditional function generated by `\prg_set_conditional:Npnn`, *etc*, to indicate when a true or false branch should be taken. While they may appear multiple times each within the code of such conditionals, the execution of the conditional must result in the expansion of one of these two functions *exactly once*.

The return functions trigger what is internally an f-expansion process to complete the evaluation of the conditional. Therefore, after `\prg_return_true:` or `\prg_return_false:` there must be no non-expandable material in the input stream for the remainder of the expansion of the conditional code. This includes other instances of either of these functions.

---

```
\prg_generate_conditional_variant:Nnn \prg_generate_conditional_variant:Nnn \langle name\rangle:\langle arg spec\rangle
                                         {⟨variant argument specifiers⟩} {⟨condition specifiers⟩}
```

---

New: 2017-12-12

Defines argument-specifier variants of conditionals. This is equivalent to running `\cs_generate_variant:Nn` *{conditional}* {⟨variant argument specifiers⟩} on each *(conditional)* described by the *(condition specifiers)*. These base-form *(conditionals)* are obtained from the *(name)* and *(arg spec)* as described for `\prg_new_conditional:Npnn`, and they should be defined.

## 9.2 The boolean data type

This section describes a boolean data type which is closely connected to conditional processing as sometimes you want to execute some code depending on the value of a switch (*e.g.*, draft/final) and other times you perhaps want to use it as a predicate function in an `\if_predicate:w` test. The problem of the primitive `\if_false:` and `\if_true:` tokens is that it is not always safe to pass them around as they may interfere with scanning for termination of primitive conditional processing. Therefore, we employ two canonical booleans: `\c_true_bool` or `\c_false_bool`. Besides preventing problems

as described above, it also allows us to implement a simple boolean parser supporting the logical operations And, Or, Not, *etc.* which can then be used on both the boolean type and predicate functions.

All conditional \bool\_ functions except assignments are expandable and expect the input to also be fully expandable (which generally means being constructed from predicate functions and booleans, possibly nested).

**TeXhackers note:** The `bool` data type is not implemented using the `\iffalse`/`\iftrue` primitives, in contrast to `\newif`, *etc.*, in plain TeX, L<sup>A</sup>T<sub>E</sub>X 2<sub><</sub> and so on. Programmers should not base use of `bool` switches on any particular expectation of the implementation.

---

`\bool_new:N` `\bool_new:N` *boolean*

`\bool_new:c` Creates a new *boolean* or raises an error if the name is already taken. The declaration is global. The *boolean* is initially `false`.

---

`\bool_const:Nn` `\bool_const:Nn` *boolean* {*boolexpr*}

`\bool_const:cn` Creates a new constant *boolean* or raises an error if the name is already taken. The value of the *boolean* is set globally to the result of evaluating the *boolexpr*.  
New: 2017-11-28

---

`\bool_set_false:N` `\bool_set_false:N` *boolean*

`\bool_set_false:c` Sets *boolean* logically `false`.

---

`\bool_gset_false:N`

---

`\bool_gset_false:c`

---

`\bool_set_true:N` `\bool_set_true:N` *boolean*

`\bool_set_true:c` Sets *boolean* logically `true`.

---

`\bool_gset_true:N`

---

`\bool_gset_true:c`

---

`\bool_set_eq:NN` `\bool_set_eq:NN` *boolean*<sub>1</sub> *boolean*<sub>2</sub>

`\bool_set_eq:(cN|Nc|cc)` Sets *boolean*<sub>1</sub> to the current value of *boolean*<sub>2</sub>.

---

`\bool_gset_eq:NN`

---

`\bool_gset_eq:(cN|Nc|cc)`

---

`\bool_set:Nn` `\bool_set:Nn` *boolean* {*boolexpr*}

`\bool_set:cn` `\bool_gset:Nn` Evaluates the *boolean expression* as described for `\bool_if:nTF`, and sets the *boolean* variable to the logical truth of this evaluation.  
`\bool_gset:cn`

---

Updated: 2017-07-15

---

`\bool_set_inverse:N` `\bool_set_inverse:N` *boolean*

`\bool_set_inverse:c` `\bool_gset_inverse:N` Toggles the *boolean* from `true` to `false` and conversely: sets it to the inverse of its current value.

### 9.2.1 Constant and scratch booleans

---

```
\c_true_bool Constants that represent true and false, respectively. Used to implement predicates.
\c_false_bool
```

---

---

```
\l_tmpa_bool A scratch boolean for local assignment. It is never used by the kernel code, and so is
\l_tmpb_bool safe for use with any LATEX3-defined function. However, it may be overwritten by other
non-kernel code and so should only be used for short-term storage.
```

---

---

`\g_tmpa_bool` A scratch boolean for global assignment. It is never used by the kernel code, and so is safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, it may be overwritten by other non-kernel code and so should only be used for short-term storage.

### 9.3 Boolean expressions

As we have a boolean datatype and predicate functions returning boolean  $\langle \text{true} \rangle$  or  $\langle \text{false} \rangle$  values, it seems only fitting that we also provide a parser for  $\langle \text{boolean expressions} \rangle$ .

A boolean expression is an expression which given input in the form of predicate functions and boolean variables, return boolean  $\langle \text{true} \rangle$  or  $\langle \text{false} \rangle$ . It supports the logical operations And, Or and Not as the well-known infix operators `&&` and `||` and prefix `!` with their usual precedences (namely, `&&` binds more tightly than `||`). In addition to this, parentheses can be used to isolate sub-expressions. For example,

```
\int_compare_p:n { 1 = 1 } &&
(
  \int_compare_p:n { 2 = 3 } ||
  \int_compare_p:n { 4 <= 4 } ||
  \str_if_eq_p:nn { abc } { def }
) &&
! \int_compare_p:n { 2 = 4 }
```

is a valid boolean expression.

Contrarily to some other programming languages, the operators `&&` and `||` evaluate both operands in all cases, even when the first operand is enough to determine the result. This “eager” evaluation should be contrasted with the “lazy” evaluation of `\bool_lazy_...` functions.

**TeXhackers note:** The eager evaluation of boolean expressions is unfortunately necessary in T<sub>E</sub>X. Indeed, a lazy parser can get confused if `&&` or `||` or parentheses appear as (unbraced) arguments of some predicates. For instance, the innocuous-looking expression below would break (in a lazy parser) if #1 were a closing parenthesis and `\l_tmpa_bool` were `true`.

```
( \l_tmpa_bool || \token_if_eq_meaning_p:NN X #1 )
```

Minimal (lazy) evaluation can be obtained using the conditionals `\bool_lazy_all:nTF`, `\bool_lazy_and:nnTF`, `\bool_lazy_any:nTF`, or `\bool_lazy_or:nnTF`, which only evaluate their boolean expression arguments when they are needed to determine the resulting truth value. For example, when evaluating the boolean expression

```
\bool_lazy_and_p:nn
{
  \bool_lazy_any_p:n
  {
    { \int_compare_p:n { 2 = 3 } }
    { \int_compare_p:n { 4 <= 4 } }
    { \int_compare_p:n { 1 = \error } } % skipped
  }
}
{ ! \int_compare_p:n { 2 = 4 } }
```

the line marked with `skipped` is not expanded because the result of `\bool_lazy_any_p:n` is known once the second boolean expression is found to be logically `true`. On the other hand, the last line is expanded because its logical value is needed to determine the result of `\bool_lazy_and_p:nn`.

---

```
\bool_if_p:n * \bool_if_p:n {\langle boolean expression\rangle}
\bool_if:nTF * \bool_if:nTF {\langle boolean expression\rangle} {\langle true code\rangle} {\langle false code\rangle}
```

---

Updated: 2017-07-15

Tests the current truth of `\langle boolean expression\rangle`, and continues expansion based on this result. The `\langle boolean expression\rangle` should consist of a series of predicates or boolean variables with the logical relationship between these defined using `&&` (“And”), `||` (“Or”), `!` (“Not”) and parentheses. The logical Not applies to the next predicate or group.

---

```
\bool_lazy_all_p:n * \bool_lazy_all_p:n {\{\langle boolexpr_1\rangle\} {\langle boolexpr_2\rangle} \cdots {\langle boolexpr_N\rangle}\}}
\bool_lazy_all:nTF * \bool_lazy_all:nTF {\{\langle boolexpr_1\rangle\} {\langle boolexpr_2\rangle} \cdots {\langle boolexpr_N\rangle}\}} {\langle true code\rangle}
{\langle false code\rangle}
```

---

New: 2015-11-15

Updated: 2017-07-15

Implements the “And” operation on the `\langle boolean expressions\rangle`, hence is `true` if all of them are `true` and `false` if any of them is `false`. Contrarily to the infix operator `&&`, only the `\langle boolean expressions\rangle` which are needed to determine the result of `\bool_lazy_all:nTF` are evaluated. See also `\bool_lazy_and:nnTF` when there are only two `\langle boolean expressions\rangle`.

---

```
\bool_lazy_and_p:nn * \bool_lazy_and_p:nn {\{\langle boolexpr_1\rangle\} {\langle boolexpr_2\rangle\}}
\bool_lazy_and:nnTF * \bool_lazy_and:nnTF {\{\langle boolexpr_1\rangle\} {\langle boolexpr_2\rangle\}} {\langle true code\rangle} {\langle false code\rangle}
```

---

New: 2015-11-15

Updated: 2017-07-15

Implements the “And” operation between two boolean expressions, hence is `true` if both are `true`. Contrarily to the infix operator `&&`, the `\langle boolexpr_2\rangle` is only evaluated if it is needed to determine the result of `\bool_lazy_and:nnTF`. See also `\bool_lazy_all:nTF` when there are more than two `\langle boolean expressions\rangle`.

---

```
\bool_lazy_any_p:n * \bool_lazy_any_p:n {\{\langle boolexpr_1\rangle\} {\langle boolexpr_2\rangle} \cdots {\langle boolexpr_N\rangle}\}}
\bool_lazy_any:nTF * \bool_lazy_any:nTF {\{\langle boolexpr_1\rangle\} {\langle boolexpr_2\rangle} \cdots {\langle boolexpr_N\rangle}\}} {\langle true code\rangle}
{\langle false code\rangle}
```

---

New: 2015-11-15

Updated: 2017-07-15

Implements the “Or” operation on the `\langle boolean expressions\rangle`, hence is `true` if any of them is `true` and `false` if all of them are `false`. Contrarily to the infix operator `||`, only the `\langle boolean expressions\rangle` which are needed to determine the result of `\bool_lazy_any:nTF` are evaluated. See also `\bool_lazy_or:nnTF` when there are only two `\langle boolean expressions\rangle`.

---

```
\bool_lazy_or_p:nn * \bool_lazy_or_p:nn {\{\langle boolexpr_1\rangle\} {\langle boolexpr_2\rangle\}}
\bool_lazy_or:nnTF * \bool_lazy_or:nnTF {\{\langle boolexpr_1\rangle\} {\langle boolexpr_2\rangle\}} {\langle true code\rangle} {\langle false code\rangle}
```

---

New: 2015-11-15

Updated: 2017-07-15

Implements the “Or” operation between two boolean expressions, hence is `true` if either one is `true`. Contrarily to the infix operator `||`, the `\langle boolexpr_2\rangle` is only evaluated if it is needed to determine the result of `\bool_lazy_or:nnTF`. See also `\bool_lazy_any:nTF` when there are more than two `\langle boolean expressions\rangle`.

---

```
\bool_not_p:n * \bool_not_p:n {\langle boolean expression\rangle}
```

---

Updated: 2017-07-15

Function version of `!(\langle boolean expression\rangle)` within a boolean expression.

---

```
\bool_xor_p:nn ★ \bool_xor_p:nn {\<boolexpr1>} {\<boolexpr2>}
\bool_xor:nnTF ★ \bool_xor:nnTF {\<boolexpr1>} {\<boolexpr2>} {\<true code>} {\<false code>}
```

---

New: 2018-05-09    Implements an “exclusive or” operation between two boolean expressions. There is no infix operation for this logical operation.

## 9.4 Logical loops

Loops using either boolean expressions or stored boolean values.

---

```
\bool_do_until:Nn ★ \bool_do_until:Nn <boolean> {\<code>}
```

---

Places the *<code>* in the input stream for T<sub>E</sub>X to process, and then checks the logical value of the *<boolean>*. If it is **false** then the *<code>* is inserted into the input stream again and the process loops until the *<boolean>* is **true**.

Updated: 2017-07-15

---

```
\bool_do_while:Nn ★ \bool_do_while:Nn <boolean> {\<code>}
```

---

Places the *<code>* in the input stream for T<sub>E</sub>X to process, and then checks the logical value of the *<boolean>*. If it is **true** then the *<code>* is inserted into the input stream again and the process loops until the *<boolean>* is **false**.

Updated: 2017-07-15

---

```
\bool_until_do:Nn ★ \bool_until_do:Nn <boolean> {\<code>}
```

---

This function first checks the logical value of the *<boolean>*. If it is **false** the *<code>* is placed in the input stream and expanded. After the completion of the *<code>* the truth of the *<boolean>* is re-evaluated. The process then loops until the *<boolean>* is **true**.

Updated: 2017-07-15

---

```
\bool_while_do:Nn ★ \bool_while_do:Nn <boolean> {\<code>}
```

---

This function first checks the logical value of the *<boolean>*. If it is **true** the *<code>* is placed in the input stream and expanded. After the completion of the *<code>* the truth of the *<boolean>* is re-evaluated. The process then loops until the *<boolean>* is **false**.

Updated: 2017-07-15

---

```
\bool_do_until:nn ★ \bool_do_until:nn {\<boolean expression>} {\<code>}
```

---

Updated: 2017-07-15

Places the *<code>* in the input stream for T<sub>E</sub>X to process, and then checks the logical value of the *<boolean expression>* as described for `\bool_if:nTF`. If it is **false** then the *<code>* is inserted into the input stream again and the process loops until the *<boolean expression>* evaluates to **true**.

---

```
\bool_do_while:nn ★ \bool_do_while:nn {\<boolean expression>} {\<code>}
```

---

Updated: 2017-07-15

Places the *<code>* in the input stream for T<sub>E</sub>X to process, and then checks the logical value of the *<boolean expression>* as described for `\bool_if:nTF`. If it is **true** then the *<code>* is inserted into the input stream again and the process loops until the *<boolean expression>* evaluates to **false**.

---

```
\bool_until_do:nn ★ \bool_until_do:nn {\<boolean expression>} {\<code>}
```

---

Updated: 2017-07-15

This function first checks the logical value of the *<boolean expression>* (as described for `\bool_if:nTF`). If it is **false** the *<code>* is placed in the input stream and expanded. After the completion of the *<code>* the truth of the *<boolean expression>* is re-evaluated. The process then loops until the *<boolean expression>* is **true**.

---

```
\bool_while_do:nn ☆ \bool_while_do:nn {<boolean expression>} {<code>}
```

Updated: 2017-07-15

This function first checks the logical value of the *<boolean expression>* (as described for `\bool_if:nTF`). If it is `true` the *<code>* is placed in the input stream and expanded. After the completion of the *<code>* the truth of the *<boolean expression>* is re-evaluated. The process then loops until the *<boolean expression>* is `false`.

---

```
\bool_case:n * \bool_case:nTF
\bool_case:nTF * {
  {<boolexpr case1>} {<code case1>}
  {<boolexpr case2>} {<code case2>}
  ...
  {<boolexpr casen>} {<code casen>}
}
{<true code>}
{<false code>}
```

Evaluates in turn each of the *<boolean expression cases>* until the first one that evaluates to `true`. The *<code>* associated to this first case is left in the input stream, followed by the *<true code>*, and other cases are discarded. If none of the cases match then only the *<false code>* is inserted. The function `\bool_case:n`, which does nothing if there is no match, is also available. For example

```
\bool_case:nF
{
  { \dim_compare_p:n { \l_mypkg_wd_dim <= 10pt } }
    { Fits }
  { \int_compare_p:n { \l_mypkg_total_int >= 10 } }
    { Many }
  { \l_mypkg_special_bool }
    { Special }
}
{ No idea! }
```

leaves “Fits” or “Many” or “Special” or “No idea!” in the input stream, in a way similar to some other language’s “if ... elseif ... elseif ... else ...”.

## 9.5 Producing multiple copies

---

```
\prg_replicate:nn * \prg_replicate:nn {<integer expression>} {<tokens>}
```

Updated: 2011-07-04

Evaluates the *<integer expression>* (which should be zero or positive) and creates the resulting number of copies of the *<tokens>*. The function is both expandable and safe for nesting. It yields its result after two expansion steps.

## 9.6 Detecting T<sub>E</sub>X’s mode

---

```
\mode_if_horizontal_p: * \mode_if_horizontal_p:
\mode_if_horizontal:TTF * \mode_if_horizontal:TF {<true code>} {<false code>}
```

Detects if T<sub>E</sub>X is currently in horizontal mode.

---

```
\mode_if_inner_p: * \mode_if_inner_p:  
\mode_if_inner:TF * \mode_if_inner:TF {\(true code)} {\(false code)}
```

---

Detects if TeX is currently in inner mode.

---

```
\mode_if_math_p: * \mode_if_math_p:  
\mode_if_math:TF * \mode_if_math:TF {\(true code)} {\(false code)}
```

---

Updated: 2011-09-05 Detects if TeX is currently in maths mode.

---

---

```
\mode_if_vertical_p: * \mode_if_vertical_p:  
\mode_if_vertical:TF * \mode_if_vertical:TF {\(true code)} {\(false code)}
```

---

Detects if TeX is currently in vertical mode.

## 9.7 Primitive conditionals

---

```
\if_predicate:w * \if_predicate:w {\(predicate)} {\(true code)} {\(false code)} \fi:
```

---

This function takes a predicate function and branches according to the result. (In practice this function would also accept a single boolean variable in place of the *<predicate>* but to make the coding clearer this should be done through *\if\_bool:N*.)

---

```
\if_bool:N * \if_bool:N {\(boolean)} {\(true code)} {\(false code)} \fi:
```

---

This function takes a boolean variable and branches according to the result.

## 9.8 Nestable recursions and mappings

There are a number of places where recursion or mapping constructs are used in `expl3`. At a low-level, these typically require insertion of tokens at the end of the content to allow “clean up”. To support such mappings in a nestable form, the following functions are provided.

---

```
\prg_break_point:Nn * \prg_break_point:Nn \(\type\)_map_break: {\(code)}
```

---

New: 2018-03-26

Used to mark the end of a recursion or mapping: the functions `\(\type\)_map_break:` and `\(\type\)_map_break:n` use this to break out of the loop (see `\prg_map_break:Nn` for how to set these up). After the loop ends, the *<code>* is inserted into the input stream. This occurs even if the break functions are *not* applied: `\prg_break_point:Nn` is functionally-equivalent in these cases to `\use_i:nn`.

---

```
\prg_map_break:Nn * \prg_map_break:Nn \⟨type⟩_map_break: {⟨user code⟩}
...  
New: 2018-03-26 \prg_break_point:Nn \⟨type⟩_map_break: {⟨ending code⟩}
```

---

Breaks a recursion in mapping contexts, inserting in the input stream the *⟨user code⟩* after the *⟨ending code⟩* for the loop. The function breaks loops, inserting their *⟨ending code⟩*, until reaching a loop with the same *⟨type⟩* as its first argument. This *⟨type⟩\_map\_break:* argument must be defined; it is simply used as a recognizable marker for the *⟨type⟩*.

For types with mappings defined in the kernel, *⟨type⟩\_map\_break:* and *⟨type⟩\_map\_break:n* are defined as *\prg\_map\_break:Nn \⟨type⟩\_map\_break: {}* and the same with {} omitted.

### 9.8.1 Simple mappings

In addition to the more complex mappings above, non-nestable mappings are used in a number of locations and support is provided for these.

---

```
\prg_break_point: * This copy of \prg_do_nothing: is used to mark the end of a fast short-term recursion:
...  
New: 2018-03-27 \prg_break:n uses this to break out of the loop.
```

---

---

```
\prg_break: * \prg_break:n {⟨code⟩} ... \prg_break_point:  
\prg_break:n * Breaks a recursion which has no ⟨ending code⟩ and which is not a user-breakable mapping
...  
New: 2018-03-27 (see for instance implementation of \int_step_function:nnnN), and inserts the ⟨code⟩
in the input stream.
```

---

## 9.9 Internal programming functions

---

```
\group_align_safe_begin: * \group_align_safe_begin:
\group_align_safe_end: * ...
...  
Updated: 2011-08-11 \group_align_safe_end:
```

---

These functions are used to enclose material in a TEX alignment environment within a specially-constructed group. This group is designed in such a way that it does not add brace groups to the output but does act as a group for the & token inside *\halign*. This is necessary to allow grabbing of tokens for testing purposes, as TEX uses group level to determine the effect of alignment tokens. Without the special grouping, the use of a function such as *\peek\_after:Nw* would result in a forbidden comparison of the internal *\endtemplate* token, yielding a fatal error. Each *\group\_align\_safe\_begin:* must be matched by a *\group\_align\_safe\_end:*, although this does not have to occur within the same function.

# Chapter 10

## The `\I3sys` module System/runtime functions

### 10.1 The name of the job

---

`\c_sys_jobname_str` Constant that gets the “job name” assigned when TeX starts.

New: 2015-09-19

Updated: 2019-10-27

**TeXhackers note:** This is the TeX primitive `\jobname`. For technical reasons, the string here is not of the same internal form as other, but may be manipulated using normal string functions.

### 10.2 Date and time

---

`\c_sys_minute_int` The date and time at which the current job was started: these are all reported as integers.  
`\c_sys_hour_int`

`\c_sys_day_int` **TeXhackers note:** Whilst the underlying TeX primitives `\time`, `\day`, `\month`, and `\year` can be altered by the user, this interface to the time and date is intended to be the “real” values.  
`\c_sys_month_int`  
`\c_sys_year_int`

New: 2015-09-22

---

`\c_sys_timestamp_str` The timestamp for the current job: the format is as described for `\file_timestamp:n`.

New: 2023-08-27

## 10.3 Engine

---

```
\sys_if_engine_luatex_p: * \sys_if_engine_pdftex_p:  
\sys_if_engine_luatex:TF * \sys_if_engine_pdftex:TF {\(true code\)} {\(false code\)}  
\sys_if_engine_pdftex_p: * Conditionals which allow engine-specific code to be used. The names follow naturally  
\sys_if_engine_pdftex:TF * from those of the engine binaries: note that the (u)ptex tests are for ε-pTeX and ε-upTeX  
\sys_if_engine_ptex_p: * as expl3 requires the ε-TeX extensions. Each conditional is true for exactly one supported  
\sys_if_engine_ptex:TF * engine. In particular, \sys_if_engine_ptex_p: is true for ε-pTeX but false for ε-upTeX.  
\sys_if_engine_uptex_p: *  
\sys_if_engine_uptex:TF *  
\sys_if_engine_xetex_p: *  
\sys_if_engine_xetex:TF *
```

---

New: 2015-09-07

---

`\c_sys_engine_str` The current engine given as a lower case string: one of `luatex`, `pdftex`, `ptex`, `uptex` or `xetex`.

---

New: 2015-09-19

---

`\c_sys_engine_exec_str` The name of the standard executable for the current TeX engine given as a lower case string: one of `luatex`, `luahbtex`, `pdftex`, `eptex`, `euptex` or `xetex`.

---

New: 2020-08-20

---

`\c_sys_engine_format_str` The name of the preloaded format for the current TeX run given as a lower case string: one of `lualatex` (or `dviulualatex`), `pdflatex` (or `latex`), `platex`, `uplatex` or `xelatex` for LATEX, similar names for plain TeX (except pdfTeX in DVI mode yields `etex`), and `cont-en` for ConTeXt (i.e. the `\fmtname`).

---

New: 2020-08-20

---

`\c_sys_engine_version_str` The version string of the current engine, in the same form as given in the banner issued when running a job. For pdfTeX and LuaTeX this is of the form

---

$\langle major \rangle.\langle minor \rangle.\langle revision \rangle$

For XeTeX, the form is

$\langle major \rangle.\langle minor \rangle$

For pTeX and upTeX, only releases since TeX Live 2018 make the data available, and the form is more complex, as it comprises the pTeX version, the upTeX version and the e-pTeX version.

$p\langle major \rangle.\langle minor \rangle.\langle revision \rangle-u\langle major \rangle.\langle minor \rangle-\langle epTeX \rangle$

where the `u` part is only present for upTeX.

---

`\sys_timer: * \sys_timer:`

New: 2021-05-12

Expands to the current value of the engine's timer clock, a non-negative integer. This function is only defined for engines with timer support. This command measures not just CPU time but real time (including time waiting for user input). The unit are scaled seconds ( $2^{-16}$  seconds).

---

```
\sys_if_timer_exist_p: * \sys_if_timer_exist_p:  
\sys_if_timer_exist:TF * \sys_if_timer_exist:TF {{true code}} {{false code}}
```

---

New: 2021-05-12 Tests whether current engine has timer support.

---

## 10.4 Output format

---

```
\sys_if_output_dvi_p: * \sys_if_output_dvi_p:  
\sys_if_output_dvi:TF * \sys_if_output_dvi:TF {{true code}} {{false code}}
```

---

**\sys\_if\_output\_pdf\_p:** \* Conditionals which give the current output mode the T<sub>E</sub>X run is operating in. This is always one of two outcomes, DVI mode or PDF mode. The two sets of conditionals are thus complementary and are both provided to allow the programmer to emphasise the most appropriate case.

---

**\c\_sys\_output\_str** The current output mode given as a lower case string: one of `dvi` or `pdf`.

---

New: 2015-09-19

---

## 10.5 Platform

---

```
\sys_if_platform_unix_p: * \sys_if_platform_unix_p:  
\sys_if_platform_unix:TF * \sys_if_platform_unix:TF {{true code}} {{false code}}  
\sys_if_platform_windows_p: *  
\sys_if_platform_windows:TF *
```

---

New: 2018-07-27

Conditionals which allow platform-specific code to be used. The names follow the Lua `os.type()` function, *i.e.* all Unix-like systems are `unix` (including Linux and MacOS).

**\c\_sys\_platform\_str** The current platform given as a lower case string: one of `unix`, `windows` or `unknown`.

---

New: 2018-07-27

---

## 10.6 Random numbers

---

```
\sys_rand_seed: * \sys_rand_seed:
```

---

New: 2017-05-27 Expands to the current value of the engine's random seed, a non-negative integer. In engines without random number support this expands to 0.

---

```
\sys_gset_rand_seed:n \sys_gset_rand_seed:n {<int expr>}
```

New: 2017-05-27 Globally sets the seed for the engine's pseudo-random number generator to the *<integer expression>*. This random seed affects all `\..._rand` functions (such as `\int_rand:nn` or `\clist_rand_item:n`) as well as other packages relying on the engine's random number generator. In engines without random number support this produces an error.

**TEXhackers note:** While a 32-bit (signed) integer can be given as a seed, only the absolute value is used and any number beyond  $2^{28}$  is divided by an appropriate power of 2. We recommend using an integer in  $[0, 2^{28} - 1]$ .

## 10.7 Access to the shell

---

```
\sys_get_shell:nnN \sys_get_shell:nnN {<shell command>} {<setup>} {tl var}
\sys_get_shell:nnNTF \sys_get_shell:nnNTF {<shell command>} {<setup>} {tl var} {<true code>} {<false code>}
```

New: 2019-09-20

Defines `{tl var}` to the text returned by the *<shell command>*. The *<shell command>* is converted to a string using `\tl_to_str:n`. Category codes may need to be set appropriately via the *<setup>* argument, which is run just before running the *<shell command>* (in a group). If shell escape is disabled, the `{tl var}` will be set to `\q_no_value` in the non-branching version. Note that quote characters ("") *cannot* be used inside the *<shell command>*. The `\sys_get_shell:nnNTF` conditional inserts the *<true code>* if the shell is available and no quote is detected, and the *<false code>* otherwise.

*Note:* It is not possible to tell from TeX if a command is allowed in restricted shell escape. If restricted escape is enabled, the `true` branch is taken: if the command is forbidden at this stage, a low-level TeX error will arise.

---

```
\c_sys_shell_escape_int
```

This variable exposes the internal triple of the shell escape status. The possible values are

New: 2017-05-27

- 0** Shell escape is disabled
- 1** Unrestricted shell escape is enabled
- 2** Restricted shell escape is enabled

---

```
\sys_if_shell_p: * \sys_if_shell_p:
\sys_if_shell:TF * \sys_if_shell:TF {<true code>} {<false code>}
```

New: 2017-05-27 Performs a check for whether shell escape is enabled. This returns true if either of restricted or unrestricted shell escape is enabled.

---

```
\sys_if_shell_unrestricted_p: * \sys_if_shell_unrestricted_p:
\sys_if_shell_unrestricted:TF * \sys_if_shell_unrestricted:TF {<true code>} {<false code>}
```

New: 2017-05-27

Performs a check for whether *unrestricted* shell escape is enabled.

---

```
\sys_if_shell_restricted_p: * \sys_if_shell_restricted_p:  
\sys_if_shell_restricted:TF * \sys_if_shell_restricted:TF {{true code}} {{false code}}
```

---

New: 2017-05-27

Performs a check for whether *restricted* shell escape is enabled. This returns false if unrestricted shell escape is enabled. Unrestricted shell escape is not considered a superset of restricted shell escape in this case. To find whether any shell escape is enabled use `\sys_if_shell:TF`.

---

```
\sys_shell_now:n \sys_shell_now:n {{tokens}}  
\sys_shell_now:e Execute <tokens> through shell escape immediately.
```

---

New: 2017-05-27

---

```
\sys_shell_shipout:n \sys_shell_shipout:n {{tokens}}  
\sys_shell_shipout:e Execute <tokens> through shell escape at shipout.
```

---

New: 2017-05-27

## 10.8 Loading configuration data

---

```
\sys_load_backend:n \sys_load_backend:n {{backend}}
```

---

New: 2019-09-12 Loads the additional configuration file needed for backend support. If the *<backend>* is empty, the standard backend for the engine in use will be loaded. This command may only be used once.

---

```
\sys_ensure_backend: \sys_ensure_backend:
```

---

New: 2022-07-29 Ensures that a backend has been loaded by calling `\sys_load_backend:n` if required.

---

`\c_sys_backend_str` Set to the name of the backend in use by `\sys_load_backend:n` when issued. Possible values are

- pdftex
- luatex
- xetex
- dvips
- dvipdfmx
- dvisvgm

---

```
\sys_load_debug: \sys_load_debug:
```

---

New: 2019-09-12 Load the additional configuration file for debugging support.

### 10.8.1 Final settings

---

\sys\_finalise: \sys\_finalise:

New: 2019-10-06 Finalises all system-dependent functionality: required before loading a backend.

---

# Chapter 11

## The `l3msg` module

### Messages

Messages need to be passed to the user by modules, either when errors occur or to indicate how the code is proceeding. The `l3msg` module provides a consistent method for doing this (as opposed to writing directly to the terminal or log).

The system used by `l3msg` to create messages divides the process into two distinct parts. Named messages are created in the first part of the process; at this stage, no decision is made about the type of output that the message will produce. The second part of the process is actually producing a message. At this stage a choice of message *class* has to be made, for example `error`, `warning` or `info`.

By separating out the creation and use of messages, several benefits are available. First, the messages can be altered later without needing details of where they are used in the code. This makes it possible to alter the language used, the detail level and so on. Secondly, the output which results from a given message can be altered. This can be done on a message class, module or message name basis. In this way, message behaviour can be altered and messages can be entirely suppressed.

### 11.1 Creating new messages

All messages have to be created before they can be used. The text of messages is automatically wrapped to the length available in the console. As a result, formatting is only needed where it helps to show meaning. In particular, `\\\` may be used to force a new line and `\_` forces an explicit space. Additionally, `\{`, `\#`, `\}`, `\%` and `\~` can be used to produce the corresponding character.

Messages may be subdivided *by one level* using the `/` character. This is used within the message filtering system to allow for example the L<sup>A</sup>T<sub>E</sub>X kernel messages to belong to the module L<sup>A</sup>T<sub>E</sub>X while still being filterable at a more granular level. Thus for example

```
\msg_new:nnn { mymodule } { submodule / message } ...
```

will allow to filter out specifically messages from the `submodule`.

Some authors may find the need to include spaces as `\~` characters tedious. This can be avoided by locally resetting the category code of `_`.

```

\char_set_catcode_space:n { '\ }
\msg_new:nnn { foo } { bar }
{Some message text using '#1' and usual message shorthands \{ \ \ \}.}
\char_set_catcode_ignore:n { '\ }

```

although in general this may be confusing; simply writing the messages using ~ characters is the method favored by the team.

---

\msg\_new:nnnn

\msg\_new:nnee

\msg\_new:nnn

\msg\_new:nne

---

Updated: 2011-08-16

\msg\_new:nnnn {\⟨module⟩} {\⟨message⟩} {\⟨text⟩} {\⟨more text⟩}

Creates a ⟨message⟩ for a given ⟨module⟩. The message is defined to first give ⟨text⟩ and then ⟨more text⟩ if the user requests it. If no ⟨more text⟩ is available then a standard text is given instead. Within ⟨text⟩ and ⟨more text⟩ four parameters (#1 to #4) can be used: these will be supplied at the time the message is used. An error is raised if the ⟨message⟩ already exists.

---

\msg\_set:nnnn

\msg\_set:nnn

\msg\_gset:nnnn

---

\msg\_gset:nnn

\msg\_set:nnnn {\⟨module⟩} {\⟨message⟩} {\⟨text⟩} {\⟨more text⟩}

Sets up the text for a ⟨message⟩ for a given ⟨module⟩. The message is defined to first give ⟨text⟩ and then ⟨more text⟩ if the user requests it. If no ⟨more text⟩ is available then a standard text is given instead. Within ⟨text⟩ and ⟨more text⟩ four parameters (#1 to #4) can be used: these will be supplied at the time the message is used.

---

\msg\_if\_exist\_p:nn \* \msg\_if\_exist\_p:nn {\⟨module⟩} {\⟨message⟩}

\msg\_if\_exist:nnTF \* \msg\_if\_exist:nnTF {\⟨module⟩} {\⟨message⟩} {\⟨true code⟩} {\⟨false code⟩}

---

New: 2012-03-03 Tests whether the ⟨message⟩ for the ⟨module⟩ is currently defined.

## 11.2 Customizable information for message modules

---

\msg\_module\_name:n \* \msg\_module\_name:n {\⟨module⟩}

---

New: 2018-10-10 Expands to the public name of the ⟨module⟩ as defined by \g\_msg\_module\_name\_prop (or otherwise leaves the ⟨module⟩ unchanged).

---

\msg\_module\_type:n \* \msg\_module\_type:n {\⟨module⟩}

---

New: 2018-10-10 Expands to the description which applies to the ⟨module⟩, for example a Package or Class. The information here is defined in \g\_msg\_module\_type\_prop, and will default to Package if an entry is not present.

---

\g\_msg\_module\_name\_prop Provides a mapping between the module name used for messages, and that for documentation.

---

New: 2018-10-10

---

\g\_msg\_module\_type\_prop Provides a mapping between the module name used for messages, and that type of module. For example, for LATEX3 core messages, an empty entry is set here meaning that they are not described using the standard Package text.

## 11.3 Contextual information for messages

---

\msg\_line\_context: ★ \msg\_line\_context:

Prints the current line number when a message is given, and thus suitable for giving context to messages. The number itself is proceeded by the text `on line`.

---

\msg\_line\_number: ★ \msg\_line\_number:

Prints the current line number when a message is given.

---

\msg\_fatal\_text:n ★ \msg\_fatal\_text:n {<module>}

Produces the standard text

Fatal Package <module> Error

This function can be redefined to alter the language in which the message is given, using #1 as the name of the <module> to be included.

---

\msg\_critical\_text:n ★ \msg\_critical\_text:n {<module>}

Produces the standard text

Critical Package <module> Error

This function can be redefined to alter the language in which the message is given, using #1 as the name of the <module> to be included.

---

\msg\_error\_text:n ★ \msg\_error\_text:n {<module>}

Produces the standard text

Package <module> Error

This function can be redefined to alter the language in which the message is given, using #1 as the name of the <module> to be included.

---

\msg\_warning\_text:n ★ \msg\_warning\_text:n {<module>}

Produces the standard text

Package <module> Warning

This function can be redefined to alter the language in which the message is given, using #1 as the name of the <module> to be included. The <type> of <module> may be adjusted: Package is the standard outcome: see \msg\_module\_type:n.

---

\msg\_info\_text:n ★ \msg\_info\_text:n {<module>}

Produces the standard text:

Package <module> Info

This function can be redefined to alter the language in which the message is given, using #1 as the name of the <module> to be included. The <type> of <module> may be adjusted: Package is the standard outcome: see \msg\_module\_type:n.

---

```
\msg_see_documentation_text:n ∗ \msg_see_documentation_text:n {⟨module⟩}
```

---

Updated: 2018-09-30

---

Produces the standard text

See the ⟨module⟩ documentation for further information.

This function can be redefined to alter the language in which the message is given, using #1 as the name of the ⟨module⟩ to be included. The name of the ⟨module⟩ is produced using \msg\_module\_name:n.

## 11.4 Issuing messages

Messages behave differently depending on the message class. In all cases, the message may be issued supplying 0 to 4 arguments. If the number of arguments supplied here does not match the number in the definition of the message, extra arguments are ignored, or empty arguments added (of course the sense of the message may be impaired). The four arguments are converted to strings before being added to the message text: the e-type variants should be used to expand material. Note that this expansion takes place with the standard definitions in effect, which means that shorthands such as \~ or \\ are *not* available; instead one should use \iow\_char:N \~ and \iow\_newline:, respectively. The following message classes exist:

- **fatal**, ending the TeX run;
- **critical**, ending the file being input;
- **error**, interrupting the TeX run without ending it;
- **warning**, written to terminal and log file, for important messages that may require corrections by the user;
- **note** (less common than **info**) for important information messages written to the terminal and log file;
- **info** for normal information messages written to the log file only;
- **term** and **log** for un-decorated messages written to the terminal and log file, or to the log file only;
- **none** for suppressed messages.

---

```
\msg_fatal:nnnnnn          \msg_fatal:nnnnnnn {\module} {\message} {\arg one} {\arg two}
\msg_fatal:nneeee           {\arg three} {\arg four}
\msg_fatal:nnnnn
\msg_fatal:(nneee|nnnee)
\msg_fatal:nnnn
\msg_fatal:(nnVV|nnVn|nnnV|nnee|nnne)
\msg_fatal:nnn
\msg_fatal:(nnV|nne)
\msg_fatal:nn
```

Updated: 2012-08-11

Issues *<module>* error *<message>*, passing *<arg one>* to *<arg four>* to the text-creating functions. After issuing a fatal error the T<sub>E</sub>X run halts. No PDF file will be produced in this case (DVI mode runs may produce a truncated DVI file).

---

```
\msg_critical:nnnnnn          \msg_critical:nnnnnnn {\module} {\message} {\arg one} {\arg
\msg_critical:nneeee           two} {\arg three} {\arg four}
\msg_critical:nnnnn
\msg_critical:(nneee|nnnee)
\msg_critical:nnnn
\msg_critical:(nnVV|nnVn|nnnV|nnee|nnne)
\msg_critical:nnn
\msg_critical:(nnV|nne)
\msg_critical:nn
```

Updated: 2012-08-11

Issues *<module>* error *<message>*, passing *<arg one>* to *<arg four>* to the text-creating functions. After issuing a critical error, T<sub>E</sub>X stops reading the current input file. This may halt the T<sub>E</sub>X run (if the current file is the main file) or may abort reading a sub-file.

**T<sub>E</sub>Xhackers note:** The T<sub>E</sub>X `\endinput` primitive is used to exit the file. In particular, the rest of the current line remains in the input stream.

---

```
\msg_error:nnnnnn          \msg_error:nnnnnnn {\module} {\message} {\arg one} {\arg two}
\msg_error:nneeee           {\arg three} {\arg four}
\msg_error:nnnnn
\msg_error:(nneee|nnnee)
\msg_error:nnnn
\msg_error:(nnVV|nnVn|nnnV|nnee|nnne)
\msg_error:nnn
\msg_error:(nnV|nne)
\msg_error:nn
```

Updated: 2012-08-11

Issues *<module>* error *<message>*, passing *<arg one>* to *<arg four>* to the text-creating functions. The error interrupts processing and issues the text at the terminal. After user input, the run continues.

---

```
\msg_warning:nnnnnn          \msg_warning:nnnnnnn {\module} {\message} {\arg one} {\arg  
\\msg_warning:nneeee          two} {\arg three} {\arg four}  
\\msg_warning:nnnnn           \msg_warning:(nnnee|nnnee)  
\\msg_warning:nnnn            \msg_warning:(nnVV|nnVn|nnnV|nnee|nnne)  
\\msg_warning:nnn             \msg_warning:(nnV|nne)  
\\msg_warning:nn              \msg_warning:
```

---

Updated: 2012-08-11

Issues  $\langle module \rangle$  warning  $\langle message \rangle$ , passing  $\langle arg\ one \rangle$  to  $\langle arg\ four \rangle$  to the text-creating functions. The warning text is added to the log file and the terminal, but the TeX run is not interrupted.

---

```
\msg_note:nnnnnn          \msg_note:nnnnnnn {\module} {\message} {\arg one} {\arg two} {\arg  
\\msg_note:nneeee          three} {\arg four}  
\\msg_note:nnnnn           \msg_info:nnnnnn {\module} {\message} {\arg one} {\arg two} {\arg  
\\msg_note:(nneee|nnnee)   three} {\arg four}  
\\msg_note:nnnn            \msg_note:(nnVV|nnVn|nnnV|nnee|nnne)  
\\msg_note:nnn             \msg_note:(nnV|nne)  
\\msg_note:nn               \msg_info:nnnnnn  
\\msg_info:nneeee          \msg_info:(nneee|nnnee)  
\\msg_info:nnnn            \msg_info:(nnVV|nnVn|nnnV|nnee|nnne)  
\\msg_info:nnn             \msg_info:(nnV|nne)  
\\msg_info:nn
```

---

New: 2021-05-18

Issues  $\langle module \rangle$  information  $\langle message \rangle$ , passing  $\langle arg\ one \rangle$  to  $\langle arg\ four \rangle$  to the text-creating functions. For the more common  $\text{\msg_info:nnnnnn}$ , the information text is added to the log file only, while  $\text{\msg_note:nnnnnn}$  adds the info text to both the log file and the terminal. The TeX run is not interrupted.

---

```
\msg_term:nnnnnn
\msg_term:nneeee
\msg_term:nnnnn
\msg_term:(nneee|nnnee)
\msg_term:nnnn
\msg_term:(nnVV|nnVn|nnnV|nnee|nnne)
\msg_term:nnn
\msg_term:(nnV|nne)
\msg_term:nn
\msg_log:nnnnnn
\msg_log:nneeee
\msg_log:nnnnn
\msg_log:(nneee|nnnee)
\msg_log:nnnn
\msg_log:(nnVV|nnVn|nnnV|nnee|nnne)
\msg_log:nnn
\msg_log:(nnV|nne)
\msg_log:nn
```

---

Updated: 2012-08-11

Issues *<module>* information *<message>*, passing *<arg one>* to *<arg four>* to the text-creating functions. The output is briefer than `\msg_info:nnnnnn`, omitting for instance the module name. It is added to the log file by `\msg_log:nnnnnn` while `\msg_term:nnnnnn` also prints it on the terminal.

---

```
\msg_none:nnnnnn
\msg_none:nneeee
\msg_none:nnnnn
\msg_none:(nneee|nnnee)
\msg_none:nnnn
\msg_none:(nnVV|nnVn|nnnV|nnee|nnne)
\msg_none:nnn
\msg_none:(nnV|nne)
\msg_none:nn
```

---

Updated: 2012-08-11

Does nothing: used as a message class to prevent any output at all (see the discussion of message redirection).

### 11.4.1 Messages for showing material

---

```
\msg_show:nnnnnn          \msg_show:nnnnnnn {\module} {\message} {\arg one} {\arg two} {\arg three} {\arg four}
\msg_show:nneeee
\msg_show:nnnnn
\msg_show:(nneee|nnnee)
\msg_show:nnnn
\msg_show:(nnVV|nnVn|nnnV|nnee|nnne)
\msg_show:nnn
\msg_show:(nnV|nne)
\msg_show:nn
```

---

New: 2017-12-04

Issues *<module>* information *<message>*, passing *<arg one>* to *<arg four>* to the text-creating functions. The information text is shown on the terminal and the TeX run is interrupted in a manner similar to `\tl_show:n`. This is used in conjunction with `\msg_show_item:n` and similar functions to print complex variable contents completely. If the formatted text does not contain `>~` at the start of a line, an additional line `>~.` will be put at the end. In addition, a final period is added if not present.

---

```
* \seq_map_function:NN <seq> \msg_show_item:n
\msg_show_item_unbraced:n * \prop_map_function:NN <prop> \msg_show_item:nn
\msg_show_item:nn      *
\msg_show_item_unbraced:nn *
```

---

New: 2017-12-04

Used in the text of messages for `\msg_show:nnnnnn` to show or log a list of items or key-value pairs. The output of `\msg_show_item:n` produces a newline, the prefix `>`, two spaces, then the braced string representation of its argument. The two-argument versions separates the key and value using `=>`, and the unbraced versions don't print the surrounding braces.

These functions are suitable for usage with iterator functions like `\seq_map_function:NN`, `\prop_map_function:NN`, etc. For example, with a sequence `\l_tmpa_seq` containing `a`, `{b}` and `\c`,

```
\seq_map_function:NN \l_tmpa_seq \msg_show_item:n
```

would expand to three lines:

```
>_{a}
>_{b}
>_{\c}
```

### 11.4.2 Expandable error messages

In very rare cases it may be necessary to produce errors in an expansion-only context. The functions in this section should only be used if there is no alternative approach using `\msg_error:nnnnnn` or other non-expandable commands from the previous section. Despite having a similar interface as non-expandable messages, expandable errors must be handled internally very differently from normal error messages, as none of the tools

to print to the terminal or the log file are expandable. As a result, short-hands such as `\{` or `\\"` do not work, and messages must be very short (with default settings, they are truncated after approximately 50 characters). It is advisable to ensure that the message is understandable even when truncated, by putting the most important information up front. Another particularity of expandable messages is that they cannot be redirected or turned off by the user.

---

```
\msg_expandable_error:nnnnn * \msg_expandable_error:nnnnn {{module}} {{message}} {{arg one}} {{arg
\msg_expandable_error:nnfff * two}} {{arg three}} {{arg four}}
\msg_expandable_error:nnnn * *
\msg_expandable_error:nnff * *
\msg_expandable_error:nnnn * *
\msg_expandable_error:nnff * *
\msg_expandable_error:nnn * *
\msg_expandable_error:nmf * *
\msg_expandable_error:nn * *
```

---

New: 2015-08-06

Updated: 2019-02-28

---

Issues an “Undefined error” message from TEX itself using the undefined control sequence `\????` then prints “! `<module>`: ”`<error message>`, which should be short. With default settings, anything beyond approximately 60 characters long (or bytes in some engines) is cropped. A leading space might be removed as well.

## 11.5 Redirecting messages

Each message has a “name”, which can be used to alter the behaviour of the message when it is given. Thus we might have

```
\msg_new:nnnn { module } { my-message } { Some~text } { Some~more~text }
```

to define a message, with

```
\msg_error:nn { module } { my-message }
```

when it is used. With no filtering, this raises an error. However, we could alter the behaviour with

```
\msg_redirect_class:nn { error } { warning }
```

to turn all errors into warnings, or with

```
\msg_redirect_module:nnn { module } { error } { warning }
```

to alter only messages from that module, or even

```
\msg_redirect_name:nnn { module } { my-message } { warning }
```

to target just one message. Redirection applies first to individual messages, then to messages from one module and finally to messages of one class. Thus it is possible to select out an individual message for special treatment even if the entire class is already redirected.

Multiple redirections are possible. Redirections can be cancelled by providing an empty argument for the target class. Redirection to a missing class raises an error

immediately. Infinite loops are prevented by eliminating the redirection starting from the target of the redirection that caused the loop to appear. Namely, if redirections are requested as  $A \rightarrow B$ ,  $B \rightarrow C$  and  $C \rightarrow A$  in this order, then the  $A \rightarrow B$  redirection is cancelled.

---

```
\msg_redirect_class:nn \msg_redirect_class:nn {<class one>} {<class two>}
```

Updated: 2012-04-27

Changes the behaviour of messages of *<class one>* so that they are processed using the code for those of *<class two>*. Each *<class>* can be one of **fatal**, **critical**, **error**, **warning**, **note**, **info**, **term**, **log**, **none**.

---

```
\msg_redirect_module:nnn \msg_redirect_module:nnn {<module>} {<class one>} {<class two>}
```

Updated: 2012-04-27

Redirects message of *<class one>* for *<module>* to act as though they were from *<class two>*. Messages of *<class one>* from sources other than *<module>* are not affected by this redirection. This function can be used to make some messages “silent” by default. For example, all of the **warning** messages of *<module>* could be turned off with:

```
\msg_redirect_module:nnn { module } { warning } { none }
```

---

```
\msg_redirect_name:nnn \msg_redirect_name:nnn {<module>} {<message>} {<class>}
```

Updated: 2012-04-27

Redirects a specific *<message>* from a specific *<module>* to act as a member of *<class>* of messages. No further redirection is performed. This function can be used to make a selected message “silent” without changing global parameters:

```
\msg_redirect_name:nnn { module } { annoying-message } { none }
```

## Chapter 12

# The `I3file` module File and I/O operations

This module provides functions for working with external files. Some of these functions apply to an entire file, and have prefix `\file_...`, while others are used to work with files on a line by line basis and have prefix `\ior_...` (reading) or `\iow_...` (writing).

It is important to remember that when reading external files `TEX` attempts to locate them using both the operating system path and entries in the `TEX` file database (most `TEX` systems use such a database). Thus the “current path” for `TEX` is somewhat broader than that for other programs.

For functions which expect a `<file name>` argument, this argument may contain both literal items and expandable content, which should on full expansion be the desired file name. Active characters (as declared in `\l_char_active_seq`) are *not* expanded, allowing the direct use of these in file names. Quote tokens ("") are not permitted in file names as they are reserved for internal use by some `TEX` primitives.

Spaces are trimmed at the beginning and end of the file name: this reflects the fact that some file systems do not allow or interact unpredictably with spaces in these positions. When no extension is given, this will trim spaces from the start of the name only.

### 12.1 Input–output stream management

As `TEX` engines have a limited number of input and output streams, direct use of the streams by the programmer is not supported in `LATEX3`. Instead, an internal pool of streams is maintained, and these are allocated and deallocated as needed by other modules. As a result, the programmer should close streams when they are no longer needed, to release them for other processes.

Note that I/O operations are global: streams should all be declared with global names and treated accordingly.

---

`\ior_new:N` `\ior_new:N <stream>`  
`\ior_new:c` `\iow_new:N <stream>`  
`\iow_new:N` Globally reserves the name of the *<stream>*, either for reading or for writing as appropriate. The *<stream>* is not opened until the appropriate `\..._open:Nn` function is used.  
New: 2011-09-26  
Updated: 2011-12-27

Attempting to use a *<stream>* which has not been opened is an error, and the *<stream>* will behave as the corresponding `\c_term_`....

---

`\ior_open:Nn` `\ior_open:Nn <stream> {{file name}}`  
`\ior_open:cn` Opens *<file name>* for reading using *<stream>* as the control sequence for file access. If the *<stream>* was already open it is closed before the new operation begins. The *<stream>* is available for access immediately and will remain allocated to *<file name>* until a `\ior_close:N` instruction is given or the TeX run ends. If the file is not found, an error is raised.  
Updated: 2012-02-10

---

`\ior_open:NnTF` `\ior_open:NnTF <stream> {{file name}} {{true code}} {{false code}}`  
`\ior_open:cnTF` Opens *<file name>* for reading using *<stream>* as the control sequence for file access. If the *<stream>* was already open it is closed before the new operation begins. The *<stream>* is available for access immediately and will remain allocated to *<file name>* until a `\ior_close:N` instruction is given or the TeX run ends. The *<true code>* is then inserted into the input stream. If the file is not found, no error is raised and the *<false code>* is inserted into the input stream.  
New: 2013-01-12

---

`\iow_open:Nn` `\iow_open:Nn <stream> {{file name}}`  
`\iow_open:(NV|cn|cV)` Opens *<file name>* for writing using *<stream>* as the control sequence for file access. If the *<stream>* was already open it is closed before the new operation begins. The *<stream>* is available for access immediately and will remain allocated to *<file name>* until a `\iow_close:N` instruction is given or the TeX run ends. Opening a file for writing clears any existing content in the file (*i.e.* writing is *not* additive).  
Updated: 2012-02-09

---

`\ior_shell_open:Nn` `\ior_shell_open:Nn <stream> {{shell command}}`  
New: 2019-05-08

Opens the *pseudo-file* created by the output of the *<shell command>* for reading using *<stream>* as the control sequence for access. If the *<stream>* was already open it is closed before the new operation begins. The *<stream>* is available for access immediately and will remain allocated to *<shell command>* until a `\ior_close:N` instruction is given or the TeX run ends. If piped system calls are disabled an error is raised.

For details of handling of the *<shell command>*, see `\sys_get_shell:nnNTF`.

---

`\iow_shell_open:Nn` `\iow_shell_open:Nn <stream> {{shell command}}`  
New: 2023-05-25

Opens the *pseudo-file* created by the output of the *<shell command>* for writing using *<stream>* as the control sequence for access. If the *<stream>* was already open it is closed before the new operation begins. The *<stream>* is available for access immediately and will remain allocated to *<shell command>* until a `\iow_close:N` instruction is given or the TeX run ends. If piped system calls are disabled an error is raised.

For details of handling of the *<shell command>*, see `\sys_get_shell:nnNTF`.

---

\ior_close:N	\ior_close:N <i>stream</i>
\ior_close:c	\iow_close:N <i>stream</i>
\iow_close:N	Closes the <i>stream</i> . Streams should always be closed when they are finished with as this
\iow_close:c	ensures that they remain available to other programmers.

---

Updated: 2012-07-31

---

\ior_show:N	\ior_show:N <i>stream</i>
\ior_show:c	\ior_log:N <i>stream</i>
\ior_log:N	\iow_show:N <i>stream</i>
\ior_log:c	\iow_log:N <i>stream</i>
\iow_show:N	Display (to the terminal or log file) the file name associated to the (read or write) <i>stream</i> .
\iow_show:c	
\iow_log:N	
\iow_log:c	

---

New: 2021-05-11

---

\ior_show_list:	\ior_show_list:
\ior_log_list:	\ior_log_list:
\iow_show_list:	\iow_show_list:
\iow_log_list:	\iow_log_list:

---

New: 2017-06-27 Display (to the terminal or log file) a list of the file names associated with each open (read or write) stream. This is intended for tracking down problems.

### 12.1.1 Reading from files

Reading from files and reading from the terminal are separate processes in `expl3`. The functions `\ior_get:NN` and `\ior_str_get:NN`, and their branching equivalents, are designed to work with *files*.

---

```
\ior_get:NN  \ior_get:NN <stream> <token list variable>
\ior_get:NNTF \ior_get:NNTF <stream> <token list variable> <true code> <false code>
```

---

New: 2012-06-24 Updated: 2019-03-23 Function that reads one or more lines (until an equal number of left and right braces are found) from the file input *<stream>* and stores the result locally in the *<token list>* variable. The material read from the *<stream>* is tokenized by  $\text{\TeX}$  according to the category codes and  $\text{\endlinechar}$  in force when the function is used. Assuming normal settings, any lines which do not end in a comment character % have the line ending converted to a space, so for example input

```
a b c
```

results in a token list  $\text{a}_{\text{\_}}\text{b}_{\text{\_}}\text{c}_{\text{\_}}$ . Any blank line is converted to the token  $\text{\par}$ . Therefore, blank lines can be skipped by using a test such as

```
\ior_get:NN \l_my_stream \l_tmpa_t1
\tl_set:Nn \l_tmpb_t1 { \par }
\tl_if_eq:NNF \l_tmpa_t1 \l_tmpb_t1
...
```

Also notice that if multiple lines are read to match braces then the resulting token list can contain  $\text{\par}$  tokens. In the non-branching version, where the *<stream>* is not open the *<tl var>* is set to  $\text{\q_no_value}$ .

**TeXhackers note:** This protected macro is a wrapper around the  $\text{\TeX}$  primitive  $\text{\read}$ . Regardless of settings,  $\text{\TeX}$  replaces trailing space and tab characters (character codes 32 and 9) in each line by an end-of-line character (character code  $\text{\endlinechar}$ , omitted if  $\text{\endlinechar}$  is negative or too large) before turning characters into tokens according to current category codes. With default settings, spaces appearing at the beginning of lines are also ignored.

---

```
\ior_str_get:NN  \ior_str_get:NN <stream> <token list variable>
\ior_str_get:NNTF \ior_str_get:NNTF <stream> <token list variable> <true code> <false code>
```

---

New: 2016-12-04 Updated: 2019-03-23 Function that reads one line from the file input *<stream>* and stores the result locally in the *<token list>* variable. The material is read from the *<stream>* as a series of tokens with category code 12 (other), with the exception of space characters which are given category code 10 (space). Multiple whitespace characters are retained by this process. It always only reads one line and any blank lines in the input result in the *<token list variable>* being empty. Unlike  $\text{\ior_get:NN}$ , line ends do not receive any special treatment. Thus input

```
a b c
```

results in a token list  $\text{a}_{\text{\_}}\text{b}_{\text{\_}}\text{c}_{\text{\_}}$  with the letters  $\text{a}$ ,  $\text{b}$ , and  $\text{c}$  having category code 12. In the non-branching version, where the *<stream>* is not open the *<tl var>* is set to  $\text{\q_no_value}$ .

**TeXhackers note:** This protected macro is a wrapper around the  $\varepsilon\text{-}\text{\TeX}$  primitive  $\text{\readline}$ . Regardless of settings,  $\text{\TeX}$  removes trailing space and tab characters (character codes 32 and 9). However, the end-line character normally added by this primitive is not included in the result of  $\text{\ior_str_get:NN}$ .

All mappings are done at the current group level, *i.e.* any local assignments made by the *<function>* or *<code>* discussed below remain in effect after the loop.

---

`\ior_map_inline:Nn` `\ior_map_inline:Nn <stream> {<inline function>}`

New: 2012-02-11 Applies the *<inline function>* to each set of *<lines>* obtained by calling `\ior_get:NN` until reaching the end of the file. TEX ignores any trailing new-line marker from the file it reads. The *<inline function>* should consist of code which receives the *<line>* as #1.

---

`\ior_str_map_inline:Nn` `\ior_str_map_inline:Nn <stream> {<inline function>}`

New: 2012-02-11 Applies the *<inline function>* to every *<line>* in the *<stream>*. The material is read from the *<stream>* as a series of tokens with category code 12 (other), with the exception of space characters which are given category code 10 (space). The *<inline function>* should consist of code which receives the *<line>* as #1. Note that TEX removes trailing space and tab characters (character codes 32 and 9) from every line upon input. TEX also ignores any trailing new-line marker from the file it reads.

---

`\ior_map_variable>NNn` `\ior_map_variable>NNn <stream> {<tl var>} {<code>}`

New: 2019-01-13 For each set of *<lines>* obtained by calling `\ior_get:NN` until reaching the end of the file, stores the *<lines>* in the *<tl var>* then applies the *<code>*. The *<code>* will usually make use of the *<variable>*, but this is not enforced. The assignments to the *<variable>* are local. Its value after the loop is the last set of *<lines>*, or its original value if the *<stream>* is empty. TEX ignores any trailing new-line marker from the file it reads. This function is typically faster than `\ior_map_inline:Nn`.

---

`\ior_str_map_variable>NNn` `\ior_str_map_variable>NNn <stream> {<variable>} {<code>}`

New: 2019-01-13 For each *<line>* in the *<stream>*, stores the *<line>* in the *<variable>* then applies the *<code>*. The material is read from the *<stream>* as a series of tokens with category code 12 (other), with the exception of space characters which are given category code 10 (space). The *<code>* will usually make use of the *<variable>*, but this is not enforced. The assignments to the *<variable>* are local. Its value after the loop is the last *<line>*, or its original value if the *<stream>* is empty. Note that TEX removes trailing space and tab characters (character codes 32 and 9) from every line upon input. TEX also ignores any trailing new-line marker from the file it reads. This function is typically faster than `\ior_str_map_inline:Nn`.

---

`\ior_map_break:` `\ior_map_break:`

New: 2012-06-29 Used to terminate a `\ior_map_...` function before all lines from the *<stream>* have been processed. This normally takes place within a conditional statement, for example

```
\ior_map_inline:Nn \l_my_ior
{
    \str_if_eq:nnTF { #1 } { bingo }
        { \ior_map_break: }
    {
        % Do something useful
    }
}
```

Use outside of a `\ior_map_...` scenario leads to low level TEX errors.

**TEXhackers note:** When the mapping is broken, additional tokens may be inserted before further items are taken from the input stream. This depends on the design of the mapping function.

---

```
\ior_map_break:n \ior_map_break:n {<code>}
```

---

New: 2012-06-29 Used to terminate a `\ior_map_...` function before all lines in the `<stream>` have been processed, inserting the `<code>` after the mapping has ended. This normally takes place within a conditional statement, for example

```
\ior_map_inline:Nn \l_my_iор
{
  \str_if_eq:nnTF { #1 } { bingo }
    { \ior_map_break:n { <code> } }
  {
    % Do something useful
  }
}
```

Use outside of a `\ior_map_...` scenario leads to low level T<sub>E</sub>X errors.

**TeXhackers note:** When the mapping is broken, additional tokens may be inserted before the `<code>` is inserted into the input stream. This depends on the design of the mapping function.

---

```
\ior_if_eof_p:N * \ior_if_eof_p:N <stream>
\ior_if_eof:NF * \ior_if_eof:NF <stream> {<true code>} {<false code>}
```

---

Updated: 2012-02-10 Tests if the end of a file `<stream>` has been reached during a reading operation. The test also returns a `true` value if the `<stream>` is not open.

### 12.1.2 Reading from the terminal

---

```
\ior_get_term:nN \ior_get_term:nN <prompt> <token list variable>
```

---

```
\ior_str_get_term:nN
```

---

New: 2019-03-23 Function that reads one or more lines (until an equal number of left and right braces are found) from the terminal and stores the result locally in the `<token list>` variable. Tokenization occurs as described for `\ior_get:NN` or `\ior_str_get:NN`, respectively. When the `<prompt>` is empty, T<sub>E</sub>X will wait for input without any other indication: typically the programmer will have provided a suitable text using e.g. `\iow_term:n`. Where the `<prompt>` is given, it will appear in the terminal followed by an `=`, e.g.

```
prompt=
```

### 12.1.3 Writing to files

---

```
\iow_now:Nn \iow_now:Nn <stream> {<tokens>}
```

---

```
\iow_now:(NV|Ne|cn|cV|ce)
```

---

Updated: 2012-06-05 This function writes `<tokens>` to the specified `<stream>` immediately (*i.e.* the write operation is called on expansion of `\iow_now:Nn`).

---

```
\iow_log:n \iow_log:n {<tokens>}
```

---

```
\iow_log:e
```

This function writes the given `<tokens>` to the log (transcript) file immediately: it is a dedicated version of `\iow_now:Nn`.

---

`\iow_term:n \iow_term:n {⟨tokens⟩}`

`\iow_term:e` This function writes the given *⟨tokens⟩* to the terminal file immediately: it is a dedicated version of `\iow_now:Nn`.

---

`\iow_shipout:Nn \iow_shipout:Nn {⟨stream⟩ {⟨tokens⟩}}`

`\iow_shipout:(Ne|cn|ce)` This function writes *⟨tokens⟩* to the specified *⟨stream⟩* when the current page is finalised (*i.e.* at shipout). The *e*-type variants expand the *⟨tokens⟩* at the point where the function is used but *not* when the resulting tokens are written to the *⟨stream⟩* (*cf.* `\iow_shipout_e:Nn`).

**TeXhackers note:** When using `expl3` with a format other than L<sup>A</sup>T<sub>E</sub>X, new line characters inserted using `\iow_newline:` or using the line-wrapping code `\iow_wrap:nnnN` are not recognized in the argument of `\iow_shipout:Nn`. This may lead to the insertion of additional unwanted line-breaks.

---

`\iow_shipout_e:Nn \iow_shipout_e:Nn {⟨stream⟩ {⟨tokens⟩}}`

`\iow_shipout_e:(Ne|cn|ce)` This function writes *⟨tokens⟩* to the specified *⟨stream⟩* when the current page is finalised (*i.e.* at shipout). The *⟨tokens⟩* are expanded at the time of writing in addition to any expansion when the function is used. This makes these functions suitable for including material finalised during the page building process (such as the page number integer).

Updated: 2023-09-17

**TeXhackers note:** This is a wrapper around the TeX primitive `\write`. When using `expl3` with a format other than L<sup>A</sup>T<sub>E</sub>X, new line characters inserted using `\iow_newline:` or using the line-wrapping code `\iow_wrap:nnnN` are not recognized in the argument of `\iow_shipout:Nn`. This may lead to the insertion of additional unwanted line-breaks.

---

`\iow_char:N ∗ \iow_char:N {⟨char⟩}`

Inserts *⟨char⟩* into the output stream. Useful when trying to write difficult characters such as %, {, }, etc. in messages, for example:

```
\iow_now:Ne \g_my_iow { \iow_char:N {\text \iow_char:N } }
```

The function has no effect if writing is taking place without expansion (*e.g.* in the second argument of `\iow_now:Nn`).

---

`\iow_newline: ∗ \iow_newline:`

Function to add a new line within the *⟨tokens⟩* written to a file. The function has no effect if writing is taking place without expansion (*e.g.* in the second argument of `\iow_now:Nn`).

**TeXhackers note:** When using `expl3` with a format other than L<sup>A</sup>T<sub>E</sub>X, the character inserted by `\iow_newline:` is not recognized by TeX, which may lead to the insertion of additional unwanted line-breaks. This issue only affects `\iow_shipout:Nn`, `\iow_shipout_e:Nn` and direct uses of primitive operations.

### 12.1.4 Wrapping lines in output

---

`\iow_wrap:nnN \iow_wrap:nnN {\langle text\rangle} {\langle run-on text\rangle} {\langle set up\rangle} {⟨function⟩}`  
`\iow_wrap:nenN`

New: 2012-06-28  
Updated: 2017-12-04

This function wraps the *⟨text⟩* to a fixed number of characters per line. At the start of each line which is wrapped, the *⟨run-on text⟩* is inserted. The line character count targeted is the value of `\l_iow_line_count_int` minus the number of characters in the *⟨run-on text⟩* for all lines except the first, for which the target number of characters is simply `\l_iow_line_count_int` since there is no run-on text. The *⟨text⟩* and *⟨run-on text⟩* are exhaustively expanded by the function, with the following substitutions:

- `\\\` or `\iow_newline`: may be used to force a new line,
- `\_` may be used to represent a forced space (for example after a control sequence),
- `\#, \%, \{, \}, \~` may be used to represent the corresponding character,
- `\iow_wrap_allow_break`: may be used to allow a line-break without inserting a space,
- `\iow_indent:n` may be used to indent a part of the *⟨text⟩* (not the *⟨run-on text⟩*).

Additional functions may be added to the wrapping by using the *⟨set up⟩*, which is executed before the wrapping takes place: this may include overriding the substitutions listed.

Any expandable material in the *⟨text⟩* which is not to be expanded on wrapping should be converted to a string using `\token_to_str:N`, `\tl_to_str:n`, `\tl_to_str:N`, etc.

The result of the wrapping operation is passed as a braced argument to the *⟨function⟩*, which is typically a wrapper around a write operation. The output of `\iow_wrap:nnN` (*i.e.* the argument passed to the *⟨function⟩*) consists of characters of category “other” (category code 12), with the exception of spaces which have category “space” (category code 10). This means that the output does *not* expand further when written to a file.

**TEXhackers note:** Internally, `\iow_wrap:nnN` carries out an e-type expansion on the *⟨text⟩* to expand it. This is done in such a way that `\exp_not:N` or `\exp_not:n` could be used to prevent expansion of material. However, this is less conceptually clear than conversion to a string, which is therefore the supported method for handling expandable material in the *⟨text⟩*.

---

`\iow_wrap_allow_break: \iow_wrap_allow_break:`

New: 2023-04-25

In the first argument of `\iow_wrap:nnN` (for instance in messages), inserts a break-point that allows a line break. If no break occurs, this function adds nothing to the output.

---

`\iow_indent:n \iow_indent:n {\langle text\rangle}`

New: 2011-09-21

In the first argument of `\iow_wrap:nnN` (for instance in messages), indents *⟨text⟩* by four spaces. This function does not cause a line break, and only affects lines which start within the scope of the *⟨text⟩*. In case the indented *⟨text⟩* should appear on separate lines from the surrounding text, use `\\\` to force line breaks.

---

`\l_iow_line_count_int` The maximum number of characters in a line to be written by the `\iow_wrap:nnN` function. This value depends on the  $\text{\TeX}$  system in use: the standard value is 78, which is typically correct for unmodified  $\text{\TeX}$  Live and MiK $\text{\TeX}$  systems.

New: 2012-06-24

### 12.1.5 Constant input–output streams, and variables

---

`\g_tmpa_iow` Scratch input stream for global use. These are never used by the kernel code, and so are safe for use with any  $\text{\LaTeX}3$ -defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

New: 2017-12-11

---

`\c_log_iow` Constant output streams for writing to the log and to the terminal (plus the log), respectively.

`\c_term_iow`

---

`\g_tmpa_iow` Scratch output stream for global use. These are never used by the kernel code, and so are safe for use with any  $\text{\LaTeX}3$ -defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

New: 2017-12-11

### 12.1.6 Primitive conditionals

---

```
\if_eof:w ∗ \if_eof:w ⟨stream⟩
    ⟨true code⟩
\else:
    ⟨false code⟩
\fi:
```

Tests if the `⟨stream⟩` returns “end of file”, which is true for non-existent files. The `\else:` branch is optional.

**$\text{\TeX}$ hackers note:** This is the  $\text{\TeX}$  primitive `\ifeof`.

## 12.2 File operations

### 12.2.1 Basic file operations

---

`\g_file_curr_dir_str` Contain the directory, name and extension of the current file. The directory is empty if the file was loaded without an explicit path (*i.e.* if it is in the  $\text{\TeX}$  search path), and does *not* end in / other than the case that it is exactly equal to the root directory. The `⟨name⟩` and `⟨ext⟩` parts together make up the file name, thus the `⟨name⟩` part may be thought of as the “job name” for the current file.

`\g_file_curr_name_str`

`\g_file_curr_ext_str`

New: 2017-06-21

Note that  $\text{\TeX}$  does not provide information on the `⟨dir⟩` and `⟨ext⟩` part for the main (top level) file and that this file always has empty `⟨dir⟩` and `⟨ext⟩` components. Also, the `⟨name⟩` here will be equal to `\c_sys_jobname_str`, which may be different from the real file name (if set using `--jobname`, for example).

---

`\l_file_search_path_seq` Each entry is the path to a directory which should be searched when seeking a file. Each path can be relative or absolute, and need not include the trailing slash. Spaces need not be quoted.

New: 2017-06-18  
Updated: 2023-06-15

---

**TeXhackers note:** When working as a package in L<sup>A</sup>T<sub>E</sub>X 2<sub>&</sub>, `expl3` will automatically append the current `\input@path` to the set of values from `\l_file_search_path_seq`.

---

`\file_if_exist_p:n` ★ `\file_if_exist_p:n {<file name>}`  
`\file_if_exist_p:V` ★ `\file_if_exist:nTF {<file name>} {<true code>} {<false code>}`  
`\file_if_exist:nTF` ★ Expands the argument of the `\file name` to give a string, then searches for this string  
`\file_if_exist:VTF` ★ using the current TeX search path and the additional paths controlled by `\l_file_search_path_seq`.

Updated: 2023-09-18

---

### 12.2.2 Information about files and file contents

Functions in this section return information about files as `expl3 str` data, *except* that the non-expandable functions set their return *token list* to `\q_no_value` if the file requested is not found. As such, comparison of file names, hashes, sizes, etc., should use `\str_if_eq:nnTF` rather than `\tl_if_eq:nnTF` and so on.

---

`\file_hex_dump:n` ★ `\file_hex_dump:n {<file name>}`  
`\file_hex_dump:V` ★ `\file_hex_dump:nnn {<file name>} {<start index>} {<end index>}`  
`\file_hex_dump:nnn` ★ Searches for `<file name>` using the current TeX search path and the additional paths controlled by `\l_file_search_path_seq`. It then expands to leave the hexadecimal dump of the file content in the input stream. The file is read as bytes, which means that in contrast to most TeX behaviour there will be a difference in result depending on the line endings used in text files. The same file will produce the same result between different engines: the algorithm used is the same in all cases. When the file is not found, the result of expansion is empty. The `{<start index>}` and `{<end index>}` values work as described for `\str_range:nnn`.

New: 2019-11-19

---

`\file_get_hex_dump:nN` `\file_get_hex_dump:nN {<file name>} {tl var}`  
`\file_get_hex_dump:VN` `\file_get_hex_dump:nnnN {<file name>} {<start index>} {<end index>} {tl var}`  
`\file_get_hex_dump:nTF`  
`\file_get_hex_dump:VNTF`  
`\file_get_hex_dump:nnnn`  
`\file_get_hex_dump:Vnnn`  
`\file_get_hex_dump:nnnnTF`  
`\file_get_hex_dump:VnnNTF`

Sets the `{tl var}` to the result of applying `\file_hex_dump:n/\file_hex_dump:nnn` to the `<file>`. If the file is not found, the `{tl var}` will be set to `\q_no_value`.

New: 2019-11-19

---

<code>\file_mdfive_hash:n</code> ★	<code>\file_mdfive_hash:n {&lt;file name&gt;}</code>	
<code>\file_mdfive_hash:V</code> ★		Sets the <code>&lt;tl var&gt;</code> to the result of applying <code>\file_mdfive_hash:n</code> to the <code>&lt;file&gt;</code> . If the file is not found, the <code>&lt;tl var&gt;</code> will be set to <code>\q_no_value</code> .

<code>\file_get_timestamp:VNTF</code>		
New: 2017-07-09		
Updated: 2019-02-16		

---

```
\file_compare_timestamp_p:nNn      * \file_compare_timestamp_p:nNn {\(file-1)} <comparator>
\file_compare_timestamp_p:(nNV|VNn|VNV) * {\(file-2)}
\file_compare_timestamp:nNnTF       * \file_compare_timestamp:nNnTF {\(file-1)} <comparator>
\file_compare_timestamp:(nNV|VNn|VNV)TF * {\(file-2)} {\(true code)} {\(false code)}
```

New: 2019-05-13

Updated: 2019-09-20

---

Compares the file stamps on the two *files* as indicated by the *comparator*, and inserts either the *true code* or *false case* as required. A file which is not found is treated as older than any file which is found. This allows for example the construct

```
\file_compare_timestamp:nNnT { source-file } > { derived-file }
{
    % Code to regenerate derived file
}
```

to work when the derived file is entirely absent. The timestamp of two absent files is regarded as different. This is not available in older versions of Xe<sub>T</sub>E<sub>X</sub>.

---

```
\file_get_full_name:nN      \file_get_full_name:nN {\(file name)} {\(tl)}
\file_get_full_name:VN      \file_get_full_name:nNTF {\(file name)} {\(tl)} {\(true code)} {\(false code)}
\file_get_full_name:nNTF
\file_get_full_name:VNTF
```

Searches for *file name* in the path as detailed for `\file_if_exist:nTF`, and if found sets the *tl var* the fully-qualified name of the file, *i.e.* the path and file name. This includes an extension `.tex` when the given *file name* has no extension but the file found has that extension. In the non-branching version, the *tl var* will be set to `\q_no_value` in the case that the file does not exist.

---

```
\file_full_name:n ☆ \file_full_name:n {\(file name)}
```

```
\file_full_name:V ☆
```

New: 2019-09-03

Searches for *file name* in the path as detailed for `\file_if_exist:nTF`, and if found leaves the fully-qualified name of the file, *i.e.* the path and file name, in the input stream. This includes an extension `.tex` when the given *file name* has no extension but the file found has that extension. If the file is not found on the path, the expansion is empty.

---

```
\file_parse_full_name:nNNN \file_parse_full_name:nNNN {\(full name)} {\(dir)} {\(name)} {\(ext)}
```

```
\file_parse_full_name:VNNN
```

New: 2017-06-23

Updated: 2020-06-24

---

- The *(dir)*: everything up to the last / (path separator) in the *(file path)*. As with system PATH variables and related functions, the *(dir)* does *not* include the trailing / unless it points to the root directory. If there is no path (only a file name), *(dir)* is empty.
- The *(name)*: everything after the last / up to the last ., where both of those characters are optional. The *(name)* may contain multiple . characters. It is empty if *(full name)* consists only of a directory name.
- The *(ext)*: everything after the last . (including the dot). The *(ext)* is empty if there is no . after the last /.

Before parsing, the *(full name)* is expanded until only non-expandable tokens remain, except that active characters are also not expanded. Quotes ("") are invalid in file names and are discarded from the input.

---

`\file_parse_full_name:n` \* `\file_parse_full_name:n` {*full name*}  
`\file_parse_full_name:v` \* Parses the *full name* as described for `\file_parse_full_name:nNNN`, and leaves *dir*,  
New: 2020-06-24 *name*, and *ext* in the input stream, each inside a pair of braces.

---

`\file_parse_full_name_apply:nN` \* `\file_parse_full_name_apply:nN` {*full name*} *function*  
`\file_parse_full_name_apply:VN` \*

New: 2020-06-24

Parses the *full name* as described for `\file_parse_full_name:nNNN`, and passes *dir*, *name*, and *ext* as arguments to *function*, as an n-type argument each, in this order.

### 12.2.3 Accessing file contents

---

`\file_get:nnN` `\file_get:nnN` {*file name*} {*setup*} *tl*  
`\file_get:VnN` `\file_get:nnNTF` {*file name*} {*setup*} *tl* {*true code*} {*false code*}  
`\file_get:nnNTF` Defines *tl* to the contents of *file name*. Category codes may need to be set appropriately via the *setup* argument. The non-branching version sets the *tl* to `\q_no_value` if the file is not found. The branching version runs the *true code* after the assignment to *tl* if the file is found, and *false code* otherwise. The file content will be tokenized using the current category code régime,  
New: 2019-01-16  
Updated: 2019-02-16

---

`\file_input:n` `\file_input:n` {*file name*}  
`\file_input:V` Searches for *file name* in the path as detailed for `\file_if_exist:nTF`, and if found reads in the file as additional L<sup>A</sup>T<sub>E</sub>X source. All files read are recorded for information and the file name stack is updated by this function. An error is raised if the file is not found.  
Updated: 2017-06-26

---

`\file_input_raw:n` \* `\file_input_raw:n` {*file name*}  
`\file_input_raw:V` \* Searches for *file name* in the path as detailed for `\file_if_exist:nTF`, and if found reads in the file as additional T<sub>E</sub>X source. No data concerning the file is tracked. If the file is not found, no action is taken.  
New: 2023-05-18

---

**TEXhackers note:** This function is intended only for contexts where files must be read purely by expansion, for example at the start of a table cell in an `\halign`.

---

`\file_if_exist_input:n` `\file_if_exist_input:n` {*file name*}  
`\file_if_exist_input:V` `\file_if_exist_input:nF` {*file name*} {*false code*}  
`\file_if_exist_input:nF` Searches for *file name* using the current T<sub>E</sub>X search path and the additional paths included in `\l_file_search_path_seq`. If found then reads in the file as additional L<sup>A</sup>T<sub>E</sub>X source as described for `\file_input:n`, otherwise inserts the *false code*. Note that these functions do not raise an error if the file is not found, in contrast to `\file_input:n`.  
New: 2014-07-02

---

---

```
\file_input_stop: \file_input_stop:
```

New: 2017-07-07 Ends the reading of a file started by `\file_input:n` or similar before the end of the file is reached. Where the file reading is being terminated due to an error, `\msg_critical:nn(nn)` should be preferred.

**TeXhackers note:** This function must be used on a line on its own: TeX reads files line-by-line and so any additional tokens in the “current” line will still be read.

This is also true if the function is hidden inside another function (which will be the normal case), i.e., all tokens on the same line in the source file are still processed. Putting it on a line by itself in the definition doesn’t help as it is the line where it is used that counts!

---

```
\file_show_list: \file_show_list:  
\file_log_list: \file_log_list:
```

These functions list all files loaded by L<sup>A</sup>T<sub>E</sub>X 2<sub>E</sub> commands that populate `\@filelist` or by `\file_input:n`. While `\file_show_list:` displays the list in the terminal, `\file_log_list:` outputs it to the log file only.

# Chapter 13

## The `\l3luatex` module LuaTeX-specific functions

The LuaTeX engine provides access to the Lua programming language, and with it access to the “internals” of TeX. In order to use this within the framework provided here, a family of functions is available. When used with pdfTeX, pTeX, upTeX or XeTeX these raise an error: use `\sys_if_engine_luatex:T` to avoid this. Details on using Lua with the LuaTeX engine are given in the LuaTeX manual.

### 13.1 Breaking out to Lua

---

```
\lua_now:n * \lua_now:n {⟨token list⟩}
```

---

```
\lua_now:e *
```

New: 2018-06-18

The `⟨token list⟩` is first tokenized by TeX, which includes converting line ends to spaces in the usual TeX manner and which respects currently-applicable TeX category codes. The resulting `⟨Lua input⟩` is passed to the Lua interpreter for processing. Each `\lua_now:n` block is treated by Lua as a separate chunk. The Lua interpreter executes the `⟨Lua input⟩` immediately, and in an expandable manner.

**TeXhackers note:** `\lua_now:e` is a macro wrapper around `\directlua`: when LuaTeX is in use two expansions are required to yield the result of the Lua code.

---

```
\lua_shipout_e:n \lua_shipout:n {⟨token list⟩}
```

---

```
\lua_shipout:n
```

---

New: 2018-06-18

The `⟨token list⟩` is first tokenized by TeX, which includes converting line ends to spaces in the usual TeX manner and which respects currently-applicable TeX category codes. The resulting `⟨Lua input⟩` is passed to the Lua interpreter when the current page is finalised (*i.e.* at shipout). Each `\lua_shipout:n` block is treated by Lua as a separate chunk. The Lua interpreter will execute the `⟨Lua input⟩` during the page-building routine: no TeX expansion of the `⟨Lua input⟩` will occur at this stage.

In the case of the `\lua_shipout_e:n` version the input is fully expanded by TeX in an e-type manner during the shipout operation.

**TeXhackers note:** At a TeX level, the `⟨Lua input⟩` is stored as a “whatsit”.

---

```
\lua_escape:n * \lua_escape:n {\langle token list\rangle}
```

---

```
\lua_escape:e *
```

New: 2015-06-29

Converts the *<token list>* such that it can safely be passed to Lua: embedded backslashes, double and single quotes, and newlines and carriage returns are escaped. This is done by prepending an extra token consisting of a backslash with category code 12, and for the line endings, converting them to `\n` and `\r`, respectively.

**TeXhackers note:** `\lua_escape:e` is a macro wrapper around `\luaescapestring`: when `LuaTeX` is in use two expansions are required to yield the result of the Lua code.

---

```
\lua_load_module:n \lua_load_module:n {\langle Lua module name\rangle}
```

---

```
New: 2022-05-14
```

Loads a Lua module into the Lua interpreter.

`\lua_now:n` passes its *{<token list>}* argument to the Lua interpreter as a single line, with characters interpreted under the current catcode regime. These two facts mean that `\lua_now:n` rarely behaves as expected for larger pieces of code. Therefore, package authors should **not** write significant amounts of Lua code in the arguments to `\lua_now:n`. Instead, it is strongly recommended that they write the majority of their Lua code in a separate file, and then load it using `\lua_load_module:n`.

**TeXhackers note:** This is a wrapper around the Lua call `require '⟨module⟩'`.

## 13.2 Lua interfaces

As well as interfaces for `TeX`, there are a small number of Lua functions provided here.

---

`ltx.utils` Most public interfaces provided by the module are stored within the `ltx.utils` table.

---

```
ltx.utils.filereadmp <dump> = ltx.utils.filereadmp(<file>,<offset>,<length>)
```

Returns the uppercase hexadecimal representation of the content of the *<file>* read as bytes. If the *<length>* is given, only this part of the file is returned; similarly, one may specify the *<offset>* from the start of the file. If the *<length>* is not given, the entire file is read starting at the *<offset>*.

---

```
ltx.utils.filemd5sum <hash> = ltx.utils.filemd5sum(<file>)
```

Returns the MD5 sum of the file contents read as bytes; note that the result will depend on the nature of the line endings used in the file, in contrast to normal `TeX` behaviour. If the *<file>* is not found, nothing is returned with *no error raised*.

---

```
ltx.utils.filemoddate <date> = ltx.utils.filemoddate(<file>)
```

Returns the date/time of last modification of the *<file>* in the format

`D:<year><month><day><hour><minute><second><offset>`

where the latter may be Z (UTC) or *<plus-minus><hours>'<minutes>*'. If the *<file>* is not found, nothing is returned with *no error raised*.

---

```
ltx.utils.filesize size = ltx.utils.filesize(<file>)
```

Returns the size of the *<file>* in bytes. If the *<file>* is not found, nothing is returned with *no error raised*.

## Chapter 14

# The `\I3legacy` module

## Interfaces to legacy concepts

There are a small number of TeX or L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  concepts which are not used in expl3 code but which need to be manipulated when working as a L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  package. To allow these to be integrated cleanly into expl3 code, a set of legacy interfaces are provided here.

---

`\legacy_if_p:n` \* `\legacy_if_p:n {<name>}`  
`\legacy_if:nTF` \* `\legacy_if:nTF {<name>} {<true code>} {<false code>}`

Tests if the L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub> /plain TeX conditional (generated by `\newif`) is `true` or `false` and branches accordingly. The `<name>` of the conditional should *omit* the leading `if`.

---

`\legacy_if_set_true:n`    `\legacy_if_set_true:n {<name>}`  
`\legacy_if_set_false:n`    `\legacy_if_set_false:n {<name>}`  
`\legacy_if_gset_true:n` Sets the L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub> /plain TeX conditional `\if<name>` (generated by `\newif`) to be `true`  
`\legacy_if_gset_false:n` or `false`.

---

New: 2021-05-10

---

`\legacy_if_set:nn`    `\legacy_if_set:nn {<name>} {<boolexpr>}`  
`\legacy_if_gset:nn` Sets the L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub> /plain TeX conditional `\if<name>` (generated by `\newif`) to the result  
New: 2021-05-10 of evaluating the `<boolean expression>`.

**Part IV**  
**Data types**

# Chapter 15

## The `\tl` module Token lists

TeX works with tokens, and L<sup>A</sup>T<sub>E</sub>X3 therefore provides a number of functions to deal with lists of tokens. Token lists may be present directly in the argument to a function:

```
\foo:n { a collection of \tokens }
```

or may be stored in a so-called “token list variable”, which have the suffix `tl`: a token list variable can also be used as the argument to a function, for example

```
\foo:N \l_some_tl
```

In both cases, functions are available to test and manipulate the lists of tokens, and these have the module prefix `tl`. In many cases, functions which can be applied to token list variables are paired with similar functions for application to explicit lists of tokens: the two “views” of a token list are therefore collected together here.

A token list (explicit, or stored in a variable) can be seen either as a list of “items”, or a list of “tokens”. An item is whatever `\use:n` would grab as its argument: a single non-space token or a brace group, with optional leading explicit space characters (each item is thus itself a token list). A token is either a normal `N` argument, or `,`, `{`, or `}` (assuming normal TeX category codes). Thus for example

```
{ Hello } ~ world
```

contains six items (`Hello`, `w`, `o`, `r`, `l` and `d`), but thirteen tokens (`{`, `H`, `e`, `l`, `l`, `o`, `}`, `,`, `w`, `o`, `r`, `l` and `d`). Functions which act on items are often faster than their analogue acting directly on tokens.

### 15.1 Creating and initialising token list variables

---

```
\tl_new:N \tl_new:N <tl var>
```

`\tl_new:c` Creates a new `<tl var>` or raises an error if the name is already taken. The declaration is global. The `<tl var>` is initially empty.

<u>\tl_const:Nn</u>	<code>\tl_const:Nn &lt;tl var&gt; {&lt;tokens&gt;}</code>
<u>\tl_const:(Ne cn ce)</u>	Creates a new constant $\langle tl\ var \rangle$ or raises an error if the name is already taken. The value of the $\langle tl\ var \rangle$ is set globally to the $\langle tokens \rangle$ .
<u>\tl_clear:N</u>	<code>\tl_clear:N &lt;tl var&gt;</code>
<u>\tl_clear:c</u>	Clears all entries from the $\langle tl\ var \rangle$ .
<u>\tl_gclear:N</u>	<code>\tl_gclear:N</code>
<u>\tl_gclear:c</u>	
<u>\tl_clear_new:N</u>	<code>\tl_clear_new:N &lt;tl var&gt;</code>
<u>\tl_clear_new:c</u>	Ensures that the $\langle tl\ var \rangle$ exists globally by applying <code>\tl_new:N</code> if necessary, then applies <code>\tl_(g)clear:N</code> to leave the $\langle tl\ var \rangle$ empty.
<u>\tl_gclear_new:N</u>	<code>\tl_gclear_new:N</code>
<u>\tl_gclear_new:c</u>	
<u>\tl_set_eq:NN</u>	<code>\tl_set_eq:NN &lt;tl var<sub>1</sub>&gt; &lt;tl var<sub>2</sub>&gt;</code>
<u>\tl_set_eq:(cN Nc cc)</u>	Sets the content of $\langle tl\ var_1 \rangle$ equal to that of $\langle tl\ var_2 \rangle$ .
<u>\tl_gset_eq:NN</u>	<code>\tl_gset_eq:NN</code>
<u>\tl_gset_eq:(cN Nc cc)</u>	
<u>\tl_concat:NNN</u>	<code>\tl_concat:NNN &lt;tl var<sub>1</sub>&gt; &lt;tl var<sub>2</sub>&gt; &lt;tl var<sub>3</sub>&gt;</code>
<u>\tl_concat:ccc</u>	Concatenates the content of $\langle tl\ var_2 \rangle$ and $\langle tl\ var_3 \rangle$ together and saves the result in $\langle tl\ var_1 \rangle$ . The $\langle tl\ var_2 \rangle$ is placed at the left side of the new token list.
<u>\tl_gconcat:NNN</u>	<code>\tl_gconcat:NNN</code>
<u>\tl_gconcat:ccc</u>	
New: 2012-05-18	
<u>\tl_if_exist_p:N *</u>	<code>\tl_if_exist_p:N &lt;tl var&gt;</code>
<u>\tl_if_exist_p:c *</u>	<code>\tl_if_exist:cTF &lt;tl var&gt; {&lt;true code&gt;} {&lt;false code&gt;}</code>
<u>\tl_if_exist:cTF *</u>	Tests whether the $\langle tl\ var \rangle$ is currently defined. This does not check that the $\langle tl\ var \rangle$ really is a token list variable.
New: 2012-03-03	

## 15.2 Adding data to token list variables

<u>\tl_set:Nn</u>	<code>\tl_set:Nn &lt;tl var&gt; {&lt;tokens&gt;}</code>
<u>\tl_set:(NV Nv No Ne Nf cn cV cv co ce cf)</u>	Sets $\langle tl\ var \rangle$ to contain $\langle tokens \rangle$ , removing any previous content from the variable.
<u>\tl_gset:Nn</u>	
<u>\tl_gset:(NV Nv No Ne Nf cn cV cv co ce cf)</u>	
<u>\tl_put_left:Nn</u>	<code>\tl_put_left:Nn &lt;tl var&gt; {&lt;tokens&gt;}</code>
<u>\tl_put_left:(NV Nv Ne No cn cV cv ce co)</u>	Appends $\langle tokens \rangle$ to the left side of the current content of $\langle tl\ var \rangle$ .
<u>\tl_gput_left:Nn</u>	
<u>\tl_gput_left:(NV Nv Ne No cn cV cv ce co)</u>	

---

`\tl_put_right:Nn` \* `\tl_put_right:Nn <tl var> {<tokens>}`  
`\tl_put_right:(NV|Nv|Ne|No|cn|cV|cv|ce|co)`  
`\tl_gput_right:Nn`  
`\tl_gput_right:(NV|Nv|Ne|No|cn|cV|cv|ce|co)`

---

Appends *<tokens>* to the right side of the current content of *<tl var>*.

### 15.3 Token list conditionals

---

`\tl_if_blank_p:n` \* `\tl_if_blank_p:n {<token list>}`  
`\tl_if_blank_p:(e|V|o)` \* `\tl_if_blank:nTF {<token list>} {<true code>} {<false code>}`  
`\tl_if_blank:nTF` \* Tests if the *<token list>* consists only of blank spaces (*i.e.* contains no item). The test is  
`\tl_if_blank:(e|V|o)TF` \* true if *<token list>* is zero or more explicit space characters (explicit tokens with character  
 Updated: 2019-09-04 code 32 and category code 10), and is false otherwise.

---

---

`\tl_if_empty_p:N` \* `\tl_if_empty_p:N <tl var>`  
`\tl_if_empty_p:c` \* `\tl_if_empty:NTF <tl var> {<true code>} {<false code>}`  
`\tl_if_empty:NTF` \* Tests if the *<tl var>* is entirely empty (*i.e.* contains no tokens at all).  
`\tl_if_empty:cTF` \*

---

---

`\tl_if_empty_p:n` \* `\tl_if_empty_p:n {<token list>}`  
`\tl_if_empty_p:(V|o|e)` \* `\tl_if_empty:nTF {<token list>} {<true code>} {<false code>}`  
`\tl_if_empty:nTF` \* Tests if the *<token list>* is entirely empty (*i.e.* contains no tokens at all).  
`\tl_if_empty:(V|o|e)TF` \*

---

New: 2012-05-24

Updated: 2012-06-05

---

---

`\tl_if_eq_p:NN` \* `\tl_if_eq_p:NN <tl var1> <tl var2>`  
`\tl_if_eq_p:(Nc|cN|cc)` \* `\tl_if_eq:NNTF <tl var1> <tl var2> {<true code>} {<false code>}`  
`\tl_if_eq:NNTF` \* Compares the content of *<tl var<sub>1</sub>>* and *<tl var<sub>2</sub>>* and is logically true if the two contain  
`\tl_if_eq:(Nc|cN|cc)TF` \* the same list of tokens (*i.e.* identical in both the list of characters they contain and the  
 category codes of those characters). Thus for example

```

\tl_set:Nn \l_tmpa_tl { abc }
\tl_set:Ne \l_tmpb_tl { \tl_to_str:n { abc } }
\tl_if_eq:NNTF \l_tmpa_tl \l_tmpb_tl { true } { false }

```

yields false. See also `\str_if_eq:nnTF` for a comparison that ignores category codes.

---

`\tl_if_eq:NnTF` `\tl_if_eq:NnTF <tl var1> {<token list2>} {<true code>} {<false code>}`

---

`\tl_if_eq:cnTF` Tests if the *<tl var<sub>1</sub>>* and the *<token list<sub>2</sub>>* contain the same list of tokens, both in respect  
 New: 2020-07-14 of character codes and category codes. This conditional is not expandable: see `\tl_if_eq:NNTF` for an expandable version when both token lists are stored in variables, or  
`\str_if_eq:nnTF` if category codes are not important.

<code>\tl_if_eq:nnTF</code>	<code>\tl_if_eq:nnTF {\langle token list<sub>1</sub> \rangle} {\langle token list<sub>2</sub> \rangle} {\langle true code \rangle} {\langle false code \rangle}</code>
<code>\tl_if_eq:(nV ne Vn en ee)TF</code>	Tests if $\langle token list_1 \rangle$ and $\langle token list_2 \rangle$ contain the same list of tokens, both in respect of character codes and category codes. This conditional is not expandable: see <code>\tl_if_eq:NNTF</code> for an expandable version when token lists are stored in variables, or <code>\str_if_eq:nnTF</code> if category codes are not important.
<code>\tl_if_in:NnTF</code>	<code>\tl_if_in:NnTF \langle tl var \rangle {\langle token list \rangle} {\langle true code \rangle} {\langle false code \rangle}</code>
<code>\tl_if_in:(NV No cn cV co)TF</code>	Tests if the $\langle token list \rangle$ is found in the content of the $\langle tl var \rangle$ . The $\langle token list \rangle$ cannot contain the tokens {, } or # (more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6).
<code>\tl_if_in:nnTF</code>	<code>\tl_if_in:nnTF {\langle token list<sub>1</sub> \rangle} {\langle token list<sub>2</sub> \rangle} {\langle true code \rangle} {\langle false code \rangle}</code>
<code>\tl_if_in:(Vn VV on oo nV no)TF</code>	Tests if $\langle token list_2 \rangle$ is found inside $\langle token list_1 \rangle$ . The $\langle token list_2 \rangle$ cannot contain the tokens {, } or # (more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6). The search does <i>not</i> enter brace (category code 1/2) groups.
<code>\tl_if_novalue_p:n * \tl_if_novalue_p:n {\langle token list \rangle}</code>	
<code>\tl_if_novalue:nTF * \tl_if_novalue:nTF {\langle token list \rangle} {\langle true code \rangle} {\langle false code \rangle}</code>	
<small>New: 2017-11-14</small>	Tests if the $\langle token list \rangle$ and the special <code>\c_novalue_t1</code> marker contain the same list of tokens, both in respect of character codes and category codes. This means that <code>\exp_args:No \tl_if_novalue:nTF { \c_novalue_t1 }</code> is logically <b>true</b> but <code>\tl_if_novalue:nTF { \c_novalue_t1 }</code> is logically <b>false</b> . This function is intended to allow construction of flexible document interface structures in which missing optional arguments are detected.
<code>\tl_if_single_p:N * \tl_if_single_p:N \langle tl var \rangle</code>	
<code>\tl_if_single_p:c * \tl_if_single:NTF \langle tl var \rangle {\langle true code \rangle} {\langle false code \rangle}</code>	
<code>\tl_if_single:NTF * \tl_if_single:cTF *</code>	Tests if the content of the $\langle tl var \rangle$ consists of a single $\langle item \rangle$ , <i>i.e.</i> is a single normal token (neither an explicit space character nor a begin-group character) or a single brace group, surrounded by optional spaces on both sides. In other words, such a token list has token count 1 according to <code>\tl_count:N</code> .
<small>Updated: 2011-08-13</small>	
<code>\tl_if_single_p:n * \tl_if_single_p:n {\langle token list \rangle}</code>	
<code>\tl_if_single:nTF * \tl_if_single:nTF {\langle token list \rangle} {\langle true code \rangle} {\langle false code \rangle}</code>	
<small>Updated: 2011-08-13</small>	Tests if the $\langle token list \rangle$ has exactly one $\langle item \rangle$ , <i>i.e.</i> is a single normal token (neither an explicit space character nor a begin-group character) or a single brace group, surrounded by optional spaces on both sides. In other words, such a token list has token count 1 according to <code>\tl_count:n</code> .
<code>\tl_if_single_token_p:n * \tl_if_single_token_p:n {\langle token list \rangle}</code>	
<code>\tl_if_single_token:nTF * \tl_if_single_token:nTF {\langle token list \rangle} {\langle true code \rangle} {\langle false code \rangle}</code>	Tests if the token list consists of exactly one token, <i>i.e.</i> is either a single space character or a single normal token. Token groups ({}...) are not single tokens.

### 15.3.1 Testing the first token

---

```
\tl_if_head_eq_catcode_p:nN      * \tl_if_head_eq_catcode_p:nN {\langle token list\rangle} {test token}
\tl_if_head_eq_catcode_p:(VN|eN|oN) * \tl_if_head_eq_catcode:nNTF {\langle token list\rangle} {test token}
\tl_if_head_eq_catcode:nNTF      *   {\langle true code\rangle} {\langle false code\rangle}
\tl_if_head_eq_catcode:(VN|eN|oN)TF *
```

---

Updated: 2012-07-09

Tests if the first *<token>* in the *<token list>* has the same category code as the *(test token)*. In the case where the *<token list>* is empty, the test is always **false**.

---

```
\tl_if_head_eq_charcode_p:nN      * \tl_if_head_eq_charcode_p:nN {\langle token list\rangle} {test token}
\tl_if_head_eq_charcode_p:(VN|eN|fN) * \tl_if_head_eq_charcode:nNTF {\langle token list\rangle} {test token}
\tl_if_head_eq_charcode:nNTF      *   {\langle true code\rangle} {\langle false code\rangle}
\tl_if_head_eq_charcode:(VN|eN|fN)TF *
```

---

Updated: 2012-07-09

Tests if the first *<token>* in the *<token list>* has the same character code as the *(test token)*. In the case where the *<token list>* is empty, the test is always **false**.

---

```
\tl_if_head_eq_meaning_p:nN      * \tl_if_head_eq_meaning_p:nN {\langle token list\rangle} {test token}
\tl_if_head_eq_meaning_p:(VN|eN) * \tl_if_head_eq_meaning:nNTF {\langle token list\rangle} {test token}
\tl_if_head_eq_meaning:nNTF      *   {\langle true code\rangle} {\langle false code\rangle}
\tl_if_head_eq_meaning:(VN|eN)TF *
```

---

Updated: 2012-07-09

Tests if the first *<token>* in the *<token list>* has the same meaning as the *(test token)*. In the case where *<token list>* is empty, the test is always **false**.

---

```
\tl_if_head_is_group_p:n * \tl_if_head_is_group_p:n {\langle token list\rangle}
\tl_if_head_is_group:nTF * \tl_if_head_is_group:nTF {\langle token list\rangle} {\langle true code\rangle} {\langle false code\rangle}
```

---

New: 2012-07-08

Tests if the first *<token>* in the *<token list>* is an explicit begin-group character (with category code 1 and any character code), in other words, if the *<token list>* starts with a brace group. In particular, the test is **false** if the *<token list>* starts with an implicit token such as `\c_group_begin_token`, or if it is empty. This function is useful to implement actions on token lists on a token by token basis.

---

```
\tl_if_head_is_N_type_p:n * \tl_if_head_is_N_type_p:n {\langle token list\rangle}
\tl_if_head_is_N_type:nTF * \tl_if_head_is_N_type:nTF {\langle token list\rangle} {\langle true code\rangle} {\langle false code\rangle}
```

---

New: 2012-07-08

Tests if the first *<token>* in the *<token list>* is a normal N-type argument. In other words, it is neither an explicit space character (explicit token with character code 32 and category code 10) nor an explicit begin-group character (with category code 1 and any character code). An empty argument yields **false**, as it does not have a normal first token. This function is useful to implement actions on token lists on a token by token basis.

---

```
\tl_if_head_is_space_p:n ∗ \tl_if_head_is_space_p:n {⟨token list⟩}
\tl_if_head_is_space:nTF ∗ \tl_if_head_is_space:nTF {⟨token list⟩} {⟨true code⟩} {⟨false code⟩}
```

---

Updated: 2012-07-08

Tests if the first ⟨token⟩ in the ⟨token list⟩ is an explicit space character (explicit token with character code 32 and category code 10). In particular, the test is `false` if the ⟨token list⟩ starts with an implicit token such as `\c_space_token`, or if it is empty. This function is useful to implement actions on token lists on a token by token basis.

## 15.4 Working with token lists as a whole

### 15.4.1 Using token lists

---

```
\tl_to_str:n ∗ \tl_to_str:n {⟨token list⟩}
\tl_to_str:(o|V|v|e) ∗
```

---

Converts the ⟨token list⟩ to a ⟨string⟩, leaving the resulting character tokens in the input stream. A ⟨string⟩ is a series of tokens with category code 12 (other) with the exception of spaces, which retain category code 10 (space). The base function requires only a single expansion. Its argument *must* be braced.

**TEXhackers note:** This is the  $\varepsilon$ -TEX primitive `\detokenize`. Converting a ⟨token list⟩ to a ⟨string⟩ yields a concatenation of the string representations of every token in the ⟨token list⟩. The string representation of a control sequence is

- an escape character, whose character code is given by the internal parameter `\escapechar`, absent if the `\escapechar` is negative or greater than the largest character code;
- the control sequence name, as defined by `\cs_to_str:N`;
- a space, unless the control sequence name is a single character whose category at the time of expansion of `\tl_to_str:n` is not “letter”.

The string representation of an explicit character token is that character, doubled in the case of (explicit) macro parameter characters (normally #). In particular, the string representation of a token list may depend on the category codes in effect when it is evaluated, and the value of the `\escapechar`: for instance `\tl_to_str:n {\a}` normally produces the three character “backslash”, “lower-case a”, “space”, but it may also produce a single “lower-case a” if the escape character is negative and `a` is currently not a letter.

---

```
\tl_to_str:N ∗ \tl_to_str:N ⟨tl var⟩
```

---

`\tl_to_str:c ∗` Converts the content of the ⟨tl var⟩ into a series of characters with category code 12 (other) with the exception of spaces, which retain category code 10 (space). This ⟨string⟩ is then left in the input stream. For low-level details, see the notes given for `\tl_to_str:n`.

---

```
\tl_use:N ∗ \tl_use:N ⟨tl var⟩
```

---

`\tl_use:c ∗` Recovers the content of a ⟨tl var⟩ and places it directly in the input stream. An error is raised if the variable does not exist or if it is invalid. Note that it is possible to use a ⟨tl var⟩ directly without an accessor function.

### 15.4.2 Counting and reversing token lists

---

`\tl_count:n` \* `\tl_count:n {<token list>}`  
`\tl_count:(V|v|e)o` \* Counts the number of *items* in the *<token list>* and leaves this information in the input stream. Unbraced tokens count as one element as do each token group *{...}*. This process ignores any unprotected spaces within the *<token list>*. See also `\tl_count:N`. This function requires three expansions, giving an *<integer denotation>*.

New: 2012-05-13

---

---

`\tl_count:N` \* `\tl_count:N <tl var>`  
`\tl_count:c` \* Counts the number of *items* in the *<tl var>* and leaves this information in the input stream. Unbraced tokens count as one element as do each token group *{...}*. This process ignores any unprotected spaces within the *<tl var>*. See also `\tl_count:n`. This function requires three expansions, giving an *<integer denotation>*.

New: 2012-05-13

---

---

`\tl_count_tokens:n` \* `\tl_count_tokens:n {<token list>}`  
New: 2019-02-25 Counts the number of TEX tokens in the *<token list>* and leaves this information in the input stream. Every token, including spaces and braces, contributes one to the total; thus for instance, the token count of `a~{bc}` is 6.

---

---

`\tl_reverse:n` \* `\tl_reverse:n {<token list>}`  
`\tl_reverse:(V|o|f|e)` \* Reverses the order of the *items* in the *<token list>*, so that *item<sub>1</sub>**item<sub>2</sub>**item<sub>3</sub>*...*item<sub>n</sub>* becomes *item<sub>n</sub>*...*item<sub>3</sub>**item<sub>2</sub>**item<sub>1</sub>*. This process preserves unprotected space within the *<token list>*. Tokens are not reversed within braced token groups, which keep their outer set of braces. In situations where performance is important, consider `\tl_reverse_items:n`. See also `\tl_reverse:N`.

Updated: 2012-01-08

---

**TEXhackers note:** The result is returned within `\unexpanded`, which means that the token list does not expand further when appearing in an `e`-type or `x`-type argument expansion.

---

`\tl_reverse:N` `\tl_reverse:N <tl var>`  
`\tl_reverse:c`  
`\tl_greverse:N`  
`\tl_greverse:c` Sets the *<tl var>* to contain the result of reversing the order of its *items*, so that *item<sub>1</sub>**item<sub>2</sub>**item<sub>3</sub>*...*item<sub>n</sub>* becomes *item<sub>n</sub>*...*item<sub>3</sub>**item<sub>2</sub>**item<sub>1</sub>*. This process preserves unprotected spaces within the *<tl var>*. Braced token groups are copied without reversing the order of tokens, but keep the outer set of braces. This is equivalent to a combination of an assignment and `\tl_reverse:V`. See also `\tl_reverse_items:n` for improved performance.

Updated: 2012-01-08

---

---

`\tl_reverse_items:n` \* `\tl_reverse_items:n {<token list>}`  
New: 2012-01-08 Reverses the order of the *items* in the *<token list>*, so that *item<sub>1</sub>**item<sub>2</sub>**item<sub>3</sub>*...*item<sub>n</sub>* becomes *{(item<sub>n</sub>)}*...*{(item<sub>3</sub>)}**{(item<sub>2</sub>)}**{(item<sub>1</sub>)}*. This process removes any unprotected space within the *<token list>*. Braced token groups are copied without reversing the order of tokens, and keep the outer set of braces. Items which are initially not braced are copied with braces in the result. In cases where preserving spaces is important, consider the slower function `\tl_reverse:n`.

---

**TEXhackers note:** The result is returned within `\unexpanded`, which means that the token list does not expand further when appearing in an `e`-type or `x`-type argument expansion.

---

`\tl_trim_spaces:n` \* `\tl_trim_spaces:n {<token list>}`

`\tl_trim_spaces:(V|v|e|o)` \* Removes any leading and trailing explicit space characters (explicit tokens with character code 32 and category code 10) from the `<token list>` and leaves the result in the input stream.

New: 2011-07-09

Updated: 2012-06-25

---

`\tl_trim_spaces_apply:nN` \* `\tl_trim_spaces_apply:nN {<token list>} {function}`

`\tl_trim_spaces_apply:on` \* Removes any leading and trailing explicit space characters (explicit tokens with character code 32 and category code 10) from the `<token list>` and passes the result to the `<function>` as an `n`-type argument.

New: 2018-04-12

New: 2011-07-09

---

`\tl_trim_spaces:N` `\tl_trim_spaces:N {tl var}`

`\tl_trim_spaces:c`  
`\tl_gtrim_spaces:N`  
`\tl_gtrim_spaces:c` Sets the `<tl var>` to contain the result of removing any leading and trailing explicit space characters (explicit tokens with character code 32 and category code 10) from its contents.

---

New: 2011-07-09

### 15.4.3 Viewing token lists

---

`\tl_show:N` `\tl_show:N {tl var}`

`\tl_show:c` Displays the content of the `<tl var>` on the terminal.

Updated: 2021-04-29

**TeXhackers note:** This is similar to the T<sub>E</sub>X primitive `\show`, wrapped to a fixed number of characters per line.

---

`\tl_show:n` `\tl_show:n {<token list>}`

`\tl_show:e` Displays the `<token list>` on the terminal.

Updated: 2015-08-07

**TeXhackers note:** This is similar to the ε-T<sub>E</sub>X primitive `\showtokens`, wrapped to a fixed number of characters per line.

---

`\tl_log:N` `\tl_log:N {tl var}`

`\tl_log:c` Writes the content of the `<tl var>` in the log file. See also `\tl_show:N` which displays the result in the terminal.

New: 2014-08-22

Updated: 2021-04-29

---

`\tl_log:n` `\tl_log:n {<token list>}`

`\tl_log:(e|x)` Writes the `<token list>` in the log file. See also `\tl_show:n` which displays the result in the terminal.

New: 2014-08-22

Updated: 2015-08-07

## 15.5 Manipulating items in token lists

### 15.5.1 Mapping over token lists

All mappings are done at the current group level, *i.e.* any local assignments made by the  $\langle function \rangle$  or  $\langle code \rangle$  discussed below remain in effect after the loop.

<code>\tl_map_function:NN</code> ☆	<code>\tl_map_function:NN {tl var} &lt;function&gt;</code>
<code>\tl_map_function:cN</code> ☆	Applies $\langle function \rangle$ to every $\langle item \rangle$ in the $\langle tl var \rangle$ . The $\langle function \rangle$ receives one argument for each iteration. This may be a number of tokens if the $\langle item \rangle$ was stored within braces. Hence the $\langle function \rangle$ should anticipate receiving n-type arguments. See also <code>\tl_map_function:nN</code> .
Updated: 2012-06-29	
<code>\tl_map_function:nN</code> ☆	<code>\tl_map_function:nN {{token list}} &lt;function&gt;</code>
Updated: 2012-06-29	Applies $\langle function \rangle$ to every $\langle item \rangle$ in the $\langle token list \rangle$ . The $\langle function \rangle$ receives one argument for each iteration. This may be a number of tokens if the $\langle item \rangle$ was stored within braces. Hence the $\langle function \rangle$ should anticipate receiving n-type arguments. See also <code>\tl_map_function:NN</code> .
<code>\tl_map_inline:Nn</code>	<code>\tl_map_inline:Nn {tl var} {{inline function}}</code>
<code>\tl_map_inline:cn</code>	Applies the $\langle inline function \rangle$ to every $\langle item \rangle$ stored within the $\langle tl var \rangle$ . The $\langle inline function \rangle$ should consist of code which receives the $\langle item \rangle$ as #1. See also <code>\tl_map_function:NN</code> .
Updated: 2012-06-29	
<code>\tl_map_inline:nn</code>	<code>\tl_map_inline:nn {{token list}} {{inline function}}</code>
Updated: 2012-06-29	Applies the $\langle inline function \rangle$ to every $\langle item \rangle$ stored within the $\langle token list \rangle$ . The $\langle inline function \rangle$ should consist of code which receives the $\langle item \rangle$ as #1. See also <code>\tl_map_function:nN</code> .
<code>\tl_map_tokens:Nn</code> ☆	<code>\tl_map_tokens:Nn {tl var} {{code}}</code>
<code>\tl_map_tokens:cn</code> ☆	<code>\tl_map_tokens:nn {{token list}} {{code}}</code>
<code>\tl_map_tokens:nn</code> ☆	Analogue of <code>\tl_map_function:NN</code> which maps several tokens instead of a single function. The $\langle code \rangle$ receives each $\langle item \rangle$ in the $\langle tl var \rangle$ or in the $\langle token list \rangle$ as a trailing brace group. For instance,
New: 2019-09-02	
	<pre>\tl_map_tokens:Nn \l_my_tl { \prg_replicate:nn { 2 } }</pre>
	expands to twice each $\langle item \rangle$ in the $\langle tl var \rangle$ : for each $\langle item \rangle$ in <code>\l_my_tl</code> the function <code>\prg_replicate:nn</code> receives 2 and $\langle item \rangle$ as its two arguments. The function <code>\tl_map_inline:Nn</code> is typically faster but is not expandable.
<code>\tl_map_variable&gt;NNn</code>	<code>\tl_map_variable&gt;NNn {tl var} &lt;variable&gt; {{code}}</code>
<code>\tl_map_variable:cNn</code>	Stores each $\langle item \rangle$ of the $\langle tl var \rangle$ in turn in the (token list) $\langle variable \rangle$ and applies the $\langle code \rangle$ . The $\langle code \rangle$ will usually make use of the $\langle variable \rangle$ , but this is not enforced. The assignments to the $\langle variable \rangle$ are local. Its value after the loop is the last $\langle item \rangle$ in the $\langle tl var \rangle$ , or its original value if the $\langle tl var \rangle$ is blank. See also <code>\tl_map_inline:Nn</code> .
Updated: 2012-06-29	

---

`\tl_map_variable:nNn \tl_map_variable:nNn {token list} {variable} {code}`

Updated: 2012-06-29

Stores each *item* of the *token list* in turn in the (token list) *variable* and applies the *code*. The *code* will usually make use of the *variable*, but this is not enforced. The assignments to the *variable* are local. Its value after the loop is the last *item* in the *tl var*, or its original value if the *tl var* is blank. See also `\tl_map_inline:nn`.

---

`\tl_map_break: ☆ \tl_map_break:`

Updated: 2012-06-29

Used to terminate a `\tl_map_...` function before all entries in the *token list* have been processed. This normally takes place within a conditional statement, for example

```
\tl_map_inline:Nn \l_my_tl
{
    \str_if_eq:nnT { #1 } { bingo } { \tl_map_break: }
    % Do something useful
}
```

See also `\tl_map_break:n`. Use outside of a `\tl_map_...` scenario leads to low level TeX errors.

**TeXhackers note:** When the mapping is broken, additional tokens may be inserted before further items are taken from the input stream. This depends on the design of the mapping function.

---

`\tl_map_break:n ☆ \tl_map_break:n {code}`

Updated: 2012-06-29

Used to terminate a `\tl_map_...` function before all entries in the *token list* have been processed, inserting the *code* after the mapping has ended. This normally takes place within a conditional statement, for example

```
\tl_map_inline:Nn \l_my_tl
{
    \str_if_eq:nnT { #1 } { bingo }
    { \tl_map_break:n { <code> } }
    % Do something useful
}
```

Use outside of a `\tl_map_...` scenario leads to low level TeX errors.

**TeXhackers note:** When the mapping is broken, additional tokens may be inserted before the *code* is inserted into the input stream. This depends on the design of the mapping function.

### 15.5.2 Head and tail of token lists

Functions which deal with either only the very first item (balanced text or single normal token) in a token list, or the remaining tokens.

---

`\tl_head:N` \* `\tl_head:n`  $\{ \langle token \; list \rangle \}$   
`\tl_head:n` \* Leaves in the input stream the first  $\langle item \rangle$  in the  $\langle token \; list \rangle$ , discarding the rest of the  $\langle token \; list \rangle$ . All leading explicit space characters (explicit tokens with character code 32 and category code 10) are discarded; for example  
Updated: 2012-09-09

```
\tl_head:n { abc }
```

and

```
\tl_head:n { ~ abc }
```

both leave `a` in the input stream. If the “head” is a brace group, rather than a single token, the braces are removed, and so

```
\tl_head:n { ~ { ~ ab } c }
```

yields `ab`. A blank  $\langle token \; list \rangle$  (see `\tl_if_blank:nTF`) results in `\tl_head:n` leaving nothing in the input stream.

**TEXhackers note:** The result is returned within `\exp_not:n`, which means that the token list does not expand further when appearing in an `e`-type or `x`-type argument expansion.

---

`\tl_head:w` \* `\tl_head:w`  $\langle token \; list \rangle$   $\{ \}$  `\q_stop`

Leaves in the input stream the first  $\langle item \rangle$  in the  $\langle token \; list \rangle$ , discarding the rest of the  $\langle token \; list \rangle$ . All leading explicit space characters (explicit tokens with character code 32 and category code 10) are discarded. A blank  $\langle token \; list \rangle$  (which consists only of space characters) results in a low-level `TEX` error, which may be avoided by the inclusion of an empty group in the input (as shown), without the need for an explicit test. Alternatively, `\tl_if_blank:nF` may be used to avoid using the function with a “blank” argument. This function requires only a single expansion, and thus is suitable for use within an `o`-type expansion. In general, `\tl_head:n` should be preferred if the number of expansions is not critical.

---

`\tl_tail:N` \* `\tl_tail:n`  $\{ \langle token \; list \rangle \}$   
`\tl_tail:n` \* Discards all leading explicit space characters (explicit tokens with character code 32 and category code 10) and the first  $\langle item \rangle$  in the  $\langle token \; list \rangle$ , and leaves the remaining tokens  
Updated: 2012-09-01 in the input stream. Thus for example

```
\tl_tail:n { a ~ {bc} d }
```

and

```
\tl_tail:n { ~ a ~ {bc} d }
```

both leave `~a{bc}d` in the input stream. A blank  $\langle token \; list \rangle$  (see `\tl_if_blank:nTF`) results in `\tl_tail:n` leaving nothing in the input stream.

**TEXhackers note:** The result is returned within `\exp_not:n`, which means that the token list does not expand further when appearing in an `e`-type or `x`-type argument expansion.

If you wish to handle token lists where the first token may be a space, and this

needs to be treated as the head/tail, this can be accomplished using `\tl_if_head_is_space:nTF`, for example

```
\exp_last_unbraced:NNo
  \cs_new:Npn \__mypkg_gobble_space:w \c_space_tl { }
\cs_new:Npn \mypkg_tl_head_keep_space:n #1
{
  \tl_if_head_is_space:nTF {#1}
  { ~ }
  { \tl_head:n {#1} }
}
\cs_new:Npn \mypkg_tl_tail_keep_space:n #1
{
  \tl_if_head_is_space:nTF {#1}
  { \exp_not:o { \__mypkg_gobble_space:w #1 } }
  { \tl_tail:n {#1} }
}
```

### 15.5.3 Items and ranges in token lists

---

`\tl_item:nn` \* `\tl_item:nn` {*token list*} {*integer expression*}

`\tl_item:Nn` \* *Indexing items in the *token list* from 1 on the left, this function evaluates the *integer expression* and leaves the appropriate item from the *token list* in the input stream.*  
`\tl_item:cN` \* *New: 2014-07-17 If the *integer expression* is negative, indexing occurs from the right of the token list, starting at -1 for the right-most item. If the index is out of bounds, then the function expands to nothing.*

**TEXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the `\item` does not expand further when appearing in an `e`-type or `x`-type argument expansion.

---

`\tl_rand_item:N` \* `\tl_rand_item:N` *tl var*  
`\tl_rand_item:c` \* `\tl_rand_item:n` {*token list*}

`\tl_rand_item:n` \* *Selects a pseudo-random item of the *token list*. If the *token list* is blank, the result is empty. This is not available in older versions of X<sub>H</sub>TeX.*  
*New: 2016-12-06*

**TEXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the `\item` does not expand further when appearing in an `e`-type or `x`-type argument expansion.

---

```
\tl_range:Nnn * \tl_range:Nnn {tl var} {\langle start index\rangle} {\langle end index\rangle}
\tl_range:nnn * \tl_range:nnn {\langle token list\rangle} {\langle start index\rangle} {\langle end index\rangle}
```

---

New: 2017-02-17 Leaves in the input stream the items from the  $\langle start index \rangle$  to the  $\langle end index \rangle$  inclusive.  
Updated: 2017-07-15 Spaces and braces are preserved between the items returned (but never at either end of the list). Here  $\langle start index \rangle$  and  $\langle end index \rangle$  should be  $\langle integer expressions \rangle$ . For describing in detail the functions' behavior, let  $m$  and  $n$  be the start and end index respectively. If either is 0, the result is empty. A positive index means ‘start counting from the left end’, and a negative index means ‘from the right end’. Let  $l$  be the count of the token list.

The *actual start point* is determined as  $M = m$  if  $m > 0$  and as  $M = l + m + 1$  if  $m < 0$ . Similarly the *actual end point* is  $N = n$  if  $n > 0$  and  $N = l + n + 1$  if  $n < 0$ . If  $M > N$ , the result is empty. Otherwise it consists of all items from position  $M$  to position  $N$  inclusive; for the purpose of this rule, we can imagine that the token list extends at infinity on either side, with void items at positions  $s$  for  $s \leq 0$  or  $s > l$ .

Spaces in between items in the actual range are preserved. Spaces at either end of the token list will be removed anyway (think to the token list being passed to `\tl_trim_spaces:n` to begin with).

Thus, with  $l = 7$  as in the examples below, all of the following are equivalent and result in the whole token list

```
\tl_range:nnn { abcd~{e{}}fg } { 1 } { 7 }
\tl_range:nnn { abcd~{e{}}fg } { 1 } { 12 }
\tl_range:nnn { abcd~{e{}}fg } { -7 } { 7 }
\tl_range:nnn { abcd~{e{}}fg } { -12 } { 7 }
```

Here are some more interesting examples. The calls

```
\iow_term:e { \tl_range:nnn { abcd{e{}}fg } { 2 } { 5 } }
\iow_term:e { \tl_range:nnn { abcd{e{}}fg } { 2 } { -3 } }
\iow_term:e { \tl_range:nnn { abcd{e{}}fg } { -6 } { 5 } }
\iow_term:e { \tl_range:nnn { abcd{e{}}fg } { -6 } { -3 } }
```

are all equivalent and will print `bcd{e{}}` on the terminal; similarly

```
\iow_term:e { \tl_range:nnn { abcd~{e{}}fg } { 2 } { 5 } }
\iow_term:e { \tl_range:nnn { abcd~{e{}}fg } { 2 } { -3 } }
\iow_term:e { \tl_range:nnn { abcd~{e{}}fg } { -6 } { 5 } }
\iow_term:e { \tl_range:nnn { abcd~{e{}}fg } { -6 } { -3 } }
```

are all equivalent and will print `bcd {e{}}` on the terminal (note the space in the middle). To the contrary,

```
\tl_range:nnn { abcd~{e{}}f } { 2 } { 4 }
```

will discard the space after ‘d’.

If we want to get the items from, say, the third to the last in a token list `<tl>`, the call is `\tl_range:nnn { <tl> } { 3 } { -1 }`. Similarly, for discarding the last item, we can do `\tl_range:nnn { <tl> } { 1 } { -2 }`.

**TeXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the  $\langle item \rangle$  does not expand further when appearing in an `e`-type or `x`-type argument expansion.

#### 15.5.4 Sorting token lists

---

```
\tl_sort:Nn \tl_sort:Nn <tl var> {<comparison code>}
```

**\tl\_gsort:Nn** Sorts the items in the *<tl var>* according to the *<comparison code>*, and assigns the result to *<tl var>*. The details of sorting comparison are described in Section 6.1.

**\tl\_gsort:cn**

---

New: 2017-02-06

---

```
\tl_sort:nN * \tl_sort:nN {<token list>} {<conditional>}
```

---

Sorts the items in the *<token list>*, using the *<conditional>* to compare items, and leaves the result in the input stream. The *<conditional>* should have signature :nnTF, and return **true** if the two items being compared should be left in the same order, and **false** if the items should be swapped. The details of sorting comparison are described in Section 6.1.

**TEXhackers note:** The result is returned within `\exp_not:n`, which means that the token list does not expand further when appearing in an **e**-type or **x**-type argument expansion.

### 15.6 Manipulating tokens in token lists

#### 15.6.1 Replacing tokens

Within token lists, replacement takes place at the top level: there is no recursion into brace groups (more precisely, within a group defined by a category code 1/2 pair).

---

```
\tl_replace_once:Nnn \tl_replace_once:Nnn <tl var> {<old tokens>} {<new tokens>}
```

**\tl\_replace\_once:(NVn|NnV|Nen|Nne|Nee|cnn|cVn|cnV|cen|cne|cee)**

---

**\tl\_greplace\_once:Nnn**

```
\tl_greplace_once:(NVn|NnV|Nen|Nne|Nee|cnn|cVn|cnV|cen|cne|cee)
```

---

Updated: 2011-08-11

Replaces the first (leftmost) occurrence of *<old tokens>* in the *<tl var>* with *<new tokens>*. *(Old tokens)* cannot contain {, } or # (more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6).

---

```
\tl_replace_all:Nnn \tl_replace_all:Nnn <tl var> {<old tokens>} {<new tokens>}
```

**\tl\_replace\_all:(NVn|NnV|Nen|Nne|Nee|cnn|cVn|cnV|cen|cne|cee)**

---

**\tl\_greplace\_all:Nnn**

```
\tl_greplace_all:(NVn|NnV|Nen|Nne|Nee|cnn|cVn|cnV|cen|cne|cee)
```

---

Updated: 2011-08-11

Replaces all occurrences of *<old tokens>* in the *<tl var>* with *<new tokens>*. *(Old tokens)* cannot contain {, } or # (more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6). As this function operates from left to right, the pattern *<old tokens>* may remain after the replacement (see `\tl_remove_all:Nn` for an example).

---

```
\tl_remove_once:Nn          \tl_remove_once:Nn <tl var> {<tokens>}
\tl_remove_once:(NV|Ne|cn|cV|ce)
\tl_gremove_once:Nn
\tl_gremove_once:(NV|Ne|cn|cV|ce)
```

---

Updated: 2011-08-11

Removes the first (leftmost) occurrence of *<tokens>* from the *<tl var>*. The *<tokens>* cannot contain {, } or # (more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6).

---

```
\tl_remove_all:Nn          \tl_remove_all:Nn <tl var> {<tokens>}
\tl_remove_all:(NV|Ne|cn|cV|ce)
\tl_gremove_all:Nn
\tl_gremove_all:(NV|Ne|cn|cV|ce)
```

---

Updated: 2011-08-11

Removes all occurrences of *<tokens>* from the *<tl var>*. The *<tokens>* cannot contain {, } or # (more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6). As this function operates from left to right, the pattern *<tokens>* may remain after the removal, for instance,

```
\tl_set:Nn \l_tmpa_tl {abbccd} \tl_remove_all:Nn \l_tmpa_tl {bc}
results in \l_tmpa_tl containing abcd.
```

### 15.6.2 Reassigning category codes

These functions allow the rescanning of tokens: re-apply TeX's tokenization process to apply category codes different from those in force when the tokens were absorbed. Whilst this functionality is supported, it is often preferable to find alternative approaches to achieving outcomes rather than rescanning tokens (for example construction of token lists token-by-token with intervening category code changes or using `\char_generate:nn`).

---

```
\tl_set_rescan:Nnn          \tl_set_rescan:Nnn <tl var> {<setup>} {<tokens>}
\tl_set_rescan:(NnV|Nne|Nno|cnn|cnV|cne|cno)
\tl_gset_rescan:Nnn
\tl_gset_rescan:(NnV|Nne|Nno|cnn|cnV|cne|cno)
```

---

Updated: 2015-08-11

Sets *<tl var>* to contain *<tokens>*, applying the category code régime specified in the *<setup>* before carrying out the assignment. (Category codes applied to tokens not explicitly covered by the *<setup>* are those in force at the point of use of `\tl_set_rescan:Nnn`.) This allows the *<tl var>* to contain material with category codes other than those that apply when *<tokens>* are absorbed. The *<setup>* is run within a group and may contain any valid input, although only changes in category codes, such as uses of `\cctab_select:N`, are relevant. See also `\tl_rescan:nn`.

**TeXhackers note:** The *<tokens>* are first turned into a string (using `\tl_to_str:n`). If the string contains one or more characters with character code `\newlinechar` (set equal to `\endlinechar` unless that is equal to 32, before the user *<setup>*), then it is split into lines at these characters, then read as if reading multiple lines from a file, ignoring spaces (catcode 10) at the beginning and spaces and tabs (character code 32 or 9) at the end of every line. Otherwise, spaces (and tabs) are retained at both ends of the single-line string, as if it appeared in the middle of a line read from a file.

---

```
\tl_rescan:nn  \tl_rescan:nn {<setup>} {<tokens>}
```

`\tl_rescan:nV`

Rescans *<tokens>* applying the category code régime specified in the *<setup>*, and leaves the resulting tokens in the input stream. (Category codes applied to tokens not explicitly covered by the *<setup>* are those in force at the point of use of `\tl_rescan:nn`.) The *<setup>* is run within a group and may contain any valid input, although only changes in category codes, such as uses of `\cctab_select:N`, are relevant. See also `\tl_set_rescan:Nnn`, which is more robust than using `\tl_set:Nn` in the *<tokens>* argument of `\tl_rescan:nn`.

Updated: 2015-08-11

**TeXhackers note:** The *<tokens>* are first turned into a string (using `\tl_to_str:n`). If the string contains one or more characters with character code `\newlinechar` (set equal to `\endlinechar` unless that is equal to 32, before the user *<setup>*), then it is split into lines at these characters, then read as if reading multiple lines from a file, ignoring spaces (catcode 10) at the beginning and spaces and tabs (character code 32 or 9) at the end of every line. Otherwise, spaces (and tabs) are retained at both ends of the single-line string, as if it appeared in the middle of a line read from a file.

Contrarily to the `\scantokens` ε-TEX primitive, `\tl_rescan:nn` tokenizes the whole string in the same category code regime rather than one token at a time, so that directives such as `\verb` that rely on changing category codes will not function properly.

## 15.7 Constant token lists

---

```
\c_empty_tl
```

Constant that is always empty.

---

`\c_novalue_t1` A marker for the absence of an argument. This constant `t1` can safely be typeset (*cf.* `\q_- nil`), with the result being `-NoValue-`. It is important to note that `\c_novalue_t1` is constructed such that it will *not* match the simple text input `-NoValue-`, *i.e.* that

```
\tl_if_eq:NnTF \c_novalue_t1 { -NoValue- }
```

is logically **false**. The `\c_novalue_t1` marker is intended for use in creating document-level interfaces, where it serves as an indicator that an (optional) argument was omitted. In particular, it is distinct from a simple empty `t1`.

---

`\c_space_t1` An explicit space character contained in a token list (compare this with `\c_space_token`). For use where an explicit space is required.

## 15.8 Scratch token lists

---

`\l_tmpa_t1` Scratch token lists for local assignment. These are never used by the kernel code, and so  
`\l_tmpb_t1` are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

---

`\g_tmpa_t1` Scratch token lists for global assignment. These are never used by the kernel code, and so  
`\g_tmpb_t1` are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

# Chapter 16

## The **|3tl-build** module Piecewise **tl** constructions

### 16.1 Constructing $\langle tl\ var \rangle$ by accumulation

When creating a  $\langle tl\ var \rangle$  by accumulation of many tokens, the performance available using a combination of `\tl_set:Nn` and `\tl_put_right:Nn` or similar begins to become an issue. To address this, a set of functions are available to “build” a  $\langle tl\ var \rangle$ . The performance of this approach is much more efficient than the standard `\tl_put_right:Nn`, but the constructed token list cannot be accessed during construction other than by methods provided in this section.

Whilst the exact performance difference is dependent on the size of each added block of tokens and the total number of blocks, in general, the `\tl_build_(g)put...` functions will out-perform the basic `\tl_(g)put...` equivalent if more than 100 non-empty addition operations occur. See <https://github.com/latex3/latex3/issues/1393#issuecomment-1880164756> for a more detailed analysis.

---

`\tl_build_begin:N`    `\tl_build_begin:N`  $\langle tl\ var \rangle$   
`\tl_build_gbegin:N`

New: 2018-04-01

Clears the  $\langle tl\ var \rangle$  and sets it up to support other `\tl_build_...` functions. Until `\tl_build_end:N`  $\langle tl\ var \rangle$  is called, applying any function from |3tl other than `\tl_build_...` will lead to incorrect results. The `begin` and `gbegin` functions must be used for local and global  $\langle tl\ var \rangle$  respectively.

---

`\tl_build_put_left:Nn`    `\tl_build_put_left:Nn`  $\langle tl\ var \rangle$   $\{ \langle tokens \rangle \}$   
`\tl_build_put_left:Ne`    `\tl_build_put_right:Nn`  $\langle tl\ var \rangle$   $\{ \langle tokens \rangle \}$

`\tl_build_gput_left:Nn`  
`\tl_build_gput_left:Ne`  
`\tl_build_put_right:Nn`  
`\tl_build_put_right:Ne`  
`\tl_build_gput_right:Nn`  
`\tl_build_gput_right:Ne`

New: 2018-04-01

Adds  $\langle tokens \rangle$  to the left or right side of the current contents of  $\langle tl\ var \rangle$ . The  $\langle tl\ var \rangle$  must have been set up with `\tl_build_begin:N` or `\tl_build_gbegin:N`. The `put` and `gput` functions must be used for local and global  $\langle tl\ var \rangle$  respectively. The `right` functions are about twice faster than the `left` functions.

---

```
\tl_build_end:N \tl_build_end:N <tl var>
```

---

```
\tl_build_gend:N
```

Gets the contents of  $\langle tl\ var\rangle$  and stores that into the  $\langle tl\ var\rangle$  using `\tl_set:Nn` or `\tl_gset:Nn`. The  $\langle tl\ var\rangle$  must have been set up with `\tl_build_begin:N` or `\tl_build_gbegin:N`. The `end` and `gend` functions must be used for local and global  $\langle tl\ var\rangle$  respectively. These functions completely remove the setup code that enabled  $\langle tl\ var\rangle$  to be used for other `\tl_build_...` functions. After the action of `end/gend`, the  $\langle tl\ var\rangle$  may be manipulated using standard `tl` functions.

New: 2018-04-01

---

```
\tl_build_get_intermediate>NN \tl_build_get_intermediate>NN <tl var1> <tl var2>
```

---

New: 2023-12-14

Stores the contents of the  $\langle tl\ var_1\rangle$  in the  $\langle tl\ var_2\rangle$ . The  $\langle tl\ var_1\rangle$  must have been set up with `\tl_build_begin:N` or `\tl_build_gbegin:N`. The  $\langle tl\ var_2\rangle$  is a “normal” token list variable, assigned locally using `\tl_set:Nn`.

## Chapter 17

# The `I3str` module

## Strings

`TEX` associates each character with a category code: as such, there is no concept of a “string” as commonly understood in many other programming languages. However, there are places where we wish to manipulate token lists while in some sense “ignoring” category codes: this is done by treating token lists as strings in a `TEX` sense.

A `TEX` string (and thus an `expl3` string) is a series of characters which have category code 12 (“other”) with the exception of space characters which have category code 10 (“space”). Thus at a technical level, a `TEX` string is a token list with the appropriate category codes. In this documentation, these are simply referred to as strings.

String variables are simply specialised token lists, but by convention should be named with the suffix `...str`. Such variables should contain characters with category code 12 (other), except spaces, which have category code 10 (blank space). All the functions in this module which accept a token list argument first convert it to a string using `\tl_to_str:n` for internal processing, and do not treat a token list or the corresponding string representation differently.

As a string is a subset of the more general token list, it is sometimes unclear when one should be used over the other. Use a string variable for data that isn’t primarily intended for typesetting and for which a level of protection from unwanted expansion is suitable. This data type simplifies comparison of variables since there are no concerns about expansion of their contents.

The functions `\cs_to_str:N`, `\tl_to_str:n`, `\tl_to_str:N` and `\token_to_str:N` (and variants) generate strings from the appropriate input: these are documented in `I3basics`, `I3tl` and `I3token`, respectively.

Most expandable functions in this module come in three flavours:

- `\str_...:N`, which expect a token list or string variable as their argument;
- `\str_...:n`, taking any token list (or string) as an argument;
- `\str_..._ignore_spaces:n`, which ignores any space encountered during the operation: these functions are typically faster than those which take care of escaping spaces appropriately.

## 17.1 Creating and initialising string variables

---

`\str_new:N` `\str_new:N <str var>`  
`\str_new:c` Creates a new `<str var>` or raises an error if the name is already taken. The declaration  
New: 2015-09-18 is global. The `<str var>` is initially empty.

---

`\str_const:Nn` `\str_const:Nn <str var> {<token list>}`  
`\str_const:(NV|Ne|cn|cV|ce)` Creates a new constant `<str var>` or raises an error if the name is already taken. The  
New: 2015-09-18 value of the `<str var>` is set globally to the `<token list>`, converted to a string.  
Updated: 2018-07-28

---

`\str_clear:N` `\str_clear:N <str var>`  
`\str_clear:c` Clears the content of the `<str var>`.  
`\str_gclear:N`  
`\str_gclear:c`  
New: 2015-09-18

---

`\str_clear_new:N` `\str_clear_new:N <str var>`  
`\str_clear_new:c`  
`\str_gclear_new:N`  
`\str_gclear_new:c` Ensures that the `<str var>` exists globally by applying `\str_new:N` if necessary, then  
applies `\str_(g)clear:N` to leave the `<str var>` empty.  
New: 2015-09-18

---

`\str_set_eq:NN` `\str_set_eq:NN <str var1> <str var2>`  
`\str_set_eq:(cN|Nc|cc)` Sets the content of `<str var1>` equal to that of `<str var2>`.  
`\str_gset_eq:NN`  
`\str_gset_eq:(cN|Nc|cc)`  
New: 2015-09-18

---

`\str_concat:NNN` `\str_concat:NNN <str var1> <str var2> <str var3>`  
`\str_concat:ccc`  
`\str_gconcat:NNN`  
`\str_gconcat:ccc` Concatenates the content of `<str var2>` and `<str var3>` together and saves the result in  
`<str var1>`. The `<str var2>` is placed at the left side of the new string variable. The  
`<str var2>` and `<str var3>` must indeed be strings, as this function does not convert their  
contents to a string.  
New: 2017-10-08

---

`\str_if_exist_p:N *` `\str_if_exist_p:N <str var>`  
`\str_if_exist_p:c *` `\str_if_exist:NTF <str var> {<true code>} {<false code>}`  
`\str_if_exist:NTF *` Tests whether the `<str var>` is currently defined. This does not check that the `<str var>`  
`\str_if_exist:cTF *` really is a string.  
New: 2015-09-18

---

## 17.2 Adding data to string variables

---

\str\_set:Nn \str\_set:(NV|Ne|cn|cV|ce) Converts the *(token list)* to a *(string)*, and stores the result in *(str var)*.  
\str\_gset:Nn  
\str\_gset:(NV|Ne|cn|cV|ce)  
New: 2015-09-18  
Updated: 2018-07-28

---

\str\_put\_left:Nn \str\_put\_left:(NV|Ne|cn|cV|ce) Converts the *(token list)* to a *(string)*, and prepends the result to *(str var)*. The current contents of the *(str var)* are not automatically converted to a string.  
\str\_gput\_left:Nn  
\str\_gput\_left:(NV|Ne|cn|cV|ce)  
New: 2015-09-18  
Updated: 2018-07-28

---

\str\_put\_right:Nn \str\_put\_right:(NV|Ne|cn|cV|Ne) Converts the *(token list)* to a *(string)*, and appends the result to *(str var)*. The current contents of the *(str var)* are not automatically converted to a string.  
\str\_gput\_right:Nn  
\str\_gput\_right:(NV|Ne|cn|cV|ce)  
New: 2015-09-18  
Updated: 2018-07-28

---

Converts the *(token list)* to a *(string)*, and appends the result to *(str var)*. The current contents of the *(str var)* are not automatically converted to a string.

## 17.3 String conditionals

---

\str\_if\_empty\_p:N \* \str\_if\_empty\_p:N (str var)  
\str\_if\_empty\_p:c \* \str\_if\_empty:NTF (str var) {*true code*} {*false code*}  
\str\_if\_empty:NTF \* Tests if the *(string variable)* is entirely empty (*i.e.* contains no characters at all).  
\str\_if\_empty:cTF \*  
\str\_if\_empty\_p:n \*  
\str\_if\_empty:nTF \*  
New: 2015-09-18  
Updated: 2022-03-21

---

\str\_if\_eq\_p:NN \* \str\_if\_eq\_p:NN (str var<sub>1</sub>) (str var<sub>2</sub>)  
\str\_if\_eq\_p:(Nc|cN|cc) \* \str\_if\_eq:NNTF (str var<sub>1</sub>) (str var<sub>2</sub>) {*true code*} {*false code*}  
\str\_if\_eq:NNTF \* Compares the content of two *(str variables)* and is logically **true** if the two contain the same characters in the same order. See \tl\_if\_eq:NNTF to compare tokens (including their category codes) rather than characters.  
New: 2015-09-18

---

---

```
\str_if_eq_p:nn          * \str_if_eq_p:nn {\(tl1)} {\(tl2)}
\str_if_eq_p:(Vn|on|no|nV|VV|vn|nv|ee) * \str_if_eq:nnTF {\(tl1)} {\(tl2)} {\(true code)} {\(false code)}
\str_if_eq:nnTF          *
\str_if_eq:(Vn|on|no|nV|VV|vn|nv|ee)TF *
```

---

Updated: 2018-06-18

Compares the two *<token lists>* on a character basis (namely after converting them to strings), and is **true** if the two *<strings>* contain the same characters in the same order. Thus for example

```
\str_if_eq_p:no {\ abc } {\ \tl_to_str:n {\ abc } }
```

is logically **true**. See **\tl\_if\_eq:nnTF** to compare tokens (including their category codes) rather than characters.

---

```
\str_if_in:NnTF \str_if_in:NnTF <str var> {\(token list)} {\(true code)} {\(false code)}
\str_if_in:cnTF          Converts the <token list> to a <string> and tests if that <string> is found in the content of
New: 2017-10-08 the <str var>.
```

---

---

```
\str_if_in:nnTF \str_if_in:nnTF {\(tl1)} {\(tl2)} {\(true code)} {\(false code)}
New: 2017-10-08 Converts both <token lists> to <strings> and tests whether <string2> is found inside
<string1>.
```

---

---

```
\str_case:nn          * \str_case:nnTF {\(test string)}
\str_case:(Vn|on|en|nV|nv)  * {
\str_case:nnTF          *   {\(string case1)} {\(code case1)}
\str_case:(Vn|on|en|nV|nv)TF *   {\(string case2)} {\(code case2)}
\str_case:Nn          *   ...
\str_case:NnTF          *   {\(string casen)} {\(code casen)}
}
{\(true code)}
{\(false code)}
```

---

Compares the *<test string>* in turn with each of the *<string case>*s (all token lists are converted to strings). If the two are equal (as described for **\str\_if\_eq:nnTF**) then the associated *<code>* is left in the input stream and other cases are discarded. If any of the cases are matched, the *<true code>* is also inserted into the input stream (after the code for the appropriate case), while if none match then the *<false code>* is inserted. The function **\str\_case:nn**, which does nothing if there is no match, is also available.

This set of functions performs no expansion on each *<string case>* argument, so any variable in there will be compared as a string. If expansion is needed in the *<string case>*s, then **\str\_case\_e:nn(TF)** should be used instead.

---

```
\str_case_e:nn    * \str_case_e:nnTF {\⟨test string⟩}
\str_case_e:en    *
\str_case_e:nnTF *
\str_case_e:enTF *

```

New: 2018-06-19

---

```

        {
            {\⟨string case1⟩} {\⟨code case1⟩}
            {\⟨string case2⟩} {\⟨code case2⟩}
            ...
            {\⟨string casen⟩} {\⟨code casen⟩}
        }
        {\⟨true code⟩}
        {\⟨false code⟩}

```

Compares the full expansion of the *⟨test string⟩* in turn with the full expansion of the *⟨string case⟩*s (all token lists are converted to strings). If the two full expansions are equal (as described for `\str_if_eq:eeTF`) then the associated *⟨code⟩* is left in the input stream and other cases are discarded. If any of the cases are matched, the *⟨true code⟩* is also inserted into the input stream (after the code for the appropriate case), while if none match then the *⟨false code⟩* is inserted. The function `\str_case_e:nn`, which does nothing if there is no match, is also available. In `\str_case_e:nn(TF)`, the *⟨test string⟩* is expanded in each comparison, and must always yield the same result: for example, random numbers must not be used within this string.

---

```
\str_compare_p:nNn * \str_compare_p:nNn {\⟨t1⟩} ⟨relation⟩ {\⟨t2⟩}
\str_compare_p:eNe * \str_compare:nNnTF {\⟨t1⟩} ⟨relation⟩ {\⟨t2⟩} {\⟨true code⟩} {\⟨false code⟩}
\str_compare:nNnTF *
\str_compare:eNeTF *

```

New: 2021-05-17

---

Compares the two *⟨token lists⟩* on a character by character basis (namely after converting them to strings) in a lexicographic order according to the character codes of the characters. The *⟨relation⟩* can be `<`, `=`, or `>` and the test is `true` under the following conditions:

- for `<`, if the first string is earlier than the second in lexicographic order;
- for `=`, if the two strings have exactly the same characters;
- for `>`, if the first string is later than the second in lexicographic order.

Thus for example the following is logically `true`:

```
\str_compare_p:nNn { ab } < { abc }
```

**TEXhackers note:** This is a wrapper around the `\(pdf)strcmp`. It is meant for programming and not for sorting textual contents, as it simply considers character codes and not more elaborate considerations of grapheme clusters, locale, etc.

## 17.4 Mapping over strings

All mappings are done at the current group level, *i.e.* any local assignments made by the *⟨function⟩* or *⟨code⟩* discussed below remain in effect after the loop.

---

```
\str_map_function:nN ☆ \str_map_function:nN {\⟨token list⟩} ⟨function⟩
\str_map_function:NN ☆ \str_map_function:NN ⟨str var⟩ ⟨function⟩
\str_map_function:cN ☆

```

New: 2017-11-14

---

Converts the *⟨token list⟩* to a *⟨string⟩* then applies *⟨function⟩* to every *⟨character⟩* in the *⟨string⟩* including spaces.

---

\str\_map\_inline:nn \str\_map\_inline:nn {⟨token list⟩} {⟨inline function⟩}  
\str\_map\_inline:Nn \str\_map\_inline:Nn ⟨str var⟩ {⟨inline function⟩}  
\str\_map\_inline:cN Converts the ⟨token list⟩ to a ⟨string⟩ then applies the ⟨inline function⟩ to every ⟨character⟩ in the ⟨str var⟩ including spaces. The ⟨inline function⟩ should consist of code which receives the ⟨character⟩ as #1.  
New: 2017-11-14

---

\str\_map\_tokens:nn ☆ \str\_map\_tokens:nn {⟨token list⟩} {⟨code⟩}  
\str\_map\_tokens:Nn ☆ \str\_map\_tokens:Nn ⟨str var⟩ {⟨code⟩}  
\str\_map\_tokens:cN Converts the ⟨token list⟩ to a ⟨string⟩ then applies ⟨code⟩ to every ⟨character⟩ in the ⟨string⟩ including spaces. The ⟨code⟩ receives each character as a trailing brace group. This is equivalent to \str\_map\_function:nN if the ⟨code⟩ consists of a single function.  
New: 2021-05-05

---

\str\_map\_variable:nNn \str\_map\_variable:nNn {⟨token list⟩} ⟨variable⟩ {⟨code⟩}  
\str\_map\_variable:NNn \str\_map\_variable:NNn ⟨str var⟩ ⟨variable⟩ {⟨code⟩}  
\str\_map\_variable:cNn Converts the ⟨token list⟩ to a ⟨string⟩ then stores each ⟨character⟩ in the ⟨string⟩ (including spaces) in turn in the (string or token list) ⟨variable⟩ and applies the ⟨code⟩. The ⟨code⟩ will usually make use of the ⟨variable⟩, but this is not enforced. The assignments to the ⟨variable⟩ are local. Its value after the loop is the last ⟨character⟩ in the ⟨string⟩, or its original value if the ⟨string⟩ is empty. See also \str\_map\_inline:Nn.  
New: 2017-11-14

---

\str\_map\_break: ☆ \str\_map\_break:  
New: 2017-10-08 Used to terminate a \str\_map\_... function before all characters in the ⟨string⟩ have been processed. This normally takes place within a conditional statement, for example

```
\str_map_inline:Nn \l_my_str
{
    \str_if_eq:nnT {#1} {bingo} { \str_map_break: }
    % Do something useful
}
```

See also \str\_map\_break:n. Use outside of a \str\_map\_... scenario leads to low level TeX errors.

**TeXhackers note:** When the mapping is broken, additional tokens may be inserted before continuing with the code that follows the loop. This depends on the design of the mapping function.

---

`\str_map_break:n`  $\star$  `\str_map_break:n {<code>}`

New: 2017-10-08 Used to terminate a `\str_map_...` function before all characters in the  $\langle string \rangle$  have been processed, inserting the  $\langle code \rangle$  after the mapping has ended. This normally takes place within a conditional statement, for example

```
\str_map_inline:Nn \l_my_str
{
    \str_if_eq:nnT { #1 } { bingo }
        { \str_map_break:n { <code> } }
    % Do something useful
}
```

Use outside of a `\str_map_...` scenario leads to low level T<sub>E</sub>X errors.

**TeXhackers note:** When the mapping is broken, additional tokens may be inserted before the  $\langle code \rangle$  is inserted into the input stream. This depends on the design of the mapping function.

## 17.5 Working with the content of strings

---

`\str_use:N`  $\star$  `\str_use:N {str var}`

New: 2015-09-18 Recovers the content of a  $\langle str var \rangle$  and places it directly in the input stream. An error is raised if the variable does not exist or if it is invalid. Note that it is possible to use a  $\langle str \rangle$  directly without an accessor function.

---

`\str_count:N`  $\star$  `\str_count:n {<token list>}`

`\str_count:c`  $\star$

`\str_count:n`  $\star$

`\str_count_ignore_spaces:n`  $\star$

New: 2015-09-18

Leaves in the input stream the number of characters in the string representation of  $\langle token list \rangle$ , as an integer denotation. The functions differ in their treatment of spaces. In the case of `\str_count:N` and `\str_count:n`, all characters including spaces are counted. The `\str_count_ignore_spaces:n` function leaves the number of non-space characters in the input stream.

---

`\str_count_spaces:N`  $\star$  `\str_count_spaces:n {<token list>}`

New: 2015-09-18 `\str_count_spaces:c`  $\star$  Leaves in the input stream the number of space characters in the string representation of  $\langle token list \rangle$ , as an integer denotation. Of course, this function has no `_ignore_spaces` variant.

---

```
\str_head:N          * \str_head:n {\<token list>}
\str_head:c          *
\str_head:n          *
\str_head_ignore_spaces:n *
```

---

New: 2015-09-18

Converts the  $\langle token\ list\rangle$  into a  $\langle string\rangle$ . The first character in the  $\langle string\rangle$  is then left in the input stream, with category code “other”. The functions differ if the first character is a space:  $\text{\str\_head:N}$  and  $\text{\str\_head:n}$  return a space token with category code 10 (blank space), while the  $\text{\str\_head\_ignore\_spaces:n}$  function ignores this space character and leaves the first non-space character in the input stream. If the  $\langle string\rangle$  is empty (or only contains spaces in the case of the  $\_ignore\_spaces$  function), then nothing is left on the input stream.

---

```
\str_tail:N          * \str_tail:n {\<token list>}
\str_tail:c          *
\str_tail:n          *
\str_tail_ignore_spaces:n *
```

---

New: 2015-09-18

Converts the  $\langle token\ list\rangle$  to a  $\langle string\rangle$ , removes the first character, and leaves the remaining characters (if any) in the input stream, with category codes 12 and 10 (for spaces). The functions differ in the case where the first character is a space:  $\text{\str\_tail:N}$  and  $\text{\str\_tail:n}$  only trim that space, while  $\text{\str\_tail\_ignore\_spaces:n}$  removes the first non-space character and any space before it. If the  $\langle token\ list\rangle$  is empty (or blank in the case of the  $\_ignore\_spaces$  variant), then nothing is left on the input stream.

---

```
\str_item:Nn         * \str_item:nn {\<token list>} {\<integer expression>}
\str_item:nn         *
\str_item_ignore_spaces:nn *
```

---

New: 2015-09-18

Converts the  $\langle token\ list\rangle$  to a  $\langle string\rangle$ , and leaves in the input stream the character in position  $\langle integer\ expression\rangle$  of the  $\langle string\rangle$ , starting at 1 for the first (left-most) character. In the case of  $\text{\str\_item:Nn}$  and  $\text{\str\_item:nn}$ , all characters including spaces are taken into account. The  $\text{\str\_item\_ignore\_spaces:nn}$  function skips spaces when counting characters. If the  $\langle integer\ expression\rangle$  is negative, characters are counted from the end of the  $\langle string\rangle$ . Hence,  $-1$  is the right-most character, etc.

---

```

\str_range:Nnn          * \str_range:nnn {\langle token list\rangle} {\langle start index\rangle} {\langle end index\rangle}
\str_range:cnn          *
\str_range:nnn          *
\str_range_ignore_spaces:nnn *

```

New: 2015-09-18

---

Converts the  $\langle token\ list\rangle$  to a  $\langle string\rangle$ , and leaves in the input stream the characters from the  $\langle start\ index\rangle$  to the  $\langle end\ index\rangle$  inclusive. Spaces are preserved and counted as items (contrast this with  $\backslash tl\_range:nnn$  where spaces are not counted as items and are possibly discarded from the output).

Here  $\langle start\ index\rangle$  and  $\langle end\ index\rangle$  should be integer denotations. For describing in detail the functions' behavior, let  $m$  and  $n$  be the start and end index respectively. If either is 0, the result is empty. A positive index means 'start counting from the left end', a negative index means 'start counting from the right end'. Let  $l$  be the count of the token list.

The *actual start point* is determined as  $M = m$  if  $m > 0$  and as  $M = l + m + 1$  if  $m < 0$ . Similarly the *actual end point* is  $N = n$  if  $n > 0$  and  $N = l + n + 1$  if  $n < 0$ . If  $M > N$ , the result is empty. Otherwise it consists of all items from position  $M$  to position  $N$  inclusive; for the purpose of this rule, we can imagine that the token list extends at infinity on either side, with void items at positions  $s$  for  $s \leq 0$  or  $s > l$ . For instance,

```

\iow_term:e { \str_range:nnn { abcdef } { 2 } { 5 } }
\iow_term:e { \str_range:nnn { abcdef } { -4 } { -1 } }
\iow_term:e { \str_range:nnn { abcdef } { -2 } { -1 } }
\iow_term:e { \str_range:nnn { abcdef } { 0 } { -1 } }

```

prints **bcd**, **cde**, **ef**, and an empty line to the terminal. The  $\langle start\ index\rangle$  must always be smaller than or equal to the  $\langle end\ index\rangle$ : if this is not the case then no output is generated. Thus

```

\iow_term:e { \str_range:nnn { abcdef } { 5 } { 2 } }
\iow_term:e { \str_range:nnn { abcdef } { -1 } { -4 } }

```

both yield empty strings.

The behavior of  $\backslash str\_range\_ignore\_spaces:nnn$  is similar, but spaces are removed before starting the job. The input

```

\iow_term:e { \str_range:nnn { abcdefg } { 2 } { 5 } }
\iow_term:e { \str_range:nnn { abcdefg } { 2 } { -3 } }
\iow_term:e { \str_range:nnn { abcdefg } { -6 } { 5 } }
\iow_term:e { \str_range:nnn { abcdefg } { -6 } { -3 } }

\iow_term:e { \str_range:nnn { abc~efg } { 2 } { 5 } }
\iow_term:e { \str_range:nnn { abc~efg } { 2 } { -3 } }
\iow_term:e { \str_range:nnn { abc~efg } { -6 } { 5 } }
\iow_term:e { \str_range:nnn { abc~efg } { -6 } { -3 } }

\iow_term:e { \str_range_ignore_spaces:nnn { abcdefg } { 2 } { 5 } }
\iow_term:e { \str_range_ignore_spaces:nnn { abcdefg } { 2 } { -3 } }
\iow_term:e { \str_range_ignore_spaces:nnn { abcdefg } { -6 } { 5 } }
\iow_term:e { \str_range_ignore_spaces:nnn { abcdefg } { -6 } { -3 } }

```

```
\iow_term:e { \str_range_ignore_spaces:nnn { abcd~efg } { 2 } { 5 } }
\iow_term:e { \str_range_ignore_spaces:nnn { abcd~efg } { 2 } { -3 } }
\iow_term:e { \str_range_ignore_spaces:nnn { abcd~efg } { -6 } { 5 } }
\iow_term:e { \str_range_ignore_spaces:nnn { abcd~efg } { -6 } { -3 } }
```

will print four instances of `bcde`, four instances of `bc e` and eight instances of `bcde`.

## 17.6 Modifying string variables

---

`\str_replace_once:Nnn`  
`\str_replace_once:cnn`  
`\str_greplace_once:Nnn`  
`\str_greplace_once:cnn`

`\str_replace_once:Nnn <str var> {<old>} {<new>}`

Converts the `<old>` and `<new>` token lists to strings, then replaces the first (leftmost) occurrence of `<old string>` in the `<str var>` with `<new string>`.

New: 2017-10-08

---

---

`\str_replace_all:Nnn`  
`\str_replace_all:cnn`  
`\str_greplace_all:Nnn`  
`\str_greplace_all:cnn`

`\str_replace_all:Nnn <str var> {<old>} {<new>}`

Converts the `<old>` and `<new>` token lists to strings, then replaces all occurrences of `<old string>` in the `<str var>` with `<new string>`. As this function operates from left to right, the pattern `<old string>` may remain after the replacement (see `\str_remove_all:Nn` for an example).

New: 2017-10-08

---

---

`\str_remove_once:Nn`  
`\str_remove_once:cn`  
`\str_gremove_once:Nn`  
`\str_gremove_once:cn`

`\str_remove_once:Nn <str var> {<token list>}`

Converts the `<token list>` to a `<string>` then removes the first (leftmost) occurrence of `<string>` from the `<str var>`.

New: 2017-10-08

---

---

`\str_remove_all:Nn`  
`\str_remove_all:cn`  
`\str_gremove_all:Nn`  
`\str_gremove_all:cn`

`\str_remove_all:Nn <str var> {<token list>}`

Converts the `<token list>` to a `<string>` then removes all occurrences of `<string>` from the `<str var>`. As this function operates from left to right, the pattern `<string>` may remain after the removal, for instance,

New: 2017-10-08

---

`\str_set:Nn \l_tmpa_str {abbccd} \str_remove_all:Nn \l_tmpa_str {bc}`

results in `\l_tmpa_str` containing `abcd`.

## 17.7 String manipulation

---

```
\str_lowercase:n * \str_lowercase:n {\langle tokens\rangle}
\str_lowercase:f * \str_uppercase:n {\langle tokens\rangle}
\str_uppercase:n * Converts the input \langle tokens\rangle to their string representation, as described for \tl_to_-
\str_uppercase:f * str:n, and then to the lower or upper case representation using a one-to-one mapping
New: 2019-11-26 as described by the Unicode Consortium file UnicodeData.txt.
```

---

These functions are intended for case changing programmatic data in places where upper/lower case distinctions are meaningful. One example would be automatically generating a function name from user input where some case changing is needed. In this situation the input is programmatic, not textual, case does have meaning and a language-independent one-to-one mapping is appropriate. For example

```
\cs_new_protected:Npn \myfunc:nn #1#2
{
    \cs_set_protected:cpx
    {
        user
        \str_uppercase:f { \tl_head:n {\#1} }
        \str_lowercase:f { \tl_tail:n {\#1} }
    }
    { #2 }
}
```

would be used to generate a function with an auto-generated name consisting of the upper case equivalent of the supplied name followed by the lower case equivalent of the rest of the input.

These functions should *not* be used for

- Caseless comparisons: use `\str_casfold:n` for this situation (case folding is distinct from lower casing).
- Case changing text for typesetting: see the `\text_lowercase:n(n)`, `\text_uppercase:n(n)` and `\text_titlecase_(all|once):n(n)` functions which correctly deal with context-dependence and other factors appropriate to text case changing.

---

`\str_casefold:n` \* `\str_casefold:n {⟨tokens⟩}`

---

`\str_casefold:v` \* Converts the input `⟨tokens⟩` to their string representation, as described for `\tl_to_str:n`, and then folds the case of the resulting `⟨string⟩` to remove case information. The result of this process is left in the input stream.

New: 2022-10-16

String folding is a process used for material such as identifiers rather than for “text”. The folding provided by `\str_casefold:n` follows the mappings provided by the [Unicode Consortium](#), who [state](#):

Case folding is primarily used for caseless comparison of text, such as identifiers in a computer program, rather than actual text transformation. Case folding in Unicode is based on the lowercase mapping, but includes additional changes to the source text to help make it language-insensitive and consistent. As a result, case-folded text should be used solely for internal processing and generally should not be stored or displayed to the end user.

The folding approach implemented by `\str_casefold:n` follows the “full” scheme defined by the Unicode Consortium (*e.g.* SSfolds to SS). As case-folding is a language-insensitive process, there is no special treatment of Turkic input (*i.e.* I always folds to i and not to ı).

---

`\str_mdfive_hash:n` \* `\str_mdfive_hash:n {⟨t1⟩}`

---

`\str_mdfive_hash:e` \* Expands to the MD5 sum generated from the `⟨t1⟩`, which is converted to a `⟨string⟩` as described for `\tl_to_str:n`.

New: 2023-05-19

## 17.8 Viewing strings

---

`\str_show:N`      `\str_show:N ⟨str var⟩`

---

`\str_show:c`      Displays the content of the `⟨str var⟩` on the terminal.  
`\str_show:n`

New: 2015-09-18

Updated: 2021-04-29

---

---

`\str_log:N`      `\str_log:N ⟨str var⟩`

---

`\str_log:c`      Writes the content of the `⟨str var⟩` in the log file.  
`\str_log:n`

New: 2019-02-15

Updated: 2021-04-29

---

## 17.9 Constant strings

---

<code>\c_ampersand_str</code>	Constant strings, containing a single character token, with category code 12.
<code>\c_atsign_str</code>	
<code>\c_backslash_str</code>	
<code>\c_left_brace_str</code>	
<code>\c_right_brace_str</code>	
<code>\c_circumflex_str</code>	
<code>\c_colon_str</code>	
<code>\c_dollar_str</code>	
<code>\c_hash_str</code>	
<code>\c_percent_str</code>	
<code>\c_tilde_str</code>	
<code>\c_underscore_str</code>	
<code>\c_zero_str</code>	

---

New: 2015-09-19

Updated: 2020-12-22

---

---

<code>\c_empty_str</code>	Constant that is always empty.
---------------------------	--------------------------------

---

New: 2023-12-07

## 17.10 Scratch strings

---

<code>\l_tmpa_str</code>	Scratch strings for local assignment. These are never used by the kernel code, and so
<code>\l_tmpb_str</code>	are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

---

---

<code>\g_tmpa_str</code>	Scratch strings for global assignment. These are never used by the kernel code, and so
<code>\g_tmpb_str</code>	are safe for use with any L <sup>A</sup> T <sub>E</sub> X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

---

## Chapter 18

# The `I3str-convert` module

## String encoding conversions

### 18.1 Encoding and escaping schemes

Traditionally, string encodings only specify how strings of characters should be stored as bytes. However, the resulting lists of bytes are often to be used in contexts where only a restricted subset of bytes are permitted (*e.g.*, PDF string objects, URLs). Hence, storing a string of characters is done in two steps.

- The code points (“character codes”) are expressed as bytes following a given “encoding”. This can be UTF-16, ISO 8859-1, *etc.* See Table 1 for a list of supported encodings.<sup>6</sup>
- Bytes are translated to `TEx` tokens through a given “escaping”. Those are defined for the most part by the `pdf` file format. See Table 2 for a list of escaping methods supported.<sup>6</sup>

---

<sup>6</sup>Encodings and escapings will be added as they are requested.

Table 1: Supported encodings. Non-alphanumeric characters are ignored, and capital letters are lower-cased before searching for the encoding in this list.

$\langle Encoding \rangle$	description
<code>utf8</code>	UTF-8
<code>utf16</code>	UTF-16, with byte-order mark
<code>utf16be</code>	UTF-16, big-endian
<code>utf16le</code>	UTF-16, little-endian
<code>utf32</code>	UTF-32, with byte-order mark
<code>utf32be</code>	UTF-32, big-endian
<code>utf32le</code>	UTF-32, little-endian
<code>iso88591, latin1</code>	ISO 8859-1
<code>iso88592, latin2</code>	ISO 8859-2
<code>iso88593, latin3</code>	ISO 8859-3
<code>iso88594, latin4</code>	ISO 8859-4
<code>iso88595</code>	ISO 8859-5
<code>iso88596</code>	ISO 8859-6
<code>iso88597</code>	ISO 8859-7
<code>iso88598</code>	ISO 8859-8
<code>iso88599, latin5</code>	ISO 8859-9
<code>iso885910, latin6</code>	ISO 8859-10
<code>iso885911</code>	ISO 8859-11
<code>iso885913, latin7</code>	ISO 8859-13
<code>iso885914, latin8</code>	ISO 8859-14
<code>iso885915, latin9</code>	ISO 8859-15
<code>iso885916, latin10</code>	ISO 8859-16
<code>clist</code>	comma-list of integers
<code>{empty}</code>	native (Unicode) string
<code>default</code>	like <code>utf8</code> with 8-bit engines, and like native with unicode-engines

Table 2: Supported escapings. Non-alphanumeric characters are ignored, and capital letters are lower-cased before searching for the escaping in this list.

$\langle Escaping \rangle$	description
<code>bytes, or empty</code>	arbitrary bytes
<code>hex, hexadecimal</code>	byte = two hexadecimal digits
<code>name</code>	see <code>\pdfescapeName</code>
<code>string</code>	see <code>\pdfescapeString</code>
<code>url</code>	encoding used in URLs

## 18.2 Conversion functions

---

```
\str_set_convert:Nnnn \str_set_convert:Nnnn <str var> {<string>} {<name 1>} {<name 2>}
```

---

This function converts the *<string>* from the encoding given by *<name 1>* to the encoding given by *<name 2>*, and stores the result in the *<str var>*. Each *<name>* can have the form *<encoding>* or *<encoding>/<escaping>*, where the possible values of *<encoding>* and *<escaping>* are given in Tables 1 and 2, respectively. The default escaping is to input and output bytes directly. The special case of an empty *<name>* indicates the use of “native” strings, 8-bit for pdfTEX, and Unicode strings for the other two engines.

For example,

```
\str_set_convert:Nnnn \l_foo_str { Hello! } { } { utf16/hex }
```

results in the variable `\l_foo_str` holding the string `FEFF00480065006C006C006F0021`. This is obtained by converting each character in the (native) string `Hello!` to the UTF-16 encoding, and expressing each byte as a pair of hexadecimal digits. Note the presence of a (big-endian) byte order mark “`FEFF`”, which can be avoided by specifying the encoding `utf16be/hex`.

An error is raised if the *<string>* is not valid according to the *<escaping 1>* and *<encoding 1>*, or if it cannot be reencoded in the *<encoding 2>* and *<escaping 2>* (for instance, if a character does not exist in the *<encoding 2>*). Erroneous input is replaced by the Unicode replacement character “`FFFD`”, and characters which cannot be reencoded are replaced by either the replacement character “`FFFD`” if it exists in the *<encoding 2>*, or an encoding-specific replacement character, or the question mark character.

---

```
\str_set_convert:NnnnTF \str_set_convert:NnnnTF <str var> {<string>} {<name 1>} {<name 2>} {<true code>}
```

---

As `\str_set_convert:Nnnn`, converts the *<string>* from the encoding given by *<name 1>* to the encoding given by *<name 2>*, and assigns the result to *<str var>*. Contrarily to `\str_set_convert:Nnnn`, the conditional variant does not raise errors in case the *<string>* is not valid according to the *<name 1>* encoding, or cannot be expressed in the *<name 2>* encoding. Instead, the *<false code>* is performed.

## 18.3 Conversion by expansion (for PDF contexts)

A small number of expandable functions are provided for use in PDF string/name contexts. These *assume UTF-8* and *no escaping* in the input.

---

```
\str_convert_pdfname:n * \str_convert_pdfname:n <string>
```

---

As `\str_set_convert:Nnnn`, converts the *<string>* on a byte-by-byte basis with non-ASCII codepoints escaped using hashes.

## 18.4 Possibilities, and things to do

Encoding/escaping-related tasks.

- In X<sub>H</sub>T<sub>E</sub>X/LuaT<sub>E</sub>X, would it be better to use the `^~~~....` approach to build a string from a given list of character codes? Namely, within a group, assign `0-9a-f` and all characters we want to category “other”, then assign `^` the category superscript, and use `\scantokens`.
- Change `\str_set_convert:Nnnn` to expand its last two arguments.
- Describe the internal format in the code comments. Refuse code points in `["D800, "DFFF]` in the internal representation?
- Add documentation about each encoding and escaping method, and add examples.
- The `hex` unescaping should raise an error for odd-token count strings.
- Decide what bytes should be escaped in the `url` escaping. Perhaps the characters `! ' ()*-./0123456789_` are safe, and all other characters should be escaped?
- Automate generation of 8-bit mapping files.
- Change the framework for 8-bit encodings: for decoding from 8-bit to Unicode, use 256 integer registers; for encoding, use a tree-box.
- More encodings (see Heiko’s `stringenc`). CESU?
- More escapings: ASCII85, shell escapes, lua escapes, *etc.*?

# Chapter 19

## The **I3quark** module Quarks and scan marks

Two special types of constants in IATEX3 are “quarks” and “scan marks”. By convention all constants of type quark start out with `\q_`, and scan marks start with `\s_`.

### 19.1 Quarks

Quarks are control sequences (and in fact, token lists) that expand to themselves and should therefore *never* be executed directly in the code. This would result in an endless loop!

They are meant to be used as delimiter in weird functions, the most common use case being the ‘stop token’ (*i.e.* `\q_stop`). For example, when writing a macro to parse a user-defined date

```
\date_parse:n {19/June/1981}
```

one might write a command such as

```
\cs_new:Npn \date_parse:n #1 { \date_parse_aux:w #1 \q_stop }
\cs_new:Npn \date_parse_aux:w #1 / #2 / #3 \q_stop
{ <do something with the date> }
```

Quarks are sometimes also used as error return values for functions that receive erroneous input. For example, in the function `\prop_get:NnN` to retrieve a value stored in some key of a property list, if the key does not exist then the return value is the quark `\q_no_value`. As mentioned above, such quarks are extremely fragile and it is imperative when using such functions that code is carefully written to check for pathological cases to avoid leakage of a quark into an uncontrolled environment.

Quarks also permit the following ingenious trick when parsing tokens: when you pick up a token in a temporary variable and you want to know whether you have picked up a particular quark, all you have to do is compare the temporary variable to the quark using `\tl_if_eq:NNTF`. A set of special quark testing functions is set up below. All the quark testing functions are expandable although the ones testing only single tokens are much faster.

## 19.2 Defining quarks

---

`\quark_new:N \quark_new:N <quark>`

Creates a new  $\langle \text{quark} \rangle$  which expands only to  $\langle \text{quark} \rangle$ . The  $\langle \text{quark} \rangle$  is defined globally, and an error message is raised if the name was already taken.

---

`\q_stop` Used as a marker for delimited arguments, such as

`\cs_set:Npn \tmp:w #1#2 \q_stop {#1}`

---

`\q_mark` Used as a marker for delimited arguments when `\q_stop` is already in use.

---

`\q_nil` Quark to mark a null value in structured variables or functions. Used as an end delimiter when this may itself need to be tested (in contrast to `\q_stop`, which is only ever used as a delimiter).

---

`\q_no_value` A canonical value for a missing value, when one is requested from a data structure. This is therefore used as a “return” value by functions such as `\prop_get:NnN` if there is no data to return.

## 19.3 Quark tests

The method used to define quarks means that the single token (N) tests are faster than the multi-token (n) tests. The latter should therefore only be used when the argument can definitely take more than a single token.

---

`\quark_if_nil_p:N * \quark_if_nil_p:N <token>`  
`\quark_if_nil:nTF * \quark_if_nil:nTF <token> {\<true code>} {\<false code>}`

Tests if the  $\langle \text{token} \rangle$  is equal to `\q_nil`.

---

`\quark_if_nil_p:n * \quark_if_nil_p:n {\<token list>}`  
`\quark_if_nil_p:(o|V) * \quark_if_nil:nTF {\<token list>} {\<true code>} {\<false code>}`  
`\quark_if_nil:nTF * Tests if the <token list> contains only \q_nil (distinct from <token list> being empty or`  
`\quark_if_nil:(o|V)TF * containing \q_nil plus one or more other tokens).`

---

`\quark_if_no_value_p:N * \quark_if_no_value_p:N <token>`  
`\quark_if_no_value_p:c * \quark_if_no_value:nTF <token> {\<true code>} {\<false code>}`  
`\quark_if_no_value:nTF * Tests if the <token> is equal to \q_no_value.`  
`\quark_if_no_value:cTF *`

---

`\quark_if_no_value_p:n * \quark_if_no_value_p:n {\<token list>}`  
`\quark_if_no_value:nTF * \quark_if_no_value:nTF {\<token list>} {\<true code>} {\<false code>}`

Tests if the  $\langle \text{token list} \rangle$  contains only `\q_no_value` (distinct from  $\langle \text{token list} \rangle$  being empty or containing `\q_no_value` plus one or more other tokens).

## 19.4 Recursion

This module provides a uniform interface to intercepting and terminating loops as when one is doing tail recursion. The building blocks follow below and an example is shown in Section 19.4.1.

---

**\q\_recursion\_tail** This quark is appended to the data structure in question and appears as a real element there. This means it gets any list separators around it.

---

**\q\_recursion\_stop** This quark is added *after* the data structure. Its purpose is to make it possible to terminate the recursion at any point easily.

---

**\quark\_if\_recursion\_tail\_stop:N** \* **\quark\_if\_recursion\_tail\_stop:N** *(token)*

Tests if *(token)* contains only the marker **\q\_recursion\_tail**, and if so uses **\use\_none\_delimit\_by\_q\_recursion\_stop:w** to terminate the recursion that this belongs to. The recursion input must include the marker tokens **\q\_recursion\_tail** and **\q\_recursion\_stop** as the last two items.

---

**\quark\_if\_recursion\_tail\_stop:n** \* **\quark\_if\_recursion\_tail\_stop:n** {*(token list)*}  
**\quark\_if\_recursion\_tail\_stop:o** \*

---

Updated: 2011-09-06

Tests if the *(token list)* contains only **\q\_recursion\_tail**, and if so uses **\use\_none\_delimit\_by\_q\_recursion\_stop:w** to terminate the recursion that this belongs to. The recursion input must include the marker tokens **\q\_recursion\_tail** and **\q\_recursion\_stop** as the last two items.

---

**\quark\_if\_recursion\_tail\_stop\_do:Nn** \* **\quark\_if\_recursion\_tail\_stop\_do:Nn** *(token)* {{*insertion*}}

Tests if *(token)* contains only the marker **\q\_recursion\_tail**, and if so uses **\use\_i\_delimit\_by\_q\_recursion\_stop:w** to terminate the recursion that this belongs to. The recursion input must include the marker tokens **\q\_recursion\_tail** and **\q\_recursion\_stop** as the last two items. The *(insertion)* code is then added to the input stream after the recursion has ended.

---

**\quark\_if\_recursion\_tail\_stop\_do:nn** \* **\quark\_if\_recursion\_tail\_stop\_do:nn** {*(token list)*} {{*insertion*}}  
**\quark\_if\_recursion\_tail\_stop\_do:on** \*

---

Updated: 2011-09-06

Tests if the *(token list)* contains only **\q\_recursion\_tail**, and if so uses **\use\_i\_delimit\_by\_q\_recursion\_stop:w** to terminate the recursion that this belongs to. The recursion input must include the marker tokens **\q\_recursion\_tail** and **\q\_recursion\_stop** as the last two items. The *(insertion)* code is then added to the input stream after the recursion has ended.

---

```
\quark_if_recursion_tail_break:NN * \quark_if_recursion_tail_break:nN {\langle token list\rangle}
\quark_if_recursion_tail_break:nN * \langle type\rangle_map_break:
```

---

New: 2018-04-10

---

Tests if *<token list>* contains only `\q_recursion_tail`, and if so terminates the recursion using `\langle type\rangle_map_break:`. The recursion end should be marked by `\prg_break_point:Nn \langle type\rangle_map_break:`.

#### 19.4.1 An example of recursion with quarks

Quarks are mainly used internally in the `expl3` code to define recursion functions such as `\tl_map_inline:nn` and so on. Here is a small example to demonstrate how to use quarks in this fashion. We shall define a command called `\my_map dbl:nn` which takes a token list and applies an operation to every *pair* of tokens. For example, `\my_map dbl:nn {abcd} {[--#1--#2--]~}` would produce “[*-a-b-*] [*-c-d-*]”. Using quarks to define such functions simplifies their logic and ensures robustness in many cases.

Here’s the definition of `\my_map dbl:nn`. First of all, define the function that does the processing based on the inline function argument #2. Then initiate the recursion using an internal function. The token list #1 is terminated using `\q_recursion_tail`, with delimiters according to the type of recursion (here a pair of `\q_recursion_tail`), concluding with `\q_recursion_stop`. These quarks are used to mark the end of the token list being operated upon.

```
\cs_new:Npn \my_map dbl:nn #1#2
{
    \cs_set:Npn \__my_map dbl_fn:nn ##1 ##2 {\#2}
    \__my_map dbl:nn #1 \q_recursion_tail \q_recursion_tail
    \q_recursion_stop
}
```

The definition of the internal recursion function follows. First check if either of the input tokens are the termination quarks. Then, if not, apply the inline function to the two arguments.

```
\cs_new:Nn \__my_map dbl:nn
{
    \quark_if_recursion_tail_stop:n {\#1}
    \quark_if_recursion_tail_stop:n {\#2}
    \__my_map dbl_fn:nn {\#1} {\#2}
```

Finally, recurse:

```
\__my_map dbl:nn
```

Note that contrarily to `LATEX3` built-in mapping functions, this mapping function cannot be nested, since the second map would overwrite the definition of `\__my_map dbl_fn:nn`.

## 19.5 Scan marks

Scan marks are control sequences set equal to `\scan_stop:`, hence never expand in an expansion context and are (largely) invisible if they are encountered in a typesetting context.

Like quarks, they can be used as delimiters in weird functions and are often safer to use for this purpose. Since they are harmless when executed by TeX in non-expandable contexts, they can be used to mark the end of a set of instructions. This allows to skip to that point if the end of the instructions should not be performed (see `\3regex`).

---

`\scan_new:N` `\scan_new:N <scan mark>`

New: 2018-04-01 Creates a new `<scan mark>` which is set equal to `\scan_stop:`. The `<scan mark>` is defined globally, and an error message is raised if the name was already taken by another scan mark.

---

`\s_stop` Used at the end of a set of instructions, as a marker that can be jumped to using `\use_-none_delimit_by_s_stop:w`.

New: 2018-04-01

---

`\use_none_delimit_by_s_stop:w * \use_none_delimit_by_s_stop:w <tokens> \s_stop`

New: 2018-04-01

Removes the `<tokens>` and `\s_stop` from the input stream. This leads to a low-level TeX error if `\s_stop` is absent.

# Chapter 20

## The `I3seq` module Sequences and stacks

LATEX3 implements a “sequence” data type, which contain an ordered list of entries which may contain any *<balanced text>*. It is possible to map functions to sequences such that the function is applied to every item in the sequence.

Sequences are also used to implement stack functions in LATEX3. This is achieved using a number of dedicated stack functions.

### 20.1 Creating and initialising sequences

---

`\seq_new:N \seq_new:N <seq var>`

`\seq_new:c` Creates a new *<seq var>* or raises an error if the name is already taken. The declaration is global. The *<seq var>* initially contains no items.

---

`\seq_clear:N \seq_clear:N <seq var>`

`\seq_clear:c` Clears all items from the *<seq var>*.

`\seq_gclear:N`

`\seq_gclear:c`

---

`\seq_clear_new:N \seq_clear_new:N <seq var>`

`\seq_clear_new:c` Ensures that the *<seq var>* exists globally by applying `\seq_new:N` if necessary, then applies `\seq_(g)clear:N` to leave the *<seq var>* empty.

---

`\seq_set_eq:NN \seq_set_eq:NN <seq var1> <seq var2>`

`\seq_set_eq:(cN|Nc|cc)` Sets the content of *<seq var<sub>1</sub>>* equal to that of *<seq var<sub>2</sub>>*.

`\seq_gset_eq:NN`

`\seq_gset_eq:(cN|Nc|cc)`

---

```
\seq_set_from_clist:NN          \seq_set_from_clist:NN <seq var> <comma-list>
\seq_set_from_clist:(cN|Nc|cc)
\seq_set_from_clist:Nn
\seq_set_from_clist:cn
\seq_gset_from_clist:NN
\seq_gset_from_clist:(cN|Nc|cc)
\seq_gset_from_clist:Nn
\seq_gset_from_clist:cn
```

---

New: 2014-07-17

Converts the data in the *<comma list>* into a *<seq var>*: the original *<comma list>* is unchanged.

---

```
\seq_const_from_clist:Nn \seq_const_from_clist:Nn <seq var> {{<comma-list>}}
```

---

```
\seq_const_from_clist:cn Creates a new constant <seq var> or raises an error if the name is already taken. The
New: 2017-11-28 <seq var> is set globally to contain the items in the <comma list>.
```

---

---

```
\seq_set_split:Nnn          \seq_set_split:Nnn <seq var> {{<delimiter>}} {{<token list>}}
\seq_set_split:(NVn|NnV|NVV|Nne|Nee)
\seq_gset_split:Nnn
\seq_gset_split:(NVn|NnV|NVV|Nne|Nee)
```

---

New: 2011-08-15

Updated: 2012-07-02

Splits the *<token list>* into *<items>* separated by *<delimiter>*, and assigns the result to the *<seq var>*. Spaces on both sides of each *<item>* are ignored, then one set of outer braces is removed (if any); this space trimming behaviour is identical to that of `\l3clist` functions. Empty *<items>* are preserved by `\seq_set_split:Nnn`, and can be removed afterwards using `\seq_remove_all:Nn <seq var> {}`. The *<delimiter>* may not contain {, } or # (assuming `\tex`'s normal category code régime). If the *<delimiter>* is empty, the *<token list>* is split into *<items>* as a *<token list>*. See also `\seq_set_split_keep_spaces:Nnn`, which omits space stripping.

---

```
\seq_set_split_keep_spaces:Nnn \seq_set_split_keep_spaces:Nnn <seq var> {{<delimiter>}} {{<token list>}}
\seq_set_split_keep_spaces:NnV
\seq_gset_split_keep_spaces:Nnn
\seq_gset_split_keep_spaces:NnV
```

---

New: 2021-03-24

Splits the *<token list>* into *<items>* separated by *<delimiter>*, and assigns the result to the *<seq var>*. One set of outer braces is removed (if any) but any surrounding spaces are retained: any braces *inside* one or more spaces are therefore kept. Empty *<items>* are preserved by `\seq_set_split_keep_spaces:Nnn`, and can be removed afterwards using `\seq_remove_all:Nn <seq var> {}`. The *<delimiter>* may not contain {, } or # (assuming `\tex`'s normal category code régime). If the *<delimiter>* is empty, the *<token list>* is split into *<items>* as a *<token list>*. See also `\seq_set_split:Nnn`, which removes spaces around the delimiters.

---

`\seq_set_filter:NNn` `\seq_set_filter>NNn <seq var1> <seq var2> {<inline boolexpr>}`  
`\seq_gset_filter:NNn` Evaluates the `<inline boolexpr>` for every `<item>` stored within the `<seq var2>`. The `<inline boolexpr>` receives the `<item>` as #1. The sequence of all `<items>` for which the `<inline boolexpr>` evaluated to `true` is assigned to `<seq var1>`.

---

New: 2012-06-15

**TeXhackers note:** Contrarily to other mapping functions, `\seq_map_break:` cannot be used in this function, and would lead to low-level TeX errors.

---

`\seq_concat:NNN` `\seq_concat>NNN <seq var1> <seq var2> <seq var3>`  
`\seq_concat:ccc` Concatenates the content of `<seq var2>` and `<seq var3>` together and saves the result in `<seq var1>`. The items in `<seq var2>` are placed at the left side of the new sequence.  
`\seq_gconcat:NNN`  
`\seq_gconcat:ccc`

---

---

`\seq_if_exist_p:N *` `\seq_if_exist_p:N <seq var>`  
`\seq_if_exist_p:c *` `\seq_if_exist:NTF <seq var> {<true code>} {<false code>}`  
`\seq_if_exist:NTF *` Tests whether the `<seq var>` is currently defined. This does not check that the `<seq var>` really is a sequence variable.  
`\seq_if_exist:cTF *`

---

New: 2012-03-03

## 20.2 Appending data to sequences

---

`\seq_put_left:Nn` `\seq_put_left:Nn <seq var> {<item>}`  
`\seq_put_left:(NV|Nv|Ne|No|cn|cV|cv|ce|co)`  
`\seq_gput_left:Nn`  
`\seq_gput_left:(NV|Nv|Ne|No|cn|cV|cv|ce|co)`

---

Appends the `<item>` to the left of the `<seq var>`.

---

`\seq_put_right:Nn` `\seq_put_right:Nn <seq var> {<item>}`  
`\seq_put_right:(NV|Nv|Ne|No|cn|cV|cv|ce|co)`  
`\seq_gput_right:Nn`  
`\seq_gput_right:(NV|Nv|Ne|No|cn|cV|cv|ce|co)`

---

Appends the `<item>` to the right of the `<seq var>`.

## 20.3 Recovering items from sequences

Items can be recovered from either the left or the right of sequences. For implementation reasons, the actions at the left of the sequence are faster than those acting on the right. These functions all assign the recovered material locally, *i.e.* setting the `<token list variable>` used with `\tl_set:Nn` and *never* `\tl_gset:Nn`.

---

`\seq_get_left:NN` `\seq_get_left:NN <seq var> <token list variable>`  
`\seq_get_left:cN` Stores the left-most item from a `<seq var>` in the `<token list variable>` without removing it from the `<seq var>`. The `<token list variable>` is assigned locally. If `<seq var>` is empty the `<token list variable>` is set to the special marker `\q_no_value`.  
Updated: 2012-05-14

---

---

`\seq_get_right:NN` `\seq_get_right:NN <seq var> <token list variable>`  
`\seq_get_right:cN` Stores the right-most item from a `<seq var>` in the `<token list variable>` without removing it from the `<seq var>`. The `<token list variable>` is assigned locally. If `<seq var>` is empty the `<token list variable>` is set to the special marker `\q_no_value`.

---

`\seq_pop_left:NN` `\seq_pop_left:NN <seq var> <token list variable>`  
`\seq_pop_left:cN` Pops the left-most item from a `<seq var>` into the `<token list variable>`, i.e. removes the item from the sequence and stores it in the `<token list variable>`. Both of the variables are assigned locally. If `<seq var>` is empty the `<token list variable>` is set to the special marker `\q_no_value`.

---

`\seq_gpop_left:NN` `\seq_gpop_left:NN <seq var> <token list variable>`  
`\seq_gpop_left:cN` Pops the left-most item from a `<seq var>` into the `<token list variable>`, i.e. removes the item from the sequence and stores it in the `<token list variable>`. The `<seq var>` is modified globally, while the assignment of the `<token list variable>` is local. If `<seq var>` is empty the `<token list variable>` is set to the special marker `\q_no_value`.

---

`\seq_pop_right:NN` `\seq_pop_right:NN <seq var> <token list variable>`  
`\seq_pop_right:cN` Pops the right-most item from a `<seq var>` into the `<token list variable>`, i.e. removes the item from the sequence and stores it in the `<token list variable>`. Both of the variables are assigned locally. If `<seq var>` is empty the `<token list variable>` is set to the special marker `\q_no_value`.

---

`\seq_gpop_right:NN` `\seq_gpop_right:NN <seq var> <token list variable>`  
`\seq_gpop_right:cN` Pops the right-most item from a `<seq var>` into the `<token list variable>`, i.e. removes the item from the sequence and stores it in the `<token list variable>`. The `<seq var>` is modified globally, while the assignment of the `<token list variable>` is local. If `<seq var>` is empty the `<token list variable>` is set to the special marker `\q_no_value`.

---

`\seq_item:Nn` \* `\seq_item:Nn <seq var> {<integer expression>}`  
`\seq_item:(NV|Ne|cn|cV|ce)` \* Indexing items in the `<seq var>` from 1 at the top (left), this function evaluates the `<integer expression>` and leaves the appropriate item from the sequence in the input stream. If the `<integer expression>` is negative, indexing occurs from the bottom (right) of the sequence. If the `<integer expression>` is larger than the number of items in the `<seq var>` (as calculated by `\seq_count:N`) then the function expands to nothing.

---

**TeXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the `<item>` does not expand further when appearing in an e-type or x-type argument expansion.

---

`\seq_rand_item:N` \* `\seq_rand_item:N <seq var>`  
`\seq_rand_item:c` \* Selects a pseudo-random item of the `<seq var>`. If the `<seq var>` is empty the result is empty. This is not available in older versions of X<sub>E</sub>T<sub>E</sub>X.

---

**TeXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the `<item>` does not expand further when appearing in an e-type or x-type argument expansion.

## 20.4 Recovering values from sequences with branching

The functions in this section combine tests for non-empty sequences with recovery of an item from the sequence. They offer increased readability and performance over separate testing and recovery phases.

`\seq_get_left:NNTF \seq_get_left:NNTF <seq var> <token list variable> {{true code}} {{false code}}`

`\seq_get_left:cNTF`

If the `<seq var>` is empty, leaves the `<false code>` in the input stream. The value of the `<token list variable>` is not defined in this case and should not be relied upon. If the `<seq var>` is non-empty, stores the left-most item from the `<seq var>` in the `<token list variable>` without removing it from the `<seq var>`, then leaves the `<true code>` in the input stream. The `<token list variable>` is assigned locally.

New: 2012-05-14

Updated: 2012-05-19

`\seq_get_right:NNTF \seq_get_right:NNTF <seq var> <token list variable> {{true code}} {{false code}}`

`\seq_get_right:cNTF`

If the `<seq var>` is empty, leaves the `<false code>` in the input stream. The value of the `<token list variable>` is not defined in this case and should not be relied upon. If the `<seq var>` is non-empty, stores the right-most item from the `<seq var>` in the `<token list variable>` without removing it from the `<seq var>`, then leaves the `<true code>` in the input stream. The `<token list variable>` is assigned locally.

New: 2012-05-19

`\seq_pop_left:NNTF \seq_pop_left:NNTF <seq var> <token list variable> {{true code}} {{false code}}`

`\seq_pop_left:cNTF`

If the `<seq var>` is empty, leaves the `<false code>` in the input stream. The value of the `<token list variable>` is not defined in this case and should not be relied upon. If the `<seq var>` is non-empty, pops the left-most item from the `<seq var>` in the `<token list variable>`, i.e. removes the item from the `<seq var>`, then leaves the `<true code>` in the input stream. Both the `<seq var>` and the `<token list variable>` are assigned locally.

New: 2012-05-14

Updated: 2012-05-19

`\seq_gpop_left:NNTF \seq_gpop_left:NNTF <seq var> <token list variable> {{true code}} {{false code}}`

`\seq_gpop_left:cNTF`

If the `<seq var>` is empty, leaves the `<false code>` in the input stream. The value of the `<token list variable>` is not defined in this case and should not be relied upon. If the `<seq var>` is non-empty, pops the left-most item from the `<seq var>` in the `<token list variable>`, i.e. removes the item from the `<seq var>`, then leaves the `<true code>` in the input stream. The `<seq var>` is modified globally, while the `<token list variable>` is assigned locally.

New: 2012-05-14

Updated: 2012-05-19

`\seq_pop_right:NNTF \seq_pop_right:NNTF <seq var> <token list variable> {{true code}} {{false code}}`

`\seq_pop_right:cNTF`

If the `<seq var>` is empty, leaves the `<false code>` in the input stream. The value of the `<token list variable>` is not defined in this case and should not be relied upon. If the `<seq var>` is non-empty, pops the right-most item from the `<seq var>` in the `<token list variable>`, i.e. removes the item from the `<seq var>`, then leaves the `<true code>` in the input stream. Both the `<seq var>` and the `<token list variable>` are assigned locally.

---

`\seq_gpop_right:NNTF` `\seq_gpop_right:NNTF <seq var> <token list variable> {<true code>} {<false code>}`

---

`\seq_gpop_right:cNTF` If the `<seq var>` is empty, leaves the `<false code>` in the input stream. The value of the `<token list variable>` is not defined in this case and should not be relied upon. If the `<seq var>` is non-empty, pops the right-most item from the `<seq var>` in the `<token list variable>`, i.e. removes the item from the `<seq var>`, then leaves the `<true code>` in the input stream. The `<seq var>` is modified globally, while the `<token list variable>` is assigned locally.

New: 2012-05-19

## 20.5 Modifying sequences

While sequences are normally used as ordered lists, it may be necessary to modify the content. The functions here may be used to update sequences, while retaining the order of the unaffected entries.

---

`\seq_remove_duplicates:N` `\seq_remove_duplicates:N <seq var>`  
`\seq_remove_duplicates:c`  
`\seq_gremove_duplicates:N` Removes duplicate items from the `<seq var>`, leaving the left most copy of each item in the `<seq var>`. The `<item>` comparison takes place on a token basis, as for `\tl_if_eq:nnTF`.  
`\seq_gremove_duplicates:c`

**TeXhackers note:** This function iterates through every item in the `<seq var>` and does a comparison with the `<items>` already checked. It is therefore relatively slow with large sequences.

---

`\seq_remove_all:Nn` `\seq_remove_all:Nn <seq var> {<item>}`  
`\seq_remove_all:(NV|Ne|cn|cV|ce)`  
`\seq_gremove_all:Nn`  
`\seq_gremove_all:(NV|Ne|cn|cV|ce)`

Removes every occurrence of `<item>` from the `<seq var>`. The `<item>` comparison takes place on a token basis, as for `\tl_if_eq:nnTF`.

---

`\seq_set_item:Nnn` `\seq_set_item:Nnn <seq var> {<int expr>} {<item>}`  
`\seq_set_item:cnn`  
`\seq_set_item:NnnTF` `\seq_set_item:NnnTF <seq var> {<int expr>} {<item>} {<true code>} {<false code>}`  
`\seq_set_item:cnnTF` Removes the item of `<seq var>` at the position given by evaluating the `<int expr>` and replaces it by `<item>`. Items are indexed from 1 on the left/top of the `<seq var>`, or from -1 on the right/bottom. If the `<int expr>` is zero or is larger (in absolute value) than the number of items in the sequence, the `<seq var>` is not modified. In these cases, `\seq_set_item:Nnn` raises an error while `\seq_set_item:NnnTF` runs the `<false code>`. In cases where the assignment was successful, `<true code>` is run afterwards.  
`\seq_gset_item:Nnn`  
`\seq_gset_item:cnn`  
`\seq_gset_item:NnnTF`  
`\seq_gset_item:cnnTF`

New: 2021-04-29

---

`\seq_reverse:N` `\seq_reverse:N <seq var>`  
`\seq_reverse:c`  
`\seq_greverse:N` Reverses the order of the items stored in the `<seq var>`.  
`\seq_greverse:c`

New: 2014-07-18

---

`\seq_sort:Nn` `\seq_sort:cn` `\seq_gsort:Nn` `\seq_gsort:cn`

Sorts the items in the  $\langle \text{seq var} \rangle$  according to the  $\langle \text{comparison code} \rangle$ , and assigns the result to  $\langle \text{seq var} \rangle$ . The details of sorting comparison are described in Section 6.1.

Updated: 2017-02-06

---

---

`\seq_shuffle:N` `\seq_shuffle:c` `\seq_gshuffle:N` `\seq_gshuffle:c`

Sets the  $\langle \text{seq var} \rangle$  to the result of placing the items of the  $\langle \text{seq var} \rangle$  in a random order. Each item is (roughly) as likely to end up in any given position.

Updated: 2018-04-29

---

**TEXhackers note:** For sequences with more than 13 items or so, only a small proportion of all possible permutations can be reached, because the random seed `\sys_rand_seed:` only has 28-bits. The use of `\toks` internally means that sequences with more than 32767 or 65535 items (depending on the engine) cannot be shuffled.

## 20.6 Sequence conditionals

---

`\seq_if_empty_p:N` \* `\seq_if_empty_p:N`  $\langle \text{seq var} \rangle$   
`\seq_if_empty_p:c` \* `\seq_if_empty:NTF`  $\langle \text{seq var} \rangle$   $\{\langle \text{true code} \rangle\}$   $\{\langle \text{false code} \rangle\}$   
`\seq_if_empty:NTF` \* Tests if the  $\langle \text{seq var} \rangle$  is empty (containing no items).  
`\seq_if_empty:cTF` \*

---

`\seq_if_in:NnTF`  $\langle \text{seq var} \rangle$   $\{\langle \text{item} \rangle\}$   $\{\langle \text{true code} \rangle\}$   $\{\langle \text{false code} \rangle\}$   
`\seq_if_in:(NV|Nv|Ne|No|cn|cV|cv|ce|co)TF`

Tests if the  $\langle \text{item} \rangle$  is present in the  $\langle \text{seq var} \rangle$ .

## 20.7 Mapping over sequences

All mappings are done at the current group level, *i.e.* any local assignments made by the  $\langle \text{function} \rangle$  or  $\langle \text{code} \rangle$  discussed below remain in effect after the loop.

---

`\seq_map_function>NN` ☆ `\seq_map_function>NN`  $\langle \text{seq var} \rangle$   $\langle \text{function} \rangle$

`\seq_map_function:cN` ☆

Updated: 2012-06-29

---

Applies  $\langle \text{function} \rangle$  to every  $\langle \text{item} \rangle$  stored in the  $\langle \text{seq var} \rangle$ . The  $\langle \text{function} \rangle$  will receive one argument for each iteration. The  $\langle \text{items} \rangle$  are returned from left to right. To pass further arguments to the  $\langle \text{function} \rangle$ , see `\seq_map_tokens:Nn`. The function `\seq_map_inline:Nn` is faster than `\seq_map_function>NN` for sequences with more than about 10 items.

---

`\seq_map_inline:Nn` `\seq_map_inline:Nn`  $\langle \text{seq var} \rangle$   $\{\langle \text{inline function} \rangle\}$

`\seq_map_inline:cn`

Updated: 2012-06-29

---

Applies  $\langle \text{inline function} \rangle$  to every  $\langle \text{item} \rangle$  stored within the  $\langle \text{seq var} \rangle$ . The  $\langle \text{inline function} \rangle$  should consist of code which will receive the  $\langle \text{item} \rangle$  as #1. The  $\langle \text{items} \rangle$  are returned from left to right.

---

\seq\_map\_tokens:Nn  $\star$  \seq\_map\_tokens:Nn *seq var* {*code*}  
\seq\_map\_tokens:cn  $\star$  Analogue of \seq\_map\_function:NN which maps several tokens instead of a single function. The *code* receives each item in the *seq var* as a trailing brace group. For instance,

---

\seq\_map\_tokens:Nn \l\_my\_seq { \prg\_replicate:nn { 2 } }

expands to twice each item in the *seq var*: for each item in \l\_my\_seq the function \prg\_replicate:nn receives 2 and *item* as its two arguments. The function \seq\_map\_inline:Nn is typically faster but it is not expandable.

---

\seq\_map\_variable>NNn \seq\_map\_variable>NNn *seq var* *variable* {*code*}  
\seq\_map\_variable:(Ncn|cNn|ccn)  
Updated: 2012-06-29

---

Stores each *item* of the *seq var* in turn in the (token list) *variable* and applies the *code*. The *code* will usually make use of the *variable*, but this is not enforced. The assignments to the *variable* are local. Its value after the loop is the last *item* in the *seq var*, or its original value if the *seq var* is empty. The *items* are returned from left to right.

---

\seq\_map\_indexed\_function:NN  $\star$  \seq\_map\_indexed\_function:NN *seq var* *function*  
New: 2018-05-03

---

Applies *function* to every entry in the *seq var*. The *function* should have signature :nn. It receives two arguments for each iteration: the *index* (namely 1 for the first entry, then 2 and so on) and the *item*.

---

\seq\_map\_indexed\_inline:Nn \seq\_map\_indexed\_inline:Nn *seq var* {*inline function*}  
New: 2018-05-03 Applies *inline function* to every entry in the *seq var*. The *inline function* should consist of code which receives the *index* (namely 1 for the first entry, then 2 and so on) as #1 and the *item* as #2.

---

---

\seq\_map\_pairwise\_function:NNN  $\star$  \seq\_map\_pairwise\_function:NNN *seq<sub>1</sub>* *seq<sub>2</sub>* *function*  
\seq\_map\_pairwise\_function:(NcN|cNN|ccN)  $\star$   
New: 2023-05-10

---

Applies *function* to every pair of items *seq<sub>1-item</sub>*–*seq<sub>2-item</sub>* from the two sequences, returning items from both sequences from left to right. The *function* receives two n-type arguments for each iteration. The mapping terminates when the end of either sequence is reached (*i.e.* whichever sequence has fewer items determines how many iterations occur).

---

`\seq_map_break: ☆ \seq_map_break:`

Updated: 2012-06-29 Used to terminate a `\seq_map_...` function before all entries in the `\seq var` have been processed. This normally takes place within a conditional statement, for example

```
\seq_map_inline:Nn \l_my_seq
{
    \str_if_eq:nnTF { #1 } { bingo }
        { \seq_map_break: }
    {
        % Do something useful
    }
}
```

Use outside of a `\seq_map_...` scenario leads to low level T<sub>E</sub>X errors.

**TEXhackers note:** When the mapping is broken, additional tokens may be inserted before further items are taken from the input stream. This depends on the design of the mapping function.

---

`\seq_map_break:n ☆ \seq_map_break:n {<code>}`

Updated: 2012-06-29 Used to terminate a `\seq_map_...` function before all entries in the `\seq var` have been processed, inserting the `<code>` after the mapping has ended. This normally takes place within a conditional statement, for example

```
\seq_map_inline:Nn \l_my_seq
{
    \str_if_eq:nnTF { #1 } { bingo }
        { \seq_map_break:n { <code> } }
    {
        % Do something useful
    }
}
```

Use outside of a `\seq_map_...` scenario leads to low level T<sub>E</sub>X errors.

**TEXhackers note:** When the mapping is broken, additional tokens may be inserted before the `<code>` is inserted into the input stream. This depends on the design of the mapping function.

---

`\seq_set_map:NNn \seq_set_map:NNn <seq var1> <seq var2> {{inline function}}`

`\seq_gset_map:NNn` Applies `<inline function>` to every `<item>` stored within the `<seq var2>`. The `<inline function>` should consist of code which will receive the `<item>` as `#1`. The sequence resulting applying `<inline function>` to each `<item>` is assigned to `<seq var1>`.

New: 2011-12-22

Updated: 2020-07-16

**TEXhackers note:** Contrarily to other mapping functions, `\seq_map_break:` cannot be used in this function, and would lead to low-level T<sub>E</sub>X errors.

---

<code>\seq_set_map_e:NNn</code>	<code>\seq_set_map_e&gt;NNn &lt;seq var<sub>1</sub>&gt; &lt;seq var<sub>2</sub>&gt; {&lt;inline function&gt;}</code>
<code>\seq_gset_map_e:NNn</code>	Applies <i>&lt;inline function&gt;</i> to every <i>&lt;item&gt;</i> stored within the <i>&lt;seq var<sub>2</sub>&gt;</i> . The <i>&lt;inline function&gt;</i> should consist of code which will receive the <i>&lt;item&gt;</i> as #1. The sequence resulting from e-expanding <i>&lt;inline function&gt;</i> applied to each <i>&lt;item&gt;</i> is assigned to <i>&lt;seq var<sub>1</sub>&gt;</i> .
<small>New: 2020-07-16</small>	
<small>Updated: 2023-10-26</small>	As such, the code in <i>&lt;inline function&gt;</i> should be expandable.

---

**TEXhackers note:** Contrarily to other mapping functions, `\seq_map_break:` cannot be used in this function, and would lead to low-level TeX errors.

---

<code>\seq_count:N *</code>	<code>\seq_count:N &lt;seq var&gt;</code>
<code>\seq_count:c *</code>	Leaves the number of items in the <i>&lt;seq var&gt;</i> in the input stream as an <i>&lt;integer denotation&gt;</i> .
<small>New: 2012-07-13</small>	The total number of items in a <i>&lt;seq var&gt;</i> includes those which are empty and duplicates, i.e. every item in a <i>&lt;seq var&gt;</i> is unique.

---

## 20.8 Using the content of sequences directly

---

<code>\seq_use:Nnnn *</code>	<code>\seq_use:Nnnn &lt;seq var&gt; {&lt;separator between two&gt;}</code>
<code>\seq_use:cnnn *</code>	<code>{&lt;separator between more than two&gt;} {&lt;separator between final two&gt;}</code>
<small>New: 2013-05-26</small>	Places the contents of the <i>&lt;seq var&gt;</i> in the input stream, with the appropriate <i>&lt;separator&gt;</i> between the items. Namely, if the sequence has more than two items, the <i>&lt;separator between more than two&gt;</i> is placed between each pair of items except the last, for which the <i>&lt;separator between final two&gt;</i> is used. If the sequence has exactly two items, then they are placed in the input stream separated by the <i>&lt;separator between two&gt;</i> . If the sequence has a single item, it is placed in the input stream, and an empty sequence produces no output. An error is raised if the variable does not exist or if it is invalid.

For example,

```
\seq_set_split:Nnn \l_tmpa_seq { | } { a | b | c | {de} | f }
\seq_use:Nnnn \l_tmpa_seq { ~and~ } { ,~ } { ,~and~ }
```

inserts “a, b, c, de, and f” in the input stream. The first separator argument is not used in this case because the sequence has more than 2 items.

**TEXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the *<items>* do not expand further when appearing in an e-type or x-type argument expansion.

---

`\seq_use:Nn` \* `\seq_use:Nn <seq var> {<separator>}`

`\seq_use:cN` \* Places the contents of the `<seq var>` in the input stream, with the `<separator>` between the items. If the sequence has a single item, it is placed in the input stream with no `<separator>`, and an empty sequence produces no output. An error is raised if the variable does not exist or if it is invalid.

New: 2013-05-26

For example,

```
\seq_set_split:Nnn \l_tmpa_seq { | } { a | b | c | {de} | f }
\seq_use:Nn \l_tmpa_seq { ~and~ }
```

inserts “a and b and c and de and f” in the input stream.

**TEXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the `<items>` do not expand further when appearing in an e-type or x-type argument expansion.

## 20.9 Sequences as stacks

Sequences can be used as stacks, where data is pushed to and popped from the top of the sequence. (The left of a sequence is the top, for performance reasons.) The stack functions for sequences are not intended to be mixed with the general ordered data functions detailed in the previous section: a sequence should either be used as an ordered data type or as a stack, but not in both ways.

---

`\seq_get:NN` `\seq_get:NN <seq var> <token list variable>`

`\seq_get:cN` Updated: 2012-05-14 Reads the top item from a `<seq var>` into the `<token list variable>` without removing it from the `<seq var>`. The `<token list variable>` is assigned locally. If `<seq var>` is empty the `<token list variable>` is set to the special marker `\q_no_value`.

---

`\seq_pop:NN` `\seq_pop:NN <seq var> <token list variable>`

`\seq_pop:cN` Updated: 2012-05-14 Pops the top item from a `<seq var>` into the `<token list variable>`. Both of the variables are assigned locally. If `<seq var>` is empty the `<token list variable>` is set to the special marker `\q_no_value`.

---

`\seq_gpop:NN` `\seq_gpop:NN <seq var> <token list variable>`

`\seq_gpop:cN` Updated: 2012-05-14 Pops the top item from a `<seq var>` into the `<token list variable>`. The `<seq var>` is modified globally, while the `<token list variable>` is assigned locally. If `<seq var>` is empty the `<token list variable>` is set to the special marker `\q_no_value`.

---

`\seq_get:NNTF` `\seq_get:NNTF <seq var> <token list variable> {<true code>} {<false code>}`

`\seq_get:cNTF` New: 2012-05-14 Updated: 2012-05-19 If the `<seq var>` is empty, leaves the `<false code>` in the input stream. The value of the `<token list variable>` is not defined in this case and should not be relied upon. If the `<seq var>` is non-empty, stores the top item from a `<seq var>` in the `<token list variable>` without removing it from the `<seq var>`. The `<token list variable>` is assigned locally.

\seq\_pop:NNTF \seq\_pop:NNTF *<seq var>* *<token list variable>* {*<true code>*} {*<false code>*}  
\seq\_pop:cNTF If the *<seq var>* is empty, leaves the *<false code>* in the input stream. The value of the  
  *<token list variable>* is not defined in this case and should not be relied upon. If the  
  *<seq var>* is non-empty, pops the top item from the *<seq var>* in the *<token list variable>*,  
  *i.e.* removes the item from the *<seq var>*. Both the *<seq var>* and the *<token list variable>*  
  are assigned locally.  
New: 2012-05-14  
Updated: 2012-05-19

\seq\_gpop:NNTF \seq\_gpop:NNTF *<seq var>* *<token list variable>* {*<true code>*} {*<false code>*}  
\seq\_gpop:cNTF If the *<seq var>* is empty, leaves the *<false code>* in the input stream. The value of the *<token list variable>* is not defined in this case and should not be relied upon. If the *<seq var>* is non-empty, pops the top item from the *<seq var>* in the *<token list variable>*, i.e. removes the item from the *<seq var>*. The *<seq var>* is modified globally, while the *<token list variable>* is assigned locally.

```
\seq_push:Nn                                \seq_push:Nn <seq var> {{item}}
\seq_push:(NV|Nv|Ne|No|cn|cV|cv|ce|co)
\seq_gpush:Nn
\seq_gpush:(NV|Nv|Ne|No|cn|cV|cv|ce|co)
```

Adds the {*<item>*} to the top of the *<seq var>*.

## 20.10 Sequences as sets

Sequences can also be used as sets, such that all of their items are distinct. Usage of sequences as sets is not currently widespread, hence no specific set function is provided. Instead, it is explained here how common set operations can be performed by combining several functions described in earlier sections. When using sequences to implement sets, one should be careful not to rely on the order of items in the sequence representing the set.

Sets should not contain several occurrences of a given item. To make sure that a  $\langle \text{seq } \textit{var} \rangle$  only has distinct items, use `\seq_remove_duplicates:N` ( $\langle \text{seq } \textit{var} \rangle$ ). This function is relatively slow, and to avoid performance issues one should only use it when necessary.

Some operations on a set `<seq var>` are straightforward. For instance, `\seq_count:N <seq var>` expands to the number of items, while `\seq_if_in:NnTF <seq var> {<item>}` tests if the `<item>` is in the set.

Adding an  $\langle item \rangle$  to a set  $\langle seq\ var \rangle$  can be done by appending it to the  $\langle seq\ var \rangle$  if it is not already in the  $\langle seq\ var \rangle$ :

```
\seq_if_in:NnF seq var {item}  
{ \seq_put_right:Nn seq var {item} }
```

Removing an  $\langle item \rangle$  from a set  $\langle seq\ var \rangle$  can be done using `\seq_remove_all:Nn`,

\seq\_remove\_all:Nn \seq var {*item*}

The intersection of two sets  $\langle \text{seq } \textit{var}_1 \rangle$  and  $\langle \text{seq } \textit{var}_2 \rangle$  can be stored into  $\langle \text{seq } \textit{var}_3 \rangle$  by collecting items of  $\langle \text{seq } \textit{var}_1 \rangle$  which are in  $\langle \text{seq } \textit{var}_2 \rangle$ .

```
\seq_clear:N <seq var3>
\seq_map_inline:Nn <seq var1>
{
  \seq_if_in:NnT <seq var2> {#1}
  { \seq_put_right:Nn <seq var3> {#1} }
}
```

The code as written here only works if  $\langle \text{seq } \text{var}_3 \rangle$  is different from the other two sequence variables. To cover all cases, items should first be collected in a sequence  $\backslash \text{l\_}\langle \text{pkg} \rangle\text{\_internal\_seq}$ , then  $\langle \text{seq } \text{var}_3 \rangle$  should be set equal to this internal sequence. The same remark applies to other set functions.

The union of two sets  $\langle \text{seq } \text{var}_1 \rangle$  and  $\langle \text{seq } \text{var}_2 \rangle$  can be stored into  $\langle \text{seq } \text{var}_3 \rangle$  through

```
\seq_concat:NNN <seq var3> <seq var1> <seq var2>
\seq_remove_duplicates:N <seq var3>
```

or by adding items to (a copy of)  $\langle \text{seq } \text{var}_1 \rangle$  one by one

```
\seq_set_eq:NN <seq var3> <seq var1>
\seq_map_inline:Nn <seq var2>
{
  \seq_if_in:NnF <seq var3> {#1}
  { \seq_put_right:Nn <seq var3> {#1} }
}
```

The second approach is faster than the first when the  $\langle \text{seq } \text{var}_2 \rangle$  is short compared to  $\langle \text{seq } \text{var}_1 \rangle$ .

The difference of two sets  $\langle \text{seq } \text{var}_1 \rangle$  and  $\langle \text{seq } \text{var}_2 \rangle$  can be stored into  $\langle \text{seq } \text{var}_3 \rangle$  by removing items of the  $\langle \text{seq } \text{var}_2 \rangle$  from (a copy of) the  $\langle \text{seq } \text{var}_1 \rangle$  one by one.

```
\seq_set_eq:NN <seq var3> <seq var1>
\seq_map_inline:Nn <seq var2>
{ \seq_remove_all:Nn <seq var3> {#1} }
```

The symmetric difference of two sets  $\langle \text{seq } \text{var}_1 \rangle$  and  $\langle \text{seq } \text{var}_2 \rangle$  can be stored into  $\langle \text{seq } \text{var}_3 \rangle$  by computing the difference between  $\langle \text{seq } \text{var}_1 \rangle$  and  $\langle \text{seq } \text{var}_2 \rangle$  and storing the result as  $\backslash \text{l\_}\langle \text{pkg} \rangle\text{\_internal\_seq}$ , then the difference between  $\langle \text{seq } \text{var}_2 \rangle$  and  $\langle \text{seq } \text{var}_1 \rangle$ , and finally concatenating the two differences to get the symmetric differences.

```
\seq_set_eq:NN \l_\langle \text{pkg} \rangle\text{\_internal\_seq} <seq var1>
\seq_map_inline:Nn <seq var2>
{ \seq_remove_all:Nn \l_\langle \text{pkg} \rangle\text{\_internal\_seq} {#1} }
\seq_set_eq:NN <seq var3> <seq var2>
\seq_map_inline:Nn <seq var1>
{ \seq_remove_all:Nn <seq var3> {#1} }
\seq_concat:NNN <seq var3> <seq var3> \l_\langle \text{pkg} \rangle\text{\_internal\_seq}
```

## 20.11 Constant and scratch sequences

---

`\c_empty_seq` Constant that is always empty.

New: 2012-07-02

---

**\l\_tmpa\_seq** Scratch sequences for local assignment. These are never used by the kernel code, and so  
**\l\_tmpb\_seq** are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by  
New: 2012-04-26 other non-kernel code and so should only be used for short-term storage.

---

**\g\_tmpa\_seq** Scratch sequences for global assignment. These are never used by the kernel code, and so  
**\g\_tmpb\_seq** are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by  
New: 2012-04-26 other non-kernel code and so should only be used for short-term storage.

## 20.12 Viewing sequences

---

**\seq\_show:N**      \seq\_show:N *seq var*  
**\seq\_show:c**      Displays the entries in the *seq var* in the terminal.  
Updated: 2021-04-29

---

**\seq\_log:N**      \seq\_log:N *seq var*  
**\seq\_log:c**      Writes the entries in the *seq var* in the log file.  
New: 2014-08-12  
Updated: 2021-04-29

# Chapter 21

## The `I3int` module Integers

Calculation and comparison of integer values can be carried out using literal numbers, `int` registers, constants and integers stored in token list variables. The standard operators `+`, `-`, `/` and `*` and parentheses can be used within such expressions to carry arithmetic operations. This module carries out these functions on *integer expressions* (“`<int expr>`”).

### 21.1 Integer expressions

Throughout this module, (almost) all `n`-type argument allow for an `<intexpr>` argument with the following syntax. The `<integer expression>` should consist, after expansion, of `+`, `-`, `*`, `/`, `(`, `)` and of course integer operands. The result is calculated by applying standard mathematical rules with the following peculiarities:

- `/` denotes division rounded to the closest integer with ties rounded away from zero;
- there is an error and the overall expression evaluates to zero whenever the absolute value of any intermediate result exceeds  $2^{31} - 1$ , except in the case of scaling operations  $a*b/c$ , for which  $a*b$  may be arbitrarily large (but the operands  $a$ ,  $b$ ,  $c$  are still constrained to an absolute value at most  $2^{31} - 1$ );
- parentheses may not appear after unary `+` or `-`, namely placing `+()` or `-()` at the start of an expression or after `+`, `-`, `*`, `/` or `(` leads to an error.

Each integer operand can be either an integer variable (with no need for `\int_use:N`) or an integer denotation. For example both

```
\int_show:n { 5 + 4 * 3 - ( 3 + 4 * 5 ) }
```

and

```
\tl_new:N \l_my_tl
\tl_set:Nn \l_my_tl { 5 }
\int_new:N \l_my_int
\int_set:Nn \l_my_int { 4 }
\int_show:n { \l_my_tl + \l_my_int * 3 - ( 3 + 4 * 5 ) }
```

show the same result  $-6$  because `\l_my_t1` expands to the integer denotation  $5$  while the integer variable `\l_my_int` takes the value  $4$ . As the  $\langle\text{integer expression}\rangle$  is fully expanded from left to right during evaluation, fully expandable and restricted-expandable functions can both be used, and `\exp_not:n` and its variants have no effect while `\exp_not:N` may incorrectly interrupt the expression.

**TeXhackers note:** Exactly two expansions are needed to evaluate `\int_eval:n`. The result is *not* an  $\langle\text{internal integer}\rangle$ , and therefore should be terminated by a space if used in `\int_value:w` or in a TeX-style integer assignment.

As all TeX integers, integer operands can also be: `\value{\LaTeX\ counter}`; dimension or skip variables, converted to integers in `sp`; the character code of some character given as ' $\langle\text{char}\rangle$ ' or '`\langle\text{char}\rangle`'; octal numbers given as ' followed by digits from  $0$  to  $7$ ; or hexadecimal numbers given as " followed by digits and upper case letters from `A` to `F`.

---

```
\int_eval:n ∗ \int_eval:n {<int expr>}
```

Evaluates the  $\langle \text{int expr} \rangle$  and leaves the result in the input stream as an integer denotation: for positive results an explicit sequence of decimal digits not starting with 0, for negative results – followed by such a sequence, and 0 for zero. The  $\langle \text{int expr} \rangle$  should consist, after expansion, of  $+$ ,  $-$ ,  $*$ ,  $/$ ,  $($ ,  $)$  and of course integer operands. The result is calculated by applying standard mathematical rules with the following peculiarities:

- $/$  denotes division rounded to the closest integer with ties rounded away from zero;
- there is an error and the overall expression evaluates to zero whenever the absolute value of any intermediate result exceeds  $2^{31} - 1$ , except in the case of scaling operations  $a*b/c$ , for which  $a*b$  may be arbitrarily large;
- parentheses may not appear after unary  $+$  or  $-$ , namely placing  $+()$  or  $-()$  at the start of an expression or after  $+$ ,  $-$ ,  $*$ ,  $/$  or  $($  leads to an error.

Each integer operand can be either an integer variable (with no need for `\int_use:N`) or an integer denotation. For example both

```
\int_eval:n { 5 + 4 * 3 - ( 3 + 4 * 5 ) }
```

and

```
\tl_new:N \l_my_tl
\tl_set:Nn \l_my_tl { 5 }
\int_new:N \l_my_int
\int_set:Nn \l_my_int { 4 }
\int_eval:n { \l_my_tl + \l_my_int * 3 - ( 3 + 4 * 5 ) }
```

evaluate to  $-6$  because `\l_my_tl` expands to the integer denotation 5. As the  $\langle \text{int expr} \rangle$  is fully expanded from left to right during evaluation, fully expandable and restricted-expandable functions can both be used, and `\exp_not:n` and its variants have no effect while `\exp_not:N` may incorrectly interrupt the expression.

**TeXhackers note:** Exactly two expansions are needed to evaluate `\int_eval:n`. The result is *not* an  $\langle \text{internal integer} \rangle$ , and therefore requires suitable termination if used in a TeX-style integer assignment.

As all TeX integers, integer operands can also be dimension or skip variables, converted to integers in `sp`, or octal numbers given as ‘`\`’ followed by digits other than 8 and 9, or hexadecimal numbers given as ‘`\#`’ followed by digits or upper case letters from A to F, or the character code of some character or one-character control sequence, given as ‘ $\langle \text{char} \rangle$ ’.

---

```
\int_eval:w ∗ \int_eval:w <int expr>
```

New: 2018-03-30 Evaluates the  $\langle \text{int expr} \rangle$  as described for `\int_eval:n`. The end of the expression is the first token encountered that cannot form part of such an expression. If that token is `\scan_stop`: it is removed, otherwise not. Spaces do *not* terminate the expression. However, spaces terminate explicit integers, and this may terminate the expression: for instance, `\int_eval:w 1\+1\#9` (with explicit space tokens inserted using `\~` in a code setting) expands to 29 since the digit 9 is not part of the expression. Expansion details, etc., are as given for `\int_eval:n`.

---

`\int_sign:n * \int_sign:n {\langle int expr \rangle}`

Updated: 2018-11-03 Evaluates the  $\langle \text{int expr} \rangle$  then leaves 1 or 0 or  $-1$  in the input stream according to the sign of the result.

---

`\int_abs:n * \int_abs:n {\langle int expr \rangle}`

Updated: 2012-09-26 Evaluates the  $\langle \text{int expr} \rangle$  as described for `\int_eval:n` and leaves the absolute value of the result in the input stream as an  $\langle \text{integer denotation} \rangle$  after two expansions.

---

`\int_div_round:nn * \int_div_round:nn {\langle int expr_1 \rangle} {\langle int expr_2 \rangle}`

Updated: 2012-09-26 Evaluates the two  $\langle \text{int expr} \rangle$ s as described earlier, then divides the first value by the second, and rounds the result to the closest integer. Ties are rounded away from zero. Note that this is identical to using `/` directly in an  $\langle \text{int expr} \rangle$ . The result is left in the input stream as an  $\langle \text{integer denotation} \rangle$  after two expansions.

---

`\int_div_truncate:nn * \int_div_truncate:nn {\langle int expr_1 \rangle} {\langle int expr_2 \rangle}`

Updated: 2012-02-09 Evaluates the two  $\langle \text{int expr} \rangle$ s as described earlier, then divides the first value by the second, and rounds the result towards zero. Note that division using `/` rounds to the closest integer instead. The result is left in the input stream as an  $\langle \text{integer denotation} \rangle$  after two expansions.

---

`\int_max:nn * \int_max:nn {\langle int expr_1 \rangle} {\langle int expr_2 \rangle}`

---

`\int_min:nn * \int_min:nn {\langle int expr_1 \rangle} {\langle int expr_2 \rangle}`

Updated: 2012-09-26 Evaluates the  $\langle \text{int expr} \rangle$ s as described for `\int_eval:n` and leaves either the larger or smaller value in the input stream as an  $\langle \text{integer denotation} \rangle$  after two expansions.

---

`\int_mod:nn * \int_mod:nn {\langle int expr_1 \rangle} {\langle int expr_2 \rangle}`

Updated: 2012-09-26 Evaluates the two  $\langle \text{int expr} \rangle$ s as described earlier, then calculates the integer remainder of dividing the first expression by the second. This is obtained by subtracting `\int_div_truncate:nn {\langle int expr_1 \rangle} {\langle int expr_2 \rangle}` times  $\langle \text{int expr}_2 \rangle$  from  $\langle \text{int expr}_1 \rangle$ . Thus, the result has the same sign as  $\langle \text{int expr}_1 \rangle$  and its absolute value is strictly less than that of  $\langle \text{int expr}_2 \rangle$ . The result is left in the input stream as an  $\langle \text{integer denotation} \rangle$  after two expansions.

## 21.2 Creating and initialising integers

---

`\int_new:N \int_new:Nn <integer>`

`\int_new:c` Creates a new  $\langle \text{integer} \rangle$  or raises an error if the name is already taken. The declaration is global. The  $\langle \text{integer} \rangle$  is initially equal to 0.

---

`\int_const:Nn \int_const:Nn <integer> {\langle int expr \rangle}`

`\int_const:cn` Creates a new constant  $\langle \text{integer} \rangle$  or raises an error if the name is already taken. The Updated: 2011-10-22 value of the  $\langle \text{integer} \rangle$  is set globally to the  $\langle \text{int expr} \rangle$ .

<code>\int_zero:N</code>	<code>\int_zero:N &lt;integer&gt;</code>
<code>\int_zero:c</code>	Sets <code>&lt;integer&gt;</code> to 0.
<code>\int_gzero:N</code>	
<code>\int_gzero:c</code>	
<hr/>	
<code>\int_zero_new:N</code>	<code>\int_zero_new:N &lt;integer&gt;</code>
<code>\int_zero_new:c</code>	Ensures that the <code>&lt;integer&gt;</code> exists globally by applying <code>\int_new:N</code> if necessary, then applies <code>\int_(g)zero:N</code> to leave the <code>&lt;integer&gt;</code> set to zero.
<code>\int_gzero_new:N</code>	
<code>\int_gzero_new:c</code>	
<hr/>	
	<small>New: 2011-12-13</small>
<hr/>	
<code>\int_set_eq:NN</code>	<code>\int_set_eq:NN &lt;integer<sub>1</sub>&gt; &lt;integer<sub>2</sub>&gt;</code>
<code>\int_set_eq:(cN Nc cc)</code>	Sets the content of <code>&lt;integer<sub>1</sub>&gt;</code> equal to that of <code>&lt;integer<sub>2</sub>&gt;</code> .
<code>\int_gset_eq:NN</code>	
<code>\int_gset_eq:(cN Nc cc)</code>	
<hr/>	
<code>\int_if_exist_p:N *</code>	<code>\int_if_exist_p:N &lt;int&gt;</code>

`\int_sub:cn`    Subtracts the result of the  $\langle \text{int expr} \rangle$  from the current content of the  $\langle \text{integer} \rangle$ .  
`\int_gsub:Nn`  
`\int_gsub:cn`

---

Updated: 2011-10-22

## 21.4 Using integers

---

`\int_use:N` \*  $\backslash \text{int\_use}:\text{N}$   $\langle \text{integer} \rangle$   
`\int_use:c` \* Recovers the content of an  $\langle \text{integer} \rangle$  and places it directly in the input stream. An error  
Updated: 2011-10-22 is raised if the variable does not exist or if it is invalid. Can be omitted in places where an  
 $\langle \text{integer} \rangle$  is required (such as in the first and third arguments of  $\backslash \text{int\_compare:nNnTF}$ ).

---

**TeXhackers note:**  $\backslash \text{int\_use}:\text{N}$  is the TeX primitive  $\text{\the}$ : this is one of several L<sup>A</sup>T<sub>E</sub>X3 names for this primitive.

## 21.5 Integer expression conditionals

---

`\int_compare_p:nNn` \*  $\backslash \text{int\_compare\_p}:\text{nNn}$  { $\langle \text{int expr}_1 \rangle$ }  $\langle \text{relation} \rangle$  { $\langle \text{int expr}_2 \rangle$ }  
`\int_compare:nNnTF` \*  $\backslash \text{int\_compare:nNnTF}$   
    { $\langle \text{int expr}_1 \rangle$ }  $\langle \text{relation} \rangle$  { $\langle \text{int expr}_2 \rangle$ }  
    { $\langle \text{true code} \rangle$ } { $\langle \text{false code} \rangle$ }

---

This function first evaluates each of the  $\langle \text{int expr} \rangle$ s as described for  $\backslash \text{int_eval:n}$ . The two results are then compared using the  $\langle \text{relation} \rangle$ :

Equal	=
Greater than	>
Less than	<

This function is less flexible than  $\backslash \text{int_compare:nTF}$  but around 5 times faster.

---

```
\int_compare_p:n ∗ \int_compare_p:n
\int_compare:nTF ∗   {
  Updated: 2013-01-13
    ⟨int expr1⟩ ⟨relation1⟩
    ...
    ⟨int exprN⟩ ⟨relationN⟩
    ⟨int exprN+1⟩
}
\int_compare:nTF
{
  ⟨int expr1⟩ ⟨relation1⟩
  ...
  ⟨int exprN⟩ ⟨relationN⟩
  ⟨int exprN+1⟩
}
{⟨true code⟩} {⟨false code⟩}
```

---

This function evaluates the  $\langle int \ expr \rangle$ s as described for  $\backslash \text{int\_eval}:n$  and compares consecutive result using the corresponding  $\langle relation \rangle$ , namely it compares  $\langle int \ expr_1 \rangle$  and  $\langle int \ expr_2 \rangle$  using the  $\langle relation_1 \rangle$ , then  $\langle int \ expr_2 \rangle$  and  $\langle int \ expr_3 \rangle$  using the  $\langle relation_2 \rangle$ , until finally comparing  $\langle int \ expr_N \rangle$  and  $\langle int \ expr_{N+1} \rangle$  using the  $\langle relation_N \rangle$ . The test yields **true** if all comparisons are **true**. Each  $\langle int \ expr \rangle$  is evaluated only once, and the evaluation is lazy, in the sense that if one comparison is **false**, then no other  $\langle integer \ expression \rangle$  is evaluated and no other comparison is performed. The  $\langle relations \rangle$  can be any of the following:

Equal	= or ==
Greater than or equal to	>=
Greater than	>
Less than or equal to	<=
Less than	<
Not equal	!=

This function is more flexible than  $\backslash \text{int\_compare}:nNnTF$  but around 5 times slower.

---

```
\int_case:nn   * \int_case:nnTF {\test int expr}
\int_case:nnTF *   {
  {int expr case1} {(code case1)}
  {int expr case2} {(code case2)}
  ...
  {int expr casen} {(code casen)}
}
{(true code)}
{(false code)}
```

New: 2013-07-24

---

This function evaluates the  $\langle test \ int \ expr \rangle$  and compares this in turn to each of the  $\langle int \ expr \ cases \rangle$ . If the two are equal then the associated  $\langle code \rangle$  is left in the input stream and other cases are discarded. If any of the cases are matched, the  $\langle true \ code \rangle$  is also inserted into the input stream (after the code for the appropriate case), while if none match then the  $\langle false \ code \rangle$  is inserted. The function  $\backslash int\_case:nn$ , which does nothing if there is no match, is also available. For example

```
\int_case:nnF
{ 2 * 5 }
{
  { 5 }      { Small }
  { 4 + 6 }  { Medium }
  { -2 * 10 } { Negative }
}
{ No idea! }
```

leaves “Medium” in the input stream.

---

```
\int_if_even_p:n * \int_if_odd_p:n {\int expr}
\int_if_even:nTF * \int_if_odd:nTF {\int expr}
\int_if_odd_p:n *   {(true code)} {(false code)}
```

---

$\backslash int\_if\_odd:nTF$  \* This function first evaluates the  $\langle int \ expr \rangle$  as described for  $\backslash int\_eval:n$ . It then evaluates if this is odd or even, as appropriate.

---

```
\int_if_zero_p:n * \int_if_zero_p:n {\int expr}
\int_if_zero:nTF * \int_if_zero:nTF {\int expr}
  {(true code)} {(false code)}
```

---

New: 2023-05-17

$\backslash int\_if\_zero:nTF$  \* This function first evaluates the  $\langle int \ expr \rangle$  as described for  $\backslash int\_eval:n$ . It then evaluates if this is zero or not.

## 21.6 Integer expression loops

---

```
\int_do_until:nNnn ★ \int_do_until:nNnn {\int expr1} \relation {\int expr2} {(code)}
```

---

Places the  $\langle code \rangle$  in the input stream for TeX to process, and then evaluates the relationship between the two  $\langle int \ expr \rangle$ s as described for  $\backslash int\_compare:nNnTF$ . If the test is `false` then the  $\langle code \rangle$  is inserted into the input stream again and a loop occurs until the  $\langle relation \rangle$  is `true`.

<code>\int_do_while:nNnn</code>	<code>\int_do_while:nNnn {\langle int\_expr_1 \rangle} {\langle relation \rangle} {\langle int\_expr_2 \rangle} {\langle code \rangle}</code>	Places the <code>\langle code \rangle</code> in the input stream for TeX to process, and then evaluates the relationship between the two <code>\langle int\_expr \rangle</code> s as described for <code>\int_compare:nNnTF</code> . If the test is <code>true</code> then the <code>\langle code \rangle</code> is inserted into the input stream again and a loop occurs until the <code>\langle relation \rangle</code> is <code>false</code> .
<code>\int_until_do:nNnn</code>	<code>\int_until_do:nNnn {\langle int\_expr_1 \rangle} {\langle relation \rangle} {\langle int\_expr_2 \rangle} {\langle code \rangle}</code>	Evaluates the relationship between the two <code>\langle int\_expr \rangle</code> s as described for <code>\int_compare:nNnTF</code> , and then places the <code>\langle code \rangle</code> in the input stream if the <code>\langle relation \rangle</code> is <code>false</code> . After the <code>\langle code \rangle</code> has been processed by TeX the test is repeated, and a loop occurs until the test is <code>true</code> .
<code>\int_while_do:nNnn</code>	<code>\int_while_do:nNnn {\langle int\_expr_1 \rangle} {\langle relation \rangle} {\langle int\_expr_2 \rangle} {\langle code \rangle}</code>	Evaluates the relationship between the two <code>\langle int\_expr \rangle</code> s as described for <code>\int_compare:nNnTF</code> , and then places the <code>\langle code \rangle</code> in the input stream if the <code>\langle relation \rangle</code> is <code>true</code> . After the <code>\langle code \rangle</code> has been processed by TeX the test is repeated, and a loop occurs until the test is <code>false</code> .
<code>\int_do_until:nn</code>	<code>\int_do_until:nn {\langle integer\_relation \rangle} {\langle code \rangle}</code>	Places the <code>\langle code \rangle</code> in the input stream for TeX to process, and then evaluates the <code>\langle integer\_relation \rangle</code> as described for <code>\int_compare:nTF</code> . If the test is <code>false</code> then the <code>\langle code \rangle</code> is inserted into the input stream again and a loop occurs until the <code>\langle relation \rangle</code> is <code>true</code> .
<code>\int_do_while:nn</code>	<code>\int_do_while:nn {\langle integer\_relation \rangle} {\langle code \rangle}</code>	Places the <code>\langle code \rangle</code> in the input stream for TeX to process, and then evaluates the <code>\langle integer\_relation \rangle</code> as described for <code>\int_compare:nTF</code> . If the test is <code>true</code> then the <code>\langle code \rangle</code> is inserted into the input stream again and a loop occurs until the <code>\langle relation \rangle</code> is <code>false</code> .
<code>\int_until_do:nn</code>	<code>\int_until_do:nn {\langle integer\_relation \rangle} {\langle code \rangle}</code>	Evaluates the <code>\langle integer\_relation \rangle</code> as described for <code>\int_compare:nTF</code> , and then places the <code>\langle code \rangle</code> in the input stream if the <code>\langle relation \rangle</code> is <code>false</code> . After the <code>\langle code \rangle</code> has been processed by TeX the test is repeated, and a loop occurs until the test is <code>true</code> .
<code>\int_while_do:nn</code>	<code>\int_while_do:nn {\langle integer\_relation \rangle} {\langle code \rangle}</code>	Evaluates the <code>\langle integer\_relation \rangle</code> as described for <code>\int_compare:nTF</code> , and then places the <code>\langle code \rangle</code> in the input stream if the <code>\langle relation \rangle</code> is <code>true</code> . After the <code>\langle code \rangle</code> has been processed by TeX the test is repeated, and a loop occurs until the test is <code>false</code> .

## 21.7 Integer step functions

---

```
\int_step_function:nN  ☆ \int_step_function:nN {<final value>} <function>
\int_step_function:nnN ☆ \int_step_function:nnN {<initial value>} {<final value>} <function>
\int_step_function:nnnN ☆ \int_step_function:nnnN {<initial value>} {<step>} {<final value>} <function>
```

---

New: 2012-06-04

Updated: 2018-04-22

This function first evaluates the  $\langle initial\ value\rangle$ ,  $\langle step\rangle$  and  $\langle final\ value\rangle$ , all of which should be integer expressions. The  $\langle function\rangle$  is then placed in front of each  $\langle value\rangle$  from the  $\langle initial\ value\rangle$  to the  $\langle final\ value\rangle$  in turn (using  $\langle step\rangle$  between each  $\langle value\rangle$ ). The  $\langle step\rangle$  must be non-zero. If the  $\langle step\rangle$  is positive, the loop stops when the  $\langle value\rangle$  becomes larger than the  $\langle final\ value\rangle$ . If the  $\langle step\rangle$  is negative, the loop stops when the  $\langle value\rangle$  becomes smaller than the  $\langle final\ value\rangle$ . The  $\langle function\rangle$  should absorb one numerical argument. For example

```
\cs_set:Npn \my_func:n #1 { [I~saw~#1] \quad }
\int_step_function:nnnN { 1 } { 1 } { 5 } \my_func:n
```

would print

```
[I saw 1] [I saw 2] [I saw 3] [I saw 4] [I saw 5]
```

The functions  $\text{\int\_step\_function:nN}$  and  $\text{\int\_step\_function:nnN}$  both use a fixed  $\langle step\rangle$  of 1, and in the case of  $\text{\int\_step\_function:nN}$  the  $\langle initial\ value\rangle$  is also fixed as 1. These functions are provided as simple short-cuts for code clarity.

---

```
\int_step_inline:nn \int_step_inline:nn {<final value>} <code>
\int_step_inline:nnn \int_step_inline:nnn {<initial value>} {<final value>} <code>
\int_step_inline:nnnn \int_step_inline:nnnn {<initial value>} {<step>} {<final value>} <code>
```

---

New: 2012-06-04

Updated: 2018-04-22

This function first evaluates the  $\langle initial\ value\rangle$ ,  $\langle step\rangle$  and  $\langle final\ value\rangle$ , all of which should be integer expressions. Then for each  $\langle value\rangle$  from the  $\langle initial\ value\rangle$  to the  $\langle final\ value\rangle$  in turn (using  $\langle step\rangle$  between each  $\langle value\rangle$ ), the  $\langle code\rangle$  is inserted into the input stream with  $\#1$  replaced by the current  $\langle value\rangle$ . Thus the  $\langle code\rangle$  should define a function of one argument ( $\#1$ ).

The functions  $\text{\int\_step\_inline:nn}$  and  $\text{\int\_step\_inline:nnn}$  both use a fixed  $\langle step\rangle$  of 1, and in the case of  $\text{\int\_step\_inline:nn}$  the  $\langle initial\ value\rangle$  is also fixed as 1. These functions are provided as simple short-cuts for code clarity.

---

```
\int_step_variable:nNn \int_step_variable:nNn {<final value>} <tl var> <code>
\int_step_variable:nnNn \int_step_variable:nnNn {<initial value>} {<final value>} <tl var> <code>
\int_step_variable:nnnNn \int_step_variable:nnnNn {<initial value>} {<step>} {<final value>} <tl var>
<code>
```

---

New: 2012-06-04

Updated: 2018-04-22

This function first evaluates the  $\langle initial\ value\rangle$ ,  $\langle step\rangle$  and  $\langle final\ value\rangle$ , all of which should be integer expressions. Then for each  $\langle value\rangle$  from the  $\langle initial\ value\rangle$  to the  $\langle final\ value\rangle$  in turn (using  $\langle step\rangle$  between each  $\langle value\rangle$ ), the  $\langle code\rangle$  is inserted into the input stream, with the  $\langle tl\ var\rangle$  defined as the current  $\langle value\rangle$ . Thus the  $\langle code\rangle$  should make use of the  $\langle tl\ var\rangle$ .

The functions  $\text{\int\_step\_variable:nNn}$  and  $\text{\int\_step\_variable:nnNn}$  both use a fixed  $\langle step\rangle$  of 1, and in the case of  $\text{\int\_step\_variable:nNn}$  the  $\langle initial\ value\rangle$  is also fixed as 1. These functions are provided as simple short-cuts for code clarity.

## 21.8 Formatting integers

Integers can be placed into the output stream with formatting. These conversions apply to any integer expressions.

---

```
\int_to_arabic:n * \int_to_arabic:n {\langle int expr\rangle}
```

---

```
\int_to_arabic:v * Places the value of the \langle int expr\rangle in the input stream as digits, with category code 12
```

Updated: 2011-10-22

(other).

---

```
\int_to_alpha:n * \int_to_alpha:n {\langle int expr\rangle}
```

---

```
\int_to_Alph:n * Evaluates the \langle int expr\rangle and converts the result into a series of letters, which are then left
```

Updated: 2011-09-17

in the input stream. The conversion rule uses the 26 letters of the English alphabet, in order, adding letters when necessary to increase the total possible range of representable numbers. Thus

```
\int_to_alpha:n { 1 }
```

places `a` in the input stream,

```
\int_to_alpha:n { 26 }
```

is represented as `z` and

```
\int_to_alpha:n { 27 }
```

is converted to `aa`. For conversions using other alphabets, use `\int_to_symbols:nnn` to define an alphabet-specific function. The basic `\int_to_alpha:n` and `\int_to_Alph:n` functions should not be modified. The resulting tokens are digits with category code 12 (other) and letters with category code 11 (letter).

---

```
\int_to_symbols:nnn * \int_to_symbols:nnn
```

Updated: 2011-09-17

```
{\langle int expr\rangle} {\langle total symbols\rangle}
```

```
{\langle value to symbol mapping\rangle}
```

This is the low-level function for conversion of an `\langle int expr\rangle` into a symbolic form (often letters). The `\langle total symbols\rangle` available should be given as an integer expression. Values are actually converted to symbols according to the `\langle value to symbol mapping\rangle`. This should be given as `\langle total symbols\rangle` pairs of entries, a number and the appropriate symbol. Thus the `\int_to_alpha:n` function is defined as

```
\cs_new:Npn \int_to_alpha:n #1
{
    \int_to_symbols:nnn {\#1} { 26 }
    {
        { 1 } { a }
        { 2 } { b }
        ...
        { 26 } { z }
    }
}
```

---

```
\int_to_bin:n ∗ \int_to_bin:n {⟨int expr⟩}
```

New: 2014-02-11 Calculates the value of the ⟨int expr⟩ and places the binary representation of the result in the input stream.

---

```
\int_to_hex:n ∗ \int_to_hex:n {⟨int expr⟩}
```

**\int\_to\_Hex:n ∗** Calculates the value of the ⟨int expr⟩ and places the hexadecimal (base 16) representation of the result in the input stream. Letters are used for digits beyond 9: lower case letters for \int\_to\_hex:n and upper case ones for \int\_to\_Hex:n. The resulting tokens are digits with category code 12 (other) and letters with category code 11 (letter).

---

```
\int_to_oct:n ∗ \int_to_oct:n {⟨int expr⟩}
```

New: 2014-02-11 Calculates the value of the ⟨int expr⟩ and places the octal (base 8) representation of the result in the input stream. The resulting tokens are digits with category code 12 (other) and letters with category code 11 (letter).

---

```
\int_to_base:nn ∗ \int_to_base:nn {⟨int expr⟩} {⟨base⟩}
```

**\int\_to\_Base:nn ∗** Calculates the value of the ⟨int expr⟩ and converts it into the appropriate representation in the ⟨base⟩; the later may be given as an integer expression. For bases greater than 10 the higher “digits” are represented by letters from the English alphabet: lower case letters for \int\_to\_base:n and upper case ones for \int\_to\_Base:n. The maximum ⟨base⟩ value is 36. The resulting tokens are digits with category code 12 (other) and letters with category code 11 (letter).

**TeXhackers note:** This is a generic version of \int\_to\_bin:n, etc.

---

```
\int_to_roman:n ∗ \int_to_roman:n {⟨int expr⟩}
```

**\int\_to\_Roman:n ∗** Places the value of the ⟨int expr⟩ in the input stream as Roman numerals, either lower case (\int\_to\_roman:n) or upper case (\int\_to\_Roman:n). If the value is negative or zero, the output is empty. The Roman numerals are letters with category code 11 (letter). The letters used are mdclxvi, repeated as needed: the notation with bars (such as  $\bar{v}$  for 5000) is *not* used. For instance \int\_to\_roman:n { 8249 } expands to mmmmmmmccxlxxix.

## 21.9 Converting from other formats to integers

---

```
\int_from_alpha:n ∗ \int_from_alpha:n {⟨letters⟩}
```

Updated: 2014-08-25 Converts the ⟨letters⟩ into the integer (base 10) representation and leaves this in the input stream. The ⟨letters⟩ are first converted to a string, with no expansion. Lower and upper case letters from the English alphabet may be used, with “a” equal to 1 through to “z” equal to 26. The function also accepts a leading sign, made of + and -. This is the inverse function of \int\_to\_alpha:n and \int\_to\_Alpha:n.

---

```
\int_from_bin:n ∗ \int_from_bin:n {⟨binary number⟩}
```

New: 2014-02-11 Updated: 2014-08-25 Converts the ⟨binary number⟩ into the integer (base 10) representation and leaves this in the input stream. The ⟨binary number⟩ is first converted to a string, with no expansion. The function accepts a leading sign, made of + and -, followed by binary digits. This is the inverse function of \int\_to\_bin:n.

---

```
\int_from_hex:n ∗ \int_from_hex:n {⟨hexadecimal number⟩}
```

New: 2014-02-11 Converts the ⟨hexadecimal number⟩ into the integer (base 10) representation and leaves this in the input stream. Digits greater than 9 may be represented in the ⟨hexadecimal number⟩ by upper or lower case letters. The ⟨hexadecimal number⟩ is first converted to a string, with no expansion. The function also accepts a leading sign, made of + and -. This is the inverse function of \int\_to\_hex:n and \int\_to\_Hex:n.

---

```
\int_from_oct:n ∗ \int_from_oct:n {⟨octal number⟩}
```

New: 2014-02-11 Converts the ⟨octal number⟩ into the integer (base 10) representation and leaves this in the input stream. The ⟨octal number⟩ is first converted to a string, with no expansion. The function accepts a leading sign, made of + and -, followed by octal digits. This is the inverse function of \int\_to\_oct:n.

---

```
\int_from_roman:n ∗ \int_from_roman:n {⟨roman numeral⟩}
```

Updated: 2014-08-25 Converts the ⟨roman numeral⟩ into the integer (base 10) representation and leaves this in the input stream. The ⟨roman numeral⟩ is first converted to a string, with no expansion. The ⟨roman numeral⟩ may be in upper or lower case; if the numeral contains characters besides mdclxvi or MDCLXVI then the resulting value is -1. This is the inverse function of \int\_to\_roman:n and \int\_to\_Roman:n.

---

```
\int_from_base:nn ∗ \int_from_base:nn {⟨number⟩} {⟨base⟩}
```

Updated: 2014-08-25 Converts the ⟨number⟩ expressed in ⟨base⟩ into the appropriate value in base 10. The ⟨number⟩ is first converted to a string, with no expansion. The ⟨number⟩ should consist of digits and letters (either lower or upper case), plus optionally a leading sign. The maximum ⟨base⟩ value is 36. This is the inverse function of \int\_to\_base:nn and \int\_to\_Base:nn.

## 21.10 Random integers

---

```
\int_rand:nn ∗ \int_rand:nn {⟨int expr⟩} {⟨int expr⟩}
```

New: 2016-12-06 Evaluates the two ⟨int expr⟩s and produces a pseudo-random number between the two Updated: 2018-04-27 (with bounds included). This is not available in older versions of X<sub>E</sub>T<sub>E</sub>X.

---

```
\int_rand:n ∗ \int_rand:n {⟨int expr⟩}
```

New: 2018-05-05 Evaluates the ⟨int expr⟩ then produces a pseudo-random number between 1 and the ⟨int expr⟩ (included). This is not available in older versions of X<sub>E</sub>T<sub>E</sub>X.

## 21.11 Viewing integers

---

```
\int_show:N \int_show:N {⟨integer⟩}
```

\int\_show:c Displays the value of the ⟨integer⟩ on the terminal.

---

`\int_show:n` `\int_show:n {<int expr>}`

New: 2011-11-22 Displays the result of evaluating the *<int expr>* on the terminal.

Updated: 2015-08-07

---

---

`\int_log:N` `\int_log:N {integer}`

`\int_log:c` Writes the value of the *integer* in the log file.

New: 2014-08-22

Updated: 2015-08-03

---

---

`\int_log:n` `\int_log:n {<int expr>}`

New: 2014-08-22 Writes the result of evaluating the *<int expr>* in the log file.

Updated: 2015-08-07

---

## 21.12 Constant integers

---

`\c_zero_int` Integer values used with primitive tests and assignments: their self-terminating nature makes these more convenient and faster than literal numbers.

New: 2018-05-07

---

---

`\c_max_int` The maximum value that can be stored as an integer.

---

`\c_max_register_int` Maximum number of registers.

---

`\c_max_char_int` Maximum character code completely supported by the engine.

## 21.13 Scratch integers

---

`\l_tmpa_int` Scratch integer for local assignment. These are never used by the kernel code, and so `\l_tmpb_int` are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

---

`\g_tmpa_int` Scratch integer for global assignment. These are never used by the kernel code, and so `\g_tmpb_int` are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

## 21.14 Direct number expansion

---

```
\int_value:w * \int_value:w <integer>
\int_value:w <integer denotation> <optional space>
```

New: 2018-03-27

Expands the following tokens until an *<integer>* is formed, and leaves a normalized form (no leading sign except for negative numbers, no leading digit 0 except for zero) in the input stream as category code 12 (other) characters. The *<integer>* can consist of any number of signs (with intervening spaces) followed by

- an integer variable (in fact, any TeX register except `\toks`) or
- explicit digits (or by '*octal digits*' or "*hexadecimal digits*" or '*character*').

In this last case expansion stops once a non-digit is found; if that is a space it is removed as in f-expansion, and so `\exp_stop_f:` may be employed as an end marker. Note that protected functions *are* expanded by this process.

This function requires exactly one expansion to produce a value, and so is suitable for use in cases where a number is required "directly". In general, `\int_eval:n` is the preferred approach to generating numbers.

**TeXhackers note:** This is the TeX primitive `\number`.

## 21.15 Primitive conditionals

---

```
\if_int_compare:w * \if_int_compare:w <integer1> <relation> <integer2>
  <true code>
\else:
  <false code>
\fi:
```

Compare two integers using *<relation>*, which must be one of =, < or > with category code 12. The `\else:` branch is optional.

**TeXhackers note:** This is the TeX primitive `\ifnum`.

---

```
\if_case:w * \if_case:w <integer> <case0>
\or:      * \or: <case1>
\or: ...
\else: <default>
\fi:
```

Selects a case to execute based on the value of the *<integer>*. The first case (*<case<sub>0</sub>>*) is executed if *<integer>* is 0, the second (*<case<sub>1</sub>>*) if the *<integer>* is 1, etc. The *<integer>* may be a literal, a constant or an integer expression (e.g. using `\int_eval:n`).

**TeXhackers note:** These are the TeX primitives `\ifcase` and `\or`.

---

```
\if_int_odd:w ∗ \if_int_odd:w ⟨tokens⟩ ⟨optional space⟩
    ⟨true code⟩
\else:
    ⟨true code⟩
\fi:
```

Expands ⟨tokens⟩ until a non-numeric token or a space is found, and tests whether the resulting ⟨integer⟩ is odd. If so, ⟨true code⟩ is executed. The \else: branch is optional.

**TeXhackers note:** This is the TeX primitive \ifodd.

## Chapter 22

# The `l3flag` module Expandable flags

Flags are the only data-type that can be modified in expansion-only contexts. This module is meant mostly for kernel use: in almost all cases, booleans or integers should be preferred to flags because they are very significantly faster.

A flag can hold any (small) non-negative value, which we call its  $\langle height \rangle$ . In expansion-only contexts, a flag can only be “raised”: this increases the  $\langle height \rangle$  by 1. The  $\langle height \rangle$  can also be queried expandably. However, decreasing it, or setting it to zero requires non-expandable assignments.

Flag variables are always local.

A typical use case of flags would be to keep track of whether an exceptional condition has occurred during expandable processing, and produce a meaningful (non-expandable) message after the end of the expandable processing. This is exemplified by `l3str-convert`, which for performance reasons performs conversions of individual characters expandably and for readability reasons produces a single error message describing incorrect inputs that were encountered.

Flags should not be used without carefully considering the fact that raising a flag takes a time and memory proportional to its height and that the memory cannot be reclaimed even if the flag is cleared. Flags should not be used unless it is unavoidable.

In earlier versions, flags were referenced by an `n`-type  $\langle flag\ name \rangle$  such as `fp-overflow`, used as part of `\use:c` constructions. All of the commands described below have `n`-type analogues that can still appear in old code, but the `N`-type commands are to be preferred moving forward. The `n`-type  $\langle flag\ name \rangle$  is simply mapped to `\l_flag_name_flag`, which makes it easier for packages using public flags (such as `l3fp`) to retain backwards compatibility.

### 22.1 Setting up flags

---

`\flag_new:N \flag_new:N ⟨flag var⟩`

`\flag_new:c` Creates a new  $\langle flag\ var \rangle$ , or raises an error if the name is already taken. The declaration is global, but flags are always local variables. The  $\langle flag\ var \rangle$  initially has zero height.  
New: 2024-01-12

---

\flag\_clear:N \flag\_clear:N *flag var*

\flag\_clear:c Sets the height of the *flag var* to zero. The assignment is local.

New: 2024-01-12

---

---

\flag\_clear\_new:N \flag\_clear\_new:N *flag var*

\flag\_clear\_new:c Ensures that the *flag var* exists globally by applying \flag\_new:N if necessary, then applies \flag\_clear:N, setting the height to zero locally.

---

\flag\_show:N \flag\_show:N *flag var*

\flag\_show:c Displays the height of the *flag var* in the terminal.

New: 2024-01-12

---

---

\flag\_log:N \flag\_log:N *flag var*

\flag\_log:c Writes the height of the *flag var* in the log file.

New: 2024-01-12

---

## 22.2 Expandable flag commands

---

\flag\_if\_exist\_p:N \* \flag\_if\_exist\_p:N *flag var*

\flag\_if\_exist\_p:c \* \flag\_if\_exist:NTF *flag var* {*true code*} {*false code*}

\flag\_if\_exist:NTF \* This function returns **true** if the *flag var* is currently defined, and **false** otherwise.

\flag\_if\_exist:cTF \* This does not check that the *flag var* really is a flag variable.

New: 2024-01-12

---

---

\flag\_if\_raised\_p:N \* \flag\_if\_raised\_p:N *flag var*

\flag\_if\_raised\_p:c \* \flag\_if\_raised:NTF *flag var* {*true code*} {*false code*}

\flag\_if\_raised:NTF \* This function returns **true** if the *flag var* has non-zero height, and **false** if the *flag var*

\flag\_if\_raised:cTF \* has zero height.

New: 2024-01-12

---

---

\flag\_height:N \* \flag\_height:N *flag var*

\flag\_height:c \* Expands to the height of the *flag var* as an integer denotation.

New: 2024-01-12

---

---

\flag\_raise:N \* \flag\_raise:N *flag var*

\flag\_raise:c \* The height of *flag var* is increased by 1 locally.

New: 2024-01-12

---

---

\flag\_ensure\_raised:N \* \flag\_ensure\_raised:N *flag var*

\flag\_ensure\_raised:c \* Ensures the *flag var* is raised by making its height at least 1, locally.

New: 2024-01-12

---

---

`\l_tmpa_flag` Scratch flag for local assignment. These are never used by the kernel code, and so are safe  
`\l_tmpb_flag` for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by other  
New: 2024-01-12 non-kernel code and so should only be used for short-term storage.

## Chapter 23

# The `l3clist` module

## Comma separated lists

Comma lists (in short, `clist`) contain ordered data where items can be added to the left or right end of the list. This data type allows basic list manipulations such as adding/removing items, applying a function to every item, removing duplicate items, extracting a given item, using the comma list with specified separators, and so on. Sequences (defined in `l3seq`) are safer, faster, and provide more features, so they should often be preferred to comma lists. Comma lists are mostly useful when interfacing with L<sup>A</sup>T<sub>E</sub>X 2<sub>E</sub> or other code that expects or provides items separated by commas.

Several items can be added at once. To ease input of comma lists from data provided by a user outside an `\ExplSyntaxOn ... \ExplSyntaxOff` block, spaces are removed from both sides of each comma-delimited argument upon input. Blank arguments are ignored, to allow for trailing commas or repeated commas (which may otherwise arise when concatenating comma lists “by hand”). In addition, a set of braces is removed if the result of space-trimming is braced: this allows the storage of any item in a comma list. For instance,

```
\clist_new:N \l_my_clist
\clist_put_left:Nn \l_my_clist { ~a~ , ~{b}~ , c~\d }
\clist_put_right:Nn \l_my_clist { ~{e~} , , {{f}} , }
```

results in `\l_my_clist` containing `a,b,c~\d,{e~},{{f}}` namely the five items `a`, `b`, `c~\d`, `e~` and `{f}`. Comma lists normally do not contain empty or blank items so the following gives an empty comma list:

```
\clist_clear_new:N \l_my_clist
\clist_set:Nn \l_my_clist { , ~ , , }
\clist_if_empty:NTF \l_my_clist { true } { false }
```

and it leaves `true` in the input stream. To include an “unsafe” item (empty, or one that contains a comma, or starts or ends with a space, or is a single brace group), surround it with braces.

Any `n`-type token list is a valid comma list input for `l3clist` functions, which will split the token list at every comma and process the items as described above. On the other hand, `N`-type functions expect comma list variables, which are particular token list variables in which this processing of items (and removal of blank items) has already

occurred. Because comma list variables are token list variables, expanding them once yields their items separated by commas, and  $\text{\l3tl}$  functions such as  $\text{\t1_show:N}$  can be applied to them. (These functions often have  $\text{\l3clist}$  analogues, which should be preferred.)

Almost all operations on comma lists are noticeably slower than those on sequences so converting the data to sequences using  $\text{\seq_set_from_clist:Nn}$  (see  $\text{\l3seq}$ ) may be advisable if speed is important. The exception is that  $\text{\clist_if_in:NnTF}$  and  $\text{\clist_remove_duplicates:N}$  may be faster than their sequence analogues for large lists. However, these functions work slowly for “unsafe” items that must be braced, and may produce errors when their argument contains {, } or # (assuming the usual T<sub>E</sub>X category codes apply). The sequence data type should thus certainly be preferred to comma lists to store such items.

## 23.1 Creating and initialising comma lists

---

`\clist_new:N \clist_new:N <clist var>`

`\clist_new:c` Creates a new  $\langle \text{clist var} \rangle$  or raises an error if the name is already taken. The declaration is global. The  $\langle \text{clist var} \rangle$  initially contains no items.

---

`\clist_const:Nn \clist_const:Nn <clist var> {<comma list>}`

`\clist_const:(Ne|cn|ce)` Creates a new constant  $\langle \text{clist var} \rangle$  or raises an error if the name is already taken. The value of the  $\langle \text{clist var} \rangle$  is set globally to the  $\langle \text{comma list} \rangle$ .

---

`\clist_clear:N \clist_clear:N <clist var>`

`\clist_clear:c` Clears all items from the  $\langle \text{clist var} \rangle$ .  
`\clist_gclear:N`

---

`\clist_gclear:c`

---

`\clist_clear_new:N \clist_clear_new:N <clist var>`

`\clist_clear_new:c` Ensures that the  $\langle \text{clist var} \rangle$  exists globally by applying  $\text{\clist_new:N}$  if necessary, then applies  $\text{\clist_(g)clear:N}$  to leave the list empty.  
`\clist_gclear_new:N`

---

`\clist_gclear_new:c`

---

`\clist_set_eq:NN \clist_set_eq:NN <clist var1> <clist var2>`

`\clist_set_eq:(cN|Nc|cc)` Sets the content of  $\langle \text{clist var}_1 \rangle$  equal to that of  $\langle \text{clist var}_2 \rangle$ . To set a token list variable equal to a comma list variable, use  $\text{\t1_set_eq:NN}$ . Conversely, setting a comma list variable to a token list is unadvisable unless one checks space-trimming and related issues.  
`\clist_gset_eq:NN`

---

`\clist_gset_eq:(cN|Nc|cc)`

---

`\clist_set_from_seq:NN`

---

`\clist_set_from_seq:(cN|Nc|cc)`

---

`\clist_gset_from_seq:NN`

---

`\clist_gset_from_seq:(cN|Nc|cc)`

---

`New: 2014-07-17`

Converts the data in the  $\langle \text{seq var} \rangle$  into a  $\langle \text{clist var} \rangle$ : the original  $\langle \text{seq var} \rangle$  is unchanged. Items which contain either spaces or commas are surrounded by braces.

---

```
\clist_concat:NNN          \clist_concat:NNN <clist var1> <clist var2> <clist var3>
\clist_concat:ccc
\clist_gconcat:NNN
\clist_gconcat:ccc
```

Concatenates the content of *<clist var<sub>2</sub>>* and *<clist var<sub>3</sub>>* together and saves the result in *<clist var<sub>1</sub>>*. The items in *<clist var<sub>2</sub>>* are placed at the left side of the new comma list.

---

```
\clist_if_exist_p:N * \clist_if_exist_p:N <clist var>
\clist_if_exist_p:c * \clist_if_exist:NTF <clist var> {{true code}} {{false code}}
\clist_if_exist:NTF *
\clist_if_exist:cTF *
```

Tests whether the *<clist var>* is currently defined. This does not check that the *<clist var>* really is a comma list.

New: 2012-03-03

---

## 23.2 Adding data to comma lists

---

```
\clist_set:Nn               \clist_set:Nn <clist var> {{item1}, ..., {itemn}}
\clist_set:(NV|Ne|No|cn|cV|ce|co)
\clist_gset:Nn
\clist_gset:(NV|Ne|No|cn|cV|ce|co)
```

New: 2011-09-06

---

Sets *<clist var>* to contain the *<items>*, removing any previous content from the variable. Blank items are omitted, spaces are removed from both sides of each item, then a set of braces is removed if the resulting space-trimmed item is braced. To store some *<tokens>* as a single *<item>* even if the *<tokens>* contain commas or spaces, add a set of braces: `\clist_set:Nn <clist var> {{<tokens>}}`.

---

```
\clist_put_left:Nn          \clist_put_left:Nn <clist var> {{item1}, ..., {itemn}}
\clist_put_left:(NV|Nv|Ne|No|cn|cV|cv|ce|co)
\clist_gput_left:Nn
\clist_gput_left:(NV|Nv|Ne|No|cn|cV|cv|ce|co)
```

Updated: 2011-09-05

---

Appends the *<items>* to the left of the *<clist var>*. Blank items are omitted, spaces are removed from both sides of each item, then a set of braces is removed if the resulting space-trimmed item is braced. To append some *<tokens>* as a single *<item>* even if the *<tokens>* contain commas or spaces, add a set of braces: `\clist_put_left:Nn <clist var> {{<tokens>}}`.

---

```
\clist_put_right:Nn          \clist_put_right:Nn <clist var> {{item1}, ..., {itemn}}
\clist_put_right:(NV|Nv|Ne|No|cn|cV|cv|ce|co)
\clist_gput_right:Nn
\clist_gput_right:(NV|Nv|Ne|No|cn|cV|cv|ce|co)
```

Updated: 2011-09-05

---

Appends the *<items>* to the right of the *<clist var>*. Blank items are omitted, spaces are removed from both sides of each item, then a set of braces is removed if the resulting space-trimmed item is braced. To append some *<tokens>* as a single *<item>* even if the *<tokens>* contain commas or spaces, add a set of braces: `\clist_put_right:Nn <clist var> {{<tokens>}}`.

### 23.3 Modifying comma lists

While comma lists are normally used as ordered lists, it may be necessary to modify the content. The functions here may be used to update comma lists, while retaining the order of the unaffected entries.

---

```
\clist_remove_duplicates:N \clist_remove_duplicates:N <clist var>
\clist_remove_duplicates:c
\clist_gremove_duplicates:N
\clist_gremove_duplicates:c
```

---

Removes duplicate items from the *<clist var>*, leaving the left most copy of each item in the *<clist var>*. The *<item>* comparison takes place on a token basis, as for `\tl_if_eq:nnTF`.

**TeXhackers note:** This function iterates through every item in the *<clist var>* and does a comparison with the *<items>* already checked. It is therefore relatively slow with large comma lists. Furthermore, it may fail if any of the items in the *<clist var>* contains {, }, or # (assuming the usual TeX category codes apply).

---

```
\clist_remove_all:Nn \clist_remove_all:Nn <clist var> {\<item>}
\clist_remove_all:(cn|NV|cV)
\clist_gremove_all:Nn
\clist_gremove_all:(cn|NV|cV)
```

---

Updated: 2011-09-06

Removes every occurrence of *<item>* from the *<clist var>*. The *<item>* comparison takes place on a token basis, as for `\tl_if_eq:nnTF`.

**TeXhackers note:** The function may fail if the *<item>* contains {, }, or # (assuming the usual TeX category codes apply).

---

```
\clist_reverse:N \clist_reverse:N <clist var>
\clist_reverse:c
\clist_greverse:N
\clist_greverse:c
```

---

New: 2014-07-18

Reverses the order of items stored in the *<clist var>*.

---

```
\clist_reverse:n \clist_reverse:n {\<comma list>}
```

---

New: 2014-07-18

Leaves the items in the *<comma list>* in the input stream in reverse order. Contrarily to other what is done for other n-type *<comma list>* arguments, braces and spaces are preserved by this process.

**TeXhackers note:** The result is returned within `\unexpanded`, which means that the comma list does not expand further when appearing in an e-type or x-type argument expansion.

---

`\clist_sort:Nn`    `\clist_sort:Nn <clist var> {<comparison code>}`  
`\clist_sort:cn`  
`\clist_gsort:Nn`    Sorts the items in the `<clist var>` according to the `<comparison code>`, and assigns the result to `<clist var>`. The details of sorting comparison are described in Section 6.1.  
`\clist_gsort:cn`

---

New: 2017-02-06

## 23.4 Comma list conditionals

---

`\clist_if_empty_p:N *`    `\clist_if_empty_p:N <clist var>`  
`\clist_if_empty_p:c *`    `\clist_if_empty:NTF <clist var> {<true code>} {<false code>}`  
`\clist_if_empty:NTF *`    Tests if the `<clist var>` is empty (containing no items).  
`\clist_if_empty:cTF *`

---

---

`\clist_if_empty_p:n *`    `\clist_if_empty_p:n {<comma list>}`  
`\clist_if_empty:nTF *`    `\clist_if_empty:nTF {<comma list>} {<true code>} {<false code>}`

---

New: 2014-07-05 Tests if the `<clist var>` is empty (containing no items). The rules for space trimming are as for other `n`-type comma-list functions, hence the comma list `{~,~,~,~}` (without outer braces) is empty, while `{~,{},~}` (without outer braces) contains one element, which happens to be empty: the comma-list is not empty.

---

`\clist_if_in:NnTF`    `\clist_if_in:NnTF <clist var> {<item>} {<true code>} {<false code>}`  
`\clist_if_in:(NV|No|cn|cV|co)TF`  
`\clist_if_in:nnTF`  
`\clist_if_in:(nV|no)TF`

---

Updated: 2011-09-06

Tests if the `<item>` is present in the `<clist var>`. In the case of an `n`-type `<comma list>`, the usual rules of space trimming and brace stripping apply. Hence,

`\clist_if_in:nnTF { a , {b}~ , {b} , c } { b } {true} {false}`

yields `true`.

**TeXhackers note:** The function may fail if the `<item>` contains `{`, `}`, or `#` (assuming the usual TeX category codes apply).

## 23.5 Mapping over comma lists

The functions described in this section apply a specified function to each item of a comma list. All mappings are done at the current group level, *i.e.* any local assignments made by the `<function>` or `<code>` discussed below remain in effect after the loop.

When the comma list is given explicitly, as an `n`-type argument, spaces are trimmed around each item. If the result of trimming spaces is empty, the item is ignored. Otherwise, if the item is surrounded by braces, one set is removed, and the result is passed to the mapped function. Thus, if the comma list that is being mapped is `{a,{b},c}` then the arguments passed to the mapped function are ‘`a`’, ‘`{b}`’, an empty argument, and ‘`c`’.

When the comma list is given as an N-type argument, spaces have already been trimmed on input, and items are simply stripped of one set of braces if any. This case is more efficient than using n-type comma lists.

---

\clist\_map\_function:NN  $\star$  \clist\_map\_function:NN *<clist var>* *<function>*  
\clist\_map\_function:cN  $\star$  Applies *<function>* to every *<item>* stored in the *<clist var>*. The *<function>* receives one argument for each iteration. The *<items>* are returned from left to right. The function \clist\_map\_inline:Nn is in general more efficient than \clist\_map\_function:NN.  

---

Updated: 2012-06-29

---

\clist\_map\_inline:Nn \clist\_map\_inline:Nn *<clist var>* {*<inline function>*}  
\clist\_map\_inline:cn \clist\_map\_inline:nn Applies *<inline function>* to every *<item>* stored within the *<clist var>*. The *<inline function>* should consist of code which receives the *<item>* as #1. The *<items>* are returned from left to right.  

---

Updated: 2012-06-29

---

\clist\_map\_variable>NNn \clist\_map\_variable>NNn *<clist var>* *<variable>* {*<code>*}  
\clist\_map\_variable:cNn \clist\_map\_variable:nNn Stores each *<item>* of the *<clist var>* in turn in the (token list) *<variable>* and applies the *<code>*. The *<code>* will usually make use of the *<variable>*, but this is not enforced. The assignments to the *<variable>* are local. Its value after the loop is the last *<item>* in the *<clist var>*, or its original value if there were no *<item>*. The *<items>* are returned from left to right.  

---

Updated: 2012-06-29

---

\clist\_map\_tokens:Nn \clist\_map\_tokens:Nn *<clist var>* {*<code>*}  
\clist\_map\_tokens:cn \clist\_map\_tokens:nn {*<comma list>*} {*<code>*}  
\clist\_map\_tokens:nn  $\star$  Calls *<code>* {*<item>*} for every *<item>* stored in the *<clist var>*. The *<code>* receives each *<item>* as a trailing brace group. If the *<code>* consists of a single function this is equivalent to \clist\_map\_function:nN.  

---

New: 2021-05-05

---

\clist\_map\_break:  $\star$  \clist\_map\_break:  

---

Updated: 2012-06-29 Used to terminate a \clist\_map\_... function before all entries in the *<comma list>* have been processed. This normally takes place within a conditional statement, for example

```
\clist_map_inline:Nn \l_my_clist
{
    \str_if_eq:nnTF { #1 } { bingo }
        { \clist_map_break: }
    {
        % Do something useful
    }
}
```

Use outside of a \clist\_map\_... scenario leads to low level T<sub>E</sub>X errors.

**T<sub>E</sub>Xhackers note:** When the mapping is broken, additional tokens may be inserted before further items are taken from the input stream. This depends on the design of the mapping function.

---

```
\clist_map_break:n ☆ \clist_map_break:n {<code>}
```

Updated: 2012-06-29

Used to terminate a `\clist_map_...` function before all entries in the *comma list* have been processed, inserting the *<code>* after the mapping has ended. This normally takes place within a conditional statement, for example

```
\clist_map_inline:Nn \l_my_clist
{
  \str_if_eq:nnTF { #1 } { bingo }
    { \clist_map_break:n { <code> } }
  {
    % Do something useful
  }
}
```

Use outside of a `\clist_map_...` scenario leads to low level TeX errors.

**TeXhackers note:** When the mapping is broken, additional tokens may be inserted before the *<code>* is inserted into the input stream. This depends on the design of the mapping function.

---

```
\clist_count:N * \clist_count:N <list var>
```

`\clist_count:c` \* Leaves the number of items in the *<list var>* in the input stream as an *integer denotation*. The total number of items in a *<list var>* includes those which are duplicates, i.e. every item in a *<list var>* is counted.

New: 2012-07-13

## 23.6 Using the content of comma lists directly

---

```
\clist_use:Nnnn * \clist_use:Nnnn <list var> {<separator between two>}
\clist_use:cnnn * {<separator between more than two>} {<separator between final two>}
```

New: 2013-05-26

Places the contents of the *<list var>* in the input stream, with the appropriate *<separator>* between the items. Namely, if the comma list has more than two items, the *<separator between more than two>* is placed between each pair of items except the last, for which the *<separator between final two>* is used. If the comma list has exactly two items, then they are placed in the input stream separated by the *<separator between two>*. If the comma list has a single item, it is placed in the input stream, and a comma list with no items produces no output. An error is raised if the variable does not exist or if it is invalid.

For example,

```
\clist_set:Nn \l_tmpa_clist { a , b , , c , {de} , f }
\clist_use:Nnnn \l_tmpa_clist { ~and~ } { ,~ } { ,~and~ }
```

inserts “`a, b, c, de, and f`” in the input stream. The first separator argument is not used in this case because the comma list has more than 2 items.

**TeXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the *<items>* do not expand further when appearing in an `e`-type or `x`-type argument expansion.

---

```
\clist_use:Nn * \clist_use:Nn <clist var> {<separator>}
```

**New: 2013-05-26** Places the contents of the *<clist var>* in the input stream, with the *<separator>* between the items. If the comma list has a single item, it is placed in the input stream, and a comma list with no items produces no output. An error is raised if the variable does not exist or if it is invalid.

For example,

```
\clist_set:Nn \l_tmpa_clist { a , b , , c , {de} , f }
\clist_use:Nn \l_tmpa_clist { ~and~ }
```

inserts “a and b and c and de and f” in the input stream.

**TeXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the *<items>* do not expand further when appearing in an e-type or x-type argument expansion.

---

```
\clist_use:nnnn * \clist_use:nnnn <comma list> {<separator between two>}
\clist_use:nn * {<separator between more than two>} {<separator between final two>}
\clist_use:nn <comma list> {<separator>}
```

**New: 2021-05-10**

Places the contents of the *<comma list>* in the input stream, with the appropriate *<separator>* between the items. As for `\clist_set:Nn`, blank items are omitted, spaces are removed from both sides of each item, then a set of braces is removed if the resulting space-trimmed item is braced. The *<separators>* are then inserted in the same way as for `\clist_use:Nnnn` and `\clist_use:Nn`, respectively.

**TeXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the *<items>* do not expand further when appearing in an e-type or x-type argument expansion.

## 23.7 Comma lists as stacks

Comma lists can be used as stacks, where data is pushed to and popped from the top of the comma list. (The left of a comma list is the top, for performance reasons.) The stack functions for comma lists are not intended to be mixed with the general ordered data functions detailed in the previous section: a comma list should either be used as an ordered data type or as a stack, but not in both ways.

---

```
\clist_get:NN \clist_get:NN <clist var> <token list variable>
\clist_get:cN \clist_get:cN <clist var> <token list variable>
\clist_get:NNTF \clist_get:NNTF <clist var> <token list variable>
\clist_get:cNTF \clist_get:cNTF <clist var> <token list variable>
```

**New: 2012-05-14** Stores the left-most item from a *<clist var>* in the *<token list variable>* without removing it from the *<clist var>*. The *<token list variable>* is assigned locally. In the non-branching version, if the *<clist var>* is empty the *<token list variable>* is set to the marker value `\q_no_value`.

**Updated: 2019-02-16**

---

```
\clist_pop:NN \clist_pop:NN <clist var> <token list variable>
\clist_pop:cN \clist_pop:cN <clist var> <token list variable>
```

**Updated: 2011-09-06** Pops the left-most item from a *<clist var>* into the *<token list variable>*, i.e. removes the item from the comma list and stores it in the *<token list variable>*. Both of the variables are assigned locally.

---

```
\clist_gpop:NN \clist_gpop:NN <clist var> <token list variable>
```

---

```
\clist_gpop:cN
```

Pops the left-most item from a *<clist var>* into the *<token list variable>*, i.e. removes the item from the comma list and stores it in the *<token list variable>*. The *<clist var>* is modified globally, while the assignment of the *<token list variable>* is local.

---

```
\clist_pop:NNTF \clist_pop:NNTF <clist var> <token list variable> {\<true code>} {\<false code>}
```

---

```
\clist_pop:cNTF
```

If the *<clist var>* is empty, leaves the *<false code>* in the input stream. The value of the *<token list variable>* is not defined in this case and should not be relied upon. If the *<clist var>* is non-empty, pops the top item from the *<clist var>* in the *<token list variable>*, i.e. removes the item from the *<clist var>*. Both the *<clist var>* and the *<token list variable>* are assigned locally.

---

```
\clist_gpop:NNTF \clist_gpop:NNTF <clist var> <token list variable> {\<true code>} {\<false code>}
```

---

```
\clist_gpop:cNTF
```

If the *<clist var>* is empty, leaves the *<false code>* in the input stream. The value of the *<token list variable>* is not defined in this case and should not be relied upon. If the *<clist var>* is non-empty, pops the top item from the *<clist var>* in the *<token list variable>*, i.e. removes the item from the *<clist var>*. The *<clist var>* is modified globally, while the *<token list variable>* is assigned locally.

---

```
\clist_push:Nn \clist_push:Nn <clist var> {\<items>}
```

---

```
\clist_push:(NV|No|cn|cV|co)
```

---

```
\clist_gpush:Nn
```

---

```
\clist_gpush:(NV|No|cn|cV|co)
```

Adds the *{<items>}* to the top of the *<clist var>*. Spaces are removed from both sides of each item as for any n-type comma list.

## 23.8 Using a single item

---

```
\clist_item:Nn * \clist_item:Nn <clist var> {\<int expr>}
```

---

```
\clist_item:cn *
```

---

```
\clist_item:nn *
```

---

```
\clist_item:en *
```

---

```
New: 2014-07-17
```

Indexing items in the *<clist var>* from 1 at the top (left), this function evaluates the *<int expr>* and leaves the appropriate item from the comma list in the input stream. If the *<int expr>* is negative, indexing occurs from the bottom (right) of the comma list. When the *<int expr>* is larger than the number of items in the *<clist var>* (as calculated by *\clist\_count:N*) then the function expands to nothing.

**TEXhackers note:** The result is returned within the *\unexpanded* primitive (*\exp\_not:n*), which means that the *<item>* does not expand further when appearing in an e-type or x-type argument expansion.

---

`\clist_rand_item:N` \* `\clist_rand_item:N` (*clist var*)  
`\clist_rand_item:c` \* `\clist_rand_item:n` {⟨comma list⟩}  
`\clist_rand_item:n` \* Selects a pseudo-random item of the ⟨*clist var*⟩/⟨*comma list*⟩. If the ⟨*comma list*⟩ has no item, the result is empty.

New: 2016-12-06

**TeXhackers note:** The result is returned within the `\unexpanded` primitive (`\exp_not:n`), which means that the ⟨*item*⟩ does not expand further when appearing in an e-type or x-type argument expansion.

## 23.9 Viewing comma lists

---

`\clist_show:N` `\clist_show:N` (*clist var*)  
`\clist_show:c` Displays the entries in the ⟨*clist var*⟩ in the terminal.

Updated: 2021-04-29

---

`\clist_show:n` `\clist_show:n` {⟨tokens⟩}  
Displays the entries in the comma list in the terminal.

---

`\clist_log:N` `\clist_log:N` (*clist var*)  
`\clist_log:c` Writes the entries in the ⟨*clist var*⟩ in the log file. See also `\clist_show:N` which displays the result in the terminal.

New: 2014-08-22  
Updated: 2021-04-29

---

`\clist_log:n` `\clist_log:n` {⟨tokens⟩}  
Writes the entries in the comma list in the log file. See also `\clist_show:n` which displays the result in the terminal.

## 23.10 Constant and scratch comma lists

---

`\c_empty_clist` Constant that is always empty.

New: 2012-07-02

---

`\l_tmpa_clist` Scratch comma lists for local assignment. These are never used by the kernel code, and  
`\l_tmpb_clist` so are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten  
by other non-kernel code and so should only be used for short-term storage.

---

`\g_tmpa_clist` Scratch comma lists for global assignment. These are never used by the kernel code, and  
`\g_tmpb_clist` so are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten  
by other non-kernel code and so should only be used for short-term storage.

## Chapter 24

# The `I3token` module Token manipulation

This module deals with tokens. Now this is perhaps not the most precise description so let's try with a better description: When programming in TEX, it is often desirable to know just what a certain token is: is it a control sequence or something else. Similarly one often needs to know if a control sequence is expandable or not, a macro or a primitive, how many arguments it takes etc. Another thing of great importance (especially when it comes to document commands) is looking ahead in the token stream to see if a certain character is present and maybe even remove it or disregard other tokens while scanning. This module provides functions for both and as such has two primary function categories: `\token_` for anything that deals with tokens and `\peek_` for looking ahead in the token stream.

Most functions we describe here can be used on control sequences, as those are tokens as well.

It is important to distinguish two aspects of a token: its “shape” (for lack of a better word), which affects the matching of delimited arguments and the comparison of token lists containing this token, and its “meaning”, which affects whether the token expands or what operation it performs. One can have tokens of different shapes with the same meaning, but not the converse.

For instance, `\if:w`, `\if_charcode:w`, and `\tex_if:D` are three names for the same internal operation of TEX, namely the primitive testing the next two characters for equality of their character code. They have the same meaning hence behave identically in many situations. However, TEX distinguishes them when searching for a delimited argument. Namely, the example function `\show_until_if:w` defined below takes everything until `\if:w` as an argument, despite the presence of other copies of `\if:w` under different names.

```
\cs_new:Npn \show_until_if:w #1 \if:w { \tl_show:n {#1} }
\show_until_if:w \tex_if:D \if_charcode:w \if:w
```

A list of all possible shapes and a list of all possible meanings are given in section 24.7.

## 24.1 Creating character tokens

---

```
\char_set_active_eq:NN
\char_set_active_eq:Nc
\char_gset_active_eq:NN
\char_gset_active_eq:Nc
```

---

Updated: 2015-11-12

`\char_set_active_eq:NN <char> <function>`

Sets the behaviour of the `<char>` in situations where it is active (category code 13) to be equivalent to that of the `<function>`. The category code of the `<char>` is *unchanged* by this process. The `<function>` may itself be an active character.

---

```
\char_set_active_eq:nN
\char_set_active_eq:nc
\char_gset_active_eq:nN
\char_gset_active_eq:nc
```

---

New: 2015-11-12

`\char_set_active_eq:nN {<integer expression>} <function>`

Sets the behaviour of the `<char>` which has character code as given by the `<integer expression>` in situations where it is active (category code 13) to be equivalent to that of the `<function>`. The category code of the `<char>` is *unchanged* by this process. The `<function>` may itself be an active character.

---

```
\char_generate:nn *
\char_generate:nnn {<charcode>} {<catcode>}
```

---

New: 2015-09-09

Updated: 2019-01-16

Generates a character token of the given `<charcode>` and `<catcode>` (both of which may be integer expressions). The `<catcode>` may be one of

- 1 (begin group)
- 2 (end group)
- 3 (math toggle)
- 4 (alignment)
- 6 (parameter)
- 7 (math superscript)
- 8 (math subscript)
- 10 (space)
- 11 (letter)
- 12 (other)
- 13 (active)

and other values raise an error. The `<charcode>` may be any one valid for the engine in use, except that for `<catcode>` 10, `<charcode>` 0 is not allowed. Active characters cannot be generated in older versions of X<sub>E</sub>T<sub>E</sub>X. Another way to build token lists with unusual category codes is `\regex_replace:nnN {.*} {<replacement>} {tl var}`.

**TeXhackers note:** Exactly two expansions are needed to produce the character.

---

```
\c_catcode_active_space_tl
```

---

New: 2017-08-07

Token list containing one character with category code 13, (“active”), and character code 32 (space).

---

`\c_catcode_other_space_t1` Token list containing one character with category code 12, (“other”), and character code 32 (space).  
New: 2011-09-05

## 24.2 Manipulating and interrogating character tokens

---

<code>\char_set_catcode_escape:N</code>	<code>\char_set_catcode_letter:N &lt;character&gt;</code>
<code>\char_set_catcode_group_begin:N</code>	
<code>\char_set_catcode_group_end:N</code>	
<code>\char_set_catcode_math_toggle:N</code>	
<code>\char_set_catcode_alignment:N</code>	
<code>\char_set_catcode_end_line:N</code>	
<code>\char_set_catcode_parameter:N</code>	
<code>\char_set_catcode_math_superscript:N</code>	
<code>\char_set_catcode_math_subscript:N</code>	
<code>\char_set_catcode_ignore:N</code>	
<code>\char_set_catcode_space:N</code>	
<code>\char_set_catcode_letter:N</code>	
<code>\char_set_catcode_other:N</code>	
<code>\char_set_catcode_active:N</code>	
<code>\char_set_catcode_comment:N</code>	
<code>\char_set_catcode_invalid:N</code>	

---

Updated: 2015-11-11

Sets the category code of the *<character>* to that indicated in the function name. Depending on the current category code of the *<token>* the escape token may also be needed:

`\char_set_catcode_other:N \%`

The assignment is local.

---

```
\char_set_catcode_escape:n          \char_set_catcode_letter:n {\langle integer expression\rangle}
\char_set_catcode_group_begin:n
\char_set_catcode_group_end:n
\char_set_catcode_math_toggle:n
\char_set_catcode_alignment:n
\char_set_catcode_end_line:n
\char_set_catcode_parameter:n
\char_set_catcode_math_superscript:n
\char_set_catcode_math_subscript:n
\char_set_catcode_ignore:n
\char_set_catcode_space:n
\char_set_catcode_letter:n
\char_set_catcode_other:n
\char_set_catcode_active:n
\char_set_catcode_comment:n
\char_set_catcode_invalid:n
```

---

Updated: 2015-11-11

Sets the category code of the *character* which has character code as given by the *integer expression*. This version can be used to set up characters which cannot otherwise be given (*cf.* the N-type variants). The assignment is local.

---

```
\char_set_catcode:nn \char_set_catcode:nnn {\langle int expr1\rangle} {\langle int expr2\rangle}
```

---

Updated: 2015-11-11

These functions set the category code of the *character* which has character code as given by the *integer expression*. The first *integer expression* is the character code and the second is the category code to apply. The setting applies within the current TeX group. In general, the symbolic functions `\char_set_catcode_<type>` should be preferred, but there are cases where these lower-level functions may be useful.

---

```
\char_value_catcode:n * \char_value_catcode:n {\langle integer expression\rangle}
```

---

Expands to the current category code of the *character* with character code given by the *integer expression*.

---

```
\char_show_value_catcode:n \char_show_value_catcode:n {\langle integer expression\rangle}
```

---

Displays the current category code of the *character* with character code given by the *integer expression* on the terminal.

---

```
\char_set_lccode:nn \char_set_lccode:nnn {\langle int expr1\rangle} {\langle int expr2\rangle}
```

---

Updated: 2015-08-06

Sets up the behaviour of the *character* when found inside `\text_lowercase:n`, such that *character<sub>1</sub>* will be converted into *character<sub>2</sub>*. The two *characters* may be specified using an *integer expression* for the character code concerned. This may include the TeX ‘*character*’ method for converting a single character into its character code:

```
\char_set_lccode:nn { '\A } { '\a } % Standard behaviour
\char_set_lccode:nn { '\A } { '\A + 32 }
\char_set_lccode:nn { 50 } { 60 }
```

The setting applies within the current TeX group.

---

`\char_value_lccode:n` ★ `\char_value_lccode:n {<integer expression>}`

Expands to the current lower case code of the *character* with character code given by the *integer expression*.

---

`\char_show_value_lccode:n` `\char_show_value_lccode:n {<integer expression>}`

Displays the current lower case code of the *character* with character code given by the *integer expression* on the terminal.

---

`\char_set_uccode:nn` `\char_set_uccode:nn {<int expr1>} {<int expr2>}`

Updated: 2015-08-06

Sets up the behaviour of the *character* when found inside `\text_uppercase:n`, such that *character<sub>1</sub>* will be converted into *character<sub>2</sub>*. The two *characters* may be specified using an *integer expression* for the character code concerned. This may include the TeX ‘*character*’ method for converting a single character into its character code:

```
\char_set_uccode:nn { '\a } { '\A } % Standard behaviour
\char_set_uccode:nn { '\A } { '\A - 32 }
\char_set_uccode:nn { 60 } { 50 }
```

The setting applies within the current TeX group.

---

`\char_value_uccode:n` ★ `\char_value_uccode:n {<integer expression>}`

Expands to the current upper case code of the *character* with character code given by the *integer expression*.

---

`\char_show_value_uccode:n` `\char_show_value_uccode:n {<integer expression>}`

Displays the current upper case code of the *character* with character code given by the *integer expression* on the terminal.

---

`\char_set_mathcode:nn` `\char_set_mathcode:nn {<int expr1>} {<int expr2>}`

Updated: 2015-08-06

This function sets up the math code of *character*. The *character* is specified as an *integer expression* which will be used as the character code of the relevant character. The setting applies within the current TeX group.

---

`\char_value_mathcode:n` ★ `\char_value_mathcode:n {<integer expression>}`

Expands to the current math code of the *character* with character code given by the *integer expression*.

---

`\char_show_value_mathcode:n` `\char_show_value_mathcode:n {<integer expression>}`

Displays the current math code of the *character* with character code given by the *integer expression* on the terminal.

---

`\char_set_sfcode:nn` `\char_set_sfcode:nn {<int expr1>} {<int expr2>}`

Updated: 2015-08-06

This function sets up the space factor for the *character*. The *character* is specified as an *integer expression* which will be used as the character code of the relevant character. The setting applies within the current TeX group.

---

`\char_value_sfcode:n` \* `\char_value_sfcode:n {<integer expression>}`

Expands to the current space factor for the `<character>` with character code given by the `<integer expression>`.

---

`\char_show_value_sfcode:n` `\char_show_value_sfcode:n {<integer expression>}`

Displays the current space factor for the `<character>` with character code given by the `<integer expression>` on the terminal.

---

`\l_char_active_seq` Used to track which tokens may require special handling at the document level as they are (or have been at some point) of category `<active>` (catcode 13). Each entry in the sequence consists of a single escaped token, for example `\~`. Active tokens should be added to the sequence when they are defined for general document use.

New: 2012-01-23  
Updated: 2015-11-11

---

`\l_char_special_seq` Used to track which tokens will require special handling when working with verbatim-like material at the document level as they are not of categories `<letter>` (catcode 11) or `<other>` (catcode 12). Each entry in the sequence consists of a single escaped token, for example `\\"` for the backslash or `\{` for an opening brace. Escaped tokens should be added to the sequence when they are defined for general document use.

## 24.3 Generic tokens

---

`\c_group_begin_token`  
`\c_group_end_token`  
`\c_math_toggle_token`  
`\c_alignment_token`  
`\c_parameter_token`  
`\c_math_superscript_token`  
`\c_math_subscript_token`  
`\c_space_token`

These are implicit tokens which have the category code described by their name. They are used internally for test purposes but are also available to the programmer for other uses.

---

`\c_catcode_letter_token`  
`\c_catcode_other_token`

These are implicit tokens which have the category code described by their name. They are used internally for test purposes and should not be used other than for category code tests.

---

`\c_catcode_active_tl`

A token list containing an active token. This is used internally for test purposes and should not be used other than in appropriately-constructed category code tests.

## 24.4 Converting tokens

---

`\token_to_meaning:N * \token_to_meaning:N <token>`  
`\token_to_meaning:c *`

Inserts the current meaning of the *<token>* into the input stream as a series of characters of category code 12 (other). This is the primitive TeX description of the *<token>*, thus for example both functions defined by `\cs_set_nopar:Npn` and token list variables defined using `\tl_new:N` are described as **macros**.

**TeXhackers note:** This is the TeX primitive `\meaning`. The *<token>* can thus be an explicit space token or an explicit begin-group or end-group character token (`{` or `}` when normal TeX category codes apply) even though these are not valid N-type arguments.

---

`\token_to_str:N * \token_to_str:N <token>`  
`\token_to_str:c *`

Converts the given *<token>* into a series of characters with category code 12 (other). If the *<token>* is a control sequence, this will start with the current escape character with category code 12 (the escape character is part of the *<token>*). This function requires only a single expansion.

**TeXhackers note:** `\token_to_str:N` is the TeX primitive `\string`. The *<token>* can thus be an explicit space tokens or an explicit begin-group or end-group character token (`{` or `}` when normal TeX category codes apply) even though these are not valid N-type arguments.

---

`\token_to_catcode:N * \token_to_catcode:N <token>`

New: 2023-10-15

Converts the given *<token>* into a number describing its category code. If *<token>* is a control sequence this expands to 16. This can't detect the categories 0 (escape character), 5 (end of line), 9 (ignored character), 14 (comment character), or 15 (invalid character). Control sequences or active characters let to a token of one of the detectable category codes will yield that category.

## 24.5 Token conditionals

---

`\token_if_group_begin_p:N * \token_if_group_begin_p:N <token>`  
`\token_if_group_begin:NTF *` `\token_if_group_begin:NTF <token> {<true code>} {<false code>}`

Tests if *<token>* has the category code of a begin group token (`{` when normal TeX category codes are in force). Note that an explicit begin group token cannot be tested in this way, as it is not a valid N-type argument.

---

`\token_if_group_end_p:N * \token_if_group_end_p:N <token>`  
`\token_if_group_end:NTF *` `\token_if_group_end:NTF <token> {<true code>} {<false code>}`

Tests if *<token>* has the category code of an end group token (`}` when normal TeX category codes are in force). Note that an explicit end group token cannot be tested in this way, as it is not a valid N-type argument.

<code>\token_if_math_toggle_p:N * \token_if_math_toggle_p:N &lt;token&gt;</code>	Tests if <i>&lt;token&gt;</i> has the category code of a math shift token (\$ when normal TeX category codes are in force).
<code>\token_if_alignment_p:N * \token_if_alignment_p:N &lt;token&gt;</code>	
<code>\token_if_alignment:NTF * \token_if_alignment:NTF &lt;token&gt; {\&lt;true code&gt;} {\&lt;false code&gt;}</code>	Tests if <i>&lt;token&gt;</i> has the category code of an alignment token (& when normal TeX category codes are in force).
<code>\token_if_parameter_p:N * \token_if_parameter_p:N &lt;token&gt;</code>	
<code>\token_if_parameter:NTF * \token_if_parameter:NTF &lt;token&gt; {\&lt;true code&gt;} {\&lt;false code&gt;}</code>	Tests if <i>&lt;token&gt;</i> has the category code of a macro parameter token (# when normal TeX category codes are in force).
<code>\token_if_math_superscript_p:N * \token_if_math_superscript_p:N &lt;token&gt;</code>	
<code>\token_if_math_superscript:NTF * \token_if_math_superscript:NTF &lt;token&gt; {\&lt;true code&gt;} {\&lt;false code&gt;}</code>	Tests if <i>&lt;token&gt;</i> has the category code of a superscript token (^ when normal TeX category codes are in force).
<code>\token_if_math_subscript_p:N * \token_if_math_subscript_p:N &lt;token&gt;</code>	
<code>\token_if_math_subscript:NTF * \token_if_math_subscript:NTF &lt;token&gt; {\&lt;true code&gt;} {\&lt;false code&gt;}</code>	Tests if <i>&lt;token&gt;</i> has the category code of a subscript token (_) when normal TeX category codes are in force).
<code>\token_if_space_p:N * \token_if_space_p:N &lt;token&gt;</code>	
<code>\token_if_space:NTF * \token_if_space:NTF &lt;token&gt; {\&lt;true code&gt;} {\&lt;false code&gt;}</code>	Tests if <i>&lt;token&gt;</i> has the category code of a space token. Note that an explicit space token with character code 32 cannot be tested in this way, as it is not a valid N-type argument.
<code>\token_if_letter_p:N * \token_if_letter_p:N &lt;token&gt;</code>	
<code>\token_if_letter:NTF * \token_if_letter:NTF &lt;token&gt; {\&lt;true code&gt;} {\&lt;false code&gt;}</code>	Tests if <i>&lt;token&gt;</i> has the category code of a letter token.
<code>\token_if_other_p:N * \token_if_other_p:N &lt;token&gt;</code>	
<code>\token_if_other:NTF * \token_if_other:NTF &lt;token&gt; {\&lt;true code&gt;} {\&lt;false code&gt;}</code>	Tests if <i>&lt;token&gt;</i> has the category code of an “other” token.
<code>\token_if_active_p:N * \token_if_active_p:N &lt;token&gt;</code>	
<code>\token_if_active:NTF * \token_if_active:NTF &lt;token&gt; {\&lt;true code&gt;} {\&lt;false code&gt;}</code>	Tests if <i>&lt;token&gt;</i> has the category code of an active character.
<code>\token_if_eq_catcode_p:NN * \token_if_eq_catcode_p:NN &lt;token<sub>1</sub>&gt; &lt;token<sub>2</sub>&gt;</code>	
<code>\token_if_eq_catcode:NNTF * \token_if_eq_catcode:NNTF &lt;token<sub>1</sub>&gt; &lt;token<sub>2</sub>&gt; {\&lt;true code&gt;} {\&lt;false code&gt;}</code>	Tests if the two <i>&lt;tokens&gt;</i> have the same category code.

---

```
\token_if_eq_charcode_p:NN * \token_if_eq_charcode_p:NN <token1> <token2>
\token_if_eq_charcode:NNTF * \token_if_eq_charcode:NNTF <token1> <token2> {{true code}} {{false code}}
```

---

Tests if the two *<tokens>* have the same character code.

---

\token_if_primitive:NTF * \token_if_primitive:NTF <token> {{true code}} {{false code}}
```

---

Updated: 2020-09-11 Tests if the *<token>* is an engine primitive. In LuaT<sub>E</sub>X this includes primitive-like commands defined using `token.set_lua`.

---

```
\token_case_catcode:Nn    * \token_case_meaning:NnTF <test token>
\token_case_catcode:NnTF  *   {
\token_case_charcode:Nn   *     ⟨token case1⟩ {⟨code case1⟩}
\token_case_charcode:NnTF *     ⟨token case2⟩ {⟨code case2⟩}
\token_case_meaning:Nn   *     ...
\token_case_meaning:NnTF *     ⟨token casen⟩ {⟨code casen⟩}
}
New: 2020-12-03
}
{⟨true code⟩}
{⟨false code⟩}
```

---

This function compares the *<test token>* in turn with each of the *<token cases>*. If the two are equal (as described for `\token_if_eq_catcode:NNTF`, `\token_if_eq_charcode:NNTF` and `\token_if_eq_meaning:NNTF`, respectively) then the associated *<code>* is left in the input stream and other cases are discarded. If any of the cases are matched, the *<true code>* is also inserted into the input stream (after the code for the appropriate case), while if none match then the *<false code>* is inserted. The functions `\token_case_catcode:Nn`, `\token_case_charcode:Nn`, and `\token_case_meaning:Nn`, which do nothing if there is no match, are also available.

## 24.6 Peeking ahead at the next token

There is often a need to look ahead at the next token in the input stream while leaving it in place. This is handled using the “peek” functions. The generic `\peek_after:Nw` is provided along with a family of predefined tests for common cases. As peeking ahead does *not* skip spaces the predefined tests include both a space-respecting and space-skipping version. In addition, using `\peek_analysis_map_inline:n`, one can map through the following tokens in the input stream and repeatedly perform some tests.

---

`\peek_after:Nw \peek_after:Nw <function> <token>`

Locally sets the test variable `\l_peek_token` equal to *<token>* (as an implicit token, *not* as a token list), and then expands the *<function>*. The *<token>* remains in the input stream as the next item after the *<function>*. The *<token>* here may be `\`, `{` or `}` (assuming normal TeX category codes), *i.e.* it is not necessarily the next argument which would be grabbed by a normal function.

---

`\peek_gafter:Nw \peek_gafter:Nw <function> <token>`

Globally sets the test variable `\g_peek_token` equal to *<token>* (as an implicit token, *not* as a token list), and then expands the *<function>*. The *<token>* remains in the input stream as the next item after the *<function>*. The *<token>* here may be `\`, `{` or `}` (assuming normal TeX category codes), *i.e.* it is not necessarily the next argument which would be grabbed by a normal function.

---

`\l_peek_token` Token set by `\peek_after:Nw` and available for testing as described above.

---

`\g_peek_token` Token set by `\peek_gafter:Nw` and available for testing as described above.

<u>\peek_catcode:NTF</u>	<code>\peek_catcode:NTF &lt;test token&gt; {\&lt;true code&gt;} {\&lt;false code&gt;}</code>
Updated: 2012-12-20	Tests if the next <i>&lt;token&gt;</i> in the input stream has the same category code as the <i>&lt;test token&gt;</i> (as defined by the test \token_if_eq_catcode:NNTF). Spaces are respected by the test and the <i>&lt;token&gt;</i> is left in the input stream after the <i>&lt;true code&gt;</i> or <i>&lt;false code&gt;</i> (as appropriate to the result of the test).
<u>\peek_catcode_remove:NTF</u>	<code>\peek_catcode_remove:NTF &lt;test token&gt; {\&lt;true code&gt;} {\&lt;false code&gt;}</code>
Updated: 2012-12-20	Tests if the next <i>&lt;token&gt;</i> in the input stream has the same category code as the <i>&lt;test token&gt;</i> (as defined by the test \token_if_eq_catcode:NNTF). Spaces are respected by the test and the <i>&lt;token&gt;</i> is removed from the input stream if the test is true. The function then places either the <i>&lt;true code&gt;</i> or <i>&lt;false code&gt;</i> in the input stream (as appropriate to the result of the test).
<u>\peek_charcode:NTF</u>	<code>\peek_charcode:NTF &lt;test token&gt; {\&lt;true code&gt;} {\&lt;false code&gt;}</code>
Updated: 2012-12-20	Tests if the next <i>&lt;token&gt;</i> in the input stream has the same character code as the <i>&lt;test token&gt;</i> (as defined by the test \token_if_eq_charcode:NNTF). Spaces are respected by the test and the <i>&lt;token&gt;</i> is left in the input stream after the <i>&lt;true code&gt;</i> or <i>&lt;false code&gt;</i> (as appropriate to the result of the test).
<u>\peek_charcode_remove:NTF</u>	<code>\peek_charcode_remove:NTF &lt;test token&gt; {\&lt;true code&gt;} {\&lt;false code&gt;}</code>
Updated: 2012-12-20	Tests if the next <i>&lt;token&gt;</i> in the input stream has the same character code as the <i>&lt;test token&gt;</i> (as defined by the test \token_if_eq_charcode:NNTF). Spaces are respected by the test and the <i>&lt;token&gt;</i> is removed from the input stream if the test is true. The function then places either the <i>&lt;true code&gt;</i> or <i>&lt;false code&gt;</i> in the input stream (as appropriate to the result of the test).
<u>\peek_meaning:NTF</u>	<code>\peek_meaning:NTF &lt;test token&gt; {\&lt;true code&gt;} {\&lt;false code&gt;}</code>
Updated: 2011-07-02	Tests if the next <i>&lt;token&gt;</i> in the input stream has the same meaning as the <i>&lt;test token&gt;</i> (as defined by the test \token_if_eq_meaning:NNTF). Spaces are respected by the test and the <i>&lt;token&gt;</i> is left in the input stream after the <i>&lt;true code&gt;</i> or <i>&lt;false code&gt;</i> (as appropriate to the result of the test).
<u>\peek_meaning_remove:NTF</u>	<code>\peek_meaning_remove:NTF &lt;test token&gt; {\&lt;true code&gt;} {\&lt;false code&gt;}</code>
Updated: 2011-07-02	Tests if the next <i>&lt;token&gt;</i> in the input stream has the same meaning as the <i>&lt;test token&gt;</i> (as defined by the test \token_if_eq_meaning:NNTF). Spaces are respected by the test and the <i>&lt;token&gt;</i> is removed from the input stream if the test is true. The function then places either the <i>&lt;true code&gt;</i> or <i>&lt;false code&gt;</i> in the input stream (as appropriate to the result of the test).
<u>\peek_remove_spaces:n</u>	<code>\peek_remove_spaces:n {\&lt;code&gt;}</code>
New: 2018-10-01	Peeks ahead and detect if the following token is a space (category code 10 and character code 32). If so, removes the token and checks the next token. Once a non-space token is found, the <i>&lt;code&gt;</i> will be inserted into the input stream. Typically this will contain a peek operation, but this is not required.

---

```
\peek_remove_filler:n \peek_remove_filler:n {⟨code⟩}
```

New: 2022-01-10

Peeks ahead and detect if the following token is a space (category code 10) or has meaning equal to `\scan_stop:`. If so, removes the token and checks the next token. If neither of these cases apply, expands the next token using f-type expansion, then checks the resulting leading token in the same way. If after expansion the next token is neither of the two test cases, the `⟨code⟩` will be inserted into the input stream. Typically this will contain a `peek` operation, but this is not required.

**TeXhackers note:** This is essentially a macro-based implementation of how TeX handles the search for a left brace after for example `\everypar`, except that any non-expandable token cleanly ends the `⟨filler⟩` (i.e. it does not lead to a TeX error).

In contrast to TeX's filler removal, a construct `\exp_not:N \foo` will be treated in the same way as `\foo`.

---

```
\peek_N_type:TF \peek_N_type:TF {⟨true code⟩} {⟨false code⟩}
```

Updated: 2012-12-20

Tests if the next `⟨token⟩` in the input stream can be safely grabbed as an N-type argument. The test is `⟨false⟩` if the next `⟨token⟩` is either an explicit or implicit begin-group or end-group token (with any character code), or an explicit or implicit space character (with character code 32 and category code 10), or an outer token (never used in L<sup>A</sup>T<sub>E</sub>X3) and `⟨true⟩` in all other cases. Note that a `⟨true⟩` result ensures that the next `⟨token⟩` is a valid N-type argument. However, if the next `⟨token⟩` is for instance `\c_space_token`, the test takes the `⟨false⟩` branch, even though the next `⟨token⟩` is in fact a valid N-type argument. The `⟨token⟩` is left in the input stream after the `⟨true code⟩` or `⟨false code⟩` (as appropriate to the result of the test).

---

```
\peek_analysis_map_inline:n \peek_analysis_map_inline:n {⟨inline function⟩}
```

New: 2020-12-03

Updated: 2022-10-03

---

Repeatedly removes one  $\langle token \rangle$  from the input stream and applies the  $\langle inline function \rangle$  to it, until `\peek_analysis_map_break:` is called. The  $\langle inline function \rangle$  receives three arguments for each  $\langle token \rangle$  in the input stream:

- $\langle tokens \rangle$ , which both `o-expand` and `e/x-expand` to the  $\langle token \rangle$ . The detailed form of  $\langle tokens \rangle$  may change in later releases.
- $\langle char code \rangle$ , a decimal representation of the character code of the  $\langle token \rangle$ ,  $-1$  if it is a control sequence.
- $\langle catcode \rangle$ , a capital hexadecimal digit which denotes the category code of the  $\langle token \rangle$  ( $0$ : control sequence,  $1$ : begin-group,  $2$ : end-group,  $3$ : math shift,  $4$ : alignment tab,  $6$ : parameter,  $7$ : superscript,  $8$ : subscript,  $A$ : space,  $B$ : letter,  $C$ : other,  $D$ : active). This can be converted to an integer by writing " $\langle catcode \rangle$ ".

These arguments are the same as for `\tl_analysis_map_inline:nn` defined in `\3tl-analysis`. The  $\langle char code \rangle$  and  $\langle catcode \rangle$  do not take the meaning of a control sequence or active character into account: for instance, upon encountering the token `\c_group_begin_token` in the input stream, `\peek_analysis_map_inline:n` calls the  $\langle inline function \rangle$  with #1 being `\exp_not:n { \c_group_begin_token }` (with the current implementation), #2 being  $-1$ , and #3 being  $0$ , as for any other control sequence. In contrast, upon encountering an explicit begin-group token `{`, the  $\langle inline function \rangle$  is called with arguments `\exp_after:wN { \if_false: } \fi:, 123` and  $1$ .

The mapping is done at the current group level, *i.e.* any local assignments made by the  $\langle inline function \rangle$  remain in effect after the loop. Within the code, `\l_peek_token` is set equal (as a token, not a token list) to the token under consideration.

---

```
\peek_analysis_map_break: \peek_analysis_map_inline:n  
\peek_analysis_map_break:n { ... \peek_analysis_map_break:n {⟨code⟩} }
```

New: 2020-12-03

---

Stops the `\peek_analysis_map_inline:n` loop from seeking more tokens, and inserts  $\langle code \rangle$  in the input stream (empty for `\peek_analysis_map_break:`).

---

`\peek_regex:nTF \peek_regex:nTF {⟨regex⟩} {⟨true code⟩} {⟨false code⟩}`

**`\peek_regex:NTF`** Tests if the *⟨tokens⟩* that follow in the input stream match the *⟨regular expression⟩*. Any *⟨tokens⟩* that have been read are left in the input stream after the *⟨true code⟩* or *⟨false code⟩* (as appropriate to the result of the test). See `\3regex` for documentation of the syntax of regular expressions. The *⟨regular expression⟩* is implicitly anchored at the start, so for instance `\peek_regex:nTF { a }` is essentially equivalent to `\peek_charcode:NTF a`.

New: 2020-12-03

**TEXhackers note:** Implicit character tokens are correctly considered by `\peek_regex:nTF` as control sequences, while functions that inspect individual tokens (for instance `\peek_charcode:NTF`) only take into account their meaning.

The `\peek_regex:nTF` function only inspects as few tokens as necessary to determine whether the regular expression matches. For instance `\peek_regex:nTF { abc | [a-z] } { } { } abc` will only inspect the first token `a` even though the first branch `abc` of the alternative is preferred in functions such as `\peek_regex_remove_once:NTF`. This may have an effect on tokenization if the input stream has not yet been tokenized and category codes are changed.

---

`\peek_regex_remove_once:nTF \peek_regex_remove_once:nTF {⟨regex⟩} {⟨true code⟩} {⟨false code⟩}`

New: 2020-12-03

Tests if the *⟨tokens⟩* that follow in the input stream match the *⟨regex⟩*. If the test is true, the *⟨tokens⟩* are removed from the input stream and the *⟨true code⟩* is inserted, while if the test is false, the *⟨false code⟩* is inserted followed by the *⟨tokens⟩* that were originally in the input stream. See `\3regex` for documentation of the syntax of regular expressions. The *⟨regular expression⟩* is implicitly anchored at the start, so for instance `\peek_regex_remove_once:NTF { a }` is essentially equivalent to `\peek_charcode_remove:NTF a`.

**TEXhackers note:** Implicit character tokens are correctly considered by `\peek_regex_remove_once:NTF` as control sequences, while functions that inspect individual tokens (for instance `\peek_charcode:NTF`) only take into account their meaning.

---

```
\peek_regex_replace_once:n    \peek_regex_replace_once:nnTF {⟨regex⟩} {⟨replacement⟩} {⟨true code⟩}
\peek_regex_replace_once:nnTF {⟨false code⟩}
\peek_regex_replace_once:Nn
\peek_regex_replace_once:NnTF
```

---

New: 2020-12-03

If the ⟨tokens⟩ that follow in the input stream match the ⟨regex⟩, replaces them according to the ⟨replacement⟩ as for \regex\_replace\_once:nnN, and leaves the result in the input stream, after the ⟨true code⟩. Otherwise, leaves ⟨false code⟩ followed by the ⟨tokens⟩ that were originally in the input stream, with no modifications. See l3regex for documentation of the syntax of regular expressions and of the ⟨replacement⟩: for instance \O in the ⟨replacement⟩ is replaced by the tokens that were matched in the input stream. The ⟨regular expression⟩ is implicitly anchored at the start. In contrast to \regex\_replace\_once:nnN, no error arises if the ⟨replacement⟩ leads to an unbalanced token list: the tokens are inserted into the input stream without issue.

**TeXhackers note:** Implicit character tokens are correctly considered by \peek\_regex\_replace\_once:nnTF as control sequences, while functions that inspect individual tokens (for instance \peek\_charcode:NTF) only take into account their meaning.

## 24.7 Description of all possible tokens

Let us end by reviewing every case that a given token can fall into. This section is quite technical and some details are only meant for completeness. We distinguish the meaning of the token, which controls the expansion of the token and its effect on TeX’s state, and its shape, which is used when comparing token lists such as for delimited arguments. Two tokens of the same shape must have the same meaning, but the converse does not hold.

A token has one of the following shapes.

- A control sequence, characterized by the sequence of characters that constitute its name: for instance, \use:n is a five-letter control sequence.
- An active character token, characterized by its character code (between 0 and 1114111 for LuaTeX and XeTeX and less for other engines) and category code 13.
- A character token, characterized by its character code and category code (one of 1, 2, 3, 4, 6, 7, 8, 10, 11 or 12 whose meaning is described below).

There are also a few internal tokens. The following list may be incomplete in some engines.

- Expanding \the\font results in a token that looks identical to the command that was used to select the current font (such as \tenrm) but it differs from it in shape.
- A “frozen” \relax, which differs from the primitive in shape (but has the same meaning), is inserted when the closing \fi of a conditional is encountered before the conditional is evaluated.
- Expanding \noexpand ⟨token⟩ (when the ⟨token⟩ is expandable) results in an internal token, displayed (temporarily) as \notexpanded: ⟨token⟩, whose shape coincides with the ⟨token⟩ and whose meaning differs from \relax.

- An `\outer endtemplate`: can be encountered when peeking ahead at the next token; this expands to another internal token, `end` of `alignment template`.
- Tricky programming might access a frozen `\endwrite`.
- Some frozen tokens can only be accessed in interactive sessions: `\cr`, `\right`, `\endgroup`, `\fi`, `\inaccessible`.
- In `LuaTeX`, there is also the strange case of “bytes” `~~~~~1100xy` where  $x, y$  are any two lowercase hexadecimal digits, so that the hexadecimal number ranges from “`11 0000 = 1114 112`” to “`110 0ff = 1 114 367`”. These are used to output individual bytes to files, rather than UTF-8. For the purposes of token comparisons they behave like non-expandable primitive control sequences (*not characters*) whose `\meaning` is `the_character_` followed by the given byte. If this byte is in the range `80–ff` this gives an “invalid utf-8 sequence” error: applying `\token_to_str:N` or `\token_to_meaning:N` to these tokens is unsafe. Unfortunately, they don’t seem to be detectable safely by any means except perhaps `Lua` code.

The meaning of a (non-active) character token is fixed by its category code (and character code) and cannot be changed. We call these tokens *explicit* character tokens. Category codes that a character token can have are listed below by giving a sample output of the `TeX` primitive `\meaning`, together with their `LATEX3` names and most common example:

- 1 begin-group character (`group_begin`, often `{`),
- 2 end-group character (`group_end`, often `}`),
- 3 math shift character (`math_toggle`, often `$`),
- 4 alignment tab character (`alignment`, often `&`),
- 6 macro parameter character (`parameter`, often `#`),
- 7 superscript character (`math_superscript`, often `^`),
- 8 subscript character (`math_subscript`, often `_`),
- 10 blank space (`space`, often character code 32),
- 11 the letter (`letter`, such as `A`),
- 12 the character (`other`, such as `0`).

Category code 13 (*active*) is discussed below. Input characters can also have several other category codes which do not lead to character tokens for later processing: 0 (`escape`), 5 (`end_line`), 9 (`ignore`), 14 (`comment`), and 15 (`invalid`).

The meaning of a control sequence or active character can be identical to that of any character token listed above (with any character code), and we call such tokens *implicit* character tokens. The meaning is otherwise in the following list:

- a macro, used in `LATEX3` for most functions and some variables (`t1`, `fp`, `seq`, ...),
- a primitive such as `\def` or `\topmark`, used in `LATEX3` for some functions,
- a register such as `\count123`, used in `LATEX3` for the implementation of some variables (`int`, `dim`, ...),

- a constant integer such as `\char"56` or `\mathchar"121`,
- a font selection command,
- undefined.

Macros can be `\protected` or not, `\long` or not (the opposite of what L<sup>A</sup>T<sub>E</sub>X3 calls `nopar`), and `\outer` or not (unused in L<sup>A</sup>T<sub>E</sub>X3). Their `\meaning` takes the form

$\langle prefix \rangle \text{ macro} : \langle argument \rangle \rightarrow \langle replacement \rangle$

where  $\langle prefix \rangle$  is among `\protected\long\outer`,  $\langle argument \rangle$  describes parameters that the macro expects, such as `#1#2#3`, and  $\langle replacement \rangle$  describes how the parameters are manipulated, such as `\int_eval:n{#2+#1*#3}`.

Now is perhaps a good time to mention some subtleties relating to tokens with category code 10 (space). Any input character with this category code (normally, space and tab characters) becomes a normal space, with character code 32 and category code 10.

When a macro takes an undelimited argument, explicit space characters (with character code 32 and category code 10) are ignored. If the following token is an explicit character token with category code 1 (begin-group) and an arbitrary character code, then T<sub>E</sub>X scans ahead to obtain an equal number of explicit character tokens with category code 1 (begin-group) and 2 (end-group), and the resulting list of tokens (with outer braces removed) becomes the argument. Otherwise, a single token is taken as the argument for the macro: we call such single tokens “N-type”, as they are suitable to be used as an argument for a function with the signature `:N`.

When a macro takes a delimited argument T<sub>E</sub>X scans ahead until finding the delimiter (outside any pairs of begin-group/end-group explicit characters), and the resulting list of tokens (with outer braces removed) becomes the argument. Note that explicit space characters at the start of the argument are *not* ignored in this case (and they prevent brace-stripping).

# Chapter 25

## The `l3prop` module Property lists

`expl3` implements a property list data type, which contain an unordered list of entries each of which consists of a `<key>` and an associated `<value>`. The `<key>` and `<value>` may both be any balanced text, and the `<key>` is processed using `\tl_to_str:n`, meaning that category codes are ignored. It is possible to map functions to property lists such that the function is applied to every key–value pair within the list.

Each entry in a property list must have a unique `<key>`: if an entry is added to a property list which already contains the `<key>` then the new entry overwrites the existing one. The `<keys>` are compared on a string basis, using the same method as `\str_if_eq:nnTF`.

Property lists are intended for storing key-based information for use within code. This is in contrast to key–value lists, which are a form of *input* parsed by the `l3keys` module.

### 25.1 Creating and initialising property lists

---

`\prop_new:N` `\prop_new:N <property list>`

`\prop_new:c` Creates a new `<property list>` or raises an error if the name is already taken. The declaration is global. The `<property list>` initially contains no entries.

---

`\prop_clear:N` `\prop_clear:N <property list>`

`\prop_clear:c` Clears all entries from the `<property list>`.

`\prop_gclear:N`

`\prop_gclear:c`

---

`\prop_clear_new:N` `\prop_clear_new:N <property list>`

`\prop_clear_new:c` Ensures that the `<property list>` exists globally by applying `\prop_new:N` if necessary, then applies `\prop_(g)clear:N` to leave the list empty.

---

```
\prop_set_eq:NN          \prop_set_eq:NN <property list1> <property list2>
\prop_set_eq:(cN|Nc|cc)  Sets the content of <property list1> equal to that of <property list2>.
\prop_gset_eq:NN
\prop_gset_eq:(cN|Nc|cc)
```

---

```
\prop_set_from_keyval:Nn  \prop_set_from_keyval:Nn <property list>
\prop_set_from_keyval:cn  {
\prop_gset_from_keyval:Nn <key1> = <value1> ,
\prop_gset_from_keyval:cn <key2> = <value2> , ...
}
```

New: 2017-11-28

Updated: 2021-11-07

Sets <property list> to contain key–value pairs given in the second argument. If duplicate keys appear only the last of the values is kept.

Spaces are trimmed around every <key> and every <value>, and if the result of trimming spaces consists of a single brace group then a set of outer braces is removed. This enables both the <key> and the <value> to contain spaces, commas or equal signs. The <key> is then processed by \tl\_to\_str:n. This function correctly detects the = and , signs provided they have the standard category code 12 or they are active.

Notice that in contrast to most keyval lists (*e.g.* those in l3keys), each key here *must* be followed with an = sign.

---

```
\prop_const_from_keyval:Nn \prop_const_from_keyval:Nn <property list>
\prop_const_from_keyval:cn {
\prop_const_from_keyval:Nn <key1> = <value1> ,
\prop_const_from_keyval:cn <key2> = <value2> , ...
}
```

---

Creates a new constant <property list> or raises an error if the name is already taken. The <property list> is set globally to contain key–value pairs given in the second argument, processed in the way described for \prop\_set\_from\_keyval:Nn. If duplicate keys appear only the last of the values is kept. This function correctly detects the = and , signs provided they have the standard category code 12 or they are active.

Notice that in contrast to most keyval lists (*e.g.* those in l3keys), each key here *must* be followed with an = sign.

## 25.2 Adding and updating property list entries

---

```
\prop_put:Nnn          \prop_put:Nnn <property list> {<key>} {<value>}
\prop_put:(NnV|Nnv|Nne|NVn|NVV|NVv|NVe|Nvn|NvV|
            Nvv|Nve|Nen|NeV|Nev|Nee|Nno|Non|Noo|
            cnn|cnV|cnv|cne|cno|cVn|cVV|cVv|cVe|
            cvn|cvV|cvv|cve|cen|ceV|cev|cee|con|
            coo)
\prop_gput:Nnn
\prop_gput:(NnV|Nnv|Nne|NVn|NVV|NVv|NVe|Nvn|NvV|
            Nvv|Nve|Nen|NeV|Nev|Nee|Nno|Non|Noo|
            cnn|cnV|cnv|cne|cno|cVn|cVV|cVv|cVe|
            cvn|cvV|cvv|cve|cen|ceV|cev|cee|con|
            coo)
```

---

Updated: 2012-07-09

Adds an entry to the *<property list>* which may be accessed using the *<key>* and which has *<value>*. If the *<key>* is already present in the *<property list>*, the existing entry is overwritten by the new *<value>*. Both the *<key>* and *<value>* may contain any *<balanced text>*. The *<key>* is stored after processing with `\tl_to_str:n`, meaning that category codes are ignored.

---

```
\prop_put_if_new:Nnn          \prop_put_if_new:Nnn <property list> {<key>} {<value>}
\prop_put_if_new:(NVn|NnV|cnn|cVn|cnV)
\prop_gput_if_new:Nnn
\prop_gput_if_new:(NVn|NnV|cnn|cVn|cnV)
```

---

If the *<key>* is present in the *<property list>* then no action is taken. Otherwise, a new entry is added as described for `\prop_put:Nnn`.

---

```
\prop_concat:NNN          \prop_concat:NNN <property list1> <property list2> <property list3>
\prop_concat:ccc
\prop_gconcat:NNN
\prop_gconcat:ccc
```

---

Combines the key-value pairs of *<property list<sub>2</sub>>* and *<property list<sub>3</sub>>*, and saves the result in *<property list<sub>1</sub>>*. If a key appears in both *<property list<sub>2</sub>>* and *<property list<sub>3</sub>>* then the last value, namely the value in *<property list<sub>3</sub>>* is kept.

New: 2021-05-16

---

```
\prop_put_from_keyval:Nn  \prop_put_from_keyval:Nn <property list>
\prop_put_from_keyval:cn  {
\prop_gput_from_keyval:Nn <key1> = <value1> ,
\prop_gput_from_keyval:cn <key2> = <value2> , ...
}
```

---

New: 2021-05-16

Updated: 2021-11-07

Updates the *<property list>* by adding entries for each key–value pair given in the second argument. The addition is done through `\prop_put:Nnn`, hence if the *<property list>* already contains some of the keys, the corresponding values are discarded and replaced by those given in the key–value list. If duplicate keys appear in the key–value list then only the last of the values is kept.

The function is equivalent to storing the key–value pairs in a temporary property list using `\prop_set_from_keyval:Nn`, then combining *<property list>* with the temporary variable using `\prop_concat:NNN`. In particular, the *<keys>* and *<values>* are space-trimmed and unbraced as described in `\prop_set_from_keyval:Nn`. This function correctly detects the `=` and `,` signs provided they have the standard category code 12 or they are active.

## 25.3 Recovering values from property lists

---

```
\prop_get:NnN          \prop_get:NnN <property list> {\<key>} {tl var}
\prop_get:(NVN|NvN|NeN|NoN|cnN|cVN|cvN|ceN|coN|
           cnc)
```

---

Updated: 2011-08-28

Recovering the *<value>* stored with *<key>* from the *<property list>*, and places this in the *<token list variable>*. If the *<key>* is not found in the *<property list>* then the *<token list variable>* is set to the special marker `\q_no_value`. The *<token list variable>* is set within the current TeX group. See also `\prop_get:NnNTF`.

---

```
\prop_pop:NnN          \prop_pop:NnN <property list> {\<key>} {tl var}
```

---

```
\prop_pop:(NVN|NoN|cnN|cVN|coN)
```

---

Updated: 2011-08-18

Recovering the *<value>* stored with *<key>* from the *<property list>*, and places this in the *<token list variable>*. If the *<key>* is not found in the *<property list>* then the *<token list variable>* is set to the special marker `\q_no_value`. The *<key>* and *<value>* are then deleted from the property list. Both assignments are local. See also `\prop_pop:NnNTF`.

---

```
\prop_gpop:NnN          \prop_gpop:NnN <property list> {\<key>} {tl var}
```

---

```
\prop_gpop:(NVN|NoN|cnN|cVN|coN)
```

---

Updated: 2011-08-18

Recovering the *<value>* stored with *<key>* from the *<property list>*, and places this in the *<token list variable>*. If the *<key>* is not found in the *<property list>* then the *<token list variable>* is set to the special marker `\q_no_value`. The *<key>* and *<value>* are then deleted from the property list. The *<property list>* is modified globally, while the assignment of the *<token list variable>* is local. See also `\prop_gpop:NnNTF`.

---

\prop\_item:Nn \* \prop\_item:Nn *property list* {*key*}  
\prop\_item:(NV|Ne|No|cn|cV|ce|co) \*

---

New: 2014-07-17

Expands to the *value* corresponding to the *key* in the *property list*. If the *key* is missing, this has an empty expansion.

**TeXhackers note:** This function is slower than the non-expandable analogue \prop\_get:Nn. The result is returned within the \unexpanded primitive (\exp\_not:n), which means that the *value* does not expand further when appearing in an e-type or x-type argument expansion.

---

\prop\_count:N \* \prop\_count:N *property list*

\prop\_count:c \* Leaves the number of key–value pairs in the *property list* in the input stream as an *integer denotation*.

---

\prop\_to\_keyval:N \* \prop\_to\_keyval:N *property list*

Expands to the *property list* in a key–value notation. Keep in mind that a *property list* is *unordered*, while key–value interfaces don’t necessarily are, so this can’t be used for arbitrary interfaces.

**TeXhackers note:** The result is returned within the \unexpanded primitive (\exp\_not:n), which means that the key–value list does not expand further when appearing in an e-type or x-type argument expansion. It also needs exactly two steps of expansion.

## 25.4 Modifying property lists

---

\prop\_remove:Nn \* \prop\_remove:Nn *property list* {*key*}  
\prop\_remove:(NV|Ne|cn|cV|ce)  
\prop\_gremove:Nn  
\prop\_gremove:(NV|Ne|cn|cV|ce)

---

New: 2012-05-12

Removes the entry listed under *key* from the *property list*. If the *key* is not found in the *property list* no change occurs, i.e there is no need to test for the existence of a key before deleting it.

## 25.5 Property list conditionals

---

\prop\_if\_exist\_p:N \* \prop\_if\_exist\_p:N *property list*  
\prop\_if\_exist\_p:c \* \prop\_if\_exist:NTF *property list* {*true code*} {*false code*}  
\prop\_if\_exist:NTF \* Tests whether the *property list* is currently defined. This does not check that the  
\prop\_if\_exist:cTF \* *property list* really is a property list variable.

---

New: 2012-03-03

---

```
\prop_if_empty_p:N * \prop_if_empty_p:N <property list>
\prop_if_empty_p:c * \prop_if_empty:NTF <property list> {\{true code\}} {\{false code\}}
\prop_if_empty:NTF * Tests if the <property list> is empty (containing no entries).
\prop_if_empty:cTF *
```

---

---

```
\prop_if_in_p:Nn * \prop_if_in_p:Nn <property list> {\{key\}}
\prop_if_in_p:(NV|Ne|No|cn|cV|ce|co) * \prop_if_in:NnTF <property list> {\{key\}} {\{true code\}} {\{false
\prop_if_in:NnTF * code\}}
\prop_if_in:(NV|Ne|No|cn|cV|ce|co)TF *
```

---

Updated: 2011-09-15

Tests if the *key* is present in the *property list*, making the comparison using the method described by `\str_if_eq:nnTF`.

**TeXhackers note:** This function iterates through every key–value pair in the *property list* and is therefore slower than using the non-expandable `\prop_get:NnNTF`.

## 25.6 Recovering values from property lists with branching

The functions in this section combine tests for the presence of a key in a property list with recovery of the associated valued. This makes them useful for cases where different cases follow dependent on the presence or absence of a key in a property list. They offer increased readability and performance over separate testing and recovery phases.

---

```
\prop_get:NnNTF
\prop_get:(NVN|NvN|NeN|NoN|cnN|cVN|cvN|ceN|coN|
           cnc)TF * \prop_get:NnNTF <property list> {\{key\}} <token list
variable>
{\{true code\}} {\{false code\}}
```

---

Updated: 2012-05-19

If the *key* is not present in the *property list*, leaves the *false code* in the input stream. The value of the *token list variable* is not defined in this case and should not be relied upon. If the *key* is present in the *property list*, stores the corresponding *value* in the *token list variable* without removing it from the *property list*, then leaves the *true code* in the input stream. The *token list variable* is assigned locally.

---

```
\prop_pop:NnNTF
\prop_pop:(NVN|NoN|cnN|cVN|coN)TF * \prop_pop:NnNTF <property list> {\{key\}} <token list variable> {\{true
code\}} {\{false code\}}
```

---

New: 2011-08-18

Updated: 2012-05-19

If the *key* is not present in the *property list*, leaves the *false code* in the input stream. The value of the *token list variable* is not defined in this case and should not be relied upon. If the *key* is present in the *property list*, pops the corresponding *value* in the *token list variable*, *i.e.* removes the item from the *property list*. Both the *property list* and the *token list variable* are assigned locally.

---

```
\prop_gpop:NnNTF          \prop_gpop:NnNTF <property list> {<key>} <token list variable> {<true
\prop_gpop:(NVN|NoN|cnN|cVN|coN)TF code>} {<false code>}
```

---

New: 2011-08-18

Updated: 2012-05-19

If the *<key>* is not present in the *<property list>*, leaves the *<false code>* in the input stream. The value of the *<token list variable>* is not defined in this case and should not be relied upon. If the *<key>* is present in the *<property list>*, pops the corresponding *<value>* in the *<token list variable>*, *i.e.* removes the item from the *<property list>*. The *<property list>* is modified globally, while the *<token list variable>* is assigned locally.

## 25.7 Mapping over property lists

All mappings are done at the current group level, *i.e.* any local assignments made by the *<function>* or *<code>* discussed below remain in effect after the loop.

---

```
\prop_map_function:NN ☆ \prop_map_function:NN <property list> <function>
```

---

```
\prop_map_function:cN ☆
```

Updated: 2013-01-08

Applies *<function>* to every *<entry>* stored in the *<property list>*. The *<function>* receives two arguments for each iteration: the *<key>* and associated *<value>*. The order in which *<entries>* are returned is not defined and should not be relied upon. To pass further arguments to the *<function>*, see `\prop_map_tokens:Nn`.

---

```
\prop_map_inline:Nn \prop_map_inline:Nn <property list> {<inline function>}
```

---

```
\prop_map_inline:cn
```

Updated: 2013-01-08

Applies *<inline function>* to every *<entry>* stored within the *<property list>*. The *<inline function>* should consist of code which receives the *<key>* as #1 and the *<value>* as #2. The order in which *<entries>* are returned is not defined and should not be relied upon.

---

```
\prop_map_tokens:Nn ☆ \prop_map_tokens:Nn <property list> {<code>}
```

---

```
\prop_map_tokens:cn ☆
```

Analogue of `\prop_map_function:NN` which maps several tokens instead of a single function. The *<code>* receives each key–value pair in the *<property list>* as two trailing brace groups. For instance,

```
\prop_map_tokens:Nn \l_my_prop { \str_if_eq:nnT { mykey } }
```

expands to the value corresponding to `mykey`: for each pair in `\l_my_prop` the function `\str_if_eq:nnT` receives `mykey`, the *<key>* and the *<value>* as its three arguments. For that specific task, `\prop_item:Nn` is faster.

---

`\prop_map_break: ☆ \prop_map_break:`

Updated: 2012-06-29

Used to terminate a `\prop_map_...` function before all entries in the *property list* have been processed. This normally takes place within a conditional statement, for example

```
\prop_map_inline:Nn \l_my_prop
{
    \str_if_eq:nnTF { #1 } { bingo }
        { \prop_map_break: }
        {
            % Do something useful
        }
}
```

Use outside of a `\prop_map_...` scenario leads to low level T<sub>E</sub>X errors.

**T<sub>E</sub>Xhackers note:** When the mapping is broken, additional tokens may be inserted before further items are taken from the input stream. This depends on the design of the mapping function.

---

`\prop_map_break:n ☆ \prop_map_break:n {<code>}`

Updated: 2012-06-29

Used to terminate a `\prop_map_...` function before all entries in the *property list* have been processed, inserting the *<code>* after the mapping has ended. This normally takes place within a conditional statement, for example

```
\prop_map_inline:Nn \l_my_prop
{
    \str_if_eq:nnTF { #1 } { bingo }
        { \prop_map_break:n { <code> } }
        {
            % Do something useful
        }
}
```

Use outside of a `\prop_map_...` scenario leads to low level T<sub>E</sub>X errors.

**T<sub>E</sub>Xhackers note:** When the mapping is broken, additional tokens may be inserted before the *<code>* is inserted into the input stream. This depends on the design of the mapping function.

## 25.8 Viewing property lists

---

`\prop_show:N \prop_show:N <property list>`

`\prop_show:c`

Displays the entries in the *property list* in the terminal.

Updated: 2021-04-29

---

`\prop_log:N`    `\prop_log:N` *property list*)  
`\prop_log:c`    Writes the entries in the *property list* in the log file.

New: 2014-08-12  
Updated: 2021-04-29

---

## 25.9 Scratch property lists

---

`\l_tmpa_prop` Scratch property lists for local assignment. These are never used by the kernel code, and  
`\l_tmpb_prop` so are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten  
New: 2012-06-23 by other non-kernel code and so should only be used for short-term storage.

---

`\g_tmpa_prop` Scratch property lists for global assignment. These are never used by the kernel code, and  
`\g_tmpb_prop` so are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten  
New: 2012-06-23 by other non-kernel code and so should only be used for short-term storage.

## 25.10 Constants

---

`\c_empty_prop` A permanently-empty property list used for internal comparisons.

# Chapter 26

## The `\3skip` module Dimensions and skips

LATEX3 provides two general length variables: `dim` and `skip`. Lengths stored as `dim` variables have a fixed length, whereas `skip` lengths have a rubber (stretch/shrink) component. In addition, the `muskip` type is available for use in math mode: this is a special form of `skip` where the lengths involved are determined by the current math font (in `mu`). There are common features in the creation and setting of length variables, but for clarity the functions are grouped by variable type.

Many functions take *dimension expressions* (“ $\langle dim\ expr \rangle$ ”) or *skip expressions* (“ $\langle skip\ expr \rangle$ ”) as arguments.

### 26.1 Creating and initialising `dim` variables

---

`\dim_new:N \dim_new:N  $\langle dimension \rangle$`

`\dim_new:c` Creates a new  $\langle dimension \rangle$  or raises an error if the name is already taken. The declaration is global. The  $\langle dimension \rangle$  is initially equal to 0 pt.

---

`\dim_const:Nn \dim_const:Nn  $\langle dimension \rangle \{ \langle dim\ expr \rangle \}$`

`\dim_const:cn` Creates a new constant  $\langle dimension \rangle$  or raises an error if the name is already taken. The value of the  $\langle dimension \rangle$  is set globally to the  $\langle dim\ expr \rangle$ .  
New: 2012-03-05

---

`\dim_zero:N \dim_zero:N  $\langle dimension \rangle$`

`\dim_zero:c` Sets  $\langle dimension \rangle$  to 0 pt.

`\dim_gzero:N`

---

`\dim_zero_new:N \dim_zero_new:N  $\langle dimension \rangle$`

`\dim_zero_new:c` Ensures that the  $\langle dimension \rangle$  exists globally by applying `\dim_new:N` if necessary, then applies `\dim_(g)zero:N` to leave the  $\langle dimension \rangle$  set to zero.  
`\dim_gzero_new:N`  
`\dim_gzero_new:c`

---

New: 2012-01-07

---

`\dim_if_exist_p:N` \* `\dim_if_exist_p:N` *dimension*  
`\dim_if_exist_p:c` \* `\dim_if_exist:NTF` *dimension* {*true code*} {*false code*}  
`\dim_if_exist:NTF` \* Tests whether the *dimension* is currently defined. This does not check that the `\dim_if_exist:cTF` \* *dimension* really is a dimension variable.

New: 2012-03-03

---

## 26.2 Setting dim variables

---

`\dim_add:Nn` `\dim_add:Nn` *dimension* {*dim expr*}  
`\dim_add:cn`  
`\dim_gadd:Nn`  
`\dim_gadd:cn`  
Updated: 2011-10-22

---

`\dim_set:Nn` `\dim_set:Nn` *dimension* {*dim expr*}  
`\dim_set:cn`  
`\dim_gset:Nn`  
`\dim_gset:cn`  
Updated: 2011-10-22

---

`\dim_set_eq:NN` `\dim_set_eq:NN` *dimension<sub>1</sub>* *dimension<sub>2</sub>*  
`\dim_set_eq:(cN|Nc|cc)` Sets the content of *dimension<sub>1</sub>* equal to that of *dimension<sub>2</sub>*.  
`\dim_gset_eq:NN`  
`\dim_gset_eq:(cN|Nc|cc)`

---

`\dim_sub:Nn` `\dim_sub:Nn` *dimension* {*dim expr*}  
`\dim_sub:cn`  
`\dim_gsub:Nn`  
`\dim_gsub:cn`  
Updated: 2011-10-22

---

## 26.3 Utilities for dimension calculations

---

`\dim_abs:n` \* `\dim_abs:n` {*dim expr*}  
Updated: 2012-09-26 Converts the *dim expr* to its absolute value, leaving the result in the input stream as a *dimension denotation*.

---

`\dim_max:nn` \* `\dim_max:nn` {*dim expr<sub>1</sub>*} {*dim expr<sub>2</sub>*}  
`\dim_min:nn` \* `\dim_min:nn` {*dim expr<sub>1</sub>*} {*dim expr<sub>2</sub>*}  
New: 2012-09-09 Evaluates the two *dim exprs* and leaves either the maximum or minimum value in the  
Updated: 2012-09-26 input stream as appropriate, as a *dimension denotation*.

---

---

```
\dim_ratio:nn ☆ \dim_ratio:nn {⟨dim expr₁⟩} {⟨dim expr₂⟩}
```

---

Updated: 2011-10-22 Parses the two ⟨dim exprs⟩ and converts the ratio of the two to a form suitable for use inside a ⟨dim expr⟩. This ratio is then left in the input stream, allowing syntax such as

```
\dim_set:Nn \l_my_dim  
  { 10 pt * \dim_ratio:nn { 5 pt } { 10 pt } }
```

The output of \dim\_ratio:nn on full expansion is a ratio expression between two integers, with all distances converted to scaled points. Thus

```
\tl_set:Ne \l_my_tl { \dim_ratio:nn { 5 pt } { 10 pt } }  
\tl_show:N \l_my_tl
```

displays 327680/655360 on the terminal.

## 26.4 Dimension expression conditionals

---

```
\dim_compare_p:nNn ☆ \dim_compare_p:nNn {⟨dim expr₁⟩} {⟨relation⟩} {⟨dim expr₂⟩}  
\dim_compare:nNnTF ☆ \dim_compare:nNnTF  
  {⟨dim expr₁⟩} {⟨relation⟩} {⟨dim expr₂⟩}  
  {⟨true code⟩} {⟨false code⟩}
```

---

This function first evaluates each of the ⟨dim exprs⟩ as described for \dim\_eval:n. The two results are then compared using the ⟨relation⟩:

Equal	=
Greater than	>
Less than	<

This function is less flexible than \dim\_compare:nTF but around 5 times faster.

---

```
\dim_compare_p:n ∗ \dim_compare_p:n
\dim_compare:nTF ∗   {
  Updated: 2013-01-13
    ⟨dim expr1⟩ ⟨relation1⟩
    ...
    ⟨dim exprN⟩ ⟨relationN⟩
    ⟨dim exprN+1⟩
}
\dim_compare:nTF
{
  ⟨dim expr1⟩ ⟨relation1⟩
  ...
  ⟨dim exprN⟩ ⟨relationN⟩
  ⟨dim exprN+1⟩
}
{⟨true code⟩} {⟨false code⟩}
```

---

This function evaluates the  $\langle dim\ exprs \rangle$  as described for `\dim_eval:n` and compares consecutive result using the corresponding  $\langle relation \rangle$ , namely it compares  $\langle dim\ expr_1 \rangle$  and  $\langle dim\ expr_2 \rangle$  using the  $\langle relation_1 \rangle$ , then  $\langle dim\ expr_2 \rangle$  and  $\langle dim\ expr_3 \rangle$  using the  $\langle relation_2 \rangle$ , until finally comparing  $\langle dim\ expr_N \rangle$  and  $\langle dim\ expr_{N+1} \rangle$  using the  $\langle relation_N \rangle$ . The test yields `true` if all comparisons are `true`. Each  $\langle dim\ expr \rangle$  is evaluated only once, and the evaluation is lazy, in the sense that if one comparison is `false`, then no other  $\langle dim\ expr \rangle$  is evaluated and no other comparison is performed. The  $\langle relations \rangle$  can be any of the following:

Equal	= or ==
Greater than or equal to	$\geq$
Greater than	$>$
Less than or equal to	$\leq$
Less than	$<$
Not equal	$\neq$

This function is more flexible than `\dim_compare:nNnTF` but around 5 times slower.

---

```
\dim_case:nn   ∗ \dim_case:nnTF {⟨test dim expr⟩}
\dim_case:nnTF ∗   {
  {⟨dim expr case1⟩} {⟨code case1⟩}
  {⟨dim expr case2⟩} {⟨code case2⟩}
  ...
  {⟨dim expr casen⟩} {⟨code casen⟩}
}
{⟨true code⟩}
{⟨false code⟩}
```

---

New: 2013-07-24

---

This function evaluates the *⟨test dim expr⟩* and compares this in turn to each of the *⟨dim expr cases⟩*. If the two are equal then the associated *⟨code⟩* is left in the input stream and other cases are discarded. If any of the cases are matched, the *⟨true code⟩* is also inserted into the input stream (after the code for the appropriate case), while if none match then the *⟨false code⟩* is inserted. The function `\dim_case:nn`, which does nothing if there is no match, is also available. For example

```
\dim_set:Nn \l_tmpa_dim { 5 pt }
\dim_case:nnF
{ 2 \l_tmpa_dim }
{
  { 5 pt }      { Small }
  { 4 pt + 6 pt } { Medium }
  { - 10 pt }    { Negative }
}
{ No idea! }
```

leaves “Medium” in the input stream.

## 26.5 Dimension expression loops

---

```
\dim_do_until:nNnn ∗ \dim_do_until:nNnn {⟨dim expr1⟩} {⟨relation⟩} {⟨dim expr2⟩} {⟨code⟩}
```

---

Places the *⟨code⟩* in the input stream for TeX to process, and then evaluates the relationship between the two *⟨dim exprs⟩* as described for `\dim_compare:nNnTF`. If the test is `false` then the *⟨code⟩* is inserted into the input stream again and a loop occurs until the *⟨relation⟩* is `true`.

---

```
\dim_do_while:nNnn ∗ \dim_do_while:nNnn {⟨dim expr1⟩} {⟨relation⟩} {⟨dim expr2⟩} {⟨code⟩}
```

---

Places the *⟨code⟩* in the input stream for TeX to process, and then evaluates the relationship between the two *⟨dim exprs⟩* as described for `\dim_compare:nNnTF`. If the test is `true` then the *⟨code⟩* is inserted into the input stream again and a loop occurs until the *⟨relation⟩* is `false`.

---

```
\dim_until_do:nNnn ∗ \dim_until_do:nNnn {⟨dim expr1⟩} {⟨relation⟩} {⟨dim expr2⟩} {⟨code⟩}
```

---

Evaluates the relationship between the two *⟨dim exprs⟩* as described for `\dim_compare:nNnTF`, and then places the *⟨code⟩* in the input stream if the *⟨relation⟩* is `false`. After the *⟨code⟩* has been processed by TeX the test is repeated, and a loop occurs until the test is `true`.

<code>\dim_while_do:nNnn</code>	<code>\dim_while_do:nNnn {\langle dim expr_1 \rangle} {\langle relation \rangle} {\langle dim expr_2 \rangle} {\langle code \rangle}</code>
	Evaluates the relationship between the two $\langle dim\ exprs \rangle$ as described for <code>\dim_compare:nNnTF</code> , and then places the $\langle code \rangle$ in the input stream if the $\langle relation \rangle$ is <code>true</code> . After the $\langle code \rangle$ has been processed by TeX the test is repeated, and a loop occurs until the test is <code>false</code> .
<code>\dim_do_until:nn</code>	<code>\dim_do_until:nn {\langle dimension relation \rangle} {\langle code \rangle}</code>
<small>Updated: 2013-01-13</small>	Places the $\langle code \rangle$ in the input stream for TeX to process, and then evaluates the $\langle dimension\ relation \rangle$ as described for <code>\dim_compare:nTF</code> . If the test is <code>false</code> then the $\langle code \rangle$ is inserted into the input stream again and a loop occurs until the $\langle relation \rangle$ is <code>true</code> .
<code>\dim_do_while:nn</code>	<code>\dim_do_while:nn {\langle dimension relation \rangle} {\langle code \rangle}</code>
<small>Updated: 2013-01-13</small>	Places the $\langle code \rangle$ in the input stream for TeX to process, and then evaluates the $\langle dimension\ relation \rangle$ as described for <code>\dim_compare:nTF</code> . If the test is <code>true</code> then the $\langle code \rangle$ is inserted into the input stream again and a loop occurs until the $\langle relation \rangle$ is <code>false</code> .
<code>\dim_until_do:nn</code>	<code>\dim_until_do:nn {\langle dimension relation \rangle} {\langle code \rangle}</code>
<small>Updated: 2013-01-13</small>	Evaluates the $\langle dimension\ relation \rangle$ as described for <code>\dim_compare:nTF</code> , and then places the $\langle code \rangle$ in the input stream if the $\langle relation \rangle$ is <code>false</code> . <code>\dim_while_do:nn</code>	<code>\dim_while_do:nn {\langle dimension relation \rangle} {\langle code \rangle}</code>
<small>Updated: 2013-01-13</small>	Evaluates the $\langle dimension\ relation \rangle$ as described for <code>\dim_compare:nTF</code> , and then places the $\langle code \rangle$ in the input stream if the $\langle relation \rangle$ is <code>true</code> . After the $\langle code \rangle$ has been processed by TeX the test is repeated, and a loop occurs until the test is <code>false</code> .

## 26.6 Dimension step functions

<code>\dim_step_function:nnnN</code>	<code>\dim_step_function:nnnN {\langle initial value \rangle} {\langle step \rangle} {\langle final value \rangle} {\langle function \rangle}</code>
<small>New: 2018-02-18</small>	This function first evaluates the $\langle initial\ value \rangle$ , $\langle step \rangle$ and $\langle final\ value \rangle$ , all of which should be dimension expressions. The $\langle function \rangle$ is then placed in front of each $\langle value \rangle$ from the $\langle initial\ value \rangle$ to the $\langle final\ value \rangle$ in turn (using $\langle step \rangle$ between each $\langle value \rangle$ ). The $\langle step \rangle$ must be non-zero. If the $\langle step \rangle$ is positive, the loop stops when the $\langle value \rangle$ becomes larger than the $\langle final\ value \rangle$ . If the $\langle step \rangle$ is negative, the loop stops when the $\langle value \rangle$ becomes smaller than the $\langle final\ value \rangle$ . The $\langle function \rangle$ should absorb one argument.
<code>\dim_step_inline:nnnn</code>	<code>\dim_step_inline:nnnn {\langle initial value \rangle} {\langle step \rangle} {\langle final value \rangle} {\langle code \rangle}</code>
<small>New: 2018-02-18</small>	This function first evaluates the $\langle initial\ value \rangle$ , $\langle step \rangle$ and $\langle final\ value \rangle$ , all of which should be dimension expressions. Then for each $\langle value \rangle$ from the $\langle initial\ value \rangle$ to the $\langle final\ value \rangle$ in turn (using $\langle step \rangle$ between each $\langle value \rangle$ ), the $\langle code \rangle$ is inserted into the input stream with <code>#1</code> replaced by the current $\langle value \rangle$ . Thus the $\langle code \rangle$ should define a function of one argument ( <code>#1</code> ).

---

```
\dim_step_variable:nnnNn \dim_step_variable:nnnNn
  {<initial value>} {<step>} {<final value>} {tl var} {code}
```

New: 2018-02-18

This function first evaluates the *<initial value>*, *<step>* and *<final value>*, all of which should be dimension expressions. Then for each *<value>* from the *<initial value>* to the *<final value>* in turn (using *<step>* between each *<value>*), the *<code>* is inserted into the input stream, with the *<tl var>* defined as the current *<value>*. Thus the *<code>* should make use of the *<tl var>*.

## 26.7 Using `dim` expressions and variables

---

```
\dim_eval:n * \dim_eval:n {<dim expr>}
```

Updated: 2011-10-22 Evaluates the *<dim expr>*, expanding any dimensions and token list variables within the *<expression>* to their content (without requiring `\dim_use:N`/`\tl_use:N`) and applying the standard mathematical rules. The result of the calculation is left in the input stream as a *<dimension denotation>* after two expansions. This is expressed in points (`pt`), and requires suitable termination if used in a `TeX`-style assignment as it is *not* an *<internal dimension>*.

---

```
\dim_sign:n * \dim_sign:n {<dim expr>}
```

New: 2018-11-03 Evaluates the *<dim expr>* then leaves 1 or 0 or  $-1$  in the input stream according to the sign of the result.

---

```
\dim_use:N * \dim_use:N <dimension>
```

`\dim_use:c` \* Recovers the content of a *<dimension>* and places it directly in the input stream. An error is raised if the variable does not exist or if it is invalid. Can be omitted in places where a *<dimension>* is required (such as in the argument of `\dim_eval:n`).

**TeXhackers note:** `\dim_use:N` is the `TeX` primitive `\the`: this is one of several `LATEX3` names for this primitive.

---

```
\dim_to_decimal:n * \dim_to_decimal:n {<dim expr>}
```

New: 2014-07-15 Evaluates the *<dim expr>*, and leaves the result, expressed in points (`pt`) in the input stream, with *no units*. The result is rounded by `TeX` to at most five decimal places. If the decimal part of the result is zero, it is omitted, together with the decimal marker.

For example

```
\dim_to_decimal:n { 1bp }
```

leaves 1.00374 in the input stream, *i.e.* the magnitude of one “big point” when converted to (`TeX`) points.

---

```
\dim_to_decimal_in_bp:n ∗ \dim_to_decimal_in_bp:n {⟨dim expr⟩}
```

New: 2014-07-15 Updated: 2023-05-20 Evaluates the ⟨dim expr⟩, and leaves the result, expressed in big points (bp) in the input stream, with *no units*. The result is rounded by TeX to at most five decimal places. If the decimal part of the result is zero, it is omitted, together with the decimal marker.

For example

```
\dim_to_decimal_in_bp:n { 1pt }
```

leaves 0.99628 in the input stream, *i.e.* the magnitude of one (TeX) point when converted to big points.

**TeXhackers note:** The implementation of this function is re-entrant: the result of

```
\dim_compare:nNnTF
{ <x>bp } =
{ \dim_to_decimal_in_bp:n { <x>bp } bp }
```

will be logically **true**. The decimal representations may differ provided they produce the same TeX dimension.

---

```
\dim_to_decimal_in_cc:n ∗ \dim_to_decimal_in_cm:n {⟨dim expr⟩}
```

**\dim\_to\_decimal\_in\_cm:n** ∗ Evaluates the ⟨dim expr⟩, and leaves the result, expressed with the appropriate scaling in the input stream, with *no units*. If the decimal part of the result is zero, it is omitted, together with the decimal marker. The precision of the result is limited to a maximum of five decimal places with trailing zeros omitted.

New: 2023-05-20 The maximum TeX allowable dimension value (available as `\maxdimen` in plain TeX and L<sup>A</sup>T<sub>E</sub>X and `\c_max_dim` in `\exp3`) can only be expressed exactly in the units `pt`, `bp` and `sp`. The maximum allowable input values to five decimal places are

1276.00215	cc
575.83174	cm
15312.02584	dd
226.70540	in
5758.31742	mm
1365.33333	pc

(Note that these are not all equal, but rather any larger value will overflow due to the way TeX converts to `sp`.) Values given to five decimal places larger than these will result in TeX errors; the behavior if additional decimal places are given depends on the TeX internals and thus larger values are *not* supported by `\exp3`.

**TeXhackers note:** The implementation of these functions is re-entrant: the result of

```
\dim_compare:nNnTF
{ <x><unit> } =
{ \dim_to_decimal_in_<unit>:n { <x><unit> } <unit> }
```

will be logically **true**. The decimal representations may differ provided they produce the same TeX dimension.

---

```
\dim_to_decimal_in_sp:n ∗ \dim_to_decimal_in_sp:n {⟨dim expr⟩}
```

New: 2015-05-18 Evaluates the ⟨dim expr⟩, and leaves the result, expressed in scaled points (sp) in the input stream, with *no units*. The result is necessarily an integer.

---

```
\dim_to_decimal_in_unit:nn ∗ \dim_to_decimal_in_unit:nn {⟨dim expr₁⟩} {⟨dim expr₂⟩}
```

New: 2014-07-15

Updated: 2023-05-20

Evaluates the ⟨dim exprs⟩, and leaves the value of ⟨dim expr<sub>1</sub>⟩, expressed in a unit given by ⟨dim expr<sub>2</sub>⟩, in the input stream. If the decimal part of the result is zero, it is omitted, together with the decimal marker. The precision of the result is limited to a maximum of five decimal places with trailing zeros omitted.

For example

```
\dim_to_decimal_in_unit:nn { 1bp } { 1mm }
```

leaves 0.35278 in the input stream, *i.e.* the magnitude of one big point when expressed in millimetres. The conversions do *not* guarantee that TeX would yield identical results for the direct input in an equality test, thus for instance

```
\dim_compare:nNnTF
{ 1bp } =
{ \dim_to_decimal_in_unit:nn { 1bp } { 1mm } mm }
```

will take the `false` branch.

---

```
\dim_to_fp:n ∗ \dim_to_fp:n {⟨dim expr⟩}
```

New: 2012-05-08 Expands to an internal floating point number equal to the value of the ⟨dim expr⟩ in pt. Since dimension expressions are evaluated much faster than their floating point equivalent, `\dim_to_fp:n` can be used to speed up parts of a computation where a low precision and a smaller range are acceptable.

## 26.8 Viewing dim variables

---

```
\dim_show:N \dim_show:N ⟨dimension⟩
```

`\dim_show:c` Displays the value of the ⟨dimension⟩ on the terminal.

---

```
\dim_show:n \dim_show:n {⟨dim expr⟩}
```

New: 2011-11-22 Displays the result of evaluating the ⟨dim expr⟩ on the terminal.  
Updated: 2015-08-07

---

```
\dim_log:N \dim_log:N ⟨dimension⟩
```

`\dim_log:c` Writes the value of the ⟨dimension⟩ in the log file.

New: 2014-08-22  
Updated: 2015-08-03

---

**\dim\_log:n**    `\dim_log:n {<dim expr>}`  
New: 2014-08-22    Writes the result of evaluating the *<dim expr>* in the log file.  
Updated: 2015-08-07

---

## 26.9 Constant dimensions

---

**\c\_max\_dim**    The maximum value that can be stored as a dimension. This can also be used as a component of a skip.

---

**\c\_zero\_dim**    A zero length as a dimension. This can also be used as a component of a skip.

## 26.10 Scratch dimensions

---

**\l\_tmpa\_dim**    Scratch dimension for local assignment. These are never used by the kernel code, and so  
**\l\_tmpb\_dim**    are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

---

**\g\_tmpa\_dim**    Scratch dimension for global assignment. These are never used by the kernel code, and so  
**\g\_tmpb\_dim**    are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

## 26.11 Creating and initialising skip variables

---

**\skip\_new:N**    `\skip_new:N <skip>`  
**\skip\_new:c**    Creates a new *<skip>* or raises an error if the name is already taken. The declaration is global. The *<skip>* is initially equal to 0 pt.

---

**\skip\_const:Nn**    `\skip_const:Nn <skip> {<skip expr>}`  
**\skip\_const:cn**    Creates a new constant *<skip>* or raises an error if the name is already taken. The value  
New: 2012-03-05    of the *<skip>* is set globally to the *<skip expr>*.

---

**\skip\_zero:N**    `\skip_zero:N <skip>`  
**\skip\_zero:c**    Sets *<skip>* to 0 pt.  
**\skip\_gzero:N**  
**\skip\_gzero:c**

---

\skip\_zero\_new:N    \skip\_zero\_new:N *(skip)*  
\skip\_zero\_new:c  
\skip\_gzero\_new:N  
\skip\_gzero\_new:c

Ensures that the *(skip)* exists globally by applying \skip\_new:N if necessary, then applies \skip\_(g)zero:N to leave the *(skip)* set to zero.

New: 2012-01-07

---

---

\skip\_if\_exist\_p:N \* \skip\_if\_exist\_p:N *(skip)*  
\skip\_if\_exist\_p:c \* \skip\_if\_exist:NTF *(skip)* {*true code*} {*false code*}  
\skip\_if\_exist:NTF \* Tests whether the *(skip)* is currently defined. This does not check that the *(skip)* really  
\skip\_if\_exist:cTF \*

is a skip variable.

New: 2012-03-03

---

## 26.12 Setting skip variables

---

\skip\_add:Nn    \skip\_add:Nn *(skip)* {*skip expr*}  
\skip\_add:cn  
\skip\_gadd:Nn  
\skip\_gadd:cn

Updated: 2011-10-22

---

\skip\_set:Nn    \skip\_set:Nn *(skip)* {*skip expr*}  
\skip\_set:cn  
\skip\_gset:Nn  
\skip\_gset:cn

Updated: 2011-10-22

---

---

\skip\_set\_eq:NN    \skip\_set\_eq:NN *(skip<sub>1</sub>)* *(skip<sub>2</sub>)*  
\skip\_set\_eq:(cN|Nc|cc)  
\skip\_gset\_eq:NN  
\skip\_gset\_eq:(cN|Nc|cc)

Sets the content of *(skip<sub>1</sub>)* equal to that of *(skip<sub>2</sub>)*.

---

\skip\_sub:Nn    \skip\_sub:Nn *(skip)* {*skip expr*}  
\skip\_sub:cn  
\skip\_gsub:Nn  
\skip\_gsub:cn

Updated: 2011-10-22

---

## 26.13 Skip expression conditionals

---

```
\skip_if_eq_p:nn * \skip_if_eq_p:nn {\langle skip expr_1\rangle} {\langle skip expr_2\rangle}
\skip_if_eq:nnTF * \skip_if_eq:nnTF
  {\langle skip expr_1\rangle} {\langle skip expr_2\rangle}
  {\langle true code\rangle} {\langle false code\rangle}
```

---

This function first evaluates each of the  $\langle skip \ exprs \rangle$  as described for `\skip_eval:n`. The two results are then compared for exact equality, *i.e.* both the fixed and rubber components must be the same for the test to be true.

---

```
\skip_if_finite_p:n * \skip_if_finite_p:n {\langle skip expr\rangle}
\skip_if_finite:nTF * \skip_if_finite:nTF {\langle skip expr\rangle} {\langle true code\rangle} {\langle false code\rangle}
```

---

New: 2012-03-05 Evaluates the  $\langle skip \ expr \rangle$  as described for `\skip_eval:n`, and then tests if all of its components are finite.

## 26.14 Using skip expressions and variables

---

```
\skip_eval:n * \skip_eval:n {\langle skip expr\rangle}
```

---

Updated: 2011-10-22 Evaluates the  $\langle skip \ expr \rangle$ , expanding any skips and token list variables within the  $\langle expression \rangle$  to their content (without requiring `\skip_use:N/\t1_use:N`) and applying the standard mathematical rules. The result of the calculation is left in the input stream as a  $\langle glue \ denotation \rangle$  after two expansions. This is expressed in points (pt), and requires suitable termination if used in a TeX-style assignment as it is *not* an  $\langle internal \ glue \rangle$ .

---

```
\skip_use:N * \skip_use:N \langle skip \rangle
```

---

`\skip_use:c` \* Recovers the content of a  $\langle skip \rangle$  and places it directly in the input stream. An error is raised if the variable does not exist or if it is invalid. Can be omitted in places where a  $\langle dimension \rangle$  or  $\langle skip \rangle$  is required (such as in the argument of `\skip_eval:n`).

**TeXhackers note:** `\skip_use:N` is the TeX primitive `\the:` this is one of several L<sup>A</sup>T<sub>E</sub>X3 names for this primitive.

## 26.15 Viewing skip variables

---

```
\skip_show:N * \skip_show:N \langle skip \rangle
```

---

Updated: 2015-08-03 Displays the value of the  $\langle skip \rangle$  on the terminal.

---

```
\skip_show:n * \skip_show:n {\langle skip expr\rangle}
```

---

New: 2011-11-22 Updated: 2015-08-07 Displays the result of evaluating the  $\langle skip \ expr \rangle$  on the terminal.

---

`\skip_log:N`    `\skip_log:N <skip>`  
`\skip_log:c`    Writes the value of the `<skip>` in the log file.

New: 2014-08-22  
Updated: 2015-08-03

---

---

`\skip_log:n`    `\skip_log:n {<skip expr>}`  
New: 2014-08-22    Writes the result of evaluating the `<skip expr>` in the log file.  
Updated: 2015-08-07

---

## 26.16 Constant skips

---

`\c_max_skip`    The maximum value that can be stored as a skip (equal to `\c_max_dim` in length), with no stretch nor shrink component.  
Updated: 2012-11-02

---

---

`\c_zero_skip`    A zero length as a skip, with no stretch nor shrink component.  
Updated: 2012-11-01

---

## 26.17 Scratch skips

---

`\l_tmpa_skip`    Scratch skip for local assignment. These are never used by the kernel code, and so are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

---

`\g_tmpa_skip`    Scratch skip for global assignment. These are never used by the kernel code, and so are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

## 26.18 Inserting skips into the output

---

`\skip_horizontal:N`    `\skip_horizontal:N <skip>`  
`\skip_horizontal:c`    `\skip_horizontal:n {<skip expr>}`  
`\skip_horizontal:n`    Inserts a horizontal `<skip>` into the current list. The argument can also be a `<dim>`.  
Updated: 2011-10-22

**TeXhackers note:** `\skip_horizontal:N` is the TeX primitive `\hskip`.

---

```
\skip_vertical:N \skip_vertical:N <skip>
\skip_vertical:c \skip_vertical:n {<skip expr>}
```

**\skip\_vertical:n** Inserts a vertical *<skip>* into the current list. The argument can also be a *(dim)*.

Updated: 2011-10-22

**TExhackers note:** `\skip_vertical:N` is the TEx primitive `\vskip`.

## 26.19 Creating and initialising **muskip** variables

---

```
\muskip_new:N \muskip_new:N <muskip>
```

**\muskip\_new:c** Creates a new *<muskip>* or raises an error if the name is already taken. The declaration is global. The *<muskip>* is initially equal to 0 mu.

---

```
\muskip_const:Nn \muskip_const:Nn <muskip> {<muskip expr>}
```

**\muskip\_const:cn** Creates a new constant *<muskip>* or raises an error if the name is already taken. The value of the *<muskip>* is set globally to the *<muskip expr>*.  
New: 2012-03-05

---

```
\muskip_zero:N \skip_zero:N <muskip>
```

**\muskip\_zero:c** Sets *<muskip>* to 0 mu.  
**\muskip\_gzero:N**

**\muskip\_gzero:c**

---

```
\muskip_zero_new:N \muskip_zero_new:N <muskip>
```

**\muskip\_zero\_new:c** Ensures that the *<muskip>* exists globally by applying `\muskip_new:N` if necessary, then applies `\muskip_(g)zero:N` to leave the *<muskip>* set to zero.  
New: 2012-01-07

---

```
\muskip_if_exist_p:N * \muskip_if_exist_p:N <muskip>
```

**\muskip\_if\_exist\_p:c \* \muskip\_if\_exist:NTF** *<muskip>* {*true code*} {*false code*}

**\muskip\_if\_exist:NTF \*** Tests whether the *<muskip>* is currently defined. This does not check that the *<muskip>* really is a muskip variable.  
New: 2012-03-03

## 26.20 Setting **muskip** variables

---

```
\muskip_add:Nn \muskip_add:Nn <muskip> {<muskip expr>}
```

**\muskip\_add:cn** Adds the result of the *<muskip expr>* to the current content of the *<muskip>*.

**\muskip\_gadd:Nn**

**\muskip\_gadd:cn**

Updated: 2011-10-22

---

```
\muskip_set:Nn \muskip_set:Nn <muskip> {<muskip expr>}
```

Sets *<muskip>* to the value of *<muskip expr>*, which must evaluate to a math length with units and may include a rubber component (for example `1 mu plus 0.5 mu`).

---

Updated: 2011-10-22

---

```
\muskip_set_eq:NN \muskip_set_eq:NN <muskip_1> <muskip_2>
```

Sets the content of *<muskip\_1>* equal to that of *<muskip\_2>*.

---

```
\muskip_gset_eq:NN \muskip_gset_eq:(cN|Nc|cc)
```

---

```
\muskip_sub:Nn \muskip_sub:Nn <muskip> {<muskip expr>}
```

Subtracts the result of the *<muskip expr>* from the current content of the *<muskip>*.

---

```
\muskip_gsub:Nn \muskip_gsub:cn
```

---

Updated: 2011-10-22

## 26.21 Using `muskip` expressions and variables

---

```
\muskip_eval:n * \muskip_eval:n {<muskip expr>}
```

---

Updated: 2011-10-22 Evaluates the *<muskip expr>*, expanding any skips and token list variables within the *<expression>* to their content (without requiring `\muskip_use:N/\tl_use:N`) and applying the standard mathematical rules. The result of the calculation is left in the input stream as a *<muglue denotation>* after two expansions. This is expressed in `mu`, and requires suitable termination if used in a `\TeX`-style assignment as it is *not* an *<internal muglue>*.

---

```
\muskip_use:N * \muskip_use:N <muskip>
```

---

Recovering the content of a *<skip>* and places it directly in the input stream. An error is raised if the variable does not exist or if it is invalid. Can be omitted in places where a *<dimension>* is required (such as in the argument of `\muskip_eval:n`).

**\TeXhackers note:** `\muskip_use:N` is the `\TeX` primitive `\the:` this is one of several L<sup>A</sup>T<sub>E</sub>X3 names for this primitive.

## 26.22 Viewing `muskip` variables

---

```
\muskip_show:N \muskip_show:N <muskip>
```

---

Displays the value of the *<muskip>* on the terminal.

---

Updated: 2015-08-03

---

`\muskip_show:n` `\muskip_show:n {<muskip expr>}`

New: 2011-11-22 Displays the result of evaluating the *<muskip expr>* on the terminal.

Updated: 2015-08-07

---

`\muskip_log:N` `\muskip_log:N <muskip>`

`\muskip_log:c` Writes the value of the *<muskip>* in the log file.

New: 2014-08-22

Updated: 2015-08-03

---

`\muskip_log:n` `\muskip_log:n {<muskip expr>}`

New: 2014-08-22 Writes the result of evaluating the *<muskip expr>* in the log file.

Updated: 2015-08-07

---

## 26.23 Constant muskips

---

`\c_max_muskip` The maximum value that can be stored as a muskip, with no stretch nor shrink component.

---

`\c_zero_muskip` A zero length as a muskip, with no stretch nor shrink component.

## 26.24 Scratch muskips

---

`\l_tmpa_muskip` Scratch muskip for local assignment. These are never used by the kernel code, and so  
`\l_tmpb_muskip` are safe for use with any LATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

---

`\g_tmpa_muskip` Scratch muskip for global assignment. These are never used by the kernel code, and so  
`\g_tmpb_muskip` are safe for use with any LATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

## 26.25 Primitive conditional

---

```
\if_dim:w ∗ \if_dim:w <dimen1> <relation> <dimen2>
    <true code>
\else:
    <false>
\fi:
```

Compare two dimensions. The *<relation>* is one of *<*, *=* or *>* with category code 12.

**TEXhackers note:** This is the T<sub>E</sub>X primitive `\ifdim`.

## Chapter 27

# The **l3keys** module Key–value interfaces

The key–value method is a popular system for creating large numbers of settings for controlling function or package behaviour. The system normally results in input of the form

```
\MyModuleSetup{  
    key-one = value one,  
    key-two = value two  
}
```

or

```
\MyModuleMacro[  
    key-one = value one,  
    key-two = value two  
]{argument}
```

for the user.

The high level functions here are intended as a method to create key–value controls. Keys are themselves created using a key–value interface, minimising the number of functions and arguments required. Each key is created by setting one or more *properties* of the key:

```
\keys_define:nn { mymodule }  
{  
    key-one .code:n = code including parameter #1,  
    key-two .tl_set:N = \l_mymodule_store_tl  
}
```

These values can then be set as with other key–value approaches:

```
\keys_set:nn { mymodule }  
{  
    key-one = value one,  
    key-two = value two  
}
```

As illustrated, keys are created inside a *(module)*: a set of related keys, typically those for a single module/L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  package. See Section for suggestions on how to divide large numbers of keys for a single module.

At a document level, `\keys_set:nn` is used within a document function, for example

```
\DeclareDocumentCommand \MyModuleSetup { m }
  { \keys_set:nn { mymodule } { #1 } }
\DeclareDocumentCommand \MyModuleMacro { o m }
{
  \group_begin:
  \keys_set:nn { mymodule } { #1 }
  % Main code for \MyModuleMacro
  \group_end:
}
```

Key names may contain any tokens, as they are handled internally using `\tl_to_str:n`. As discussed in section 27.2, it is suggested that the character / is reserved for sub-division of keys into different subsets. Functions and variables are *not* expanded when creating key names, and so

```
\tl_set:Nn \l_mymodule_tmp_tl { key }
\keys_define:nn { mymodule }
{
  \l_mymodule_tmp_tl .code:n = code
}
```

creates a key called `\l_mymodule_tmp_tl`, and not one called `key`.

## 27.1 Creating keys

---

`\keys_define:nn` `\keys_define:nn {<module>} {<keyval list>}`

`\keys_define:ne` Parses the *<keyval list>* and defines the keys listed there for *<module>*. The *<module>* name is treated as a string. In practice the *<module>* should be chosen to be unique to the module in question (unless deliberately adding keys to an existing module).

`Updated: 2017-11-14`

The *<keyval list>* should consist of one or more key names along with an associated key *property*. The properties of a key determine how it acts. The individual properties are described in the following text; a typical use of `\keys_define:nn` might read

```
\keys_define:nn { mymodule }
{
  keyname .code:n = Some~code~using~#1,
  keyname .value_required:n = true
}
```

where the properties of the key begin from the . after the key name.

The various properties available take either no arguments at all, or require one or more arguments. This is indicated in the name of the property using an argument specification. In the following discussion, each property is illustrated attached to an arbitrary *<key>*, which when used may be supplied with a *<value>*. All key *definitions* are local.

Key properties are applied in the reading order and so the ordering is significant. Key properties which define “actions”, such as `.code:n`, `.tl_set:N`, etc., override one another. Some other properties are mutually exclusive, notably `.value_required:n` and `.value_forbidden:n`, and so they replace one another. However, properties covering non-exclusive behaviours may be given in any order. Thus for example the following definitions are equivalent.

```
\keys_define:nn { mymodule }
{
  keyname .code:n      = Some~code~using~#1,
  keyname .value_required:n = true
}
\keys_define:nn { mymodule }
{
  keyname .value_required:n = true,
  keyname .code:n      = Some~code~using~#1
}
```

Note that all key properties define the key within the current TeX group, with an exception that the special `.undefine:` property *undoes* the key within the current TeX group.

---

`.bool_set:N` `<key> .bool_set:N = <boolean variable>`

`.bool_set:c` Defines `<key>` to set `<boolean variable>` to `<value>` (which must be either “`true`” or “`false`”). If the variable does not exist, it will be created globally at the point that the key is set up.

Updated: 2013-07-08

---

`.bool_set_inverse:N` `<key> .bool_set_inverse:N = <boolean variable>`

`.bool_set_inverse:c` `.bool_gset_inverse:N` Defines `<key>` to set `<boolean variable>` to the logical inverse of `<value>` (which must be either “`true`” or “`false`”). If the `<boolean variable>` does not exist, it will be created globally at the point that the key is set up.

New: 2011-08-28

Updated: 2013-07-08

---

`.choice:` `<key> .choice:`

Sets `<key>` to act as a choice key. Each valid choice for `<key>` must then be created, as discussed in section 27.3.

---

`.choices:nn` `<key> .choices:nn = {<choices>} {<code>}`

`.choices:(Vn|en|on)` Sets `<key>` to act as a choice key, and defines a series `<choices>` which are implemented using the `<code>`. Inside `<code>`, `\l_keys_choice_tl` will be the name of the choice made, and `\l_keys_choice_int` will be the position of the choice in the list of `<choices>` (indexed from 1). Choices are discussed in detail in section 27.3.

---

`.clist_set:N` `<key> .clist_set:N = <comma list variable>`

`.clist_set:c` `.clist_gset:N` `.clist_gset:c` Defines `<key>` to set `<comma list variable>` to `<value>`. Spaces around commas and empty items will be stripped. If the variable does not exist, it is created globally at the point that the key is set up.

New: 2011-09-11

---

.code:n            *<key>* .code:n = {*<code>*}

Updated: 2013-07-10

Stores the *<code>* for execution when *<key>* is used. The *<code>* can include one parameter (#1), which will be the *<value>* given for the *<key>*.

---

.cs\_set:Np        *<key>* .cs\_set:Np = *<control sequence>* *<arg. spec.>*

.cs\_set:cp

.cs\_set\_protected:Np

.cs\_set\_protected:cp

.cs\_gset:Np

.cs\_gset:cp

.cs\_gset\_protected:Np

.cs\_gset\_protected:cp

---

New: 2020-01-11

---

.default:n        *<key>* .default:n = {*<default>*}

.default:(V|e|o)

Creates a *<default>* value for *<key>*, which is used if no value is given. This will be used if only the key name is given, but not if a blank *<value>* is given:

```
\keys_define:nn { mymodule }
{
    key .code:n      = Hello~#1,
    key .default:n = World
}
\keys_set:nn { mymodule }
{
    key = Fred, % Prints 'Hello Fred'
    key,          % Prints 'Hello World'
    key = ,       % Prints 'Hello '
}
```

The default does not affect keys where values are required or forbidden. Thus a required value cannot be supplied by a default value, and giving a default value for a key which cannot take a value does not trigger an error.

When no value is given for a key as part of \keys\_set:nn, the .default:n value provides the value before key properties are considered. The only exception is when the .value\_required:n property is active: a required value cannot be supplied by the default, and must be explicitly given as part of \keys\_set:nn.

---

.dim\_set:N        *<key>* .dim\_set:N = *<dimension>*

.dim\_set:c

.dim\_gset:N

.dim\_gset:c

Updated: 2020-01-17

Defines *<key>* to set *<dimension>* to *<value>* (which must a dimension expression). If the variable does not exist, it is created globally at the point that the key is set up. The key will require a value at point-of-use unless a default is set.

---

.fp\_set:N        *<key>* .fp\_set:N = *<floating point>*

.fp\_set:c

.fp\_gset:N

.fp\_gset:c

Updated: 2020-01-17

Defines *<key>* to set *<floating point>* to *<value>* (which must a floating point expression). If the variable does not exist, it is created globally at the point that the key is set up. The key will require a value at point-of-use unless a default is set.

---

```
.groups:n <key> .groups:n = {<groups>}
```

New: 2013-07-14 Defines *<key>* as belonging to the *<groups>* (a comma-separated list). Groups provide a “secondary axis” for selectively setting keys, and are described in Section 27.7.

**TeXhackers note:** The *<groups>* argument is turned into a string then interpreted as a comma-separated list, so group names cannot contain commas nor start or end with a space character.

---

```
.inherit:n <key> .inherit:n = {<parents>}
```

New: 2016-11-22 Specifies that the *<key>* path should inherit the keys listed as any of the *<parents>* (a comma list), which can be a module or a sub-division thereof. For example, after setting

```
\keys_define:nn { foo } { test .code:n = \tl_show:n {#1} }
\keys_define:nn { } { bar .inherit:n = foo }
```

setting

```
\keys_set:nn { bar } { test = a }
```

will be equivalent to

```
\keys_set:nn { foo } { test = a }
```

Inheritance applies at point of use, not at definition, thus keys may be added to the *<parent>* after the use of *.inherit:n* and will be active. If more than one *<parent>* is specified, the presence of the *<key>* will be tested for each in turn, with the first successful hit taking priority.

---

```
.initial:n <key> .initial:n = {<value>}
```

.initial:(V|e|o) Initialises the *<key>* with the *<value>*, equivalent to

Updated: 2013-07-09

```
\keys_set:nn {<module>} { <key> = <value> }
```

---

```
.int_set:N <key> .int_set:N = <integer>
```

.int\_set:c Defines *<key>* to set *<integer>* to *<value>* (which must be an integer expression). If the variable does not exist, it is created globally at the point that the key is set up. The key will require a value at point-of-use unless a default is set.

Updated: 2020-01-17

---

```
.legacy_if_set:n <key> .legacy_if_set:n = <switch>
```

.legacy\_if\_gset:n Defines *<key>* to set legacy `\if<switch>` to *<value>* (which must be either “`true`” or “`false`”). The *<switch>* is the name of the switch *without the leading if*.

The *inverse* versions will set the *<switch>* to the logical opposite of the *<value>*.

Updated: 2022-01-15

---

```
.meta:n <key> .meta:n = {<keyval list>}
```

Updated: 2013-07-10 Makes *<key>* a meta-key, which will set *<keyval list>* in one go. The *<keyval list>* can refer as `#1` to the value given at the time the *<key>* is used (or, if no value is given, the *<key>*’s default value).

---

`.meta:nn`    `<key> .meta:nn = {<path>} {<keyval list>}`

New: 2013-07-10 Makes `<key>` a meta-key, which will set `<keyval list>` in one go using the `<path>` in place of the current one. The `<keyval list>` can refer as #1 to the value given at the time the `<key>` is used (or, if no value is given, the `<key>`'s default value).

---

`.multichoice:`    `<key> .multichoice:`

New: 2011-08-21 Sets `<key>` to act as a multiple choice key. Each valid choice for `<key>` must then be created, as discussed in section 27.3.

---

`.multichoices:nn`    `<key> .multichoices:nn {<choices>} {<code>}`

`.multichoices:(Vn|en|on)`

New: 2011-08-21 Updated: 2013-07-10 Sets `<key>` to act as a multiple choice key, and defines a series `<choices>` which are implemented using the `<code>`. Inside `<code>`, `\l_keys_choice_t1` will be the name of the choice made, and `\l_keys_choice_int` will be the position of the choice in the list of `<choices>` (indexed from 1). Choices are discussed in detail in section 27.3.

---

`.muskip_set:N`    `<key> .muskip_set:N = <muskip>`

---

`.tl_set:N` *<key>* `.tl_set:N = <token list variable>`

`.tl_set:c`

`.tl_gset:N`

`.tl_gset:c`

Defines *<key>* to set *<token list variable>* to *<value>*. If the variable does not exist, it is created globally at the point that the key is set up.

---

`.tl_set_e:N` *<key>* `.tl_set_e:N = <token list variable>`

`.tl_set_e:c`

`.tl_gset_e:N`

`.tl_gset_e:c`

Defines *<key>* to set *<token list variable>* to *<value>*, which will be subjected to an e-type expansion (*i.e.* using `\tl_set:N`). If the variable does not exist, it is created globally at the point that the key is set up.

New: 2023-09-18

---

`.undefine:` *<key>* `.undefine:`

New: 2015-07-14 Removes the definition of the *<key>* within the current T<sub>E</sub>X group.

---

`.value_forbidden:n` *<key>* `.value_forbidden:n = true|false`

New: 2015-07-14

Specifies that *<key>* cannot receive a *<value>* when used. If a *<value>* is given then an error will be issued. Setting the property “*false*” cancels the restriction.

---

`.value_required:n` *<key>* `.value_required:n = true|false`

New: 2015-07-14

Specifies that *<key>* must receive a *<value>* when used. If a *<value>* is not given then an error will be issued. Setting the property “*false*” cancels the restriction.

## 27.2 Sub-dividing keys

When creating large numbers of keys, it may be desirable to divide them into several subsets for a given module. This can be achieved either by adding a sub-division to the module name:

```
\keys_define:nn { mymodule / subset }
  { key .code:n = code }
```

or to the key name:

```
\keys_define:nn { mymodule }
  { subset / key .code:n = code }
```

As illustrated, the best choice of token for sub-dividing keys in this way is `/`. This is because of the method that is used to represent keys internally. Both of the above code fragments set the same key, which has full name `mymodule/subset/key`.

As illustrated in the next section, this subdivision is particularly relevant to making multiple choices.

## 27.3 Choice and multiple choice keys

The l3keys system supports two types of choice key, in which a series of pre-defined input values are linked to varying implementations. Choice keys are usually created so that the various values are mutually-exclusive: only one can apply at any one time. “Multiple” choice keys are also supported: these allow a selection of values to be chosen at the same time.

Mutually-exclusive choices are created by setting the `.choice:` property:

```
\keys_define:nn { mymodule }
  { key .choice: }
```

For keys which are set up as choices, the valid choices are generated by creating sub-keys of the choice key. This can be carried out in two ways.

In many cases, choices execute similar code which is dependant only on the name of the choice or the position of the choice in the list of all possibilities. Here, the keys can share the same code, and can be rapidly created using the `.choices:nn` property.

```
\keys_define:nn { mymodule }
{
  key .choices:nn =
    { choice-a, choice-b, choice-c }
  {
    You~gave~choice~'\tl_use:N \l_keys_choice_tl',~
    which~is~in~position~\int_use:N \l_keys_choice_int \c_space_tl
    in~the~list.
  }
}
```

The index `\l_keys_choice_int` in the list of choices starts at 1.

---

`\l_keys_choice_int`  
`\l_keys_choice_tl`

Inside the code block for a choice generated using `.choices:nn`, the variables `\l_keys_choice_tl` and `\l_keys_choice_int` are available to indicate the name of the current choice, and its position in the comma list. The position is indexed from 1. Note that, as with standard key code generated using `.code:n`, the value passed to the key (i.e. the choice name) is also available as `#1`.

On the other hand, it is sometimes useful to create choices which use entirely different code from one another. This can be achieved by setting the `.choice:` property of a key, then manually defining sub-keys.

```
\keys_define:nn { mymodule }
{
  key .choice:,,
  key / choice-a .code:n = code-a,
  key / choice-b .code:n = code-b,
  key / choice-c .code:n = code-c,
}
```

It is possible to mix the two methods, but manually-created choices should *not* use `\l_keys_choice_tl` or `\l_keys_choice_int`. These variables do not have defined

behaviour when used outside of code created using `.choices:nn` (*i.e.* anything might happen).

It is possible to allow choice keys to take values which have not previously been defined by adding code for the special `unknown` choice. The general behavior of the `unknown` key is described in Section 27.6. A typical example in the case of a choice would be to issue a custom error message:

```
\keys_define:nn { mymodule }
{
    key .choice:,
    key / choice-a .code:n = code-a,
    key / choice-b .code:n = code-b,
    key / choice-c .code:n = code-c,
    key / unknown .code:n =
        \msg_error:nneee { mymodule } { unknown-choice }
            { key } % Name of choice key
            { choice-a , choice-b , choice-c } % Valid choices
            { \exp_not:n {#1} } % Invalid choice given
%
%
}
```

Multiple choices are created in a very similar manner to mutually-exclusive choices, using the properties `.multichoice:` and `.multichoices:nn`. As with mutually exclusive choices, multiple choices are define as sub-keys. Thus both

```
\keys_define:nn { mymodule }
{
    key .multichoices:nn =
        { choice-a, choice-b, choice-c }
    {
        You~gave~choice~'\tl_use:N \l_keys_choice_tl',~
        which~is~in~position~
        \int_use:N \l_keys_choice_int \c_space_tl
        in~the~list.
    }
}
```

and

```
\keys_define:nn { mymodule }
{
    key .multichoice:,
    key / choice-a .code:n = code-a,
    key / choice-b .code:n = code-b,
    key / choice-c .code:n = code-c,
}
```

are valid.

When a multiple choice key is set

```
\keys_set:nn { mymodule }
{
    key = { a , b , c } % 'key' defined as a multiple choice
}
```

each choice is applied in turn, equivalent to a `clist` mapping or to applying each value individually:

```
\keys_set:nn { mymodule }
{
    key = a ,
    key = b ,
    key = c ,
}
```

Thus each separate choice will have passed to it the `\l_keys_choice_tl` and `\l_keys_choice_int` in exactly the same way as described for `.choices:nn`.

## 27.4 Key usage scope

Some keys will be used as settings which have a strictly limited scope of usage. Some will be only available once, others will only be valid until typesetting begins. To allow formats to support this in a structured way, l3keys allows this information to be specified using the `.usage:n` property.

---

`.usage:n <key> .usage:n = <scope>`

New: 2022-01-10 Defines the `<key>` to have usage within the `<scope>`, which should be one of `general`, `preamble` or `load`.

---

`\l_keys_usage_load_prop`  
`\l_keys_usage_preamble_prop`

New: 2022-01-10

l3keys itself does *not* attempt to redefine keys based on the usage scope. Rather, this information is made available with these two property lists. These hold an entry for each module (prefix); the value of each entry is a comma-separated list of the usage-restricted key(s).

## 27.5 Setting keys

---

`\keys_set:nn`

`\keys_set:(nV|nv|ne|no)`

Updated: 2017-11-14

`\keys_set:nn {<module>} {<keyval list>}`

Parses the `<keyval list>`, and sets those keys which are defined for `<module>`. The behaviour on finding an unknown key can be set by defining a special `unknown` key: this is illustrated later.

---

`\l_keys_path_str` For each key processed, information of the full *path* of the key, the *name* of the key and  
`\l_keys_key_str` the *value* of the key is available within two string and one token list variables. These  
`\l_keys_value_t1` may be used within the code of the key.

Updated: 2020-02-08

The *path* of the key is a “full” description of the key, and is unique for each key. It consists of the module and full key name, thus for example

```
\keys_set:nn { mymodule } { key-a = some-value }
```

has path `mymodule/key-a` while

```
\keys_set:nn { mymodule } { subset / key-a = some-value }
```

has path `mymodule/subset/key-a`. This information is stored in `\l_keys_path_str`.

The *name* of the key is the part of the path after the last `/`, and thus is not unique. In the preceding examples, both keys have name `key-a` despite having different paths. This information is stored in `\l_keys_key_str`.

The *value* is everything after the `=`, which may be empty if no value was given. This is stored in `\l_keys_value_t1`, and is not processed in any way by `\keys_set:nn`.

## 27.6 Handling of unknown keys

If a key has not previously been defined (is unknown), `\keys_set:nn` looks for a special `unknown` key for the same module, and if this is not defined raises an error indicating that the key name was unknown. This mechanism can be used for example to issue custom error texts. The `unknown` key also supports the `.default:n` property.

```
\keys_define:nn { mymodule }
{
  unknown .code:n =
    You~tried~to~set~key~'\l_keys_key_str'~to~'#1' ,
  unknown .default:V = \c_novalue_t1
}
```

---

`\keys_set_known:nn` `\keys_set_known:(nV|nv|ne|no)` `\keys_set_known:nnN` `\keys_set_known:(nVN|nvN|neN|noN)` `\keys_set_known:nnnN` `\keys_set_known:(nVnN|nvN|neN|noN)`

`\keys_set_known:nnN` `\keys_set_known:{<module>} {<keyval list>}` `\keys_set_known:nnN {<module>} {<keyval list>} <t1>` `\keys_set_known:nnnN {<module>} {<keyval list>} {<root>} <t1>`

---

New: 2011-08-23

Updated: 2019-01-29

These functions set keys which are known for the `<module>`, and simply ignore other keys. The `\keys_set_known:nn` function parses the `<keyval list>`, and sets those keys which are defined for `<module>`. Any keys which are unknown are not processed further by the parser. In addition, `\keys_set_known:nnN` stores the key–value pairs in the `<t1>` in comma-separated form (*i.e.* an edited version of the `<keyval list>`). When a `<root>` is given (`\keys_set_known:nnnN`), the key–value entries are returned relative to this point in the key tree. When it is absent, only the key name and value are provided. The correct list is returned by nested calls.

## 27.7 Selective key setting

In some cases it may be useful to be able to select only some keys for setting, even though these keys have the same path. For example, with a set of keys defined using

```
\keys_define:nn { mymodule }
{
    key-one .code:n = { \my_func:n {#1} } ,
    key-two .tl_set:N = \l_my_a_tl ,
    key-three .tl_set:N = \l_my_b_tl ,
    key-four .fp_set:N = \l_my_a_fp ,
}
```

the use of `\keys_set:nn` attempts to set all four keys. However, in some contexts it may only be sensible to set some keys, or to control the order of setting. To do this, keys may be assigned to *groups*: arbitrary sets which are independent of the key tree. Thus modifying the example to read

```
\keys_define:nn { mymodule }
{
    key-one .code:n = { \my_func:n {#1} } ,
    key-one .groups:n = { first } ,
    key-two .tl_set:N = \l_my_a_tl ,
    key-two .groups:n = { first } ,
    key-three .tl_set:N = \l_my_b_tl ,
    key-three .groups:n = { second } ,
    key-four .fp_set:N = \l_my_a_fp ,
}
```

assigns `key-one` and `key-two` to group `first`, `key-three` to group `second`, while `key-four` is not assigned to a group.

Selective key setting may be achieved either by selecting one or more groups to be made “active”, or by marking one or more groups to be ignored in key setting.

---

```
\keys_set_exclude_groups:nnn          \keys_set_exclude_groups:nnn {\langle module\rangle} {\langle groups\rangle} {\langle keyval
\keys_set_exclude_groups:(nnV|nnv|nno) list\rangle}
\keys_set_exclude_groups:nnN          \keys_set_exclude_groups:nnN {\langle module\rangle} {\langle groups\rangle}
\keys_set_exclude_groups:(nnVN|nnvN|nnoN) {\langle keyval list\rangle} {\langle tl\rangle}
\keys_set_exclude_groups:nnnnN         \keys_set_exclude_groups:nnnnN {\langle module\rangle} {\langle groups\rangle}
\keys_set_exclude_groups:(nnVnN|nnvnN|nnonN) {\langle keyval list\rangle} {\langle root\rangle} {\langle tl\rangle}
```

---

New: 2024-01-10

Sets keys by excluding those in the specified *groups*. The *groups* are given as a comma-separated list. Unknown keys are not assigned to any group and are thus always set. The key-value pairs for each key which is filtered out are stored in the *tl* in a comma-separated form (*i.e.* an edited version of the *keyval list*). The `\keys_set_exclude_groups:nnn` version skips this stage.

Use of `\keys_set_exclude_groups:nnnN` can be nested, with the correct residual *keyval list* returned at each stage. In the version which takes a *root* argument, the key list is returned relative to that point in the key tree. In the cases without a *root* argument, only the key names and values are returned.

---

```
\keys_set_groups:nnn          \keys_set_groups:nnn {\langle module\rangle} {\langle groups\rangle} {\langle keyval list\rangle}
\keys_set_groups:(nnV|nnv|nno)
```

New: 2013-07-14

Updated: 2017-05-27

Activates key filtering in an “opt-in” sense: only keys assigned to one or more of the *⟨groups⟩* specified are set. The *⟨groups⟩* are given as a comma-separated list. Unknown keys are not assigned to any group and are thus never set.

## 27.8 Digesting keys

---

```
\keys_compile:nnN \keys_compile:nnN {\langle module\rangle} {\langle keyval list\rangle} {\langle tl\rangle}
```

New: 2022-03-09  
 Parses the *⟨keyval list⟩* as for `\keys_set:nn`, placing the resulting code for those which set variables or functions into the *⟨tl⟩*. Thus this function “precompiles” the keyval list into a set of results which can be applied rapidly.

## 27.9 Utility functions for keys

---

```
\keys_if_exist_p:nn * \keys_if_exist_p:nn {\langle module\rangle} {\langle key\rangle}
\keys_if_exist_p:ne * \keys_if_exist:nnTF {\langle module\rangle} {\langle key\rangle} {\langle true code\rangle} {\langle false code\rangle}
\keys_if_exist:nnTF * Tests if the ⟨key⟩ exists for ⟨module⟩, i.e. if any code has been defined for ⟨key⟩.
\keys_if_exist:neTF *
```

Updated: 2022-01-10

---

```
\keys_if_choice_exist_p:nnn * \keys_if_choice_exist_p:nnn {\langle module\rangle} {\langle key\rangle} {\langle choice\rangle}
\keys_if_choice_exist:nnnTF * \keys_if_choice_exist:nnnTF {\langle module\rangle} {\langle key\rangle} {\langle choice\rangle} {\langle true code\rangle}
                                         {\langle false code\rangle}
```

New: 2011-08-21

Updated: 2017-11-14

Tests if the *⟨choice⟩* is defined for the *⟨key⟩* within the *⟨module⟩*, i.e. if any code has been defined for *⟨key⟩*/*⟨choice⟩*. The test is `false` if the *⟨key⟩* itself is not defined.

---

```
\keys_show:nn \keys_show:nn {\langle module\rangle} {\langle key\rangle}
```

Updated: 2015-08-09  
 Displays in the terminal the information associated to the *⟨key⟩* for a *⟨module⟩*, including the function which is used to actually implement it.

---

```
\keys_log:nn \keys_log:nn {\langle module\rangle} {\langle key\rangle}
```

New: 2014-08-22  
 Updated: 2015-08-09  
 Writes in the log file the information associated to the *⟨key⟩* for a *⟨module⟩*. See also `\keys_show:nn` which displays the result in the terminal.

## 27.10 Low-level interface for parsing key-val lists

To re-cap from earlier, a key-value list is input of the form

```
KeyOne = ValueOne ,  
KeyTwo = ValueTwo ,  
KeyThree
```

where each key-value pair is separated by a comma from the rest of the list, and each key-value pair does not necessarily contain an equals sign or a value! Processing this type of input correctly requires a number of careful steps, to correctly account for braces, spaces and the category codes of separators.

While the functions described earlier are used as a high-level interface for processing such input, in special circumstances you may wish to use a lower-level approach. The low-level parsing system converts a  $\langle\text{key-value list}\rangle$  into  $\langle\text{keys}\rangle$  and associated  $\langle\text{values}\rangle$ . After the parsing phase is completed, the resulting keys and values (or keys alone) are available for further processing. This processing is not carried out by the low-level parser itself, and so the parser requires the names of two functions along with the key-value list. One function is needed to process key-value pairs (it receives two arguments), and a second function is required for keys given without any value (it is called with a single argument).

The parser does not double # tokens or expand any input. Active tokens = and , appearing at the outer level of braces are converted to category “other” (12) so that the parser does not “miss” any due to category code changes. Spaces are removed from the ends of the keys and values. Keys and values which are given in braces have exactly one set removed (after space trimming), thus

```
key = {value here},
```

and

```
key = value here,
```

are treated identically.

`\keyval_parse:nnn`  $\star$  `\keyval_parse:nnn {\{code1\}} {\{code2\}\}} {\langle key-value list \rangle}`  
`\keyval_parse:(nn|nnv)`  $\star$

---

New: 2020-12-19      Updated: 2021-05-10

---

Parses the  $\langle key-value list \rangle$  into a series of  $\langle keys \rangle$  and associated  $\langle values \rangle$ , or keys alone (if no  $\langle value \rangle$  was given).  $\langle code_1 \rangle$  receives each  $\langle key \rangle$  (with no  $\langle value \rangle$ ) as a trailing brace group, whereas  $\langle code_2 \rangle$  is appended by two brace groups, the  $\langle key \rangle$  and  $\langle value \rangle$ . The order of the  $\langle keys \rangle$  in the  $\langle key-value list \rangle$  is preserved. Thus

```
\keyval_parse:nmn
  { \use_none:nn { code 1 } }
  { \use_none:nnn { code 2 } }
  { key1 = value1 , key2 = value2, key3 = , key4 }
```

is converted into an input stream

```
\use_none:nnn { code 2 } { key1 } { value1 }
\use_none:nnn { code 2 } { key2 } { value2 }
\use_none:nnn { code 2 } { key3 } { }
\use_none:nn { code 1 } { key4 }
```

Note that there is a difference between an empty value (an equals sign followed by nothing) and a missing value (no equals sign at all). Spaces are trimmed from the ends of the `<key>` and `<value>`, then one *outer* set of braces is removed from the `<key>` and `<value>` as part of the processing. If you need exactly the output shown above, you'll need to either e-type or x-type expand the function.

**TeXhackers note:** The result of each list element is returned within `\exp_not:n`, which means that the converted input stream does not expand further when appearing in an e-type or x-type argument expansion.

---

`\keyval_parse:NNn` ☆ `\keyval_parse:NNn <function1> <function2> {<key-value list>}`  
`\keyval_parse:(NNV|NNv)` ☆ Parsers the  $\langle key-value list \rangle$  into a series of  $\langle keys \rangle$  and associated  $\langle values \rangle$ , or keys alone  
 Updated: 2021-05-10

---

`\keyval_parse:NNn \function:n \function:nn`  
`{ key1 = value1 , key2 = value2, key3 = , key4 }`

is converted into an input stream

```

\function:nn { key1 } { value1 }
\function:nn { key2 } { value2 }
\function:nn { key3 } { }
\function:n   { key4 }

```

Note that there is a difference between an empty value (an equals sign followed by nothing) and a missing value (no equals sign at all). Spaces are trimmed from the ends of the  $\langle key \rangle$  and  $\langle value \rangle$ , then one *outer* set of braces is removed from the  $\langle key \rangle$  and  $\langle value \rangle$  as part of the processing.

This shares the implementation of `\keyval_parse:nnn`, the difference is only semantically.

**TeXhackers note:** The result is returned within `\exp_not:n`, which means that the converted input stream does not expand further when appearing in an `e`-type or `x`-type argument expansion.

# Chapter 28

## The `I3intarray` module Fast global integer arrays

### 28.1 `I3intarray` documentation

For applications requiring heavy use of integers, this module provides arrays which can be accessed in constant time (contrast `I3seq`, where access time is linear). These arrays have several important features

- The size of the array is fixed and must be given at point of initialisation
- The absolute value of each entry has maximum  $2^{30} - 1$  (*i.e.* one power lower than the usual `\c_max_int` ceiling of  $2^{31} - 1$ )

The use of `intarray` data is therefore recommended for cases where the need for fast access is of paramount importance.

---

`\intarray_new:Nn \intarray_new:Nn <intarray var> {<size>}`

`\intarray_new:cn` Evaluates the integer expression `<size>` and allocates an `<integer array variable>` with that number of (zero) entries. The variable name should start with `\g_` because assignments are always global.  
New: 2018-03-29

---

`\intarray_count:N * \intarray_count:N <intarray var>`

`\intarray_count:c *` Expands to the number of entries in the `<integer array variable>`. Contrarily to `\seq_count:N` this is performed in constant time.  
New: 2018-03-29

---

`\intarray_gset:Nnn \intarray_gset:Nnn <intarray var> {<position>} {<value>}`

`\intarray_gset:cnn` Stores the result of evaluating the integer expression `<value>` into the `<integer array variable>` at the (integer expression) `<position>`. If the `<position>` is not between 1 and the `\intarray_count:N`, or the `<value>`'s absolute value is bigger than  $2^{30} - 1$ , an error occurs. Assignments are always global.  
New: 2018-03-29

---

```
\intarray_const_from_clist:Nn \intarray_const_from_clist:Nn <intarray var> <int expr clist>
\intarray_const_from_clist:cn
```

---

New: 2018-05-04

Creates a new constant *<integer array variable>* or raises an error if the name is already taken. The *<integer array variable>* is set (globally) to contain as its items the results of evaluating each *<integer expression>* in the *<comma list>*.

---

```
\intarray_gzero:N \intarray_gzero:N <intarray var>
```

**\intarray\_gzero:c** Sets all entries of the *<integer array variable>* to zero. Assignments are always global.

---

New: 2018-05-04

---

```
\intarray_item:Nn * \intarray_item:Nn <intarray var> {<position>}
```

**\intarray\_item:cn \*** Expands to the integer entry stored at the (integer expression) *<position>* in the *<integer array variable>*. If the *<position>* is not between 1 and the *\intarray\_count:N*, an error occurs.

---

```
\intarray_rand_item:N * \intarray_rand_item:N <intarray var>
```

**\intarray\_rand\_item:c \*** Selects a pseudo-random item of the *<integer array>*. If the *<integer array>* is empty, produce an error.

---

```
\intarray_show:N \intarray_show:N <intarray var>
```

```
\intarray_show:c \intarray_log:N <intarray var>
```

**\intarray\_log:N** Displays the items in the *<integer array variable>* in the terminal or writes them in the log file.

---

New: 2018-05-04

### 28.1.1 Implementation notes

It is a wrapper around the `\fontdimen` primitive, used to store arrays of integers (with a restricted range: absolute value at most  $2^{30} - 1$ ). In contrast to `\l3seq` sequences the access to individual entries is done in constant time rather than linear time, but only integers can be stored. More precisely, the primitive `\fontdimen` stores dimensions but the `\l3intarray` module transparently converts these from/to integers. Assignments are always global.

While LuaTeX's memory is extensible, other engines can "only" deal with a bit less than  $4 \times 10^6$  entries in all `\fontdimen` arrays combined (with default TeX Live settings).

## Chapter 29

# The `l3fp` module Floating points

A decimal floating point number is one which is stored as a significand and a separate exponent. The module implements expandably a wide set of arithmetic, trigonometric, and other operations on decimal floating point numbers, to be used within floating point expressions. *Floating point expressions* (“`(fp expr)`”) support the following operations with their usual precedence.

- Basic arithmetic: addition  $x + y$ , subtraction  $x - y$ , multiplication  $x * y$ , division  $x / y$ , square root  $\sqrt{x}$ , and parentheses.
- Comparison operators:  $x < y$ ,  $x \leq y$ ,  $x >? y$ ,  $x != y$  etc.
- Boolean logic: sign  $\text{sign } x$ , negation  $\text{!} x$ , conjunction  $x \&& y$ , disjunction  $x || y$ , ternary operator  $x ? y : z$ .
- Exponentials:  $\exp x$ ,  $\ln x$ ,  $x^y$ ,  $\log_b x$ .
- Integer factorial:  $\text{fact } x$ .
- Trigonometry:  $\sin x$ ,  $\cos x$ ,  $\tan x$ ,  $\cot x$ ,  $\sec x$ ,  $\csc x$  expecting their arguments in radians, and  $\text{sind } x$ ,  $\text{cosd } x$ ,  $\text{tand } x$ ,  $\text{cotd } x$ ,  $\text{secd } x$ ,  $\text{csed } x$  expecting their arguments in degrees.
- Inverse trigonometric functions:  $\text{asin } x$ ,  $\text{acos } x$ ,  $\text{atan } x$ ,  $\text{acot } x$ ,  $\text{asec } x$ ,  $\text{acsc } x$  giving a result in radians, and  $\text{asind } x$ ,  $\text{acosd } x$ ,  $\text{atand } x$ ,  $\text{cotd } x$ ,  $\text{secd } x$ ,  $\text{csed } x$  giving a result in degrees.

(not yet) Hyperbolic functions and their inverse functions:  $\sinh x$ ,  $\cosh x$ ,  $\tanh x$ ,  $\coth x$ ,  $\text{sech } x$ ,  $\text{csch } x$ , and  $\text{asinh } x$ ,  $\text{acosh } x$ ,  $\text{atanh } x$ ,  $\text{acoth } x$ ,  $\text{asech } x$ ,  $\text{acsch } x$ .

- Extrema:  $\max(x_1, x_2, \dots)$ ,  $\min(x_1, x_2, \dots)$ ,  $\text{abs}(x)$ .
- Rounding functions, controlled by two optional values,  $n$  (number of places, 0 by default) and  $t$  (behavior on a tie, `nan` by default):
  - $\text{trunc}(x, n)$  rounds towards zero,
  - $\text{floor}(x, n)$  rounds towards  $-\infty$ ,

- $\text{ceil}(x, n)$  rounds towards  $+\infty$ ,
- $\text{round}(x, n, t)$  rounds to the closest value, with ties rounded to an even value by default, towards zero if  $t = 0$ , towards  $+\infty$  if  $t > 0$  and towards  $-\infty$  if  $t < 0$ .

And (*not yet*) modulo, and “quantize”.

- Random numbers: `rand()`, `randint(m, n)`.
- Constants: `pi`, `deg` (one degree in radians).
- Dimensions, automatically expressed in points, *e.g.*, `pc` is 12.
- Automatic conversion (no need for `\(\langle type \rangle\_use:N\)`) of integer, dimension, and skip variables to floating point numbers, expressing dimensions in points and ignoring the stretch and shrink components of skips.
- Tuples:  $(x_1, \dots, x_n)$  that can be stored in variables, added together, multiplied or divided by a floating point number, and nested.

Floating point numbers can be given either explicitly (in a form such as `1.234e-34`, or `-.0001`), or as a stored floating point variable, which is automatically replaced by its current value. A “floating point” is a floating point number or a tuple thereof. See section 29.12.1 for a description of what a floating point is, section 29.12.2 for details about how an expression is parsed, and section 29.12.3 to know what the various operations do. Some operations may raise exceptions (error messages), described in section 29.10.

An example of use could be the following.

```
\LaTeX{} can now compute: $ \frac{\sin(3.5)}{2} + 2\cdot 10^{-3}
= \ExplSyntaxOn \fp_to_decimal:n {sin(3.5)/2 + 2e-3} $.
```

The operation `round` can be used to limit the result’s precision. Adding `+0` avoids the possibly undesirable output `-0`, replacing it by `+0`. However, the `l3fp` module is mostly meant as an underlying tool for higher-level commands. For example, one could provide a function to typeset nicely the result of floating point computations.

```
\documentclass{article}
\usepackage{siunitx}
\ExplSyntaxOn
\NewDocumentCommand{\calcnum}{m}
  { \num{ \fp_to_scientific:n {#1} } }
\ExplSyntaxOff
\begin{document}
\calcnum{2 pi * sin(2.3^5)}
\end{document}
```

See the documentation of `siunitx` for various options of `\num`.

## 29.1 Creating and initialising floating point variables

---

\fp\_new:N      \fp\_new:N *fp var*  
\fp\_new:c      Creates a new *fp var* or raises an error if the name is already taken. The declaration is  
Updated: 2012-05-08 global. The *fp var* is initially +0.

---

\fp\_const:Nn    \fp\_const:Nn *fp var* {*fp expr*}  
\fp\_const:cn    Creates a new constant *fp var* or raises an error if the name is already taken. The  
Updated: 2012-05-08 *fp var* is set globally equal to the result of evaluating the *fp expr*.

---

\fp\_zero:N      \fp\_zero:N *fp var*  
\fp\_zero:c      Sets the *fp var* to +0.  
\fp\_gzero:N     \fp\_gzero:N  
\fp\_gzero:c  
Updated: 2012-05-08

---

\fp\_zero\_new:N   \fp\_zero\_new:N *fp var*  
\fp\_zero\_new:c   Ensures that the *fp var* exists globally by applying \fp\_new:N if necessary, then applies  
\fp\_gzero\_new:N  
\fp\_gzero\_new:c

Updated: 2012-05-08

## 29.2 Setting floating point variables

---

\fp\_set:Nn      \fp\_set:Nn *fp var* {*fp expr*}  
\fp\_set:cn      Sets *fp var* equal to the result of computing the *fp expr*.  
\fp\_gset:Nn  
\fp\_gset:cn  
Updated: 2012-05-08

---

\fp\_set\_eq:NN     \fp\_set\_eq:NN *fp var*<sub>1</sub> *fp var*<sub>2</sub>  
\fp\_set\_eq:(cN|Nc|cc)   Sets the floating point variable *fp var*<sub>1</sub> equal to the current value of *fp var*<sub>2</sub>.  
\fp\_gset\_eq:(cN|Nc|cc)  
Updated: 2012-05-08

---

\fp\_add:Nn      \fp\_add:Nn *fp var* {*fp expr*}  
\fp\_add:cn  
\fp\_gadd:Nn  
\fp\_gadd:cn      Adds the result of computing the *fp expr* to the *fp var*. This also applies if *fp var* and *floating point expression* evaluate to tuples of the same size.  
Updated: 2012-05-08

---

<code>\fp_sub:Nn</code>	<code>\fp_sub:Nn &lt;fp var&gt; {&lt;fp expr&gt;}</code>
<code>\fp_sub:cn</code>	
<code>\fp_gsub:Nn</code>	Subtracts the result of computing the <i>&lt;floating point expression&gt;</i> from the <i>&lt;fp var&gt;</i> . This also applies if <i>&lt;fp var&gt;</i> and <i>&lt;floating point expression&gt;</i> evaluate to tuples of the same size.
<code>\fp_gsub:cn</code>	

---

Updated: 2012-05-08

## 29.3 Using floating points

---

<code>\fp_eval:n</code>	<code>* \fp_eval:n {&lt;fp expr&gt;}</code>
-------------------------	---

---

<code>New: 2012-05-08</code>	Evaluates the <i>&lt;fp expr&gt;</i> and expresses the result as a decimal number with no exponent.
<code>Updated: 2012-07-08</code>	Leading or trailing zeros may be inserted to compensate for the exponent. Non-significant trailing zeros are trimmed, and integers are expressed without a decimal separator. The values $\pm\infty$ and <code>nan</code> trigger an “invalid operation” exception. For a tuple, each item is converted using <code>\fp_eval:n</code> and they are combined as $(\langle fp_1 \rangle, \langle fp_2 \rangle, \dots, \langle fp_n \rangle)$ if $n > 1$ and $(\langle fp_1 \rangle,)$ or $()$ for fewer items. This function is identical to <code>\fp_to_decimal:n</code> .

---

<code>\fp_sign:n</code>	<code>* \fp_sign:n {&lt;fp expr&gt;}</code>
-------------------------	---

---

<code>New: 2018-11-03</code>	Evaluates the <i>&lt;fp expr&gt;</i> and leaves its sign in the input stream using <code>\fp_eval:n {sign(&lt;result&gt;)}</code> : +1 for positive numbers and for $+\infty$ , -1 for negative numbers and for $-\infty$ , $\pm 0$ for $\pm 0$ . If the operand is a tuple or is <code>nan</code> , then “invalid operation” occurs and the result is 0.
------------------------------	---

---

<code>\fp_to_decimal:N</code>	<code>* \fp_to_decimal:N &lt;fp var&gt;</code>
<code>\fp_to_decimal:c</code>	<code>* \fp_to_decimal:c {&lt;fp expr&gt;}</code>

---

<code>\fp_to_decimal:n</code>	<code>* Evaluates the &lt;fp expr&gt; and expresses the result as a decimal number with no exponent.</code>
<code>New: 2012-05-08</code>	Leading or trailing zeros may be inserted to compensate for the exponent. Non-significant trailing zeros are trimmed, and integers are expressed without a decimal separator. The values $\pm\infty$ and <code>nan</code> trigger an “invalid operation” exception. For a tuple, each item is converted using <code>\fp_to_decimal:n</code> and they are combined as $(\langle fp_1 \rangle, \langle fp_2 \rangle, \dots, \langle fp_n \rangle)$ if $n > 1$ and $(\langle fp_1 \rangle,)$ or $()$ for fewer items.
<code>Updated: 2012-07-08</code>	

---

<code>\fp_to_dim:N</code>	<code>* \fp_to_dim:N &lt;fp var&gt;</code>
<code>\fp_to_dim:c</code>	<code>* \fp_to_dim:c {&lt;fp expr&gt;}</code>

---

<code>\fp_to_dim:n</code>	<code>* Evaluates the &lt;fp expr&gt; and expresses the result as a dimension (in pt) suitable for use in dimension expressions. The output is identical to \fp_to_decimal:n, with an additional trailing pt (both letter tokens). In particular, the result may be outside the range <math>[-2^{14} + 2^{-17}, 2^{14} - 2^{-17}]</math> of valid TeX dimensions, leading to overflow errors if used as a dimension. Tuples, as well as the values <math>\pm\infty</math> and <code>nan</code>, trigger an “invalid operation” exception.</code>
---------------------------	--

---

<code>\fp_to_int:N</code>	<code>* \fp_to_int:N &lt;fp var&gt;</code>
<code>\fp_to_int:c</code>	<code>* \fp_to_int:c {&lt;fp expr&gt;}</code>

---

<code>\fp_to_int:n</code>	<code>* Evaluates the &lt;fp expr&gt;, and rounds the result to the closest integer, rounding exact ties to an even integer. The result may be outside the range <math>[-2^{31} + 1, 2^{31} - 1]</math> of valid TeX integers, leading to overflow errors if used in an integer expression. Tuples, as well as the values <math>\pm\infty</math> and <code>nan</code>, trigger an “invalid operation” exception.</code>
<code>Updated: 2012-07-08</code>	

---

---

\fp\_to\_scientific:N \* \fp\_to\_scientific:N *fp var*  
\fp\_to\_scientific:c \* \fp\_to\_scientific:n {{*fp expr*}}  
\fp\_to\_scientific:n \* Evaluates the *fp expr* and expresses the result in scientific notation:  
New: 2012-05-08  
Updated: 2016-03-22

*(optional -) (digit). (15 digits)e(optional sign)(exponent)*

The leading *digit* is non-zero except in the case of  $\pm 0$ . The values  $\pm\infty$  and *nan* trigger an “invalid operation” exception. Normal category codes apply: thus the *e* is category code 11 (a letter). For a tuple, each item is converted using \fp\_to\_scientific:n and they are combined as  $((fp_1), \dots, fp_n))$  if  $n > 1$  and  $(fp_1,)$  or  $()$  for fewer items.

---

\fp\_to\_t1:N \* \fp\_to\_t1:N *fp var*  
\fp\_to\_t1:c \* \fp\_to\_t1:n {{*fp expr*}}  
\fp\_to\_t1:n \* Evaluates the *fp expr* and expresses the result in (almost) the shortest possible form.  
Updated: 2016-03-22

Numbers in the ranges  $(0, 10^{-3})$  and  $[10^{16}, \infty)$  are expressed in scientific notation with trailing zeros trimmed and no decimal separator when there is a single significant digit (this differs from \fp\_to\_scientific:n). Numbers in the range  $[10^{-3}, 10^{16})$  are expressed in a decimal notation without exponent, with trailing zeros trimmed, and no decimal separator for integer values (see \fp\_to\_decimal:n. Negative numbers start with  $-$ . The special values  $\pm 0$ ,  $\pm\infty$  and *nan* are rendered as  $0$ ,  $-0$ , *inf*, *-inf*, and *nan* respectively. Normal category codes apply and thus *inf* or *nan*, if produced, are made up of letters. For a tuple, each item is converted using \fp\_to\_t1:n and they are combined as  $((fp_1), \dots, fp_n))$  if  $n > 1$  and  $(fp_1,)$  or  $()$  for fewer items.

---

\fp\_use:N \* \fp\_use:N *fp var*  
\fp\_use:c \* Inserts the value of the *fp var* into the input stream as a decimal number with no exponent. Leading or trailing zeros may be inserted to compensate for the exponent. Non-significant trailing zeros are trimmed. Integers are expressed without a decimal separator.  
Updated: 2012-07-08

The values  $\pm\infty$  and *nan* trigger an “invalid operation” exception. For a tuple, each item is converted using \fp\_to\_decimal:n and they are combined as  $((fp_1), \dots, fp_n))$  if  $n > 1$  and  $(fp_1,)$  or  $()$  for fewer items. This function is identical to \fp\_to\_decimal:N.

## 29.4 Floating point conditionals

---

\fp\_if\_exist\_p:N \* \fp\_if\_exist\_p:N *fp var*  
\fp\_if\_exist\_p:c \* \fp\_if\_exist:NTF *fp var* {{*true code*}} {{*false code*}}  
\fp\_if\_exist:NTF \* Tests whether the *fp var* is currently defined. This does not check that the *fp var* really is a floating point variable.  
Updated: 2012-05-08

```
\fp_compare_p:nNn * \fp_compare_p:nNn {\fp expr1} {relation} {\fp expr2}
\fp_compare:nNnTF * \fp_compare:nNnTF {\fp expr1} {relation} {\fp expr2} {\true code} {\false code}
```

Updated: 2012-05-08

Compares the  $\langle fp \ expr_1 \rangle$  and the  $\langle fp \ expr_2 \rangle$ , and returns `true` if the  $\langle relation \rangle$  is obeyed. Two floating points  $x$  and  $y$  may obey four mutually exclusive relations:  $x < y$ ,  $x = y$ ,  $x > y$ , or  $x ? y$  (“not ordered”). The last case occurs exactly if one or both operands is `nan` or is a tuple, unless they are equal tuples. Note that a `nan` is distinct from any value, even another `nan`, hence  $x = x$  is not true for a `nan`. To test if a value is `nan`, compare it to an arbitrary number with the “not ordered” relation.

```
\fp_compare:nNnTF { <value> } ? { 0 }
  { } % <value> is nan
  { } % <value> is not nan
```

Tuples are equal if they have the same number of items and items compare equal (in particular there must be no `nan`). At present any other comparison with tuples yields `?` (not ordered). This is experimental.

This function is less flexible than `\fp_compare:nTF` but slightly faster. It is provided for consistency with `\int_compare:nNnTF` and `\dim_compare:nNnTF`.

```

\fp_compare_p:n * \fp_compare_p:n
\fp_compare:nTF *
  {
    Updated: 2013-12-14
    ...
    \fp_compare:N \relation_N
    \fp_compare:N+1
  }
\fp_compare:nTF
  {
    \fp_compare_1 \relation_1
    ...
    \fp_compare_N \relation_N
    \fp_compare_N+1
  }
  {{true code}} {{false code}}

```

Evaluates the  $\langle fp \ exprs \rangle$  as described for `\fp_eval:n` and compares consecutive result using the corresponding  $\langle relation \rangle$ , namely it compares  $\langle fp \ expr_1 \rangle$  and  $\langle fp \ expr_2 \rangle$  using the  $\langle relation_1 \rangle$ , then  $\langle fp \ expr_2 \rangle$  and  $\langle fp \ expr_3 \rangle$  using the  $\langle relation_2 \rangle$ , until finally comparing  $\langle fp \ expr_N \rangle$  and  $\langle fp \ expr_{N+1} \rangle$  using the  $\langle relation_N \rangle$ . The test yields `true` if all comparisons are `true`. Each  $\langle floating \ point \ expression \rangle$  is evaluated only once. Contrarily to `\int-compare:nTF`, all  $\langle fp \ exprs \rangle$  are computed, even if one comparison is `false`. Two floating points  $x$  and  $y$  may obey four mutually exclusive relations:  $x < y$ ,  $x = y$ ,  $x > y$ , or  $x ? y$  (“not ordered”). The last case occurs exactly if one or both operands is `nan` or is a tuple, unless they are equal tuples. Each  $\langle relation \rangle$  can be any (non-empty) combination of  $<$ ,  $=$ ,  $>$ , and  $?$ , plus an optional leading  $!$  (which negates the  $\langle relation \rangle$ ), with the restriction that the  $\langle relation \rangle$  may not start with  $?$ , as this symbol has a different meaning (in combination with `:`) within floating point expressions. The comparison  $x \langle relation \rangle y$  is then `true` if the  $\langle relation \rangle$  does not start with  $!$  and the actual relation ( $<$ ,  $=$ ,  $>$ , or  $?$ ) between  $x$  and  $y$  appears within the  $\langle relation \rangle$ , or on the contrary if the  $\langle relation \rangle$  starts with  $!$  and the relation between  $x$  and  $y$  does not appear within the  $\langle relation \rangle$ . Common choices of  $\langle relation \rangle$  include  $\geq$  (greater or equal),  $\neq$  (not equal),  $!?$  or  $\<\!=\!\>$  (comparable).

This function is more flexible than `\fp_compare:nNnTF` and only slightly slower.

---

```
\fp_if_nan_p:n ∗ \fp_if_nan_p:n {⟨fp expr⟩}
\fp_if_nan:nTF ∗ \fp_if_nan:nTF {⟨fp expr⟩} {⟨true code⟩} {⟨false code⟩}
```

---

New: 2019-08-25 Evaluates the ⟨fp expr⟩ and tests whether the result is exactly `nan`. The test returns `false` for any other result, even a tuple containing `nan`.

## 29.5 Floating point expression loops

---

```
\fp_do_until:nNnn ☆ \fp_do_until:nNnn {⟨fp expr1⟩} ⟨relation⟩ {⟨fp expr2⟩} {⟨code⟩}
```

---

New: 2012-08-16 Places the ⟨code⟩ in the input stream for TeX to process, and then evaluates the relationship between the two ⟨floating point expressions⟩ as described for \fp\_compare:nNnTF. If the test is `false` then the ⟨code⟩ is inserted into the input stream again and a loop occurs until the ⟨relation⟩ is `true`.

---

```
\fp_do_while:nNnn ☆ \fp_do_while:nNnn {⟨fp expr1⟩} ⟨relation⟩ {⟨fp expr2⟩} {⟨code⟩}
```

---

New: 2012-08-16 Places the ⟨code⟩ in the input stream for TeX to process, and then evaluates the relationship between the two ⟨floating point expressions⟩ as described for \fp\_compare:nNnTF. If the test is `true` then the ⟨code⟩ is inserted into the input stream again and a loop occurs until the ⟨relation⟩ is `false`.

---

```
\fp_until_do:nNnn ☆ \fp_until_do:nNnn {⟨fp expr1⟩} ⟨relation⟩ {⟨fp expr2⟩} {⟨code⟩}
```

---

New: 2012-08-16 Evaluates the relationship between the two ⟨floating point expressions⟩ as described for \fp\_compare:nNnTF, and then places the ⟨code⟩ in the input stream if the ⟨relation⟩ is `false`. After the ⟨code⟩ has been processed by TeX the test is repeated, and a loop occurs until the test is `true`.

---

```
\fp_while_do:nNnn ☆ \fp_while_do:nNnn {⟨fp expr1⟩} ⟨relation⟩ {⟨fp expr2⟩} {⟨code⟩}
```

---

New: 2012-08-16 Evaluates the relationship between the two ⟨floating point expressions⟩ as described for \fp\_compare:nNnTF, and then places the ⟨code⟩ in the input stream if the ⟨relation⟩ is `true`. After the ⟨code⟩ has been processed by TeX the test is repeated, and a loop occurs until the test is `false`.

---

```
\fp_do_until:nn ☆ \fp_do_until:nn {⟨fp expr1⟩} ⟨relation⟩ {⟨fp expr2⟩} {⟨code⟩}
```

---

New: 2012-08-16 Updated: 2013-12-14 Places the ⟨code⟩ in the input stream for TeX to process, and then evaluates the relationship between the two ⟨floating point expressions⟩ as described for \fp\_compare:nTF. If the test is `false` then the ⟨code⟩ is inserted into the input stream again and a loop occurs until the ⟨relation⟩ is `true`.

---

```
\fp_do_while:nn ☆ \fp_do_while:nn {⟨fp expr1⟩} ⟨relation⟩ {⟨fp expr2⟩} {⟨code⟩}
```

---

New: 2012-08-16 Updated: 2013-12-14 Places the ⟨code⟩ in the input stream for TeX to process, and then evaluates the relationship between the two ⟨floating point expressions⟩ as described for \fp\_compare:nTF. If the test is `true` then the ⟨code⟩ is inserted into the input stream again and a loop occurs until the ⟨relation⟩ is `false`.

---

`\fp_until_do:nn`  $\star$  `\fp_until_do:nn { \fp expr_1 } \langle relation \rangle \langle fp expr_2 \rangle \} \{ \langle code \rangle \}`

New: 2012-08-16 Evaluates the relationship between the two *floating point expressions* as described for  
Updated: 2013-12-14 `\fp_compare:nTF`, and then places the *code* in the input stream if the *relation* is  
**false**. After the *code* has been processed by TeX the test is repeated, and a loop  
occurs until the test is **true**.

---

`\fp_while_do:nn`  $\star$  `\fp_while_do:nn { \fp expr_1 } \langle relation \rangle \langle fp expr_2 \rangle \} \{ \langle code \rangle \}`

New: 2012-08-16 Evaluates the relationship between the two *floating point expressions* as described for  
Updated: 2013-12-14 `\fp_compare:nTF`, and then places the *code* in the input stream if the *relation* is  
**true**. After the *code* has been processed by TeX the test is repeated, and a loop occurs  
until the test is **false**.

---

`\fp_step_function:nnnN`  $\star$  `\fp_step_function:nnnN { \langle initial value \rangle } \{ \langle step \rangle \} \{ \langle final value \rangle \} \langle function \rangle`

`\fp_step_function:nnnc`  $\star$  This function first evaluates the *initial value*, *step* and *final value*, each of which  
should be a floating point expression evaluating to a floating point number, not a tuple.  
The *function* is then placed in front of each *value* from the *initial value* to the *final value*  
in turn (using *step* between each *value*). The *step* must be non-zero. If the  
*step* is positive, the loop stops when the *value* becomes larger than the *final value*.  
If the *step* is negative, the loop stops when the *value* becomes smaller than the *final value*. The *function* should absorb one numerical argument. For example

```
\cs_set:Npn \my_func:n #1 { [I~saw~#1] \quad }
\fp_step_function:nnnN { 1.0 } { 0.1 } { 1.5 } \my_func:n
```

would print

```
[I saw 1.0] [I saw 1.1] [I saw 1.2] [I saw 1.3] [I saw 1.4] [I saw 1.5]
```

**TeXhackers note:** Due to rounding, it may happen that adding the *step* to the *value* does  
not change the *value*; such cases give an error, as they would otherwise lead to an infinite loop.

---

`\fp_step_inline:nnnn` `\fp_step_inline:nnnn { \langle initial value \rangle } \{ \langle step \rangle \} \{ \langle final value \rangle \} \{ \langle code \rangle \}`

New: 2016-11-21 This function first evaluates the *initial value*, *step* and *final value*, all of which  
Updated: 2016-12-06 should be floating point expressions evaluating to a floating point number, not a tuple.  
Then for each *value* from the *initial value* to the *final value* in turn (using *step*  
between each *value*), the *code* is inserted into the input stream with #1 replaced by  
the current *value*. Thus the *code* should define a function of one argument (#1).

---

`\fp_step_variable:nnnN` `\fp_step_variable:nnnNn
 { \langle initial value \rangle } \{ \langle step \rangle \} \{ \langle final value \rangle \} \langle tl var \rangle \{ \langle code \rangle \}`

New: 2017-04-12 This function first evaluates the *initial value*, *step* and *final value*, all of which should  
be floating point expressions evaluating to a floating point number, not a tuple. Then  
for each *value* from the *initial value* to the *final value* in turn (using *step* between  
each *value*), the *code* is inserted into the input stream, with the *tl var* defined as  
the current *value*. Thus the *code* should make use of the *tl var*.

## 29.6 Symbolic expressions

Floating point expressions support variables: these can only be set locally, so act like standard `\l_...` variables.

```
\fp_new_variable:n { A }
\fp_set:Nn \l_tmpb_fp { 1 * sin(A) + 3**2 }
\fp_show:n { \l_tmpb_fp }
\fp_show:N \l_tmpb_fp
\fp_set_variable:nn { A } { pi/2 }
\fp_show:n { \l_tmpb_fp }
\fp_show:N \l_tmpb_fp
\fp_set_variable:nn { A } { 0 }
\fp_show:n { \l_tmpb_fp }
\fp_show:N \l_tmpb_fp
```

defines `A` to be a variable, then defines `\l_tmpb_fp` to stand for `1*sin(A)+9` (note that `3**2` is evaluated, but the `1*` product is not simplified away). Until `\l_tmpb_fp` is changed, `\fp_show:N \l_tmpb_fp` will show `((1*sin(A))+9)` regardless of the value of `A`. The next step defines `A` to be equal to `pi/2`: then `\fp_show:n { \l_tmpb_fp }` will evaluate `\l_tmpb_fp` and show 10. We then redefine `A` to be 0: since `\l_tmpb_fp` still stands for `1*sin(A)+9`, the value shown is then 9. Variables can be set with `\fp_set_variable:nn` to arbitrary floating point expressions including other variables.

---

```
\fp_new_variable:n \fp_new_variable:n {<identifier>}
```

New: 2023-10-19 Declares the `<identifier>` as a variable, which allows it to be used in floating point expressions. For instance,

```
\fp_new_variable:n { A }
\fp_show:n { A**2 - A + 1 }
```

shows `((A^2)-A)+1`. If the declaration was missing, the parser would complain about an “Unknown fp word ‘A’”. The `<identifier>` must consist entirely of Latin letters among [a-zA-Z].

---

```
\fp_set_variable:nn \fp_set_variable:nn {⟨identifier⟩} {⟨fp expr⟩}
```

New: 2023-10-19

Defines the ⟨identifier⟩ to stand in any further expression for the result of evaluating the ⟨floating point expression⟩ as much as possible. The result may contain other variables, which are then replaced by their values if they have any. For instance,

```
\fp_new_variable:n { A }
\fp_new_variable:n { B }
\fp_new_variable:n { C }
\fp_set_variable:nn { A } { 3 }
\fp_set_variable:nn { C } { A ** 2 + B * 1 }
\fp_show:n { C + 4 }
\fp_set_variable:nn { A } { 4 }
\fp_show:n { C + 4 }
```

shows  $((9+(B*1))+4)$  twice: changing the value of A to 4 does not alter C because A was replaced by its value 3 when evaluating  $A^{**2}+B*1$ .

---

```
\fp_clear_variable:n \fp_clear_variable:n {⟨identifier⟩}
```

New: 2023-10-19

Removes any value given by \fp\_set\_variable:nn to the variable with this ⟨identifier⟩. For instance,

```
\fp_new_variable:n { A }
\fp_set_variable:nn { A } { 3 }
\fp_show:n { A ^ 2 }
\fp_clear_variable:n { A }
\fp_show:n { A ^ 2 }
```

shows 9, then  $(A^2)$ .

## 29.7 User-defined functions

It is possible to define new user functions which can be used inside the argument to \fp\_eval:n, etc. These functions may take one or more named arguments, and should be implemented using expansion methods only.

---

```
\fp_new_function:n \fp_new_function:n {⟨identifier⟩}
```

New: 2023-10-19

Declares the ⟨identifier⟩ as a function, which allows it to be used in floating point expressions. For instance,

```
\fp_new_function:n { foo }
\fp_show:n { foo ( 1 + 2 , foo(3) , A ) ** 2 } }
```

shows  $(\text{foo}(3, \text{foo}(3), A))^2$ . If the declaration was missing, the parser would complain about an “Unknown fp word ‘foo’”. The ⟨identifier⟩ must consist entirely of Latin letters [a-zA-Z].

---

**\fp\_set\_function:nnn** **\fp\_set\_function:nnn {⟨identifier⟩} {⟨vars⟩} {⟨fp expr⟩}**

New: 2023-10-19

Defines the ⟨identifier⟩ to stand in any further expression for the result of evaluating the ⟨floating point expression⟩, with the ⟨identifier⟩ accepting the ⟨vars⟩ (a non-empty comma-separated list). The result may contain other functions, which are then replaced by their results if they have any. For instance,

```
\fp_new_function:n { foo }
\fp_set_function:nnn { npow } { a,b } { a**b }
\fp_show:n { npow(16,0.25) } }
```

shows 2. The names of the ⟨vars⟩ must consist entirely of Latin letters [a-zA-Z], but are otherwise not restricted: in particular, they are independent of any variables declared by **\fp\_new\_variable:n**.

---

**\fp\_clear\_function:n** **\fp\_clear\_function:n {⟨identifier⟩}**

New: 2023-10-19

Removes any definition given by **\fp\_set\_function:nnn** to the function with this ⟨identifier⟩.

## 29.8 Some useful constants, and scratch variables

---

**\c\_zero\_fp** Zero, with either sign.

**\c\_minus\_zero\_fp**

New: 2012-05-08

---

**\c\_one\_fp** One as an fp: useful for comparisons in some places.

New: 2012-05-08

---

**\c\_inf\_fp** Infinity, with either sign. These can be input directly in a floating point expression as **\c\_minus\_inf\_fp** inf and -inf.

New: 2012-05-08

---

**\c\_nan\_fp** Not a number. This can be input directly in a floating point expression as **nan**.

New: 2012-05-08

---

**\c\_e\_fp** The value of the base of the natural logarithm,  $e = \exp(1)$ .

Updated: 2012-05-08

---

**\c\_pi\_fp** The value of  $\pi$ . This can be input directly in a floating point expression as **pi**.

Updated: 2013-11-17

---

**\c\_one\_degree\_fp** The value of  $1^\circ$  in radians. Multiply an angle given in degrees by this value to obtain a result in radians. Note that trigonometric functions expecting an argument in radians or in degrees are both available. Within floating point expressions, this can be accessed as `deg`.

New: 2012-05-08  
Updated: 2013-11-17

---

## 29.9 Scratch variables

---

**\l\_tmpa\_fp** Scratch floating points for local assignment. These are never used by the kernel code, and **\l\_tmpb\_fp** so are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

---

**\g\_tmpa\_fp** Scratch floating points for global assignment. These are never used by the kernel code, and **\g\_tmpb\_fp** so are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

## 29.10 Floating point exceptions

*The functions defined in this section are experimental, and their functionality may be altered or removed altogether.*

“Exceptions” may occur when performing some floating point operations, such as  $0 / 0$ , or  $10 ** 1e9999$ . The relevant IEEE standard defines 5 types of exceptions, of which we implement 4.

- *Overflow* occurs whenever the result of an operation is too large to be represented as a normal floating point number. This results in  $\pm\infty$ .
- *Underflow* occurs whenever the result of an operation is too close to 0 to be represented as a normal floating point number. This results in  $\pm 0$ .
- *Invalid operation* occurs for operations with no defined outcome, for instance  $0/0$  or  $\sin(\infty)$ , and results in a `nan`. It also occurs for conversion functions whose target type does not have the appropriate infinite or `nan` value (*e.g.*, `\fp_to_dim:n`).
- *Division by zero* occurs when dividing a non-zero number by 0, or when evaluating functions at poles, *e.g.*,  $\ln(0)$  or  $\cot(0)$ . This results in  $\pm\infty$ .

(not yet) *Inexact* occurs whenever the result of a computation is not exact, in other words, almost always. At the moment, this exception is entirely ignored in L<sup>A</sup>T<sub>E</sub>X3.

To each exception we associate a “flag”: `\l_fp_overflow_flag`, `\l_fp_underflow_flag`, `\l_fp_invalid_operation_flag` and `\l_fp_division_by_zero_flag`. The state of these flags can be tested and modified with commands from `l3flag`

By default, the “invalid operation” exception triggers an (expandable) error, and raises the corresponding flag. Other exceptions raise the corresponding flag but do not trigger an error. The behaviour when an exception occurs can be modified (using `\fp_trap:nn`) to either produce an error and raise the flag, or only raise the flag, or do nothing at all.

---

`\fp_trap:nn`    `\fp_trap:nn {<exception>} {<trap type>}`

New: 2012-07-19 All occurrences of the  $\langle \text{exception} \rangle$  (`overflow`, `underflow`, `invalid_operation` or  
Updated: 2017-02-13 `division_by_zero`) within the current group are treated as  $\langle \text{trap type} \rangle$ , which can be

- `none`: the  $\langle \text{exception} \rangle$  will be entirely ignored, and leave no trace;
- `flag`: the  $\langle \text{exception} \rangle$  will turn the corresponding flag on when it occurs;
- `error`: additionally, the  $\langle \text{exception} \rangle$  will halt the TeX run and display some information about the current operation in the terminal.

*This function is experimental, and may be altered or removed.*

---

`\l_fp_overflow_flag`  
`\l_fp_underflow_flag`  
`\l_fp_invalid_operation_flag`  
`\l_fp_division_by_zero_flag`

Flags denoting the occurrence of various floating-point exceptions.

## 29.11 Viewing floating points

---

`\fp_show:N`    `\fp_show:N {fp var}`  
`\fp_show:c`    `\fp_show:n {fp expr}`

`\fp_show:n`    Evaluates the  $\langle \text{fp expr} \rangle$  and displays the result in the terminal.

New: 2012-05-08  
Updated: 2021-04-29

---

---

`\fp_log:N`    `\fp_log:N {fp var}`  
`\fp_log:c`    `\fp_log:n {fp expr}`

`\fp_log:n`    Evaluates the  $\langle \text{fp expr} \rangle$  and writes the result in the log file.

New: 2014-08-22  
Updated: 2021-04-29

---

## 29.12 Floating point expressions

### 29.12.1 Input of floating point numbers

We support four types of floating point numbers:

- $\pm m \cdot 10^n$ , a floating point number, with integer  $1 \leq m \leq 10^{16}$ , and  $-10000 \leq n \leq 10000$ ;
- $\pm 0$ , zero, with a given sign;
- $\pm\infty$ , infinity, with a given sign;
- `nan`, is “not a number”, and can be either quiet or signalling (*not yet*: this distinction is currently unsupported);

Normal floating point numbers are stored in base 10, with up to 16 significant figures.

On input, a normal floating point number consists of:

- $\langle sign \rangle$ : a possibly empty string of + and - characters;
- $\langle significand \rangle$ : a non-empty string of digits together with zero or one dot;
- $\langle exponent \rangle$  optionally: the character e or E, followed by a possibly empty string of + and - tokens, and a non-empty string of digits.

The sign of the resulting number is + if  $\langle sign \rangle$  contains an even number of -, and - otherwise, hence, an empty  $\langle sign \rangle$  denotes a non-negative input. The stored significand is obtained from  $\langle significand \rangle$  by omitting the decimal separator and leading zeros, and rounding to 16 significant digits, filling with trailing zeros if necessary. In particular, the value stored is exact if the input  $\langle significand \rangle$  has at most 16 digits. The stored  $\langle exponent \rangle$  is obtained by combining the input  $\langle exponent \rangle$  (0 if absent) with a shift depending on the position of the significand and the number of leading zeros.

A special case arises if the resulting  $\langle exponent \rangle$  is either too large or too small for the floating point number to be represented. This results either in an overflow (the number is then replaced by  $\pm\infty$ ), or an underflow (resulting in  $\pm 0$ ).

The result is thus  $\pm 0$  if and only if  $\langle significand \rangle$  contains no non-zero digit (*i.e.*, consists only in characters 0, and an optional period), or if there is an underflow. Note that a single dot is currently a valid floating point number, equal to +0, but that is not guaranteed to remain true.

The  $\langle significand \rangle$  must be non-empty, so e1 and e-1 are not valid floating point numbers. Note that the latter could be mistaken with the difference of “e” and 1. To avoid confusions, the base of natural logarithms cannot be input as e and should be input as exp(1) or \c\_e\_fp (which is faster).

Special numbers are input as follows:

- **inf** represents  $+\infty$ , and can be preceded by any  $\langle sign \rangle$ , yielding  $\pm\infty$  as appropriate.
- **nan** represents a (quiet) non-number. It can be preceded by any sign, but that sign is ignored.
- Any unrecognizable string triggers an error, and produces a **nan**.
- Note that commands such as \infty, \pi, or \sin do not work in floating point expressions. They may silently be interpreted as completely unexpected numbers, because integer constants (allowed in expressions) are commonly stored as mathematical characters.

### 29.12.2 Precedence of operators

We list here all the operations supported in floating point expressions, in order of decreasing precedence: operations listed earlier bind more tightly than operations listed below them.

- Function calls (**sin**, **ln**, etc).
- Binary **\*\*** and **^** (right associative).
- Unary **+**, **-**, **!**.

- Implicit multiplication by juxtaposition (`2pi`) when neither factor is in parentheses.
- Binary `*` and `/`, implicit multiplication by juxtaposition with parentheses (for instance `3(4+5)`).
- Binary `+` and `-`.
- Comparisons `>=`, `!=`, `<?`, etc.
- Logical `and`, denoted by `&&`.
- Logical `or`, denoted by `||`.
- Ternary operator `?:` (right associative).
- Comma (to build tuples).

The precedence of operations can be overridden using parentheses. In particular, the precedence of juxtaposition implies that

$$\begin{aligned} 1/2\text{pi} &= 1/(2\pi), \\ 1/2\text{pi}(\text{pi} + \text{pi}) &= (2\pi)^{-1}(\pi + \pi) \simeq 1, \\ \sin 2\text{pi} &= \sin(2)\pi \neq 0, \\ 2^{\wedge} 2\max(3, 5) &= 2^2 \max(3, 5) = 20, \\ 1\text{in}/1\text{cm} &= (1\text{in})/(1\text{cm}) = 2.54. \end{aligned}$$

Functions are called on the value of their argument, contrarily to `TEX` macros.

### 29.12.3 Operations

We now present the various operations allowed in floating point expressions, from the lowest precedence to the highest. When used as a truth value, a floating point expression is `false` if it is  $\pm 0$ , and `true` otherwise, including when it is `nan` or a tuple such as  $(0, 0)$ . Tuples are only supported to some extent by operations that work with truth values (`?:`, `||`, `&&`, `!`), by comparisons (`!<=>?`), and by `+`, `-`, `*`, `/`. Unless otherwise specified, providing a tuple as an argument of any other operation yields the “invalid operation” exception and a `nan` result.

---

`?:` `\fp_eval:n { <operand1> ? <operand2> : <operand3> }`

The ternary operator `?:` results in `<operand2>` if `<operand1>` is true (not  $\pm 0$ ), and `<operand3>` if `<operand1>` is false ( $\pm 0$ ). All three `<operands>` are evaluated in all cases; they may be tuples. The operator is right associative, hence

```
\fp_eval:n
{
  1 + 3 > 4 ? 1 :
  2 + 4 > 5 ? 2 :
  3 + 5 > 6 ? 3 : 4
}
```

first tests whether  $1 + 3 > 4$ ; since this isn’t true, the branch following `:` is taken, and  $2 + 4 > 5$  is compared; since this is true, the branch before `:` is taken, and everything else is (evaluated then) ignored. That allows testing for various cases in a concise manner, with the drawback that all computations are made in all cases.

|| \fp\_eval:n { <math>\langle operand\_1 \rangle || \langle operand\_2 \rangle </math> }

If <math>\langle operand\_1 \rangle</math> is true (not  $\pm 0$ ), use that value, otherwise the value of <math>\langle operand\_2 \rangle</math>. Both <math>\langle operands \rangle</math> are evaluated in all cases; they may be tuples. In <math>\langle operand\_1 \rangle || \langle operand\_2 \rangle || \dots || \langle operands\_n \rangle</math>, the first true (nonzero) <math>\langle operand \rangle</math> is used and if all are zero the last one ( $\pm 0$ ) is used.

&& \fp\_eval:n { <math>\langle operand\_1 \rangle \&& \langle operand\_2 \rangle </math> }

If <math>\langle operand\_1 \rangle</math> is false (equal to  $\pm 0$ ), use that value, otherwise the value of <math>\langle operand\_2 \rangle</math>. Both <math>\langle operands \rangle</math> are evaluated in all cases; they may be tuples. In <math>\langle operand\_1 \rangle \&& \langle operand\_2 \rangle \&& \dots \&& \langle operands\_n \rangle</math>, the first false ( $\pm 0$ ) <math>\langle operand \rangle</math> is used and if none is zero the last one is used.

---

```
<     \fp_eval:n
=         {
>             <math>\langle operand_1 \rangle \langle relation_1 \rangle</math>
?
>             ...
?             <math>\langle operand_N \rangle \langle relation_N \rangle</math>
?             <math>\langle operand_{N+1} \rangle</math>
}
```

Updated: 2013-12-14

Each <math>\langle relation \rangle</math> consists of a non-empty string of <code><></code>, <code>=</code>, <code>></code>, and <code>?</code>, optionally preceded by !, and may not start with ?. This evaluates to +1 if all comparisons <math>\langle operand\_i \rangle \langle relation\_i \rangle \langle operand\_{i+1} \rangle</math> are true, and +0 otherwise. All <math>\langle operands \rangle</math> are evaluated (once) in all cases. See \fp\_compare:nTF for details.

-  
+ \fp\_eval:n { <math>\langle operand\_1 \rangle + \langle operand\_2 \rangle </math> }  
- \fp\_eval:n { <math>\langle operand\_1 \rangle - \langle operand\_2 \rangle </math> }

Computes the sum or the difference of its two <math>\langle operands \rangle</math>. The “invalid operation” exception occurs for  $\infty - \infty$ . “Underflow” and “overflow” occur when appropriate. These operations supports the itemwise addition or subtraction of two tuples, but if they have a different number of items the “invalid operation” exception occurs and the result is nan.

-  
\* \fp\_eval:n { <math>\langle operand\_1 \rangle \* \langle operand\_2 \rangle </math> }  
/ \fp\_eval:n { <math>\langle operand\_1 \rangle / \langle operand\_2 \rangle </math> }

Computes the product or the ratio of its two <math>\langle operands \rangle</math>. The “invalid operation” exception occurs for  $\infty/\infty$ ,  $0/0$ , or  $0 * \infty$ . “Division by zero” occurs when dividing a finite non-zero number by  $\pm 0$ . “Underflow” and “overflow” occur when appropriate. When <math>\langle operand\_1 \rangle</math> is a tuple and <math>\langle operand\_2 \rangle</math> is a floating point number, each item of <math>\langle operand\_1 \rangle</math> is multiplied or divided by <math>\langle operand\_2 \rangle</math>. Multiplication also supports the case where <math>\langle operand\_1 \rangle</math> is a floating point number and <math>\langle operand\_2 \rangle</math> a tuple. Other combinations yield an “invalid operation” exception and a nan result.

-  
+ \fp\_eval:n { + <math>\langle operand \rangle </math> }  
- \fp\_eval:n { - <math>\langle operand \rangle </math> }  
! \fp\_eval:n { ! <math>\langle operand \rangle </math> }

The unary + does nothing, the unary - changes the sign of the <math>\langle operand \rangle</math> (for a tuple, of all its components), and ! <math>\langle operand \rangle</math> evaluates to 1 if <math>\langle operand \rangle</math> is false (is  $\pm 0$ ) and 0 otherwise (this is the not boolean function). Those operations never raise exceptions.

---

**\*\*** `\fp_eval:n { <operand1> ** <operand2> }`  
**^** `\fp_eval:n { <operand1> ^ <operand2> }`

Raises  $\langle operand_1 \rangle$  to the power  $\langle operand_2 \rangle$ . This operation is right associative, hence  $2^{2^3} = 256$ . If  $\langle operand_1 \rangle$  is negative or  $-0$  then: the result's sign is  $+$  if the  $\langle operand_2 \rangle$  is infinite and  $(-1)^p$  if the  $\langle operand_2 \rangle$  is  $p/5^q$  with  $p, q$  integers; the result is  $+0$  if  $\text{abs}(\langle operand_1 \rangle)^\text{>}<\!\! operand_2 \!\!>$  evaluates to zero; in other cases the “invalid operation” exception occurs because the sign cannot be determined. “Division by zero” occurs when raising  $\pm 0$  to a finite strictly negative power. “Underflow” and “overflow” occur when appropriate. If either operand is a tuple, “invalid operation” occurs.

---

**abs** `\fp_eval:n { abs( <fp expr> ) }`

Computes the absolute value of the  $\langle fp \ expr \rangle$ . If the operand is a tuple, “invalid operation” occurs. This operation does not raise exceptions in other cases. See also `\fp_abs:n`.

---

**exp** `\fp_eval:n { exp( <fp expr> ) }`

Computes the exponential of the  $\langle fp \ expr \rangle$ . “Underflow” and “overflow” occur when appropriate. If the operand is a tuple, “invalid operation” occurs.

---

**fact** `\fp_eval:n { fact( <fp expr> ) }`

Computes the factorial of the  $\langle fp \ expr \rangle$ . If the  $\langle fp \ expr \rangle$  is an integer between  $-0$  and  $3248$  included, the result is finite and correctly rounded. Larger positive integers give  $+\infty$  with “overflow”, while  $\text{fact}(+\infty) = +\infty$  and  $\text{fact}(\text{nan}) = \text{nan}$  with no exception. All other inputs give  $\text{nan}$  with the “invalid operation” exception.

---

**ln** `\fp_eval:n { ln( <fp expr> ) }`

Computes the natural logarithm of the  $\langle fp \ expr \rangle$ . Negative numbers have no (real) logarithm, hence the “invalid operation” is raised in that case, including for  $\ln(-0)$ . “Division by zero” occurs when evaluating  $\ln(+0) = -\infty$ . “Underflow” and “overflow” occur when appropriate. If the operand is a tuple, “invalid operation” occurs.

---

**logb** `* \fp_eval:n { logb( <fp expr> ) }`

New: 2018-11-03 Determines the exponent of the  $\langle fp \ expr \rangle$ , namely the floor of the base-10 logarithm of its absolute value. “Division by zero” occurs when evaluating  $\text{logb}(\pm 0) = -\infty$ . Other special values are  $\text{logb}(\pm\infty) = +\infty$  and  $\text{logb}(\text{nan}) = \text{nan}$ . If the operand is a tuple or is  $\text{nan}$ , then “invalid operation” occurs and the result is  $\text{nan}$ .

---

**max** `\fp_eval:n { max( <fp expr1> , <fp expr2> , ... ) }`  
**min** `\fp_eval:n { min( <fp expr1> , <fp expr2> , ... ) }`

Evaluates each  $\langle fp \ expr \rangle$  and computes the largest (smallest) of those. If any of the  $\langle fp \ expr \rangle$  is a  $\text{nan}$  or tuple, the result is  $\text{nan}$ . If any operand is a tuple, “invalid operation” occurs; these operations do not raise exceptions in other cases.

---

<code>round</code>	<code>\fp_eval:n { round ( \fp_expr ) }</code>
<code>trunc</code>	<code>\fp_eval:n { round ( \fp_expr_1 ) , \fp_expr_2 ) }</code>
<code>ceil</code>	<code>\fp_eval:n { round ( \fp_expr_1 ) , \fp_expr_2 ) , \fp_expr_3 ) }</code>
<code>floor</code>	Only <code>round</code> accepts a third argument. Evaluates $\langle fp \ expr_1 \rangle = x$ and $\langle fp \ expr_2 \rangle = n$ and $\langle fp \ expr_3 \rangle = t$ then rounds $x$ to $n$ places. If $n$ is an integer, this rounds $x$ to a multiple of $10^{-n}$ ; if $n = +\infty$ , this always yields $x$ ; if $n = -\infty$ , this yields one of $\pm 0$ , $\pm \infty$ , or <code>nan</code> ; if $n = \text{nan}$ , this yields <code>nan</code> ; if $n$ is neither $\pm \infty$ nor an integer, then an “invalid operation” exception is raised. When $\langle fp \ expr_2 \rangle$ is omitted, $n = 0$ , i.e., $\langle fp \ expr_1 \rangle$ is rounded to an integer. The rounding direction depends on the function.

New: 2013-12-14  
Updated: 2015-08-08

---

- `round` yields the multiple of  $10^{-n}$  closest to  $x$ , with ties ( $x$  half-way between two such multiples) rounded as follows. If  $t$  is `nan` (or not given) the even multiple is chosen (“ties to even”), if  $t = \pm 0$  the multiple closest to 0 is chosen (“ties to zero”), if  $t$  is positive/negative the multiple closest to  $\infty/-\infty$  is chosen (“ties towards positive/negative infinity”).
- `floor` yields the largest multiple of  $10^{-n}$  smaller or equal to  $x$  (“round towards negative infinity”);
- `ceil` yields the smallest multiple of  $10^{-n}$  greater or equal to  $x$  (“round towards positive infinity”);
- `trunc` yields a multiple of  $10^{-n}$  with the same sign as  $x$  and with the largest absolute value less than that of  $x$  (“round towards zero”).

“Overflow” occurs if  $x$  is finite and the result is infinite (this can only happen if  $\langle fp \ expr_2 \rangle < -9984$ ). If any operand is a tuple, “invalid operation” occurs.

---

<code>sign</code>	<code>\fp_eval:n { sign( \fp_expr ) }</code>
	Evaluates the $\langle fp \ expr \rangle$ and determines its sign: +1 for positive numbers and for $+\infty$ , -1 for negative numbers and for $-\infty$ , $\pm 0$ for $\pm 0$ , and <code>nan</code> for <code>nan</code> . If the operand is a tuple, “invalid operation” occurs. This operation does not raise exceptions in other cases.

---

<code>sin</code>	<code>\fp_eval:n { sin( \fp_expr ) }</code>
<code>cos</code>	<code>\fp_eval:n { cos( \fp_expr ) }</code>
<code>tan</code>	<code>\fp_eval:n { tan( \fp_expr ) }</code>
<code>cot</code>	<code>\fp_eval:n { cot( \fp_expr ) }</code>
<code>csc</code>	<code>\fp_eval:n { csc( \fp_expr ) }</code>
<code>sec</code>	<code>\fp_eval:n { sec( \fp_expr ) }</code>

---

Updated: 2013-11-17

	Computes the sine, cosine, tangent, cotangent, cosecant, or secant of the $\langle fp \ expr \rangle$ given in radians. For arguments given in degrees, see <code>sind</code> , <code>cosd</code> , etc. Note that since $\pi$ is irrational, $\sin(8\pi)$ is not quite zero, while its analogue $\sin(8 \times 180)$ is exactly zero. The trigonometric functions are undefined for an argument of $\pm \infty$ , leading to the “invalid operation” exception. Additionally, evaluating tangent, cotangent, cosecant, or secant at one of their poles leads to a “division by zero” exception. “Underflow” and “overflow” occur when appropriate. If the operand is a tuple, “invalid operation” occurs.
--	--

---

```
sind      \fp_eval:n { sind( <fp expr> ) }
cosd      \fp_eval:n { cosd( <fp expr> ) }
tand      \fp_eval:n { tand( <fp expr> ) }
cotd      \fp_eval:n { cotd( <fp expr> ) }
cscd      \fp_eval:n { cscd( <fp expr> ) }
secd      \fp_eval:n { secd( <fp expr> ) }
```

---

**New: 2013-11-02** Computes the sine, cosine, tangent, cotangent, cosecant, or secant of the  $\langle fp \ expr \rangle$  given in degrees. For arguments given in radians, see **sin**, **cos**, etc. Note that since  $\pi$  is irrational,  $\sin(8\pi)$  is not quite zero, while its analogue  $\text{sind}(8 \times 180)$  is exactly zero. The trigonometric functions are undefined for an argument of  $\pm\infty$ , leading to the “invalid operation” exception. Additionally, evaluating tangent, cotangent, cosecant, or secant at one of their poles leads to a “division by zero” exception. “Underflow” and “overflow” occur when appropriate. If the operand is a tuple, “invalid operation” occurs.

---

```
asin      \fp_eval:n { asin( <fp expr> ) }
acos      \fp_eval:n { acos( <fp expr> ) }
acsc      \fp_eval:n { acsc( <fp expr> ) }
asec      \fp_eval:n { asec( <fp expr> ) }
```

---

**New: 2013-11-02** Computes the arcsine, arccosine, arccosecant, or arcsecant of the  $\langle fp \ expr \rangle$  and returns the result in radians, in the range  $[-\pi/2, \pi/2]$  for **asin** and **acsc** and  $[0, \pi]$  for **acos** and **asec**. For a result in degrees, use **asind**, etc. If the argument of **asin** or **acos** lies outside the range  $[-1, 1]$ , or the argument of **acsc** or **asec** inside the range  $(-1, 1)$ , an “invalid operation” exception is raised. “Underflow” and “overflow” occur when appropriate. If the operand is a tuple, “invalid operation” occurs.

---

```
asind     \fp_eval:n { asind( <fp expr> ) }
acosd     \fp_eval:n { acosd( <fp expr> ) }
acscd     \fp_eval:n { acscd( <fp expr> ) }
asecd     \fp_eval:n { aecd( <fp expr> ) }
```

---

**New: 2013-11-02** Computes the arcsine, arccosine, arccosecant, or arcsecant of the  $\langle fp \ expr \rangle$  and returns the result in degrees, in the range  $[-90, 90]$  for **asind** and **acscd** and  $[0, 180]$  for **acosd** and **asecd**. For a result in radians, use **asin**, etc. If the argument of **asind** or **acosd** lies outside the range  $[-1, 1]$ , or the argument of **acscd** or **asecd** inside the range  $(-1, 1)$ , an “invalid operation” exception is raised. “Underflow” and “overflow” occur when appropriate. If the operand is a tuple, “invalid operation” occurs.

---

<code>atan</code>	<code>\fp_eval:n { atan( &lt;fp expr&gt; ) }</code>
<code>acot</code>	<code>\fp_eval:n { atan( &lt;fp expr1&gt; , &lt;fp expr2&gt; ) }</code>
<hr/>	<code>\fp_eval:n { acot( &lt;fp expr&gt; ) }</code>
<code>New: 2013-11-02</code>	<code>\fp_eval:n { acot( &lt;fp expr1&gt; , &lt;fp expr2&gt; ) }</code>

---

Those functions yield an angle in radians: `atand` and `acotd` are their analogs in degrees. The one-argument versions compute the arctangent or arccotangent of the  $\langle fp \ expr \rangle$ : arctangent takes values in the range  $[-\pi/2, \pi/2]$ , and arccotangent in the range  $[0, \pi]$ . The two-argument arctangent computes the angle in polar coordinates of the point with Cartesian coordinates  $(\langle fp \ expr_2 \rangle, \langle fp \ expr_1 \rangle)$ : this is the arctangent of  $\langle fp \ expr_1 \rangle / \langle fp \ expr_2 \rangle$ , possibly shifted by  $\pi$  depending on the signs of  $\langle fp \ expr_1 \rangle$  and  $\langle fp \ expr_2 \rangle$ . The two-argument arccotangent computes the angle in polar coordinates of the point  $(\langle fp \ expr_1 \rangle, \langle fp \ expr_2 \rangle)$ , equal to the arccotangent of  $\langle fp \ expr_1 \rangle / \langle fp \ expr_2 \rangle$ , possibly shifted by  $\pi$ . Both two-argument functions take values in the wider range  $[-\pi, \pi]$ . The ratio  $\langle fp \ expr_1 \rangle / \langle fp \ expr_2 \rangle$  need not be defined for the two-argument arctangent: when both expressions yield  $\pm 0$ , or when both yield  $\pm\infty$ , the resulting angle is one of  $\{\pm\pi/4, \pm 3\pi/4\}$  depending on signs. The “underflow” exception can occur. If any operand is a tuple, “invalid operation” occurs.

---

<code>atand</code>	<code>\fp_eval:n { atand( &lt;fp expr&gt; ) }</code>
<code>acotd</code>	<code>\fp_eval:n { atand( &lt;fp expr1&gt; , &lt;fp expr2&gt; ) }</code>
<hr/>	<code>\fp_eval:n { acotd( &lt;fp expr&gt; ) }</code>
<code>New: 2013-11-02</code>	<code>\fp_eval:n { acotd( &lt;fp expr1&gt; , &lt;fp expr2&gt; ) }</code>

---

Those functions yield an angle in degrees: `atan` and `acot` are their analogs in radians. The one-argument versions compute the arctangent or arccotangent of the  $\langle fp \ expr \rangle$ : arctangent takes values in the range  $[-90, 90]$ , and arccotangent in the range  $[0, 180]$ . The two-argument arctangent computes the angle in polar coordinates of the point with Cartesian coordinates  $(\langle fp \ expr_2 \rangle, \langle fp \ expr_1 \rangle)$ : this is the arctangent of  $\langle fp \ expr_1 \rangle / \langle fp \ expr_2 \rangle$ , possibly shifted by 180 depending on the signs of  $\langle fp \ expr_1 \rangle$  and  $\langle fp \ expr_2 \rangle$ . The two-argument arccotangent computes the angle in polar coordinates of the point  $(\langle fp \ expr_1 \rangle, \langle fp \ expr_2 \rangle)$ , equal to the arccotangent of  $\langle fp \ expr_1 \rangle / \langle fp \ expr_2 \rangle$ , possibly shifted by 180. Both two-argument functions take values in the wider range  $[-180, 180]$ . The ratio  $\langle fp \ expr_1 \rangle / \langle fp \ expr_2 \rangle$  need not be defined for the two-argument arctangent: when both expressions yield  $\pm 0$ , or when both yield  $\pm\infty$ , the resulting angle is one of  $\{\pm 45, \pm 135\}$  depending on signs. The “underflow” exception can occur. If any operand is a tuple, “invalid operation” occurs.

---

<code>sqrt</code>	<code>\fp_eval:n { sqrt( &lt;fp expr&gt; ) }</code>
-------------------	---

---

`New: 2013-12-14` Computes the square root of the  $\langle fp \ expr \rangle$ . The “invalid operation” is raised when the  $\langle fp \ expr \rangle$  is negative or is a tuple; no other exception can occur. Special values yield  $\sqrt{-0} = -0$ ,  $\sqrt{+0} = +0$ ,  $\sqrt{+\infty} = +\infty$  and  $\sqrt{\text{nan}} = \text{nan}$ .

---

**rand** `\fp_eval:n { rand() }`

New: 2016-12-05 Produces a pseudo-random floating-point number (multiple of  $10^{-16}$ ) between 0 included and 1 excluded. This is not available in older versions of X<sub>E</sub>T<sub>E</sub>X. The random seed can be queried using `\sys_rand_seed:` and set using `\sys_gset_rand_seed:n`.

**TeXhackers note:** This is based on pseudo-random numbers provided by the engine's primitive `\pdfuniformdeviate` in pdfT<sub>E</sub>X, pT<sub>E</sub>X, upT<sub>E</sub>X and `\uniformdeviate` in LuaT<sub>E</sub>X and X<sub>E</sub>T<sub>E</sub>X. The underlying code is based on Metapost, which follows an additive scheme recommended in Section 3.6 of "The Art of Computer Programming, Volume 2".

While we are more careful than `\uniformdeviate` to preserve uniformity of the underlying stream of 28-bit pseudo-random integers, these pseudo-random numbers should of course not be relied upon for serious numerical computations nor cryptography.

---

**randint** `\fp_eval:n { randint( <fp expr> ) }`  
`\fp_eval:n { randint( <fp expr1> , <fp expr2> ) }`

New: 2016-12-05 Produces a pseudo-random integer between 1 and  $\langle fp \ expr \rangle$  or between  $\langle fp \ expr_1 \rangle$  and  $\langle fp \ expr_2 \rangle$  inclusive. The bounds must be integers in the range  $(-10^{16}, 10^{16})$  and the first must be smaller or equal to the second. See **rand** for important comments on how these pseudo-random numbers are generated.

---

**inf** The special values  $+\infty$ ,  $-\infty$ , and **nan** are represented as **inf**, **-inf** and **nan** (see `\c_-inf_fp`, `\c_minus_inf_fp` and `\c_nan_fp`).

---

**pi** The value of  $\pi$  (see `\c_pi_fp`).

---

**deg** The value of  $1^\circ$  in radians (see `\c_one_degree_fp`).

---

**em** Those units of measurement are equal to their values in **pt**, namely  
**ex**

<b>in</b>	$1 \text{ in} = 72.27 \text{ pt}$
<b>pt</b>	$1 \text{ pt} = 1 \text{ pt}$
<b>pc</b>	$1 \text{ pc} = 12 \text{ pt}$
<b>cm</b>	$1 \text{ cm} = \frac{1}{2.54} \text{ in} = 28.45275590551181 \text{ pt}$
<b>mm</b>	$1 \text{ mm} = \frac{1}{25.4} \text{ in} = 2.845275590551181 \text{ pt}$
<b>dd</b>	$1 \text{ dd} = 0.376065 \text{ mm} = 1.07000856496063 \text{ pt}$
<b>cc</b>	$1 \text{ cc} = 12 \text{ dd} = 12.84010277952756 \text{ pt}$
<b>nd</b>	$1 \text{ nd} = 0.375 \text{ mm} = 1.066978346456693 \text{ pt}$
<b>nc</b>	$1 \text{ nc} = 12 \text{ nd} = 12.80374015748031 \text{ pt}$
<b>bp</b>	$1 \text{ bp} = \frac{1}{72} \text{ in} = 1.00375 \text{ pt}$
<b>sp</b>	$1 \text{ sp} = 2^{-16} \text{ pt} = 1.52587890625 \times 10^{-5} \text{ pt}.$

---

The values of the (font-dependent) units **em** and **ex** are gathered from TeX when the surrounding floating point expression is evaluated.

---

**true** Other names for 1 and +0.  
**false**

---

---

**\fp\_abs:n** \* **\fp\_abs:n** {*fp expr*}

New: 2012-05-14 Updated: 2012-07-08 Evaluates the *fp expr* as described for **\fp\_eval:n** and leaves the absolute value of the result in the input stream. If the argument is  $\pm\infty$ , **nan** or a tuple, “invalid operation” occurs. Within floating point expressions, **abs()** can be used; it accepts  $\pm\infty$  and **nan** as arguments.

---

**\fp\_max:nn** \* **\fp\_max:nn** {*fp expr<sub>1</sub>*} {*fp expr<sub>2</sub>*}

New: 2012-09-26 Evaluates the *fp exprs* as described for **\fp\_eval:n** and leaves the resulting larger (**max**) or smaller (**min**) value in the input stream. If the argument is a tuple, “invalid operation” occurs, but no other case raises exceptions. Within floating point expressions, **max()** and **min()** can be used.

## 29.13 Disclaimer and roadmap

This module may break if the escape character is among 0123456789\_+, or if it receives a TeX primitive conditional affected by **\exp\_not:N**.

The following need to be done. I’ll try to time-order the items.

- Function to count items in a tuple (and to determine if something is a tuple).
- Decide what exponent range to consider.

- Support signalling `nan`.
- Modulo and remainder, and rounding function `quantize` (and its friends analogous to `trunc`, `ceil`, `floor`).
- `\fp_format:nn {⟨fp expr⟩} {⟨format⟩}`, but what should `⟨format⟩` be? More general pretty printing?
- Add `and`, `or`, `xor`? Perhaps under the names `all`, `any`, and `xor`?
- Add  $\log(x, b)$  for logarithm of  $x$  in base  $b$ .
- `hypot` (Euclidean length). Cartesian-to-polar transform.
- Hyperbolic functions `cosh`, `sinh`, `tanh`.
- Inverse hyperbolics.
- Base conversion, input such as `0xAB.CDEF`.
- Factorial (not with !), gamma function.
- Improve coefficients of the `sin` and `tan` series.
- Treat upper and lower case letters identically in identifiers, and ignore underscores.
- Add an `array(1,2,3)` and `i=complex(0,1)`.
- Provide an experimental `map` function? Perhaps easier to implement if it is a single character, `@sin(1,2)`?
- Provide an `isnan` function analogue of `\fp_if_nan:nTF`?
- Support keyword arguments?

`Pgfmath` also provides box-measurements (depth, height, width), but boxes are not possible expandably.

Bugs, and tests to add.

- Check that functions are monotonic when they should.
- Add exceptions to `?:`, `!<=>?`, `&&`, `||`, and `!`.
- Logarithms of numbers very close to 1 are inaccurate.
- When rounding towards  $-\infty$ , `\dim_to_fp:n {0pt}` should return  $-0$ , not  $+0$ .
- The result of  $(\pm 0) + (\pm 0)$ , of  $x + (-x)$ , and of  $(-x) + x$  should depend on the rounding mode.
- `0e9999999999` gives a `TEX` “number too large” error.
- Subnormals are not implemented.

Possible optimizations/improvements.

- Document that `l3trial/l3fp-types` introduces tools for adding new types.
- In subsection 29.12.1, write a grammar.

- It would be nice if the `parse` auxiliaries for each operation were set up in the corresponding module, rather than centralizing in `l3fp-parse`.
- Some functions should get an `_o` ending to indicate that they expand after their result.
- More care should be given to distinguish expandable/restricted expandable (auxiliary and internal) functions.
- The code for the `ternary` set of functions is ugly.
- There are many `\~` missing in the doc to avoid bad line-breaks.
- The algorithm for computing the logarithm of the significand could be made to use a 5 terms Taylor series instead of 10 terms by taking  $c = 2000/(\lfloor 200x \rfloor + 1) \in [10, 95]$  instead of  $c \in [1, 10]$ . Also, it would then be possible to simplify the computation of  $t$ . However, we would then have to hard-code the logarithms of 44 small integers instead of 9.
- Improve notations in the explanations of the division algorithm (`l3fp-basics`).
- Understand and document `\_fp_basics_pack_weird_low>NNNNw` and `\_fp_basics_pack_weird_high>NNNNNNNNw` better. Move the other `basics_pack` auxiliaries to `l3fp-aux` under a better name.
- Find out if underflow can really occur for trigonometric functions, and redoc as appropriate.
- Add bibliography. Some of Kahan’s articles, some previous TeX fp packages, the international standards,...
- Also take into account the “inexact” exception?
- Support multi-character prefix operators (*e.g.*, `@/` or whatever)?

# Chapter 30

## The **l3fparray** module Fast global floating point arrays

### 30.1 **l3fparray** documentation

For applications requiring heavy use of floating points, this module provides arrays which can be accessed in constant time (contrast **l3seq**, where access time is linear). The interface is very close to that of **l3intarray**. The size of the array is fixed and must be given at point of initialisation

---

`\fparray_new:Nn \fparray_new:Nn <fparray var> {<size>}`

New: 2018-05-05 Evaluates the integer expression `<size>` and allocates an *<floating point array variable>* with that number of (zero) entries. The variable name should start with `\g_` because assignments are always global.

---

`\fparray_count:N * \fparray_count:N <fparray var>`

New: 2018-05-05 Expands to the number of entries in the *<floating point array variable>*. This is performed in constant time.

---

`\fparray_gset:Nnn \fparray_gset:Nnn <fparray var> {<position>} {<value>}`

New: 2018-05-05 Stores the result of evaluating the floating point expression `<value>` into the *<floating point array variable>* at the (integer expression) `<position>`. If the `<position>` is not between 1 and the `\fparray_count:N`, an error occurs. Assignments are always global.

---

`\fparray_gzero:N \fparray_gzero:N <fparray var>`

New: 2018-05-05 Sets all entries of the *<floating point array variable>* to +0. Assignments are always global.

---

`\fparray_item:Nn * \fparray_item:Nn <fparray var> {<position>}`

New: 2018-05-05 Applies `\fp_use:N` or `\fp_to_tl:N` (respectively) to the floating point entry stored at the (integer expression) `<position>` in the *<floating point array variable>*. If the `<position>` is not between 1 and the `\fparray_count:N`, an error occurs.

## Chapter 31

# The `I3bitset` module Bitsets

This module defines and implements the data type `bitset`, a vector of bits. The size of the vector may grow dynamically. Individual bits can be set and unset by names pointing to an index position. The names 1, 2, 3, ... are predeclared and point to the index positions 1, 2, 3,... More names can be added and existing names can be changed. The index is like all other indices in expl3 modules *1-based*. A `bitset` can be output as binary number or—as needed e.g. in a PDF dictionary—as decimal (arabic) number. Currently only a small subset of the functions provided by the `bitset` package are implemented here, mainly the functions needed to use bitsets in PDF dictionaries.

The `bitset` is stored as a string (but one shouldn't rely on the internal representation) and so the vector size is theoretically unlimited, only restricted by TeX-memory. But the functions to set and clear bits use integer functions for the index so bitsets can't be longer than  $2^{31} - 1$ . The export function `\bitset_to_arabic:N` can use functions from the `int` module only if the largest index used for this bitset is smaller than 32, for longer bitsets `fp` is used and this is slower.

## 31.1 Creating bitsets

---

```
\bitset_new:N \bitset_new:N <bitset var>
\bitset_new:c \bitset_new:Nn <bitset var>
\bitset_new:Nn {
  <name1> = <index1> ,
  <name2> = <index2> , ...
}
New: 2023-11-15
```

---

Creates a new *<bitset var>* or raises an error if the name is already taken. The declaration is global. The *<bitset var>* is initially 0.

Bitsets are implemented as string variables consisting of 1's and 0's. The rightmost number is the index position 1, so the string variable can be viewed directly as the binary number. But one shouldn't rely on the internal representation, but use the dedicated `\bitset_to_bin:N` instead to get the binary number.

The name–index pairs given in the second argument of `\bitset_new:Nn` declares names for some indices, which can be used to set and unset bits. The names 1, 2, 3, ... are predeclared and point to the index positions 1, 2, 3, ....

*(index...)* should be a positive number or an *<integer expression>* which evaluates to a positive number. The expression is evaluated when the index is used, not at declaration time. The names *<name...>* should be unique. Using a number as name, e.g. `10=1`, is allowed, it then overwrites the predeclared name 10, but the index position 10 can then only be reached if some other name for it exists, e.g. `ten=10`. It is not necessary to give every index a name, and an index can have more than one name. The named index can be extended or changed with the next function.

---

```
\bitset_addto_named_index:Nn \bitset_addto_named_index:Nn <bitset var>
{
  <name1> = <index1> ,
  <name2> = <index2> , ...
}
New: 2023-11-15
```

---

This extends or changes the name–index pairs for *<bitset var>* globally as described for `\bitset_new:Nn`.

For example after these settings

```
\bitset_new:Nn \l_pdfannot_F_bitset
{
  Invisible      = 1,
  Hidden         = 2,
  Print          = 3,
  NoZoom         = 4,
  NoRotate       = 5,
  NoView         = 6,
  ReadOnly        = 7,
  Locked          = 8,
  ToggleNoView   = 9,
  LockedContents = 10
}
\bitset_addto_named_index:Nn \l_pdfannot_F_bitset
{
```

```
    print = 3
}
```

it is possible to set bit 3 by using any of these alternatives:

```
\bitset_set_true:Nn \l_pdfannot_F_bitset {Print}
\bitset_set_true:Nn \l_pdfannot_F_bitset {print}
\bitset_set_true:Nn \l_pdfannot_F_bitset {3}
```

---

```
\bitset_if_exist_p:N * \bitset_if_exist_p:N <bitset var>
\bitset_if_exist_p:c * \bitset_if_exist:NTF <bitset var> {\<true code>} {\<false code>}
\bitset_if_exist:NTF * Tests whether the <bitset var> exist.
\bitset_if_exist:cTF *
```

New: 2023-11-15

---

## 31.2 Setting and unsetting bits

---

```
\bitset_set_true:Nn \bitset_set_true:Nn <bitset var> {\<name>}
```

This sets the bit of the index position represented by {\<name>} to 1. <name> should be either one of the predeclared names 1, 2, 3, ..., or one of the names added manually. Index position are 1-based. If needed the length of the bit vector is enlarged.

New: 2023-11-15

---

---

```
\bitset_set_false:Nn \bitset_set_false:Nn <bitset var> {\<name>}
```

This unsets the bit of the index position represented by {\<name>} (sets it to 0). <name> should be either one of the predeclared names 1, 2, 3, ..., or one of the names added manually. The index is 1-based. If the index position is larger than the current length of the bit vector nothing happens. If the leading (left most) bit is unset, zeros are not trimmed but stay in the bit vector and are still shown by \bitset\_show:N.

---

```
\bitset_clear:N \bitset_clear:N <bitset var>
```

This resets the bitset to the initial state. The declared names are not changed.

New: 2023-11-15

---

## 31.3 Using bitsets

---

```
\bitset_item:Nn * \bitset_item:Nn <bitset var> {\<name>}
```

---

This outputs 1 if the bit with the index number represented by <name> is set and 0 otherwise. <name> is either one of the predeclared names 1, 2, 3, ..., or one of the names added manually.

New: 2023-11-15

---

---

`\bitset_to_bin:N * \bitset_to_bin:N <bitset var>`

`\bitset_to_bin:c *` This leaves the current value of the bitset expressed as a binary (string) number in the input stream. If no bit has been set yet, the output is zero.  
New: 2023-11-15

---

`\bitset_to_arabic:N * \bitset_to_arabic:N <bitset var>`

`\bitset_to_arabic:c *` This leaves the current value of the bitset expressed as a decimal number in the input stream. If no bit has been set yet, the output is zero. The function uses `\int_from_bin:n` if the largest index that have been set or unset is smaller than 32, and a slower implementation based on `\fp_eval:n` otherwise.  
New: 2023-11-15

---

`\bitset_show:N \bitset_show:N <bitset var>`

`\bitset_show:c` Displays the binary and decimal values of the `<bitset var>` on the terminal.  
New: 2023-11-15

---

`\bitset_log:N \bitset_log:N <bitset var>`

`\bitset_log:c` Writes the binary and decimal values of the `<bitset var>` in the log file.  
New: 2023-11-15

---

`\bitset_show_named_index:N \bitset_show_named_index:N <bitset var>`

`\bitset_show_named_index:c` Displays declared name-index pairs of the `<bitset var>` on the terminal.  
New: 2023-11-15

---

`\bitset_log_named_index:N \bitset_log_named_index:N <bitset var>`

`\bitset_log_named_index:c` Writes declared name-index pairs of the `<bitset var>` in the log file.  
New: 2023-12-11

---

## Chapter 32

# The `\I3cctab` module

## Category code tables

A category code table enables rapid switching of all category codes in one operation. For LuaTeX, this is possible over the entire Unicode range. For other engines, only the 8-bit range (0–255) is covered by such tables. The implementation of category code tables in `expl3` also saves and restores the TeX `\endlinechar` primitive value, meaning they could be used for example to implement `\ExplSyntaxOn`.

### 32.1 Creating and initialising category code tables

---

`\cctab_new:N` `\cctab_new:N` (*category code table*)

`\cctab_new:c` Creates a new *(category code table)* variable or raises an error if the name is already taken. The declaration is global. The *(category code table)* is initialised with the codes as used by iniTeX.

---

`\cctab_const:Nn` `\cctab_const:Nn` (*category code table*) {*(category code set up)*}

`\cctab_const:cn` Creates a new *(category code table)*, applies (in a group) the *(category code set up)* on top of iniTeX settings, then saves them globally as a constant table. The *(category code set up)* can include a call to `\cctab_select:N`.

---

`\cctab_gset:Nn` `\cctab_gset:Nn` (*category code table*) {*(category code set up)*}

`\cctab_gset:cn` Starting from the iniTeX category codes, applies (in a group) the *(category code set up)*, then saves them globally in the *(category code table)*. The *(category code set up)* can include a call to `\cctab_select:N`.

---

`\cctab_gsave_current:N` `\cctab_gsave_current:N` (*category code table*)

`\cctab_gsave_current:c` Saves the current prevailing category codes in the *(category code table)*.

New: 2023-05-26

## 32.2 Using category code tables

`\cctab_begin:N \cctab_begin:N <category code table>`

`\cctab_begin:c` Switches locally the category codes in force to those stored in the `<category code table>`.  
Updated: 2020-07-02 The prevailing codes before the function is called are added to a stack, for use with `\cctab_end:..`. This function does not start a `\TeX` group.

`\cctab_end: \cctab_end:`

Updated: 2020-07-02 Ends the scope of a `<category code table>` started using `\cctab_begin:N`, returning the codes to those in force before the matching `\cctab_begin:N` was used. This must be used within the same `\TeX` group (and at the same `\TeX` group level) as the matching `\cctab_begin:N`.

`\cctab_select:N \cctab_select:N <category code table>`

`\cctab_select:c` Selects the `<category code table>` for the scope of the current group. This is in particular useful in the `<setup>` arguments of `\tl_set_rescan:Nnn`, `\tl_rescan:nn`, `\cctab_const:Nn`, and `\cctab_gset:Nn`.  
New: 2020-05-19 Updated: 2020-07-02

`\cctab_item:Nn * \cctab_item:Nn <category code table> {<int expr>}`

`\cctab_item:cn *` Determines the `<character>` with character code given by the `<int expr>` and expands to its category code specified by the `<category code table>`.  
New: 2021-05-10

## 32.3 Category code table conditionals

`\cctab_if_exist_p:N * \cctab_if_exist_p:N <category code table>`

`\cctab_if_exist_p:c * \cctab_if_exist:NTF <category code table> {<true code>} {<false code>}`

`\cctab_if_exist:NTF *` Tests whether the `<category code table>` is currently defined. This does not check that the `<category code table>` really is a category code table.  
`\cctab_if_exist:cTF *`

## 32.4 Constant and scratch category code tables

`\c_code_cctab`

Category code table for the `\Expl3` code environment; this does *not* include `\`, which is retained as an “other” character. Sets the `\endlinechar` value to 32 (a space).  
Updated: 2020-07-10

`\c_document_cctab`

Category code table for a standard `\TeX` document, as set by the `\TeX` kernel. In particular, the upper-half of the 8-bit range will be set to “active” with `\pdfTeX` *only*. No babel shorthands will be activated. Sets the `\endlinechar` value to 13 (normal line ending).  
Updated: 2020-07-08

---

**\c\_initex\_cctab** Category code table as set up by iniTeX.

Updated: 2020-07-02

---

**\c\_other\_cctab** Category code table where all characters have category code 12 (other). Sets the `\endlinechar` value to `-1`.

Updated: 2020-07-02

---

**\c\_str\_cctab** Category code table where all characters have category code 12 (other) with the exception of spaces, which have category code 10 (space). Sets the `\endlinechar` value to `-1`.

Updated: 2020-07-02

---

**\g\_tmpa\_cctab** Scratch category code tables.

**\g\_tmpb\_cctab**

New: 2023-05-26

**Text manipulation**

## Chapter 33

# The `I3unicode` module Unicode support functions

This module provides Unicode-specific functions along with loading data from a range of Unicode Consortium files. Most of the code here is internal, but there are a small set of public functions. These work with Unicode *(codepoints)* and are designed to give useable results with both Unicode-aware and 8-bit engines.

---

```
\codepoint_generate:nn ∗ \codepoint_generate:nn {⟨codepoint⟩} {⟨catcode⟩}
```

---

New: 2022-10-09

Updated: 2022-11-09

Generates one or more character tokens representing the ⟨codepoint⟩. With Unicode engines, exactly one character token will be generated, and this will have the ⟨catcode⟩ specified as the second argument:

- 1 (begin group)
- 2 (end group)
- 3 (math toggle)
- 4 (alignment)
- 6 (parameter)
- 7 (math superscript)
- 8 (math subscript)
- 10 (space)
- 11 (letter)
- 12 (other)
- 13 (active)

For 8-bit engines, between one and four character tokens will be produced: these will be the bytes of the UTF-8 representation of the ⟨codepoint⟩. For all codepoints outside of the classical ASCII range, the generated character tokens will be active (category code 13); for codepoints in the ASCII range, the given ⟨catcode⟩ will be used. To allow the result of this function to be used inside a expansion context, the result is protected by \exp\_not:n.

**TeXhackers note:** Users of (u)pTeX note that these engines are treated as 8-bit in this context. In particular, for upTeX, irrespective of the \kcatcode of the ⟨codepoint⟩, any value outside the ASCII range will result in a series of active bytes being generated.

---

```
\codepoint_str_generate:n ∗ \codepoint_str_generate:n {⟨codepoint⟩}
```

---

New: 2022-10-09

Generates one or more character tokens representing the ⟨codepoint⟩. With Unicode engines, exactly one character token will be generated. For 8-bit engines, between one and four character tokens will be produced: these will be the bytes of the UTF-8 representation of the ⟨codepoint⟩. All of the generated character tokens will be of category code 12, except any spaces (codepoint 32), which will be category code 10.

---

`\codepoint_to_category:n * \codepoint_to_category:n {⟨codepoint⟩}`

New: 2023-06-19

Expands to the Unicode general category identifier of the *⟨codepoint⟩*. The general category identifier is a string made up of two letter characters, the first uppercase and the second lowercase. The uppercase letters divide codepoints into broader groups, which are then refined by the lowercase letter. For example, codepoints representing letters all have identifiers starting L, for example Lu (uppercase letter), Lt (titlecase letter), etc. Full details are available in the documentation provided by the Unicode Consortium: see [https://www.unicode.org/reports/tr44/#General\\_Category\\_Values](https://www.unicode.org/reports/tr44/#General_Category_Values)

---

`\codepoint_to_nfd:n * \codepoint_to_nfd:n {⟨codepoint⟩}`

New: 2022-10-09

Converts the *⟨codepoint⟩* to the Unicode Normalization Form Canonical Decomposition. The generated character(s) will have the current category code as they would if typed in directly for Unicode engines; for 8-bit engines, active characters are used for all codepoints outside of the ASCII range.

## Chapter 34

# The `I3text` module

## Text processing

This module deals with manipulation of (formatted) text; such material is comprised of a restricted set of token list content. The functions provided here concern conversion of textual content for example in case changing, generation of bookmarks and extraction to tags. All of the major functions operate by expansion. Begin-group and end-group tokens in the  $\langle text \rangle$  are normalized and become `{` and `}`, respectively.

### 34.1 Expanding text

---

```
\text_expand:n * \text_expand:n {\langle text \rangle}
```

---

New: 2020-01-02

Updated: 2023-06-09

Takes user input  $\langle text \rangle$  and expands the content. Protected commands (typically formatting) are left in place, and no processing takes place of math mode material (as delimited by pairs given in `\l_text_math_delims_t1` or as the argument to commands listed in `\l_text_math_arg_t1`). Commands which are neither engine- nor L<sup>A</sup>T<sub>E</sub>X protected are expanded exhaustively. Any commands listed in `\l_text_expand_exclude_t1` are excluded from expansion, as are those in `\l_text_case_exclude_arg_t1` and `\l_text_math_arg_t1`.

---

```
\text_declare_expand_equivalent:Nn \text_declare_expand_equivalent:Nn \langle cmd \rangle {\langle replacement \rangle}
```

---

```
\text_declare_expand_equivalent:cn
```

---

New: 2020-01-22

Declares that the  $\langle replacement \rangle$  tokens should be used whenever the  $\langle cmd \rangle$  (a single token) is encountered. The  $\langle replacement \rangle$  tokens should be expandable. A token can be “replaced” by itself if the defined replacement wraps it in `\exp_not:n`, for example

```
\text_declare_expand_equivalent:Nn \' { \exp_not:n { \' } }
```

## 34.2 Case changing

---

```
\text_lowercase:n      * \text_uppercase:n  {\{tokens\}}
\text_uppercase:n      * \text_uppercase:nn {\langle BCP-47\rangle} {\{tokens\}}
\text_titlecase_all:n  * Takes user input <text> first applies \text_expand:n, then transforms the case of char-
\text_titlecase_first:n * acter tokens as specified by the function name. The category code of letters are not
\text_lowercase:nn       * changed by this process when Unicode engines are used; in 8-bit engines, case changed
\text_uppercase:nn       * charters in the ASCII range will have the current prevailing category code, while those
\text_titlecase_all:nn   * outside of it will be represented by active characters.
```

---

New: 2019-11-20

Updated: 2023-07-08

Upper- and lowercase have the obvious meanings. Titlecasing may be regarded informally as converting the first character of the *<tokens>* to uppercase. However, the process is more complex than this as there are some situations where a single lowercase character maps to a special form, for example *ij* in Dutch which becomes *IJ*. There are two functions available for titlecasing: one which applies the change to each “word” and a second which only applies at the start of the input. (Here, “word” boundaries are spaces: at present, full Unicode word breaking is not attempted.)

Importantly, notice that these functions are intended for working with user *text for typesetting*. For case changing programmatic data see the `l3str` module and discussion there of `\str_lowercase:n`, `\str_uppercase:n` and `\str_casfold:n`.

Case changing does not take place within math mode material so for example

```
\text_uppercase:n { Some~text~$y = mx + c$~with~{Braces} }
```

becomes

```
SOME TEXT $y = mx + c$ WITH {BRACES}
```

The first mandatory argument of commands listed in `\l_text_case_exclude_arg_t1` is excluded from case changing; the latter are entirely non-textual content (such as labels).

The standard mappings here follow those defined by the [Unicode Consortium](#) in `UnicodeData.txt` and `SpecialCasing.txt`. For pTeX, only the ASCII range is covered as the engine treats input outside of this range as east Asian.

Locale-sensitive conversions are enabled using the *<BCP-47>* argument, and follow Unicode Consortium guidelines. Currently, the locale strings recognized for special handling are as follows.

- Armenian (`hy` and `hy-x-yiwn`) The setting `hy` maps the codepoint U+0587, the ligature of letters `ech` and `yiwn`, to the codepoints for capital `ech` and `vew` when uppercasing: this follows the spelling reform which is used in Armenia. The alternative `hy-x-yiwn` maps U+0587 to capital `ech` and `yiwn` on uppercasing (also the output if Armenian is not selected at all).
- Azeri and Turkish (`az` and `tr`). The case pairs `I/i-dotless` and `I-dot/i` are activated for these languages. The combining dot mark is removed when lowercasing `I-dot` and introduced when upper casing `i-dotless`.
- German (`de-x-eszett`). An alternative mapping for German in which the lowercase *Eszett* maps to a *großes Eszett*.

- Greek (**e1**). Removes accents from Greek letters when uppercasing; titlecasing leaves accents in place. A variant **e1-x-iota** is available which converts the *ypogegrammeni* (subscript muted iota) to capital iota when uppercasing: the standard version retains the subscript versions.
- Lithuanian (**lt**). The lowercase letters i and j should retain a dot above when the accents grave, acute or tilde are present. This is implemented for lowercasing of the relevant uppercase letters both when input as single Unicode codepoints and when using combining accents. The combining dot is removed when uppercasing in these cases. Note that *only* the accents used in Lithuanian are covered: the behaviour of other accents are not modified.
- Medieval Latin (**la-x-medieval**). The characters u and V are interchanged on case changing.
- Dutch (**n1**). Capitalisation of ij at the beginning of titlecased input produces IJ rather than Ij.

Determining whether non-letter characters at the start of text should count as the uppercase element is controllable. When `\l_text_titlecase_check_letter_bool` is **true**, codepoints which are not letters (Unicode general category L) are not changed, and only the first *letter* is uppercased. When `\l_text_titlecase_check_letter_bool` is **false**, the first codepoint is uppercased, irrespective of the general code of the character.

---

```
\text_declare_case_equivalent:Nn \text_declare_case_equivalent:Nn <cmd> {<replacement>}
```

---

```
\text_declare_case_equivalent:cn
```

---

New: 2022-07-04

---

Declares that the *<replacement>* tokens should be used whenever the *<cmd>* (a single token) is encountered during case changing.

---

```
\text_declare_lowercase_mapping:nn \text_declare_lowercase_mapping:nn {{codepoint}} {<replacement>}
```

---

```
\text_declare_lowercase_mapping:nnn \text_declare_lowercase_mapping:nnn {{BCP-47}} {{codepoint}}
```

---

```
\text_declare_titlecase_mapping:nn {{<replacement>}}
```

---

```
\text_declare_titlecase_mapping:nnn
```

---

```
\text_declare_uppercase_mapping:nn
```

---

```
\text_declare_uppercase_mapping:nnn
```

---

New: 2023-04-11

Updated: 2023-04-20

---

Declares that the *<replacement>* tokens should be used when case mapping the *<codepoint>*, rather than the standard mapping given in the Unicode data files. The **nnn** version takes a BCP-47 tag, which can be used to specify that the customisation only applies to that locale.

---

```
\text_case_switch:nnnn * \text_case_switch:nnnn {{normal}} {{upper}} {{lower}} {{title}}
```

---

New: 2022-07-04

---

Context-sensitive function which will expand to one of the *<normal>*, *<upper>*, *<lower>* or *<title>* tokens depending on the current case changing operation. Outside of case changing, the *<normal>* tokens are produced. Within case changing, the appropriate mapping tokens are inserted.

### 34.3 Removing formatting from text

---

`\text_purify:n ∗ \text_purify:n {⟨text⟩}`

New: 2020-03-05  
Updated: 2020-05-14

Takes user input  $\langle text \rangle$  and expands as described for `\text_expand:n`, then removes all functions from the resulting text. Math mode material (as delimited by pairs given in `\l_text_math_delims_tl` or as the argument to commands listed in `\l_text_math_arg_tl`) is left contained in a pair of \$ delimiters. Non-expandable functions present in the  $\langle text \rangle$  must either have a defined equivalent (see `\text_declare_purify-equivalent:Nn`) or will be removed from the result. Implicit tokens are converted to their explicit equivalent.

---

`\text_declare_purify_equivalent:Nn \text_declare_purify_equivalent:Nn ⟨cmd⟩ {⟨replacement⟩}`  
`\text_declare_purify_equivalent:Ne`

New: 2020-03-05

Declares that the  $\langle replacement \rangle$  tokens should be used whenever the  $\langle cmd \rangle$  (a single token) is encountered. The  $\langle replacement \rangle$  tokens should be expandable.

### 34.4 Control variables

---

`\l_text_math_arg_tl`

Lists commands present in the  $\langle text \rangle$  where the argument of the command should be treated as math mode material. The treatment here is similar to `\l_text_math-delims_tl` but for a command rather than paired delimiters.

---

`\l_text_math_delims_tl`

Lists pairs of tokens which delimit (in-line) math mode content; such content *may* be excluded from processing.

---

`\l_text_case_exclude_arg_tl`

Lists commands where the first mandatory argument is excluded from case changing.

---

`\l_text_expand_exclude_tl`

Lists commands which are excluded from expansion. This protection includes everything up to and including their first braced argument.

---

`\l_text_titlecase_check_letter_bool`

Controls how the start of titlecasing is handled: when `true`, the first *letter* in text is considered. The standard setting is `true`.

## 34.5 Mapping to graphemes

Grapheme splitting is implemented using the algorithm described in Unicode Standard Annex #29. This includes support for extended grapheme clusters. Text starting with a line feed or carriage return character will drop this due to standard TeX processing. At present extended pictograms are not supported: these may be added in a future release.

---

`\text_map_function:nN ☆ \text_map_function:nN <text> {(function)}`

New: 2022-08-04

Takes user input *<text>* and expands as described for `\text_expand:n`, then maps over the *graphemes* within the result, passing each grapheme to the *(function)*. Broadly a grapheme is a “user perceived character”: the Unicode Consortium describe the decomposition of input to graphemes in depth, and the approach used here implements that algorithm. The *(function)* should accept one argument as *(balanced text)*: this may be comprise codepoints or may be a control sequence. With 8-bit engines, the codepoint(s) themselves may of course be made up of multiple bytes: the mapping will pass the correct codepoints independent of the engine in use. See also `\text_map_inline:nn`.

---

`\text_map_inline:nn \text_map_inline:nn <text> {(inline function)}`

New: 2022-08-04

Takes user input *<text>* and expands as described for `\text_expand:n`, then maps over the *graphemes* within the result, passing each grapheme to the *(inline function)*. Broadly a grapheme is a “user perceived character”: the Unicode Consortium describe the decomposition of input to graphemes in depth, and the approach used here implements that algorithm. The *(inline function)* should consist of code which receives the grapheme as *(balanced text)*: this may be comprise codepoints or may be a control sequence. With 8-bit engines, the codepoint(s) themselves may of course be made up of multiple bytes: the mapping will pass the correct codepoints independent of the engine in use. See also `\text_map_function:nN`.

---

`\text_map_break: ☆ \text_map_break:  
\text_map_break:n ☆ \text_map_break:n {(code)}`

New: 2022-08-04

Used to terminate a `\text_map_...` function before all entries in the *<text>* have been processed. This normally takes place within a conditional statement.

**Part VI**  
**Typesetting**

# Chapter 35

## The **I3box** module Boxes

Box variables contain typeset material that can be inserted on the page or in other boxes. Their contents cannot be converted back to lists of tokens. There are three kinds of box operations: horizontal mode denoted with prefix `\hbox_`, vertical mode with prefix `\vbox_`, and the generic operations working in both modes with prefix `\box_`. For instance, a new box variable containing the words “Hello, world!” (in a horizontal box) can be obtained by the following code.

```
\box_new:N \l_hello_box
\hbox_set:Nn \l_hello_box { Hello, ~ world! }
```

The argument is typeset inside a  $\text{\TeX}$  group so that any variables assigned during the construction of this box restores its value afterwards.

Box variables from **I3box** are compatible with those of  $\text{\LaTeX} 2\varepsilon$  and plain  $\text{\TeX}$  and can be used interchangeably. The **I3box** commands to construct boxes, such as `\hbox:n` or `\hbox_set:Nn`, are “color-safe”, meaning that

```
\hbox:n { \color_select:n { blue } Hello, } ~ world!
```

will result in “Hello,” taking the color blue, but “world!” remaining with the prevailing color outside the box.

### 35.1 Creating and initialising boxes

---

```
\box_new:N \box_new:N <box>
```

`\box_new:c` Creates a new `<box>` or raises an error if the name is already taken. The declaration is global. The `<box>` is initially void.

---

```
\box_clear:N \box_clear:N <box>
```

`\box_clear:c` Clears the content of the `<box>` by setting the box equal to `\c_empty_box`.

---

```
\box_gclear:N \box_gclear:c
```

---

`\box_clear_new:N` `\box_clear_new:N <box>`  
`\box_clear_new:c`  
`\box_gclear_new:N`  
`\box_gclear_new:c`

Ensures that the  $\langle box \rangle$  exists globally by applying `\box_new:N` if necessary, then applies `\box_(g)clear:N` to leave the  $\langle box \rangle$  empty.

---

---

`\box_set_eq:NN` `\box_set_eq:NN <box1> <box2>`  
`\box_set_eq:(cN|Nc|cc)`  
`\box_gset_eq:NN`  
`\box_gset_eq:(cN|Nc|cc)`

Sets the content of  $\langle box_1 \rangle$  equal to that of  $\langle box_2 \rangle$ .

---

---

`\box_if_exist_p:N` \* `\box_if_exist_p:N <box>`  
`\box_if_exist_p:c` \* `\box_if_exist:NTF <box> {<true code>} {<false code>}`  
`\box_if_exist:NTF` \* Tests whether the  $\langle box \rangle$  is currently defined. This does not check that the  $\langle box \rangle$  really is a box.

---

New: 2012-03-03

---

## 35.2 Using boxes

---

`\box_use:N` `\box_use:N <box>`  
`\box_use:c`

Inserts the current content of the  $\langle box \rangle$  onto the current list for typesetting. An error is raised if the variable does not exist or if it is invalid.

---

**TeXhackers note:** This is the TeX primitive `\copy`.

---

`\box_move_right:nn` `\box_move_right:nn {<dim expr>} {<box function>}`  
`\box_move_left:nn`

This function operates in vertical mode, and inserts the material specified by the  $\langle box function \rangle$  such that its reference point is displaced horizontally by the given  $\langle dim expr \rangle$  from the reference point for typesetting, to the right or left as appropriate. The  $\langle box function \rangle$  should be a box operation such as `\box_use:N \<box>` or a “raw” box specification such as `\vbox:n { xyz }`.

---

---

`\box_move_up:nn` `\box_move_up:nn {<dim expr>} {<box function>}`  
`\box_move_down:nn`

This function operates in horizontal mode, and inserts the material specified by the  $\langle box function \rangle$  such that its reference point is displaced vertically by the given  $\langle dim expr \rangle$  from the reference point for typesetting, up or down as appropriate. The  $\langle box function \rangle$  should be a box operation such as `\box_use:N \<box>` or a “raw” box specification such as `\vbox:n { xyz }`.

---

### 35.3 Measuring and setting box dimensions

---

`\box_dp:N \box_dp:N <box>`

`\box_dp:c` Calculates the depth (below the baseline) of the `<box>` in a form suitable for use in a `<dim expr>`.

**TeXhackers note:** This is the TeX primitive `\dp`.

---

`\box_ht:N \box_ht:N <box>`

`\box_ht:c` Calculates the height (above the baseline) of the `<box>` in a form suitable for use in a `<dim expr>`.

**TeXhackers note:** This is the TeX primitive `\ht`.

---

`\box_wd:N \box_wd:N <box>`

`\box_wd:c` Calculates the width of the `<box>` in a form suitable for use in a `<dim expr>`.

**TeXhackers note:** This is the TeX primitive `\wd`.

---

`\box_ht_plus_dp:N \box_ht_plus_dp:N <box>`

`\box_ht_plus_dp:c` Calculates the total vertical size (height plus depth) of the `<box>` in a form suitable for use in a `<dim expr>`.  
New: 2021-05-05

---

`\box_set_dp:Nn \box_set_dp:Nn <box> {<dim expr>}`

`\box_set_dp:cn` Set the depth (below the baseline) of the `<box>` to the value of the `{<dim expr>}`.  
`\box_gset_dp:Nn`  
`\box_gset_dp:cn`

Updated: 2019-01-22

---

---

`\box_set_ht:Nn \box_set_ht:Nn <box> {<dim expr>}`

`\box_set_ht:cn` Set the height (above the baseline) of the `<box>` to the value of the `{<dim expr>}`.  
`\box_gset_ht:Nn`  
`\box_gset_ht:cn`

Updated: 2019-01-22

---

---

`\box_set_wd:Nn \box_set_wd:Nn <box> {<dim expr>}`

`\box_set_wd:cn` Set the width of the `<box>` to the value of the `{<dim expr>}`.  
`\box_gset_wd:Nn`  
`\box_gset_wd:cn`

Updated: 2019-01-22

---

## 35.4 Box conditionals

---

\box\_if\_empty\_p:N \* \box\_if\_empty\_p:N ⟨box⟩  
\box\_if\_empty\_p:c \* \box\_if\_empty:NTF ⟨box⟩ {⟨true code⟩} {⟨false code⟩}  
\box\_if\_empty:NTF \* Tests if ⟨box⟩ is a empty (equal to \c\_empty\_box).  
\box\_if\_empty:cTF \*

---

\box\_if\_horizontal\_p:N \* \box\_if\_horizontal\_p:N ⟨box⟩  
\box\_if\_horizontal\_p:c \* \box\_if\_horizontal:NTF ⟨box⟩ {⟨true code⟩} {⟨false code⟩}  
\box\_if\_horizontal:NTF \* Tests if ⟨box⟩ is a horizontal box.  
\box\_if\_horizontal:cTF \*

---

\box\_if\_vertical\_p:N \* \box\_if\_vertical\_p:N ⟨box⟩  
\box\_if\_vertical\_p:c \* \box\_if\_vertical:NTF ⟨box⟩ {⟨true code⟩} {⟨false code⟩}  
\box\_if\_vertical:NTF \* Tests if ⟨box⟩ is a vertical box.  
\box\_if\_vertical:cTF \*

---

## 35.5 The last box inserted

---

\box\_set\_to\_last:N \box\_set\_to\_last:N ⟨box⟩  
\box\_set\_to\_last:c  
\box\_gset\_to\_last:N Sets the ⟨box⟩ equal to the last item (box) added to the current partial list, removing the item from the list at the same time. When applied to the main vertical list, the ⟨box⟩ is always void as it is not possible to recover the last added item.  
\box\_gset\_to\_last:c

---

## 35.6 Constant boxes

---

\c\_empty\_box This is a permanently empty box, which is neither set as horizontal nor vertical.

Updated: 2012-11-04

**TeXhackers note:** At the TeX level this is a void box.

## 35.7 Scratch boxes

---

\l\_tmpa\_box Scratch boxes for local assignment. These are never used by the kernel code, and so are safe for use with any LATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.  
\l\_tmpb\_box  
Updated: 2012-11-04

---

\g\_tmpa\_box Scratch boxes for global assignment. These are never used by the kernel code, and so are safe for use with any LATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.  
\g\_tmpb\_box

## 35.8 Viewing box contents

---

`\box_show:N` `\box_show:N <box>`

`\box_show:c` Shows full details of the content of the `<box>` in the terminal.

Updated: 2012-05-11

---

`\box_show:Nnn` `\box_show:Nnn <box> {<int expr1>} {<int expr2>}`

`\box_show:cnn` Display the contents of `<box>` in the terminal, showing the first `<int expr1>` items of the box, and descending into `<int expr2>` group levels.  
New: 2012-05-11

---

`\box_log:N` `\box_log:N <box>`

`\box_log:c` Writes full details of the content of the `<box>` to the log.

New: 2012-05-11

---

`\box_log:Nnn` `\box_log:Nnn <box> {<int expr1>} {<int expr2>}`

`\box_log:cnn` Writes the contents of `<box>` to the log, showing the first `<int expr1>` items of the box, and descending into `<int expr2>` group levels.  
New: 2012-05-11

---

## 35.9 Boxes and color

All L<sup>A</sup>T<sub>E</sub>X3 boxes are “color safe”: a color set inside the box stops applying after the end of the box has occurred.

## 35.10 Horizontal mode boxes

---

`\hbox:n` `\hbox:n {<contents>}`

Updated: 2017-04-05 Typesets the `<contents>` into a horizontal box of natural width and then includes this box in the current list for typesetting.

---

`\hbox_to_wd:nn` `\hbox_to_wd:nn {<dim expr>} {<contents>}`

Updated: 2017-04-05 Typesets the `<contents>` into a horizontal box of width `<dim expr>` and then includes this box in the current list for typesetting.

---

`\hbox_to_zero:n` `\hbox_to_zero:n {<contents>}`

Updated: 2017-04-05 Typesets the `<contents>` into a horizontal box of zero width and then includes this box in the current list for typesetting.

---

`\hbox_set:Nn` `\hbox_set:Nn <box> {<contents>}`

`\hbox_set:cn` `\hbox_gset:Nn` Typesets the `<contents>` at natural width and then stores the result inside the `<box>`.  
`\hbox_gset:cn`

Updated: 2017-04-05

---

---

\hbox\_set\_to\_wd:Nnn \hbox\_set\_to\_wd:cnn  
\hbox\_gset\_to\_wd:Nnn \hbox\_gset\_to\_wd:cnn

Typesets the *contents* to the width given by the *dim expr* and then stores the result inside the *box*.

Updated: 2017-04-05

---

\hbox\_overlap\_center:n \hbox\_overlap\_center:n {*contents*}

New: 2020-08-25 Typesets the *contents* into a horizontal box of zero width such that material protrudes equally to both sides of the insertion point.

\hbox\_overlap\_right:n \hbox\_overlap\_right:n {*contents*}

Updated: 2017-04-05 Typesets the *contents* into a horizontal box of zero width such that material protrudes to the right of the insertion point.

\hbox\_overlap\_left:n \hbox\_overlap\_left:n {*contents*}

Updated: 2017-04-05 Typesets the *contents* into a horizontal box of zero width such that material protrudes to the left of the insertion point.

---

\hbox\_set:Nw \hbox\_set:cw  
\hbox\_set\_end:  
\hbox\_gset:Nw \hbox\_gset:cw  
\hbox\_gset\_end:

Typesets the *contents* at natural width and then stores the result inside the *box*. In contrast to \hbox\_set:Nn this function does not absorb the argument when finding the *content*, and so can be used in circumstances where the *content* may not be a simple argument.

Updated: 2017-04-05

---

\hbox\_set\_to\_wd:Nnw \hbox\_set\_to\_wd:cnw  
\hbox\_gset\_to\_wd:Nnw \hbox\_gset\_to\_wd:cnw

Typesets the *contents* to the width given by the *dim expr* and then stores the result inside the *box*. In contrast to \hbox\_set\_to\_wd:Nnn this function does not absorb the argument when finding the *content*, and so can be used in circumstances where the *content* may not be a simple argument

New: 2017-06-08

---

\hbox\_unpack:N \hbox\_unpack:N {*box*}  
\hbox\_unpack:c

Unpacks the content of the horizontal *box*, retaining any stretching or shrinking applied when the *box* was set.

**TeXhackers note:** This is the TeX primitive \unhcopy.

## 35.11 Vertical mode boxes

Vertical boxes inherit their baseline from their contents. The standard case is that the baseline of the box is at the same position as that of the last item added to the box. This means that the box has no depth unless the last item added to it had depth. As a result most vertical boxes have a large height value and small or zero depth. The exception are

`_top` boxes, where the reference point is that of the first item added. These tend to have a large depth and small height, although the latter is typically non-zero.

---

`\vbox:n` `\vbox:n {\langle contents \rangle}`

Updated: 2017-04-05 Typesets the `\langle contents \rangle` into a vertical box of natural height and includes this box in the current list for typesetting.

---

`\vbox_top:n` `\vbox_top:n {\langle contents \rangle}`

Updated: 2017-04-05 Typesets the `\langle contents \rangle` into a vertical box of natural height and includes this box in the current list for typesetting. The baseline of the box is equal to that of the *first* item added to the box.

---

`\vbox_to_ht:nn` `\vbox_to_ht:nn {\langle dim expr \rangle} {\langle contents \rangle}`

Updated: 2017-04-05 Typesets the `\langle contents \rangle` into a vertical box of height `\langle dim expr \rangle` and then includes this box in the current list for typesetting.

---

`\vbox_to_zero:n` `\vbox_to_zero:n {\langle contents \rangle}`

Updated: 2017-04-05 Typesets the `\langle contents \rangle` into a vertical box of zero height and then includes this box in the current list for typesetting.

---

`\vbox_set:Nn` `\vbox_set:Nn {\langle box \rangle} {\langle contents \rangle}`

`\vbox_set:cn`  
`\vbox_gset:Nn`  
`\vbox_gset:cn`

Updated: 2017-04-05

Typesets the `\langle contents \rangle` at natural height and then stores the result inside the `\langle box \rangle`.

---

`\vbox_set_top:Nn` `\vbox_set_top:Nn {\langle box \rangle} {\langle contents \rangle}`

`\vbox_set_top:cn`  
`\vbox_gset_top:Nn`  
`\vbox_gset_top:cn`

Updated: 2017-04-05

Typesets the `\langle contents \rangle` at natural height and then stores the result inside the `\langle box \rangle`. The baseline of the box is equal to that of the *first* item added to the box.

---

`\vbox_set_to_ht:Nnn` `\vbox_set_to_ht:Nnn {\langle box \rangle} {\langle dim expr \rangle} {\langle contents \rangle}`

`\vbox_set_to_ht:cnn`  
`\vbox_gset_to_ht:Nnn`  
`\vbox_gset_to_ht:cnn`

Updated: 2017-04-05

Typesets the `\langle contents \rangle` to the height given by the `\langle dim expr \rangle` and then stores the result inside the `\langle box \rangle`.

---

`\vbox_set:Nw` `\vbox_set:Nw {\langle box \rangle} {\langle contents \rangle}` `\vbox_set_end:`

`\vbox_set:cw`  
`\vbox_set_end:`  
`\vbox_gset:Nw`  
`\vbox_gset:cw`  
`\vbox_gset_end:`

Updated: 2017-04-05

Typesets the `\langle contents \rangle` at natural height and then stores the result inside the `\langle box \rangle`. In contrast to `\vbox_set:Nn` this function does not absorb the argument when finding the `\langle content \rangle`, and so can be used in circumstances where the `\langle content \rangle` may not be a simple argument.

---

```
\vbox_set_to_ht:Nnw          \vbox_set_to_ht:Nnw <box> {\<dim expr>} <contents> \vbox_set_end:  
\vbox_set_to_ht:cnw  
\vbox_gset_to_ht:Nnw  
\vbox_gset_to_ht:cnw
```

Typesets the *<contents>* to the height given by the *<dim expr>* and then stores the result inside the *<box>*. In contrast to `\vbox_set_to_ht:Nnn` this function does not absorb the argument when finding the *<content>*, and so can be used in circumstances where the *<content>* may not be a simple argument

New: 2017-06-08

---

```
\vbox_set_split_to_ht>NNn      \vbox_set_split_to_ht>NNn <box1> <box2> {\<dim expr>}  
\vbox_set_split_to_ht:(cNn|Ncn|ccn)  
\vbox_gset_split_to_ht>NNn  
\vbox_gset_split_to_ht:(cNn|Ncn|ccn)
```

Updated: 2018-12-29

---

Sets *<box<sub>1</sub>>* to contain material to the height given by the *<dim expr>* by removing content from the top of *<box<sub>2</sub>>* (which must be a vertical box).

---

```
\vbox_unpack:N \vbox_unpack:N <box>
```

---

```
\vbox_unpack:c
```

Unpacks the content of the vertical *<box>*, retaining any stretching or shrinking applied when the *<box>* was set.

**TExhackers note:** This is the TEx primitive `\unvcopy`.

## 35.12 Using boxes efficiently

The functions above for using box contents work in exactly the same way as for any other `expl3` variable. However, for efficiency reasons, it is also useful to have functions which *drop* box contents on use. When a box is dropped, the box becomes empty at the group level *where the box was originally set* rather than necessarily *at the current group level*. For example, with

```
\hbox_set:Nn \l_tmpa_box { A }  
\group_begin:  
  \hbox_set:Nn \l_tmpa_box { B }  
  \group_begin:  
    \box_use_drop:N \l_tmpa_box  
  \group_end:  
  \box_show:N \l_tmpa_box  
\group_end:  
\box_show:N \l_tmpa_box
```

the first use of `\box_show:N` will show an entirely cleared (void) box, and the second will show the letter A in the box.

These functions should be preferred when the content of the box is no longer required after use. Note that due to the unusual scoping behaviour of `drop` functions they may be applied to both local and global boxes: the latter will naturally be set and thus cleared at a global level.

---

`\box_use_drop:N` `\box_use_drop:N <box>`

`\box_use_drop:c`

Inserts the current content of the `<box>` onto the current list for typesetting then drops the box content. An error is raised if the variable does not exist or if it is invalid. This function may be applied to local or global boxes.

**TeXhackers note:** This is the TeX primitive `\box`.

---

`\box_set_eq_drop:NN` `\box_set_eq_drop:NN <box1> <box2>`

`\box_set_eq_drop:(cN|Nc|cc)`

Sets the content of `<box1>` equal to that of `<box2>`, then drops `<box2>`.

New: 2019-01-17

---

---

`\box_gset_eq_drop:NN` `\box_gset_eq_drop:NN <box1> <box2>`

`\box_gset_eq_drop:(cN|Nc|cc)`

Sets the content of `<box1>` globally equal to that of `<box2>`, then drops `<box2>`.

New: 2019-01-17

---

---

`\hbox_unpack_drop:N` `\hbox_unpack_drop:N <box>`

`\hbox_unpack_drop:c`

Unpacks the content of the horizontal `<box>`, retaining any stretching or shrinking applied when the `<box>` was set. The original `<box>` is then dropped.

**TeXhackers note:** This is the TeX primitive `\unhbox`.

---

`\vbox_unpack_drop:N` `\vbox_unpack_drop:N <box>`

`\vbox_unpack_drop:c`

Unpacks the content of the vertical `<box>`, retaining any stretching or shrinking applied when the `<box>` was set. The original `<box>` is then dropped.

**TeXhackers note:** This is the TeX primitive `\unvbox`.

### 35.13 Affine transformations

Affine transformations are changes which (informally) preserve straight lines. Simple translations are affine transformations, but are better handled in TeX by doing the translation first, then inserting an unmodified box. On the other hand, rotation and resizing of boxed material can best be handled by modifying boxes. These transformations are described here.

---

```
\box_autosize_to_wd_and_ht:Nnn \box_autosize_to_wd_and_ht:Nnn <box> {\<x-size>} {\<y-size>}
```

```
\box_autosize_to_wd_and_ht:cnn
```

```
\box_gautosize_to_wd_and_ht:Nnn
```

```
\box_gautosize_to_wd_and_ht:cnn
```

---

New: 2017-04-04

Updated: 2019-01-22

---

Resizes the  $\langle box \rangle$  to fit within the given  $\langle x\text{-size} \rangle$  (horizontally) and  $\langle y\text{-size} \rangle$  (vertically); both of the sizes are dimension expressions. The  $\langle y\text{-size} \rangle$  is the height only: it does not include any depth. The updated  $\langle box \rangle$  is an **hbox**, irrespective of the nature of the  $\langle box \rangle$  before the resizing is applied. The final size of the  $\langle box \rangle$  is the smaller of  $\{\langle x\text{-size} \rangle\}$  and  $\{\langle y\text{-size} \rangle\}$ , *i.e.* the result fits within the dimensions specified. Negative sizes cause the material in the  $\langle box \rangle$  to be reversed in direction, but the reference point of the  $\langle box \rangle$  is unchanged. Thus a negative  $\langle y\text{-size} \rangle$  results in the  $\langle box \rangle$  having a depth dependent on the height of the original and *vice versa*.

---

```
\box_autosize_to_wd_and_ht_plus_dp:Nnn \box_autosize_to_wd_and_ht_plus_dp:Nnn <box> {\<x-size>} {\<y-size>}
```

```
\box_autosize_to_wd_and_ht_plus_dp:cnn {\<y-size>}
```

```
\box_gautosize_to_wd_and_ht_plus_dp:Nnn
```

```
\box_gautosize_to_wd_and_ht_plus_dp:cnn
```

---

```

New: 2017-04-06

Updated: 2019-01-22

Resizes the  $\langle box \rangle$  to  $\langle x-size \rangle$  (horizontally) and  $\langle y-size \rangle$  (vertically): both of the sizes are dimension expressions. The  $\langle y-size \rangle$  is the total vertical size (height plus depth). The updated  $\langle box \rangle$  is an `hbox`, irrespective of the nature of the  $\langle box \rangle$  before the resizing is applied. Negative sizes cause the material in the  $\langle box \rangle$  to be reversed in direction, but the reference point of the  $\langle box \rangle$  is unchanged. Thus a negative  $\langle y-size \rangle$  results in the  $\langle box \rangle$  having a depth dependent on the height of the original and *vice versa*.

---

```
\box_rotate:Nn \box_rotate:Nn <box> {<angle>}
```

Rotates the  $\langle box \rangle$  by  $\langle angle \rangle$  (in degrees) anti-clockwise about its reference point. The reference point of the updated box is moved horizontally such that it is at the left side of the smallest rectangle enclosing the rotated material. The updated  $\langle box \rangle$  is an hbox, irrespective of the nature of the  $\langle box \rangle$  before the rotation is applied.

---

```
\box_scale:Nnn \box_scale:Nnn <box> {<x-scale>} {<y-scale>}
```

Scales the  $\langle box \rangle$  by factors  $\langle x-scale \rangle$  and  $\langle y-scale \rangle$  in the horizontal and vertical directions, respectively (both scales are integer expressions). The updated  $\langle box \rangle$  is an hbox, irrespective of the nature of the  $\langle box \rangle$  before the scaling is applied. Negative scalings cause the material in the  $\langle box \rangle$  to be reversed in direction, but the reference point of the  $\langle box \rangle$  is unchanged. Thus a negative  $\langle y-scale \rangle$  results in the  $\langle box \rangle$  having a depth dependent on the height of the original and *vice versa*.

### 35.14 Viewing part of a box

---

```
\box_set_clipped:N \box_set_clipped:N <box>
```

Clips the  $\langle box \rangle$  in the output so that only material inside the bounding box is displayed in the output. The updated  $\langle box \rangle$  is an hbox, irrespective of the nature of the  $\langle box \rangle$  before the clipping is applied. Additional box levels are also generated by this operation.

Updated: 2023-04-14

**TeXhackers note:** Clipping is implemented by the driver, and as such the full content of the box is placed in the output file. Thus clipping does not remove any information from the raw output, and hidden material can therefore be viewed by direct examination of the file.

---

```
\box_set_trim:Nnnnn \box_set_trim:Nnnnn <box> {<left>} {<bottom>} {<right>} {<top>}
```

Adjusts the bounding box of the  $\langle box \rangle$ .  $\langle left \rangle$  is removed from the left-hand edge of the bounding box,  $\langle right \rangle$  from the right-hand edge and so forth. All adjustments are  $\langle dim exprs \rangle$ . Material outside of the bounding box is still displayed in the output unless  $\backslash box\_set\_clipped:N$  is subsequently applied. The updated  $\langle box \rangle$  is an hbox, irrespective of the nature of the  $\langle box \rangle$  before the trim operation is applied. Additional box levels are also generated by this operation. The behavior of the operation where the trims requested is greater than the size of the box is undefined.

New: 2019-01-23

---

```
\box_set_viewport:Nnnnn \box_set_viewport:Nnnnn <box> {<llx>} {<lly>} {<urx>} {<ury>}
```

Adjusts the bounding box of the  $\langle box \rangle$  such that it has lower-left co-ordinates ( $\langle llx \rangle$ ,  $\langle lly \rangle$ ) and upper-right co-ordinates ( $\langle urx \rangle$ ,  $\langle ury \rangle$ ). All four co-ordinate positions are  $\langle dim exprs \rangle$ . Material outside of the bounding box is still displayed in the output unless  $\backslash box\_set\_clipped:N$  is subsequently applied. The updated  $\langle box \rangle$  is an hbox, irrespective of the nature of the  $\langle box \rangle$  before the viewport operation is applied. Additional box levels are also generated by this operation.

New: 2019-01-23

## 35.15 Primitive box conditionals

```
\if_hbox:N * \if_hbox:N <box>
    <true code>
\else:
    <false code>
\fi:
```

Tests is  $\langle box \rangle$  is a horizontal box.

**TeXhackers note:** This is the TeX primitive `\ifhbox`.

```
\if_vbox:N * \if_vbox:N <box>
    <true code>
\else:
    <false code>
\fi:
```

Tests is  $\langle box \rangle$  is a vertical box.

**TeXhackers note:** This is the TeX primitive `\ifvbox`.

```
\if_box_empty:N * \if_box_empty:N <box>
    <true code>
\else:
    <false code>
\fi:
```

Tests is  $\langle box \rangle$  is an empty (void) box.

**TeXhackers note:** This is the TeX primitive `\ifvoid`.

# Chapter 36

## The **l3coffins** module Coffin code layer

The material in this module provides the low-level support system for coffins. For details about the design concept of a coffin, see the `xcoffins` module (in the `l3experimental` bundle).

### 36.1 Creating and initialising coffins

---

`\coffin_new:N \coffin_new:N coffin`  
`\coffin_new:c` Creates a new *coffin* or raises an error if the name is already taken. The declaration is global. The *coffin* is initially empty.

New: 2011-08-17

---

`\coffin_clear:N \coffin_clear:N coffin`  
`\coffin_clear:c` Clears the content of the *coffin*.  
`\coffin_gclear:N`  
`\coffin_gclear:c`

New: 2011-08-17  
Updated: 2019-01-21

---

`\coffin_set_eq:NN` `\coffin_set_eq:NN coffin1 coffin2`  
`\coffin_set_eq:(Nc|cN|cc)` Sets both the content and poles of *coffin*<sub>1</sub> equal to those of *coffin*<sub>2</sub>.  
`\coffin_gset_eq:NN`  
`\coffin_gset_eq:(Nc|cN|cc)`

New: 2011-08-17  
Updated: 2019-01-21

---

`\coffin_if_exist_p:N *` `\coffin_if_exist_p:N coffin`  
`\coffin_if_exist_p:c *` `\coffin_if_exist:NTF coffin {<true code>} {<false code>}`  
`\coffin_if_exist:NTF *` Tests whether the *coffin* is currently defined.

## 36.2 Setting coffin content and poles

---

```
\hcoffin_set:Nn \hcoffin_set:Nn <coffin> {<material>}
```

```
\hcoffin_set:cN
```

```
\hcoffin_gset:Nn
```

```
\hcoffin_gset:cN
```

Typesets the *<material>* in horizontal mode, storing the result in the *<coffin>*. The standard poles for the *<coffin>* are then set up based on the size of the typeset material.

---

New: 2011-08-17

Updated: 2019-01-21

---

---

```
\hcoffin_set:Nw \hcoffin_set:Nw <coffin> <material> \hcoffin_set_end:
```

```
\hcoffin_set:cw
```

```
\hcoffin_set_end:
```

```
\hcoffin_gset:Nw
```

```
\hcoffin_gset:cw
```

```
\hcoffin_gset_end:
```

Typesets the *<material>* in horizontal mode, storing the result in the *<coffin>*. The standard poles for the *<coffin>* are then set up based on the size of the typeset material. These functions are useful for setting the entire contents of an environment in a coffin.

---

New: 2011-09-10

Updated: 2019-01-21

---

---

```
\vcoffin_set:Nnn \vcoffin_set:Nnn <coffin> {<width>} {<material>}
```

```
\vcoffin_set:cnn
```

```
\vcoffin_gset:Nnn
```

```
\vcoffin_gset:cnn
```

Typesets the *<material>* in vertical mode constrained to the given *<width>* and stores the result in the *<coffin>*. The standard poles for the *<coffin>* are then set up based on the size of the typeset material.

---

New: 2011-08-17

Updated: 2019-01-21

---

---

```
\vcoffin_set:Nnw \vcoffin_set:Nnw <coffin> {<width>} <material> \vcoffin_set_end:
```

```
\vcoffin_set:cnw
```

```
\vcoffin_set_end:
```

```
\vcoffin_gset:Nnw
```

```
\vcoffin_gset:cnw
```

```
\vcoffin_gset_end:
```

Typesets the *<material>* in vertical mode constrained to the given *<width>* and stores the result in the *<coffin>*. The standard poles for the *<coffin>* are then set up based on the size of the typeset material. These functions are useful for setting the entire contents of an environment in a coffin.

---

New: 2011-09-10

---

---

```
\coffin_set_horizontal_pole:Nnn \coffin_set_horizontal_pole:Nnn <coffin>
```

```
\coffin_set_horizontal_pole:cnn {<pole>} {<offset>}
```

```
\coffin_gset_horizontal_pole:Nnn
```

```
\coffin_gset_horizontal_pole:cnn
```

---

New: 2012-07-20

Updated: 2019-01-21

---

Sets the *<pole>* to run horizontally through the *<coffin>*. The *<pole>* is placed at the *<offset>* from the baseline of the *<coffin>*. The *<offset>* should be given as a dimension expression.

---

```
\coffin_set_vertical_pole:Nnn \coffin_set_vertical_pole:Nnn <coffin> {<pole>} {<offset>}
\coffin_set_vertical_pole:cnn
\coffin_gset_vertical_pole:Nnn
\coffin_gset_vertical_pole:cnn
```

---

New: 2012-07-20

Updated: 2019-01-21

---

Sets the  $\langle pole \rangle$  to run vertically through the  $\langle coffin \rangle$ . The  $\langle pole \rangle$  is placed at the  $\langle offset \rangle$  from the left-hand edge of the bounding box of the  $\langle coffin \rangle$ . The  $\langle offset \rangle$  should be given as a dimension expression.

---

```
\coffin_reset_poles:N \coffin_reset_poles:N <coffin>
\coffin_greset_poles:N
```

---

New: 2023-05-17

Resets the poles of the  $\langle coffin \rangle$  to the standard set, removing any custom or inherited poles. The poles will therefore be equal to those that would be obtained from `\hcoffin_set:Nn` or similar; the bounding box of the coffin is not reset, so any material outside of the formal bounding box will not influence the poles.

### 36.3 Coffin affine transformations

---

```
\coffin_resize:Nnn \coffin_resize:Nnn <coffin> {<width>} {<total-height>}
```

Resized the  $\langle coffin \rangle$  to  $\langle width \rangle$  and  $\langle total-height \rangle$ , both of which should be given as dimension expressions.

---

Updated: 2019-01-23

---

```
\coffin_rotate:Nn \coffin_rotate:Nn <coffin> {<angle>}
```

Rotates the  $\langle coffin \rangle$  by the given  $\langle angle \rangle$  (given in degrees counter-clockwise). This process rotates both the coffin content and poles. Multiple rotations do not result in the bounding box of the coffin growing unnecessarily.

---

```
\coffin_scale:Nnn \coffin_scale:Nnn <coffin> {<x-scale>} {<y-scale>}
```

Scales the  $\langle coffin \rangle$  by a factors  $\langle x-scale \rangle$  and  $\langle y-scale \rangle$  in the horizontal and vertical directions, respectively. The two scale factors should be given as real numbers.

---

Updated: 2019-01-23

## 36.4 Joining and using coffins

---

<code>\coffin_attach:NnnNnnnn \coffin_attach:(cnnNnnnn Nnnccnnnn cnncnnnn) \coffin_gattach:NnnNnnnn \coffin_gattach:(cnnNnnnn Nnnccnnnn cnncnnnn)</code>	<code>\coffin_attach:NnnNnnnn   ⟨coffin<sub>1</sub>⟩ {⟨coffin<sub>1</sub>-pole<sub>1</sub>⟩} {⟨coffin<sub>1</sub>-pole<sub>2</sub>⟩}   ⟨coffin<sub>2</sub>⟩ {⟨coffin<sub>2</sub>-pole<sub>1</sub>⟩} {⟨coffin<sub>2</sub>-pole<sub>2</sub>⟩}   {⟨x-offset⟩} {⟨y-offset⟩}</code>
--	--

---

Updated: 2019-01-22

This function attaches  $\langle\text{coffin}_2\rangle$  to  $\langle\text{coffin}_1\rangle$  such that the bounding box of  $\langle\text{coffin}_1\rangle$  is not altered, *i.e.*  $\langle\text{coffin}_2\rangle$  can protrude outside of the bounding box of the coffin. The alignment is carried out by first calculating  $\langle\text{handle}_1\rangle$ , the point of intersection of  $\langle\text{coffin}_1\text{-pole}_1\rangle$  and  $\langle\text{coffin}_1\text{-pole}_2\rangle$ , and  $\langle\text{handle}_2\rangle$ , the point of intersection of  $\langle\text{coffin}_2\text{-pole}_1\rangle$  and  $\langle\text{coffin}_2\text{-pole}_2\rangle$ .  $\langle\text{coffin}_2\rangle$  is then attached to  $\langle\text{coffin}_1\rangle$  such that the relationship between  $\langle\text{handle}_1\rangle$  and  $\langle\text{handle}_2\rangle$  is described by the  $\langle x\text{-offset}\rangle$  and  $\langle y\text{-offset}\rangle$ . The two offsets should be given as dimension expressions.

---

<code>\coffin_join:NnnNnnnn \coffin_join:(cnnNnnnn Nnnccnnnn cnncnnnn) \coffin_gjoin:NnnNnnnn \coffin_gjoin:(cnnNnnnn Nnnccnnnn cnncnnnn)</code>	<code>\coffin_join:NnnNnnnn   ⟨coffin<sub>1</sub>⟩ {⟨coffin<sub>1</sub>-pole<sub>1</sub>⟩} {⟨coffin<sub>1</sub>-pole<sub>2</sub>⟩}   ⟨coffin<sub>2</sub>⟩ {⟨coffin<sub>2</sub>-pole<sub>1</sub>⟩} {⟨coffin<sub>2</sub>-pole<sub>2</sub>⟩}   {⟨x-offset⟩} {⟨y-offset⟩}</code>
--	--

---

Updated: 2019-01-22

This function joins  $\langle\text{coffin}_2\rangle$  to  $\langle\text{coffin}_1\rangle$  such that the bounding box of  $\langle\text{coffin}_1\rangle$  may expand. The new bounding box covers the area containing the bounding boxes of the two original coffins. The alignment is carried out by first calculating  $\langle\text{handle}_1\rangle$ , the point of intersection of  $\langle\text{coffin}_1\text{-pole}_1\rangle$  and  $\langle\text{coffin}_1\text{-pole}_2\rangle$ , and  $\langle\text{handle}_2\rangle$ , the point of intersection of  $\langle\text{coffin}_2\text{-pole}_1\rangle$  and  $\langle\text{coffin}_2\text{-pole}_2\rangle$ .  $\langle\text{coffin}_2\rangle$  is then attached to  $\langle\text{coffin}_1\rangle$  such that the relationship between  $\langle\text{handle}_1\rangle$  and  $\langle\text{handle}_2\rangle$  is described by the  $\langle x\text{-offset}\rangle$  and  $\langle y\text{-offset}\rangle$ . The two offsets should be given as dimension expressions.

---

<code>\coffin_typeset:Nnnnn \coffin_typeset:cnnnn</code>	<code>\coffin_typeset:Nnnnn {coffin} {⟨pole<sub>1</sub>⟩} {⟨pole<sub>2</sub>⟩}   {⟨x-offset⟩} {⟨y-offset⟩}</code>
--	---

---

Updated: 2012-07-20

Typesetting is carried out by first calculating  $\langle\text{handle}\rangle$ , the point of intersection of  $\langle\text{pole}_1\rangle$  and  $\langle\text{pole}_2\rangle$ . The coffin is then typeset in horizontal mode such that the relationship between the current reference point in the document and the  $\langle\text{handle}\rangle$  is described by the  $\langle x\text{-offset}\rangle$  and  $\langle y\text{-offset}\rangle$ . The two offsets should be given as dimension expressions. Typesetting a coffin is therefore analogous to carrying out an alignment where the “parent” coffin is the current insertion point.

## 36.5 Measuring coffins

---

<code>\coffin_dp:N \coffin_dp:N {coffin}</code>	<code>\coffin_dp:c</code>
---	---------------------------

---

Calculates the depth (below the baseline) of the  $\langle\text{coffin}\rangle$  in a form suitable for use in a  $\langle\text{dim expr}\rangle$ .

<code>\coffin_ht:N \coffin_ht:N &lt;coffin&gt;</code>
<code>\coffin_ht:c</code>
Calculates the height (above the baseline) of the <code>&lt;coffin&gt;</code> in a form suitable for use in a <code>&lt;dim expr&gt;</code> .
<code>\coffin_wd:N \coffin_wd:N &lt;coffin&gt;</code>
<code>\coffin_wd:c</code>
Calculates the width of the <code>&lt;coffin&gt;</code> in a form suitable for use in a <code>&lt;dim expr&gt;</code> .

## 36.6 Coffin diagnostics

<code>\coffin_display_handles:Nn \coffin_display_handles:Nn &lt;coffin&gt; {&lt;color&gt;}</code>
<code>\coffin_display_handles:cn</code>
Updated: 2011-09-02

This function first calculates the intersections between all of the `<pole>`s of the `<coffin>` to give a set of `<handles>`. It then prints the `<coffin>` at the current location in the source, with the position of the `<handles>` marked on the coffin. The `<handles>` are labelled as part of this process: the locations of the `<handles>` and the labels are both printed in the `<color>` specified.

<code>\coffin_mark_handle:Nnnn \coffin_mark_handle:Nnnn &lt;coffin&gt; {&lt;pole1&gt;} {&lt;pole2&gt;} {&lt;color&gt;}</code>
<code>\coffin_mark_handle:cnnn</code>
Updated: 2011-09-02

This function first calculates the `<handle>` for the `<coffin>` as defined by the intersection of `<pole1>` and `<pole2>`. It then marks the position of the `<handle>` on the `<coffin>`. The `<handle>` are labelled as part of this process: the location of the `<handle>` and the label are both printed in the `<color>` specified.

<code>\coffin_show_structure:N \coffin_show_structure:N &lt;coffin&gt;</code>
<code>\coffin_show_structure:c</code>
Updated: 2015-08-01

This function shows the structural information about the `<coffin>` in the terminal. The width, height and depth of the typeset material are given, along with the location of all of the poles of the coffin.

Notice that the poles of a coffin are defined by four values: the *x* and *y* co-ordinates of a point that the pole passes through and the *x*- and *y*-components of a vector denoting the direction of the pole. It is the ratio between the later, rather than the absolute values, which determines the direction of the pole.

<code>\coffin_log_structure:N \coffin_log_structure:N &lt;coffin&gt;</code>
<code>\coffin_log_structure:c</code>
New: 2014-08-22

This function writes the structural information about the `<coffin>` in the log file. See also `\coffin_show_structure:N` which displays the result in the terminal.  
Updated: 2015-08-01

<code>\coffin_show:N \coffin_show:N &lt;coffin&gt;</code>
<code>\coffin_show:c \coffin_log:N &lt;coffin&gt;</code>
<code>\coffin_log:N \coffin_log:c</code>
Shows full details of poles and contents of the <code>&lt;coffin&gt;</code> in the terminal or log file. See <code>\coffin_show_structure:N</code> and <code>\box_show:N</code> to show separately the pole structure and the contents. New: 2021-05-11

---

`\coffin_show:Nnn` `\coffin_show:Nnn <coffin> {<int expr1>} {<int expr2>}`  
`\coffin_show:cnn` `\coffin_log:Nnn` `\coffin_log:Nnn <coffin> {<int expr1>} {<int expr2>}`

`\coffin_log:Nnn` Shows poles and contents of the `<coffin>` in the terminal or log file, showing the first `<int expr1>` items in the coffin, and descending into `<int expr2>` group levels. See `\coffin-show_structure:N` and `\box_show:Nnn` to show separately the pole structure and the contents.

New: 2021-05-11

---

## 36.7 Constants and variables

---

`\c_empty_coffin` A permanently empty coffin.

---

`\l_tmpa_coffin` Scratch coffins for local assignment. These are never used by the kernel code, and so  
`\l_tmpb_coffin` are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by  
New: 2012-06-19 other non-kernel code and so should only be used for short-term storage.

---

`\g_tmpa_coffin` Scratch coffins for global assignment. These are never used by the kernel code, and so  
`\g_tmpb_coffin` are safe for use with any L<sup>A</sup>T<sub>E</sub>X3-defined function. However, they may be overwritten by  
New: 2019-01-24 other non-kernel code and so should only be used for short-term storage.

---

# Chapter 37

## The `I3color` module Color support

### 37.1 Color in boxes

Controlling the color of text in boxes requires a small number of control functions, so that the boxed material uses the color at the point where it is set, rather than where it is used.

---

```
\color_group_begin: \color_group_begin:  
\color_group_end: ...  
New: 2011-09-03
```

---

Creates a color group: one used to “trap” color settings. This grouping is built in to for example `\hbox_set:Nn`.

---

```
\color_ensure_current: \color_ensure_current:
```

---

New: 2011-09-03 Ensures that material inside a box uses the foreground color at the point where the box is set, rather than that in force when the box is used. This function should usually be used within a `\color_group_begin: ... \color_group_end:` group.

### 37.2 Color models

A color *model* is a way to represent sets of colors. Different models are particularly suitable for different output methods, *e.g.* screen or print. Parameter-based models can describe a very large number of unique colors, and have a varying number of *axes* which define a color space. In contrast, various proprietary models are available which define *spot* colors (more formally separations).

Core models are used to pass color information to output; these are “native” to `I3color`. Core models use real numbers in the range [0, 1] to represent values. The core models supported here are

- `gray` Grayscale color, with a single axis running from 0 (fully black) to 1 (fully white)
- `rgb` Red-green-blue color, with three axes, one for each of the components

- **cmyk** Cyan-magenta-yellow-black color, with four axes, one for each of the components

There are also interface models: these are convenient for users but have to be manipulated before storing/passing to the backend. Interface models are primarily integer-based: see below for more detail. The supported interface models are

- **Gray** Grayscale color, with a single axis running from 0 (fully black) to 15 (fully white)
- **hsb** Hue-saturation-brightness color, with three axes, all real values in the range [0, 1] for hue saturation and brightness
- **Hsb** Hue-saturation-brightness color, with three axes, integer in the range [0, 360] for hue, real values in the range [0, 1] for saturation and brightness
- **HSB** Hue-saturation-brightness color, with three axes, integers in the range [0, 240] for hue, saturation and brightness
- **HTML** HTML format representation of RGB color given as a single six-digit hexadecimal number
- **RGB** Red-green-blue color, with three axes, one for each of the components, values as integers from 0 to 255
- **wave** Light wavelength, a real number in the range 380 to 780 (nanometres)

All interface models are internally stored as **rgb**.

Finally, there are a small number of models which are parsed to allow data transfer from **xcolor** but which should not be used by end-users. These are

- **cmy** Cyan-magenta-yellow color with three axes, one for each of the components; converted to **cmyk**
- **tHsb** “Tuned” hue-saturation-brightness color with three axes, integer in the range [0, 360] for hue, real values in the range [0, 1] for saturation and brightness; converted to **rgb** using the standard tuning map defined by **xcolor**
- **&spot** Spot color tint with one value; treated as a gray tint as spot color data is not available for extraction

To allow parsing of data from **xcolor**, any leading model up the first : will be discarded; the approach of selecting an internal form for data is *not* used in **l3color**.

Additional models may be created to allow mixing of separation colors with each other or with those from other models. See Section 37.9 for more detail of color support for additional models.

When color is selected by model, the *(values)* given are specified as a comma-separated list. The length of the list will therefore be determined by the detail of the model involved.

Color models (and interconversion) are complex, and more details are given in the manual to the L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  **xcolor** package and in the *PostScript Language Reference Manual*, published by Addison-Wesley.

### 37.3 Color expressions

In addition to allowing specification of color by model and values, l3color also supports color expressions. These are created by combining one or more color names, with the amount of each specified as a value in the range 0–100. The value should be given between ! symbols in the expression. Thus for example

```
red!50!green
```

is a mixture of 50 % red and 50 % green. A trailing value is interpreted as implicitly followed by !white, and so

```
red!25
```

specifies 25 % red mixed with 75 % white.

Where the models for the mixed colors are different, the model of the first color is used. Thus

```
red!50!cyan
```

will result in a color specification using the `rgb` model, made up of 50 % red and 50 % of cyan *expressed in* `rgb`. This may be important as color model interconversion is not exact.

The one exception to the above is where the first model in an expression is `gray`. In this case, the order of mixing is “swapped” internally, so that for example

```
black!50!red
```

has the same result as

```
red!50!black
```

(the predefined colors `black` and `white` use the `gray` model).

Where more than two colors are mixed in an expression, evaluation takes place in a stepwise fashion. Thus in

```
cyan!50!magenta!10!yellow
```

the sub-expression

```
cyan!50!magenta
```

is first evaluated to give an intermediate color specification, before the second step

```
<intermediate>!10!yellow
```

where `<intermediate>` represents this transitory calculated value.

Within a color expression, . may be used to represent the color active for typesetting (the current color). This allows for example

```
.!50
```

to mean a mixture of 50 % of current color with white.

(Color expressions supported here are a subset of those provided by the L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\epsilon$</sub>  `xcolor` package. At present, only such features as are clearly useful have been added here.)

## 37.4 Named colors

Color names are stored in a single namespace, which makes them accessible as part of color expressions. Whilst they are not reserved in a technical sense, the names `black`, `white`, `red`, `green`, `blue`, `cyan`, `magenta` and `yellow` have special meaning and should not be redefined. Color names should be made up of letters, numbers and spaces only: other characters are reserved for use in color expressions. In particular, `.` represents the current color at the start of a color expression.

---

`\color_set:nn \color_set:nn {<name>} {<color expression>}`

Evaluates the `<color expression>` and stores the resulting color specification as the `<name>`.

---

`\color_set:nnn \color_set:nnn {<name>} {<model(s)>} {<value(s)>}`

Stores the color specification equivalent to the `<model(s)>` and `<values>` as the `<name>`.

---

`\color_set_eq:nn \color_set_eq:nn {<name1>} {<name2>}`

Copies the color specification in `<name2>` to `<name1>`. The special name `.` may be used to represent the current color, allowing it to be saved to a name.

---

`\color_if_exist_p:n * \color_if_exist_p:n {<name>}`

---

`\color_if_exist:nTF * \color_if_exist:nTF {<name>} {<true code>} {<false code>}`

New: 2022-08-12 Tests whether `<name>` is currently defined to provide a color specification.

---

`\color_show:n \color_show:n {<name>}`

---

`\color_log:n \color_log:n {<name>}`

New: 2021-05-11 Displays the color specification stored in the `<name>` on the terminal or log file.

## 37.5 Selecting colors

General selection of color is safe when split across pages: a stack is used to ensure that the correct color is re-selected on the new page.

These commands set the current color (`.`): other more specialised functions such as fill and stroke selectors do *not* adjust this value.

---

`\color_select:n \color_select:n {<color expression>}`

Parses the `<color expression>` and then activates the resulting color specification for typeset material.

---

`\color_select:nn \color_select:nn {<model(s)>} {<value(s)>}`

Activates the color specification equivalent to the `<model(s)>` and `<value(s)>` for typeset material.

---

`\l_color_fixed_model_t1` When this is set to a non-empty value, colors will be converted to the specified model when they are selected. Note that included images and similar are not influenced by this setting.

## 37.6 Colors for fills and strokes

Colors for drawing operations and so forth are split into strokes and fills (the latter may also be referred to as non-stroke color). The fill color is used for text under normal circumstances. Depending on the backend, stroke color may use a *stack*, in which case it exhibits the same page breaking behavior as general color. However, dvips/dvisvgm do not support this, and so color will need to be contained within a scope, such as `\draw_begin:/\draw_end:`.

---

`\color_fill:n` `\color_fill:n {<color expression>}`

`\color_stroke:n` Parses the `<color expression>` and then activates the resulting color specification for filling or stroking.

---

`\color_fill:nn` `\color_fill:nn {<model(s)>} {<value(s)>}`

`\color_stroke:nn` Activates the color specification equivalent to the `<model(s)>` and `<value(s)>` for filling or stroking.

---

`color.sc` When using dvips, this PostScript variables hold the stroke color.

### 37.6.1 Coloring math mode material

Coloring math mode material using `\color_select:nn(n)` has some restrictions and often leads to spacing issues and/or poor input syntax. Avoiding generating `\mathord` atoms whilst coloring only those parts of the input which are required needs careful handling. The functionality here covers this important use case.

---

`\color_math:nn` `\color_math:nn {<color expression>} {<content>}`

`\color_math:nnn` `\color_math:nnn {<model(s)>} {<value(s)>} {<content>}`

New: 2022-01-26 Works as for `\color_select:n(n)` but applies color only to the math mode `<content>`. The function does not generate a group and the `<content>` therefore retains its math atom states. Sub/superscripts are also properly handled.

---

`\l_color_math_active_t1` This list controls which tokens are considered as math active and should therefore be replaced by their definition during searching for sub/superscripts.  
New: 2022-01-26

## 37.7 Multiple color models

When selecting or setting a color with an explicit model, it is possible to give values for more than one model at one time. This is particularly useful where automated conversion between models does not give the desired outcome. To do this, the list of models and list of values are both subdivided using / characters (as for the similar function in xcolor). For example, to save a color with explicit cmyk and rgb values, one could use

```
\color_set:nnn { foo } { cmyk / rgb }
{ 0.1 , 0.2 , 0.3 , 0.4 / 0.1, 0.2 , 0.3 }
```

The manually-specified conversion will be used in preference to automated calculation whenever the model(s) listed are used: both in expressions and when a fixed model is active.

Similarly, the same syntax can be applied to directly selecting a color.

```
\color_select:nn { cmyk / rgb }
{ 0.1 , 0.2 , 0.3 , 0.4 / 0.1, 0.2 , 0.3 }
```

Again, this list is used when a fixed model is active: the first entry is used unless there is a fixed model matching one of the other entries.

## 37.8 Exporting color specifications

The major use of color expressions is in setting typesetting output, but there are other places in which some form of color information is required. These may need data in a different format or using a different model to the internal representation. Thus a set of functions are available to export colors in different formats.

Valid export targets are

- **backend** Two brace groups: the first containing the model, the second containing space-separated values appropriate for the model; this is the format required by backend functions of `expl3`
- **comma-sep-cmyk** Comma-separated cyan-magenta-yellow-black values
- **comma-sep-rgb** Comma-separated red-green-blue values suitable for use as a PDF annotation color
- **HTML** Uppercase two-digit hexadecimal values, expressing a red-green-blue color; the digits are *not* separated
- **space-sep-cmyk** Space-separated cyan-magenta-yellow-black values
- **space-sep-rgb** Space-separated red-green-blue values suitable for use as a PDF annotation color

---

```
\color_export:nnN \color_export:nnN {<color expression>} {<format>} {<t1>}
```

Parses the *<color expression>* as described earlier, then converts to the *<format>* specified and assigns the data to the *<t1>*.

---

```
\color_export:nnnN \color_export:nnnN {<model>} {<value(s)>} {<format>} {<t1>}
```

Expresses the combination of *<model>* and *<value(s)>* in an internal representation, then converts to the *<format>* specified and assigns the data to the *<t1>*.

## 37.9 Creating new color models

Additional color models are required to support specialist workflows, for example those involving separations (see <https://helpx.adobe.com/inDesign/using/spot-process-colors.html> for details of the use of separations in print). Color models may be split into families; for the standard device-based color models (DeviceCMYK, DeviceRGB, DeviceGray), these are synonymous. This is not generally the case: see the PDF reference for more details. (Note that l3color uses the shorter names cmyk, etc.)

---

```
\color_model_new:nnn \color_model_new:nnn {\model} {\family} {\params}
```

Creates a new *<model>* which is derived from the color model *<family>*. The latter should be one of

- **DeviceN**
- **ICCBased**
- **Separation**

(The *<family>* may be given in mixed case as-in the PDF reference: internally, case of these strings is folded.) Depending on the *<family>*, one or more *<params>* are mandatory or optional.

For a **Separation** space, there are three *compulsory* keys.

- **name** The name of the Separation, for example the formal name of a spot color ink. Such a *<name>* may contain spaces, etc., which are not permitted in the *<model>*.
- **alternative-model** An alternative device colorspace, one of **cmyk**, **rgb**, **gray** or **CIELAB**. The three parameter-based models work as described above; see below for details of CIELAB colors.
- **alternative-values** A comma-separated list of values appropriate to the **alternative-model**. This information is used by the PDF application if the **Separation** is not available.

CIELAB color separations are created using the **alternative-model = CIELAB** setting. These colors must also have an **illuminant** key, one of **a**, **c**, **e**, **d50**, **d55**, **d65** or **d75**. The **alternative-values** in this case are the three parameters *L\**, *a\** and *b\** of the CIELAB model. Full details of this device-independent color approach are given in the documentation to the **colorspace** package.

CIELAB colors *cannot* be converted into other device-dependent color spaces, and as such, mixing can only occur if colors set up using the CIELAB model are also given with an alternative parameter-based model. If that is not the case, l3color will fallback to using black as the colorant in any mixing.

For a **DeviceN** space, there is one *compulsory* key.

- **names** The names of the components of the **DeviceN** space. Each should be either the *<name>* of a **Separation** model, a process color name (**cyan**, etc.) or the special name **none**.

For a **ICCBased** space, there is one *compulsory* key.

- **file** The name of the file containing the profile.

### 37.9.1 Color profiles

Color profiles are used to ensure color accuracy by linking to collaboration. Applying a profile can be used to standardise color which is otherwise device-dependence.

---

```
\color_profile_apply:nn \color_profile_apply:nn {<profile>} {<model>}
```

---

New: 2021-02-23 This function applies a *<profile>* to one of the device *<models>*. The profile will then apply to all color of the selected *<model>*. The *<profile>* should specify an ICC profile file. The *<model>* has to be one the standard device models: `cmyk`, `gray` or `rgb`.

# Chapter 38

## The `l3pdf` module Core PDF support

### 38.1 Objects

---

`\pdf_object_new:n` `\pdf_object_new:n {⟨object⟩}`

New: 2022-08-23 Declares `⟨object⟩` as a PDF object. The object may be referenced from this point on, and written later using `\pdf_object_write:nnn`.

---

`\pdf_object_write:nnn` `\pdf_object_write:nn {⟨object⟩} {⟨type⟩} {⟨content⟩}`

`\pdf_object_write:nne` New: 2022-08-23 Writes the `⟨content⟩` as content of the `⟨object⟩`. Depending on the `⟨type⟩` declared for the object, the format required for the `⟨data⟩` will vary

array A space-separated list of values

dict Key-value pairs in the form `/⟨key⟩ ⟨value⟩`

fstream Two brace groups: `⟨file name⟩` and `⟨file content⟩`

stream Two brace groups: `⟨attributes (dictionary)⟩` and `⟨stream contents⟩`

---

`\pdf_object_ref:n *` `\pdf_object_ref:n {⟨object⟩}`

New: 2021-02-10 Inserts the appropriate information to reference the `⟨object⟩` in for example page resource allocation

---

\pdf\_object\_unnamed\_write:n \pdf\_object\_unnamed\_write:n {*type*} {*content*}  
\pdf\_object\_unnamed\_write:ne

---

New: 2021-02-10

Writes the *content* as content of an anonymous object. Depending on the *type*, the format required for the *data* will vary

array A space-separated list of values

dict Key-value pairs in the form /*key* <i>value</i>

fstream Two brace groups: *attributes (dictionary)* and *file name*

stream Two brace groups: *attributes (dictionary)* and *stream contents*

---

\pdf\_object\_ref\_last: \* \pdf\_object\_ref\_last:

---

New: 2021-02-10 Inserts the appropriate information to reference the last *object* created. This is particularly useful for anonymous objects.

---

\pdf\_pageobject\_ref:n \* \pdf\_pagobject\_ref:n {*pageobject*}

---

New: 2021-02-10 Inserts the appropriate information to reference the *pageobject*.

---

\pdf\_object\_if\_exist\_p:n \* \pdf\_object\_if\_exist\_p:n {*object*}  
\pdf\_object\_if\_exist:nTF \* \pdf\_object\_if\_exist:nTF {*object*}

---

New: 2020-05-15 Tests whether an object with name {*object*} has been defined.

## 38.2 Version

---

\pdf\_version\_compare\_p:Nn \* \pdf\_version\_compare\_p:Nn {*comparator*} {*version*}  
\pdf\_version\_compare:NnTF \* \pdf\_version\_compare:NnTF {*comparator*} {*version*} {*true code*} {*false code*}  
New: 2021-02-10

---

Compares the version of the PDF being created with the *version* string specified, using the *comparator*. Either the *true code* or *false code* will be left in the output stream.

---

\pdf\_version\_gset:n \pdf\_version\_gset:n {*version*}

---

\pdf\_version\_min\_gset:n  
New: 2021-02-10 Sets the *version* of the PDF being created. The *min* version will not alter the output version unless it is currently lower than the *version* requested.

This function may only be used up to the point where the PDF file is initialised. With dvips it sets \pdf\_version\_major: and \pdf\_version\_minor: and allows to compare the values with \pdf\_version\_compare:Nn, but the PDF version itself still has to be set with the command line option -dCompatibilityLevel of ps2pdf.

---

\pdf\_version: \* \pdf\_version:  
\pdf\_version\_major: \* Expands to the currently-active PDF version.  
\pdf\_version\_minor: \*

---

New: 2021-02-10

### 38.3 Page (media) size

---

`\pdf_pagesize_gset:nn \pdf_pagesize_gset:nn {width} {height}`

New: 2023-01-14 Sets the page size (mediabox) of the PDF being created to the *width* and *height*, both of which are *dimexpr*.

### 38.4 Compression

---

`\pdf_uncompress: \pdf_uncompress:`

New: 2021-02-10 Disables any compression of the PDF, where possible.

This function may only be used up to the point where the PDF file is initialised.

### 38.5 Destinations

Destinations are the places a link jumped too. Unlike the name may suggest they don't described an exact location in the PDF. Instead a destination contains a reference to a page along with an instruction how to display this page. The normally used "XYZ *top left zoom*" for example instructs the viewer to show the page with the given *zoom* and the top left corner at the *top left* coordinates—which then gives the impression that there is an anchor at this position.

If an instruction takes a coordinate, it is calculated by the following commands relative to the location the command is issued. So to get a specific coordinate one has to move the command to the right place.

---

`\pdf_destination:nn \pdf_destination:nnn {<name>} {<type or integer>}`

New: 2021-01-03

This creates a destination.  $\{<\text{type or integer}>\}$  can be one of `fit`, `fith`, `fitv`, `fitb`, `fitbh`, `fitbv`, `fitr`, `xyz` or an integer representing a scale factor in percent. `fitr` here gives only a lightweight version of `/FitR`: The backend code defines `fitr` so that it will with `pdfLATEX` and `LuaLATEX` use the coordinates of the surrounding box, with `dvips` and `dvipdfmx` it falls back to `fit`. For full control use `\pdf_destination:nnnn`.

The keywords match to the PDF names as described in the following tabular.

Keyword	PDF	Remarks
<code>fit</code>	<code>/Fit</code>	Fits the page to the window
<code>fith</code>	<code>/FitH top</code>	Fits the width of the page to the window
<code>fitv</code>	<code>/FitV left</code>	Fits the height of the page to the window
<code>fitb</code>	<code>/FitB</code>	Fits the page bounding box to the window
<code>fitbh</code>	<code>/FitBH top</code>	Fits the width of the page bounding box to the window.
<code>fitbv</code>	<code>/FitBV left</code>	Fits the height of the page bounding box to the window.
<code>fitr</code>	<code>/FitR left bottom right top</code>	Fits the rectangle specified by the four coordinates to the window (see above for the restrictions)
<code>xyz</code>	<code>/XYZ left top null</code>	Sets a coordinate but doesn't change the zoom.
$\{<\text{integer}>\}$	<code>/XYZ left top zoom</code>	Sets a coordinate and a zoom meaning $\{<\text{integer}>\}\%$ .

---

`\pdf_destination:nnnn \pdf_destination:nnnn {<name>} {<width>} {<height>} {<depth>}`

New: 2021-01-17

This creates a destination with `/FitR` type with the given dimensions relative to the current location. The destination is in a box of size zero, but it doesn't switch to horizontal mode.

## **Part VII**

## **Removals**

**Part VIII**  
**Implementation**

# Chapter 39

## I3bootstrap implementation

```
1 〈*package〉  
2 〈@@=kernel〉
```

### 39.1 The \pdfstrcmp primitive in X<sub>E</sub>T<sub>E</sub>X

Only pdfT<sub>E</sub>X has a primitive called \pdfstrcmp. The X<sub>E</sub>T<sub>E</sub>X version is just \strcmp, so there is some shuffling to do. As this is still a real primitive, using the pdfT<sub>E</sub>X name is “safe”.

```
3  \begingroup\expandafter\expandafter\expandafter\endgroup  
4    \expandafter\ifx\csname pdfstrcmp\endcsname\relax  
5      \let\pdfstrcmp\strcmp  
6    \fi
```

### 39.2 Loading support Lua code

When LuaT<sub>E</sub>X is used there are various pieces of Lua code which need to be loaded. The code itself is defined in I3luatex and is extracted into a separate file. Thus here the task is to load the Lua code both now and (if required) at the start of each job.

```
7  \begingroup\expandafter\expandafter\expandafter\endgroup  
8  \expandafter\ifx\csname directlua\endcsname\relax  
9  \else  
10   \ifnum\luatexversion<110 %  
11   \else
```

For LuaT<sub>E</sub>X we make sure the basic support is loaded: this is only necessary in plain.

```
12   \begingroup\expandafter\expandafter\expandafter\endgroup  
13   \expandafter\ifx\csname newcatcodetable\endcsname\relax  
14     \input{ltluatex} %  
15   \fi  
16   \begingroup\expandafter\expandafter\expandafter\endgroup  
17   \expandafter\ifx\csname newluabytecode\endcsname\relax  
18   \else  
19     \newluabytecode\@expl@luadata@bytecode  
20   \fi  
21   \directlua{require("expl3")}%
```

As the user might be making a custom format, no assumption is made about matching package mode with only loading the Lua code once. Instead, a query to Lua reveals what mode is in operation.

```

22   \ifnum 0%
23     \directlua{
24       if status.ini_version then
25         tex.write("1")
26       end
27     }>0 %
28     \everyjob\expandafter{%
29       \the\expandafter\everyjob
30       \csname\detokenize{lua_now:n}\endcsname{require("expl3")}%
31     }%
32   \fi
33 \fi
34 \fi

```

### 39.3 Engine requirements

The code currently requires  $\varepsilon$ - $\text{\TeX}$ , the set of “pd $\text{\TeX}$  extensions” *including*  $\text{\expanded}$ , and for Unicode engines the ability to generate arbitrary character tokens by expansion. That is covered by all supported engines since  $\text{\TeX}$  Live 2019, which we therefore use as a baseline for engine and  $\text{\LaTeX}$  format support. For  $\text{\LuaTeX}$ , we require at least Lua 5.3 and the `token.set_lua` function. This is available at least since  $\text{\LuaTeX}$  1.10, which again is the one in  $\text{\TeX}$  Live 2019. (u)p $\text{\TeX}$  only gained `\ifincsname` for  $\text{\TeX}$  Live 2020, but at present that primitive is unused in `expl3` so for the present it’s not tested. If and when that changes, we will need to revisit the code here.

```

```

## 39.4 The L<sup>A</sup>T<sub>E</sub>X3 code environment

The code environment is now set up.

**\ExplSyntaxOff** Before changing any category codes, in package mode we need to save the situation before loading. Note the set up here means that once applied `\ExplSyntaxOff` becomes a “do nothing” command until `\ExplSyntaxOn` is used.

```

82 \protected\edef\ExplSyntaxOff
83 {%
84   \protected\def\noexpand\ExplSyntaxOff{}%
85   \catcode 9 = \the\catcode 9\relax
86   \catcode 32 = \the\catcode 32\relax
87   \catcode 34 = \the\catcode 34\relax
88   \catcode 58 = \the\catcode 58\relax
89   \catcode 94 = \the\catcode 94\relax
90   \catcode 95 = \the\catcode 95\relax
91   \catcode 124 = \the\catcode 124\relax
92   \catcode 126 = \the\catcode 126\relax
93   \endlinechar = \the\endlinechar\relax
94   \chardef\csname\detokenize{l__kernel_expl_bool}\endcsname = 0\relax
95 }%

```

(End of definition for `\ExplSyntaxOff`. This function is documented on page 9.)

The code environment is now set up.

```

96 \catcode 9 = 9\relax
97 \catcode 32 = 9\relax
98 \catcode 34 = 12\relax
99 \catcode 58 = 11\relax
100 \catcode 94 = 7\relax
101 \catcode 95 = 11\relax

```

```

102 \catcode 124 = 12\relax
103 \catcode 126 = 10\relax
104 \endlinechar = 32\relax

```

\l\_kernel\_expl\_bool The status for code syntax: this is on at present.

```
105 \chardef\l_kernel_expl_bool = 1\relax
```

(End of definition for \l\_kernel\_expl\_bool.)

**\ExplSyntaxOn** The idea here is that multiple \ExplSyntaxOn calls are not going to mess up category codes, and that multiple calls to \ExplSyntaxOff are also not wasting time. Applying \ExplSyntaxOn alters the definition of \ExplSyntaxOff and so in package mode this function should not be used until after the end of the loading process!

```

106 \protected \def \ExplSyntaxOn
107 {
108     \bool_if:NF \l_kernel_expl_bool
109     {
110         \cs_set_protected:Npe \ExplSyntaxOff
111         {

```

(End of definition for \ExplSyntaxOn. This function is documented on page 9.)

```
137 </package>
```

# Chapter 40

## I3names implementation

138 ⟨\*package & tex⟩

The prefix here is `kernel`. A few places need `@@` to be left as is; this is obtained as `0000`.

139 ⟨`@@=kernel`⟩

The code here simply renames all of the primitives to new, internal, names.

The `\let` primitive is renamed by hand first as it is essential for the entire process to follow. This also uses `\global`, as that way we avoid leaving an unneeded csname in the hash table.

140 `\let \tex_global:D \global`  
141 `\let \tex_let:D \let`

Everything is inside a (rather long) group, which keeps `\_kernel_primitive:NN` trapped.

142 `\begingroup`

`\_kernel_primitive:NN` A temporary function to actually do the renaming.

143 `\long \def \_kernel_primitive:NN #1#2`  
144 `{ \tex_global:D \tex_let:D #2 #1 }`

(End of definition for `\_kernel_primitive:NN`.)

To allow extracting “just the names”, a bit of DocStrip fiddling.

145 ⟨/package & tex⟩  
146 ⟨\*names | tex⟩  
147 ⟨\*names | package⟩

In the current incarnation of this module, all TeX primitives are given a new name of the form `\tex_oldname:D`. But first three special cases which have symbolic original names. These are given modified new names, so that they may be entered without catcode tricks.

148 `\_kernel_primitive:NN \tex_space:D`  
149 `\_kernel_primitive:NN \tex_italiccorrection:D`  
150 `\_kernel_primitive:NN \tex_hyphen:D`

Now all the other primitives.

151 `\_kernel_primitive:NN \tex_above:D`  
152 `\_kernel_primitive:NN \tex_abovedisplayshortskip:D`  
153 `\_kernel_primitive:NN \tex_abovedisplayskip:D`  
154 `\_kernel_primitive:NN \tex_abovewithdelims:D`

```

```

Post-ε-TEX primitives do not always end up with the same name in all engines, if indeed they are available cross-engine anyway. We therefore take the approach of preferring the shortest name that makes sense. First, we deal with the primitives introduced by pdfTEX which directly relate to PDF output: these are copied with the names unchanged.

685  \__kernel_primitive:NN \tagcode                \tex_tagcode:D

```

Post pdfTeX primitive availability gets more complex. Both XeTeX and LuaTeX have varying names for some primitives from pdfTeX. Particularly for LuaTeX tracking all of that would be hard. Instead, we now check that we only save primitives if they actually exist.

```

686  </names | package>
687  (*package)
688    \tex_long:D \tex_def:D \use_i:nn #1#2 {#2}
689    \tex_long:D \tex_def:D \use_none:n #1 { }

696    }
697  </package>
698  (*names | package)

```

Some pdfTeX primitives are handled here because they got dropped in LuaTeX but the corresponding internal names are emulated later. The Lua code is already loaded at this point, so we shouldn't overwrite them.

```

699  \__kernel_primitive:NN \pdfstrcmp                  \tex_strcmp:D

703  \__kernel_primitive:NN \pdffiledump              \tex_filedump:D

```

XeTeX-specific primitives. Note that XeTeX's \strcmp is handled earlier and is “rolled up” into \pdfstrcmp. A few cross-compatibility names which lack the pdf of the original are handled later.

The set of Unicode math primitives were introduced by X<sub>E</sub>T<sub>E</sub>X and LuaT<sub>E</sub>X in a somewhat complex fashion: a few first as \XeTeX... which were then renamed with LuaT<sub>E</sub>X having a lot more. These names now all start \U... and mainly \Umath....

The job is done: close the group (using the primitive renamed!).

```
1224 \tex_endgroup:D
```

L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  moves a few primitives, so these are sorted out. In newer versions of L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub> , expl3 is loaded rather early, so only some primitives are already renamed, so we need two tests here. At the beginning of the L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  format, the primitives \end and \input are renamed, and only later on the other ones.

```

```

The `\shipout` primitive is particularly tricky as a number of packages want to hook in here. First, we see if a sufficiently-new kernel has saved a copy: if it has, just use that. Otherwise, we need to check each of the possible packages/classes that might move it: here, we are looking for those which do *not* delay action to the `\AtBeginDocument` hook. (We cannot use `\primitive` as that doesn't allow us to make a direct copy of the primitive *itself*.) As we know that L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  is in use, we use it's `\@tfor` loop here.

```

Some tidying up is needed for `\(pdf)tracingfonts`. Newer L<sup>A</sup>T<sub>E</sub>X has this simply as `\tracingfonts`, but that is overwritten by the L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  kernel. So any spurious definition has to be removed, then the real version saved either from the pdfTeX name or from L<sup>A</sup>T<sub>E</sub>X. In the latter case, we leave `\@ctracingfonts` available: this might be useful and almost all L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  users will have `expl3` loaded by `fontspec`. (We follow the usual kernel convention that `@` is used for saved primitives.)

1339   \tex_fi:D
1340 
```

In LuaTeX, we additionally emulate some primitives using Lua code.

```
1341 <*lua>
```

**\tex\_strcmp:D** Compare two strings, expanding to 0 if they are equal, -1 if the first one is smaller and 1 if the second one is smaller. Here “smaller” refers to codepoint order which does not correspond to the user expected order for most non-ASCII strings.

```

1342 local minus_tok = token_new(string.byte'-', 12)
1343 local zero_tok = token_new(string.byte'0', 12)
1344 local one_tok = token_new(string.byte'1', 12)
1345 luacmd('tex_strcmp:D', function()
1346   local first = scan_string()
1347   local second = scan_string()
1348   if first < second then
1349     put_next(minus_tok, one_tok)
1350   else
1351     put_next(first == second and zero_tok or one_tok)
1352   end
1353 end, 'global')
```

(End of definition for \tex\_strcmp:D.)

**\tex\_Ucharcat:D** Creating arbitrary chars using `tex.cprint`. The alternative approach using `token.new(...)` is about 10% slower but needed to create arbitrary space tokens.

```

1354 local sprint = tex.sprint
1355 local cprint = tex.cprint
1356 luacmd('tex_Ucharcat:D', function()
1357   local charcode = scan_int()
1358   local catcode = scan_int()
1359   if catcode == 10 then
1360     sprint(token_new(charcode, 10))
```

```

1361     else
1362         cprint(catcode, utf8_char(charcode))
1363     end
1364 end, 'global')

```

(End of definition for \tex\_Ucharcat:D.)

\tex\_filesize:D Wrap the function from ltxutils.

```

1365 luacmd('tex_filesize:D', function()
1366     local size = filesize(scan_string())
1367     if size then write(size) end
1368 end, 'global')

```

(End of definition for \tex\_filesize:D.)

\tex\_mdfivesum:D There are two cases: Either hash a file or a string. Both are already implemented in l3luatex or built-in.

```

1369 luacmd('tex_mdfivesum:D', function()
1370     local hash
1371     if scan_keyword"file" then
1372         hash = filemd5sum(scan_string())
1373     else
1374         hash = md5_HEX(scan_string())
1375     end
1376     if hash then write(hash) end
1377 end, 'global')

```

(End of definition for \tex\_mdfivesum:D.)

\tex\_filemoddate:D A primitive for getting the modification date of a file.

```

1378 luacmd('tex_filemoddate:D', function()
1379     local date = filemoddate(scan_string())
1380     if date then write(date) end
1381 end, 'global')

```

(End of definition for \tex\_filemoddate:D.)

\tex\_filedump:D An emulated primitive for getting a hexdump from a (partial) file. The length has a default of 0. This is consistent with pdfTEX, but it effectively makes the primitive useless without an explicit `length`. Therefore we allow the keyword `whole` to be used instead of a `length`, indicating that the whole remaining file should be read.

```

1382 luacmd('tex_filedump:D', function()
1383     local offset = scan_keyword'offset' and scan_int() or nil
1384     local length = scan_keyword'length' and scan_int()
1385             or not scan_keyword'whole' and 0 or nil
1386     local data = filedump(scan_string(), offset, length)
1387     if data then write(data) end
1388 end, 'global')

```

(End of definition for \tex\_filedump:D.)

1389 ⟨/lua⟩

1390 ⟨/package⟩

# Chapter 41

## I3kernel-functions: kernel-reserved functions

### 41.1 Internal kernel functions

---

\\_\\_kernel\\_chk\\_cs\\_exist:N \\_\\_kernel\\_chk\\_cs\\_exist:N *<cs>*

\\_\\_kernel\\_chk\\_cs\\_exist:c This function is only created if debugging is enabled. It checks that *<cs>* exists according to the criteria for \cs\_if\_exist:p:N, and if not raises a kernel-level error.

---

\\_\\_kernel\\_chk\\_defined:NT \\_\\_kernel\\_chk\\_defined:NT *<variable>* {\i<true code>}

If *<variable>* is not defined (according to \cs\_if\_exist:NTF), this triggers an error, otherwise the *<true code>* is run.

---

\\_\\_kernel\\_chk\\_expr:nNnN \\_\\_kernel\\_chk\\_expr:nNnN {\i<expr>} {\i<eval>} {\i<convert>} {\i<caller>}

This function is only created if debugging is enabled. By default it is equivalent to \use\_i:nnnn. When expression checking is enabled, it leaves in the input stream the result of \tex\_the:D *<eval>* *<expr>* \tex\_relax:D after checking that no token was left over. If any token was not taken as part of the expression, there is an error message displaying the result of the evaluation as well as the *<caller>*. For instance *<eval>* can be \\_\\_int\_eval:w and *<caller>* can be \int\_eval:n or \int\_set:Nn. The argument *<convert>* is empty except for mu expressions where it is \tex\_mutoglu:D, used for internal purposes.

---

\\_\\_kernel\\_chk\\_tl\\_type:NnnT \\_\\_kernel\\_chk\\_tl\\_type:NnnT *<control sequence>* {\i<specific type>} {\i<reconstruction>} {\i<true code>}

Helper to test that the *<control sequence>* is a variable of the given *<specific type>* of token list. Produces suitable error messages if the *<control sequence>* does not exist, or if it is not a token list variable at all, or if the *<control sequence>* differs from the result of e-expanding *<reconstruction>*. If all of these tests succeed then the *<true code>* is run.

---

`\_\_kernel\_codepoint\_to\_bytes:n * \_\_kernel\_codepoint\_to\_bytes:n {\langle codepoint \rangle}`

Converts the  $\langle codepoint \rangle$  to UTF-8 bytes. The expansion of this function comprises four brace groups, each of which will contain a hexadecimal value: the appropriate byte. As UTF-8 is a variable-length, one or more of the groups may be empty: the bytes read in the logical order, such that a two-byte codepoint will have groups #1 and #2 filled and #3 and #4 empty.

---

`\_\_kernel\_cs\_parm\_from\_arg\_count:nnF \_\_kernel\_cs\_parm\_from\_arg\_count:nnF {\langle follow-on \rangle} {\langle args \rangle} {\langle false code \rangle}`

Evaluates the number of  $\langle args \rangle$  and leaves the  $\langle follow-on \rangle$  code followed by a brace group containing the required number of primitive parameter markers (#1, etc.). If the number of  $\langle args \rangle$  is outside the range [0, 9], the  $\langle false code \rangle$  is inserted *instead* of the  $\langle follow-on \rangle$ .

---

`\_\_kernel\_dependency\_version\_check:Nn \_\_kernel\_dependency\_version\_check:Nn {\langle \date \rangle} {\langle file \rangle}`  
`\_\_kernel\_dependency\_version\_check:nn \_\_kernel\_dependency\_version\_check:nn {\langle date \rangle} {\langle file \rangle}`

Checks if the loaded version of the expl3 kernel is at least  $\langle date \rangle$ , required by  $\langle file \rangle$ . If the kernel date is older than  $\langle date \rangle$ , the loading of  $\langle file \rangle$  is aborted and an error is raised.

---

`\_\_kernel\_deprecation\_code:nn \_\_kernel\_deprecation\_code:nn {\langle error code \rangle} {\langle working code \rangle}`

Stores both an  $\langle error \rangle$  and  $\langle working \rangle$  definition for given material such that they can be exchanged by `\debug_on:` and `\debug_off:`.

---

`\_\_kernel\_exp\_not:w * \_\_kernel\_exp\_not:w {\langle expandable tokens \rangle} {\langle content \rangle}`

Carries out expansion on the  $\langle expandable tokens \rangle$  before preventing further expansion of the  $\langle content \rangle$  as for `\exp_not:n`. Typically, the  $\langle expandable tokens \rangle$  will alter the nature of the  $\langle content \rangle$ , i.e. allow it to be generated in some way.

`\l\_\_kernel\_expl\_bool` A boolean which records the current code syntax status: `true` if currently inside a code environment. This variable should only be set by `\ExplSyntaxOn`/`\ExplSyntaxOff`.

(*End of definition for `\l\_\_kernel\_expl\_bool`.*)

`\c\_\_kernel\_expl\_date\_tl` A token list containing the release date of the l3kernel preloaded in L<sup>A</sup>T<sub>E</sub>X 2<sub>E</sub> used to check if dependencies match.

(*End of definition for `\c\_\_kernel\_expl\_date\_tl`.*)

---

`\_\_kernel\_file\_missing:n \_\_kernel\_file\_missing:n {\langle name \rangle}`

Expands the  $\langle name \rangle$  as per `\_\_kernel_file_name_sanitize:n` then produces an error message indicating that this file was not found.

---

`\_\_kernel\_file\_name\_sanitize:n * \_\_kernel\_file\_name\_sanitize:n {\langle name \rangle}`

Updated: 2021-04-17

Expands the file name using a `\csname`-based approach, and relies on active characters (for example from UTF-8 characters) being properly set up to expand to a expansion-safe version using `\ifcsname`. This is less conservative than the token-by-token approach used before, but it is much faster.

---

```
\__kernel_file_input_push:n \__kernel_file_input_push:n {\name}
\__kernel_file_input_pop: \__kernel_file_input_pop:
```

---

Used to push and pop data from the internal file stack: needed only in package mode, where interfacing with the L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  kernel is necessary.

---

```
\__kernel_int_add:nnn * \__kernel_int_add:nnn {\integer_1} {\integer_2} {\integer_3}
```

---

Expands to the result of adding the three  $\langle integers \rangle$  (which must be suitable input for  $\backslash int\_eval:w$ ), avoiding intermediate overflow. Overflow occurs only if the overall result is outside  $[-2^{31}+1, 2^{31}-1]$ . The  $\langle integers \rangle$  may be of the form  $\backslash int\_eval:w \dots \backslash scan\_stop:$  but may be evaluated more than once.

---

```
\__kernel_intarray_gset:Nnn \__kernel_intarray_gset:Nnn {intarray var} {\index} {\value}
```

---

New: 2018-03-31

---

Faster version of  $\backslash intarray_gset:Nnn$ . Stores the  $\langle value \rangle$  into the  $\langle integer\ array\ variable \rangle$  at the  $\langle position \rangle$ . The  $\langle index \rangle$  and  $\langle value \rangle$  must be suitable for a direct assignment to a T<sub>E</sub>X count register, for instance expanding to an integer denotation or obtained through the primitive  $\backslash numexpr$  (which may be un-terminated). No bound checking is performed: the caller is responsible for ensuring that the  $\langle position \rangle$  is between 1 and the  $\backslash intarray_count:N$ , and the  $\langle value \rangle$ 's absolute value is at most  $2^{30}-1$ . Assignments are always global.

---

```
\__kernel_intarray_item:Nn * \__kernel_intarray_item:Nn {intarray var} {\index}
```

---

New: 2018-03-31

---

Faster version of  $\backslash intarray_item:Nn$ . Expands to the integer entry stored at the  $\langle index \rangle$  in the  $\langle integer\ array\ variable \rangle$ . The  $\langle index \rangle$  must be suitable for a direct assignment to a T<sub>E</sub>X count register and must be between 1 and the  $\backslash intarray_count:N$ , lest a low-level T<sub>E</sub>X error occur.

---

```
\__kernel_intarray_range_to_clist:Nnn \__kernel_intarray_range_to_clist:Nnn {intarray var} {\start index} {\end index}
```

---

New: 2020-07-12

---

Converts to integer denotations separated by commas the entries of the  $\langle intarray \rangle$  from positions  $\langle start\ index \rangle$  to  $\langle end\ index \rangle$  included. The  $\langle start\ index \rangle$  and  $\langle end\ index \rangle$  must be suitable for a direct assignment to a T<sub>E</sub>X count register, must be between 1 and the  $\backslash intarray_count:N$ , and be suitably ordered. All tokens have category code other.

---

```
\__kernel_intarray_gset_range_from_clist:Nnn \__kernel_intarray_gset_range_from_clist:Nnn {intarray var} {\start index} {\integer clist}
```

---

New: 2020-07-12

---

Stores the entries of the  $\langle clist \rangle$  as entries of the  $\langle intarray\ var \rangle$  starting from the  $\langle start\ index \rangle$ , upwards. This is done without any bound checking. The  $\langle start\ index \rangle$  and all entries of the  $\langle integer\ comma\ list \rangle$  (which do not undergo space trimming and brace stripping as in normal clist mappings) must be suitable for a direct assignment to a T<sub>E</sub>X count register. An empty entry may stop the loop.

---

`\_\_kernel\_ior\_open:Nn` `\_\_kernel\_ior\_open:Nn` *stream* {*file name*}

`\_\_kernel\_ior\_open:No`

This function has identical syntax to the public version. However, it does not take precautions against active characters in the *file name*, and it does not attempt to add a *path* to the *file name*: it is therefore intended to be used by higher-level functions which have already fully expanded the *file name* and which need to perform multiple open or close operations. See for example the implementation of `\file_get_full_name:nN`,

---

`\_\_kernel\_iow\_with:Nnn` `\_\_kernel\_iow\_with:Nnn` *integer* {*value*} {*code*}

If the *integer* is equal to the *value* then this function simply runs the *code*. Otherwise it saves the current value of the *integer*, sets it to the *value*, runs the *code*, and restores the *integer* to its former value. This is used to ensure that the `\newlinechar` is 10 when writing to a stream, which lets `\iow_newline:` work, and that `\errorcontextlines` is -1 when displaying a message.

`\_\_kernel_kern:n` `\_\_kernel_kern:n` {*length*}

Inserts a kern of the specified *length*, a dimension expression.

(End of definition for `\_\_kernel_kern:n`.)

---

`\_\_kernel_msg_show_eval:Nn` `\_\_kernel_msg_show_eval:Nn` *function* {*expression*}

`\_\_kernel_msg_log_eval:Nn`

Shows or logs the *expression* (turned into a string), an equal sign, and the result of applying the *function* to the {*expression*} (with f-expansion). For instance, if the *function* is `\int_eval:n` and the *expression* is `1+2` then this logs `> 1+2=3`.

`\g\_kernel_prg_map_int`

This integer is used by non-expandable mapping functions to track the level of nesting in force. The functions `\<type>_map_1:w`, `\<type>_map_2:w`, etc., labelled by `\g\_kernel_prg_map_int` hold functions to be mapped over various list datatypes in inline and variable mappings.

(End of definition for `\g\_kernel_prg_map_int`.)

---

`\_\_kernel_quark_new_test:N \_\_kernel_quark_new_test:N \langle name\rangle:\langle arg spec\rangle`

Defines a quark-test function `\langle name\rangle:\langle arg spec\rangle` which tests if its argument is `\q\_\_<namespace>\recursion_tail`, then acts accordingly, as described below for each possible `\langle arg spec\rangle`.

The `\langle namespace\rangle` is determined as the first (nonempty) `_`-delimited word in `\langle name\rangle` and is used internally in the definition of auxiliaries. The function `\_\_kernel_quark_new_test:N` does *not* define the `\q\_\_<namespace>\recursion_tail` and `\q\_\_<namespace>\recursion_stop` quarks. They should be manually defined with `\quark_new:N`.

There are 6 different types of quark-test functions. Which one is defined depends on the `\langle arg spec\rangle`, which *must* be one of the options listed now. Four of them are modeled after `\quark_if_recursion_tail:(N|n)` and `\quark_if_recursion_tail_do:(N|n)n`.

`n` defines `\langle name\rangle:n` such that it checks if #1 contains only `\q\_\_<namespace>\recursion_tail`, and if so consumes all tokens up to `\q\_\_<namespace>\recursion_stop` (*c.f.* `\quark_if_recursion_tail_stop:n`).

`nn` defines `\langle name\rangle:nn` such that it checks if #1 contains only `\q\_\_<namespace>\recursion_tail`, and if so consumes all tokens up to `\q\_\_<namespace>\recursion_stop`, then executes the code #2 after that (*c.f.* `\quark_if_recursion_tail_stop_do:nn`).

`N` defines `\langle name\rangle:N` such that it checks if #1 is `\q\_\_<namespace>\recursion_tail`, and if so consumes all tokens up to `\q\_\_<namespace>\recursion_stop` (*c.f.* `\quark_if_recursion_tail_stop:N`).

`Nn` defines `\langle name\rangle:Nn` such that it checks if #1 is `\q\_\_<namespace>\recursion_tail`, and if so consumes all tokens up to `\q\_\_<namespace>\recursion_stop`, then executes the code #2 after that (*c.f.* `\quark_if_recursion_tail_stop_do:Nn`).

The last two are modeled after `\quark_if_recursion_tail_break:(n|N)N`, and in those cases the quark `\q\_\_<namespace>\recursion_stop` is not used (and thus needs not be defined).

`nN` defines `\langle name\rangle:nN` such that it checks if #1 contains only `\q\_\_<namespace>\recursion_tail`, and if so uses the `\langle type\rangle_map_break:` function #2.

`NN` defines `\langle name\rangle:NN` such that it checks if #1 is `\q\_\_<namespace>\recursion_tail`, and if so uses the `\langle type\rangle_map_break:` function #2.

Any other signature, as well as a function without signature are errors, and in such case the definition is aborted.

---

`\_kernel_quark_new_conditional:Nn \_kernel_quark_new_conditional:Nn  
  \_\_<namespace>_quark_if_<name>:<arg spec> {<conditions>}`

Defines a collection of quark conditionals that test if their argument is the quark `\q_<namespace>_<name>` and perform suitable actions. The `<conditions>` are a comma-separated list of one or more of p, T, F, and TF, and one conditional is defined for each `<condition>` in the list, as described for `\prg_new_conditional:Npnn`. The conditionals are defined using `\prg_new_conditional:Npnn`, so that their name is obtained by adding p, T, F, or TF to the base name `\_\_<namespace>_quark_if_<name>:<arg spec>`.

The first argument of `\_kernel_quark_new_conditional:Nn` must contain `_quark_if_` and `:`, as these markers are used to determine the `<name>` of the quark `\q_<namespace>_<name>` to be tested. This quark should be manually defined with `\quark_new:N`, as `\_kernel_quark_new_conditional:Nn` does *not* define it.

The function `\_kernel_quark_new_conditional:Nn` can define 2 different types of quark conditionals. Which one is defined depends on the `<arg spec>`, which *must* be one of the following options, modeled after `\quark_if_nil:(N|n)(TF)`.

`n` defines `\_\_<namespace>_quark_if_<name>:<n>(TF)` such that it checks if #1 contains only `\q_<namespace>_<name>`, and executes the proper conditional branch.

`N` defines `\_\_<namespace>_quark_if_<name>:<N>(TF)` such that it checks if #1 is `\q_<namespace>_<name>`, and executes the proper conditional branch.

Any other signature, as well as a function without signature are errors, and in such case the definition is aborted.

---

`\_kernel_sys_everyjob: \_kernel_sys_everyjob:`

Inserts the internal token list required at the start of every run (job).

`\c_kernel_randint_max_int` Maximal allowed argument to `\_kernel_randint:n`. Equal to  $2^{17} - 1$ .

(*End of definition for \c\_kernel\_randint\_max\_int.*)

---

`\_kernel_randint:n \_kernel_randint:n {<max>}`

Used in an integer expression this gives a pseudo-random number between 1 and `<max>` included. One must have  $\langle max \rangle \leq 2^{17} - 1$ . The `<max>` must be suitable for `\int_value:w` (and any `\int_eval:w` must be terminated by `\scan_stop:` or equivalent).

---

`\_kernel_randint:nn \_kernel_randint:nn {<min>} {<max>}`

Used in an integer expression this gives a pseudo-random number between `<min>` and `<max>` included. The `<min>` and `<max>` must be suitable for `\int_value:w` (and any `\int_eval:w` must be terminated by `\scan_stop:` or equivalent). For small ranges  $R = \langle max \rangle - \langle min \rangle + 1 \leq 2^{17} - 1$ , `<min> - 1 + \_kernel_randint:n{R}` is faster.

---

`\_kernel_register_show:N \_kernel_register_show:N <register>`

`\_kernel_register_show:c` Used to show the contents of a TeX register at the terminal, formatted such that internal parts of the mechanism are not visible.

---

`\_kernel_register_log:N \_kernel_register_log:N <register>`

`\_kernel_register_log:c` Used to write the contents of a TeX register to the log file in a form similar to `\_kernel_register_show:N`.

---

```
\_\_kernel\_str\_to\_other:n ★ \_\_kernel\_str\_to\_other:n {⟨token list⟩}
```

Converts the ⟨*token list*⟩ to a ⟨*other string*⟩, where spaces have category code “other”. This function can be f-expanded without fear of losing a leading space, since spaces do not have category code 10 in its result. It takes a time quadratic in the character count of the string.

---

```
\_\_kernel\_str\_to\_other\_fast:n ★ \_\_kernel\_str\_to\_other\_fast:n {⟨token list⟩}
```

Same behaviour \\_\\_kernel\\_str\\_to\\_other:n but only restricted-expandable. It takes a time linear in the character count of the string.

---

```
\_\_kernel\_tl\_to\_str:w ★ \_\_kernel\_tl\_to\_str:w {⟨expandable tokens⟩} {⟨tokens⟩}
```

Carries out expansion on the ⟨*expandable tokens*⟩ before conversion of the ⟨*tokens*⟩ to a string as describe for \tl\_to\_str:n. Typically, the ⟨*expandable tokens*⟩ will alter the nature of the ⟨*tokens*⟩, *i.e.* allow it to be generated in some way. This function requires only a single expansion.

---

```
\_\_kernel\_tl\_set:Nx \_\_kernel\_tl\_set:Nx {⟨tl var⟩} {⟨tokens⟩}
```

---

```
\_\_kernel\_tl\_gset:Nx
```

Fully expands ⟨*tokens*⟩ and assigns the result to ⟨*tl var*⟩. ⟨*tokens*⟩ must be given in braces and there must be no token between ⟨*tl var*⟩ and ⟨*tokens*⟩.

---

```
\_\_kernel\_codepoint\_data:nn ★ \_\_kernel\_codepoint\_data:nn {⟨type⟩} {⟨codepoint⟩}
```

Expands to the appropriate value for the ⟨*type*⟩ of data requested for a ⟨*codepoint*⟩. The current list of ⟨*types*⟩ and results are

**lowercase** The *single* codepoint specified by `UnicodeData.txt` for lowercase mapping of the codepoint: will be equal to the input ⟨*codepoint*⟩ if there is no mapping specified in `UnicodeData.txt`

**uppercase** The *single* codepoint specified by `UnicodeData.txt` for uppercase mapping of the codepoint: will be equal to the input ⟨*codepoint*⟩ if there is no mapping specified in `UnicodeData.txt`

---

```
\_\_kernel\_codepoint\_case:nn ★ \_\_kernel\_codepoint\_case:nn {⟨mapping⟩} {⟨codepoint⟩}
```

Expands to a list of three balanced text, of which at least the first will contain a codepoint. This list of up to three codepoints specifies the full case mapping for the input ⟨*codepoint*⟩. The ⟨*mapping*⟩ should be one of

- `casifold`
- `lowercase`
- `titlecase`
- `uppercase`

## 41.2 Kernel backend functions

These functions are required to pass information to the backend. The nature of these means that they are defined only when the relevant backend is in use.

---

`\__kernel_backend_literal:n \__kernel_backend_literal:n {<content>}`  
`\__kernel_backend_literal:(e|e)`

---

Adds the *<content>* literally to the current vertical list as a whatsit. The nature of the *<content>* will depend on the backend in use.

---

`\__kernel_backend_literal_postscript:n \__kernel_backend_literal_postscript:n {<PostScript>}`  
`\__kernel_backend_literal_postscript:e`

---

Adds the *<PostScript>* literally to the current vertical list as a whatsit. No positioning is applied.

---

`\__kernel_backend_literal_pdf:n \__kernel_backend_literal_pdf:n {<PDF instructions>}`  
`\__kernel_backend_literal_pdf:e`

---

Adds the *<PDF instructions>* literally to the current vertical list as a whatsit. No positioning is applied.

---

`\__kernel_backend_literal_svg:n \__kernel_backend_literal_svg:n {<SVG instructions>}`  
`\__kernel_backend_literal_svg:e`

---

Adds the *<SVG instructions>* literally to the current vertical list as a whatsit. No positioning is applied.

---

`\__kernel_backend_postscript:n \__kernel_backend_postscript:n {<PostScript>}`  
`\__kernel_backend_postscript:e`

---

Adds the *<PostScript>* to the current vertical list as a whatsit. The PostScript reference point is adjusted to match the current position. The PostScript is inserted inside a `SDict begin/end` pair.

---

`\__kernel_backend_align_begin: \__kernel_backend_align_begin:`  
`\__kernel_backend_align_end: <PostScript literals>`  
`\__kernel_backend_align_end:`

---

Arranges to align the PostScript and DVI current positions and scales.

---

`\__kernel_backend_scope_begin: \__kernel_backend_scope_begin:`  
`\__kernel_backend_scope_end: <content>`  
`\__kernel_backend_scope_end:`

---

Creates a scope for instructions at the backend level.

---

`\__kernel_backend_matrix:n \__kernel_backend_matrix:n {<matrix>}`  
`\__kernel_backend_matrix:e` Applies the *<matrix>* to the current transformation matrix.

---

---

`\g\__kernel_backend_header_bool`

---

Specifies whether to write headers for the backend.

---

`\l_kernel_color_stack_int` The color stack used in pdfTeX and LuaTeX for the main color.

# Chapter 42

## I3basics implementation

1391 ⟨\*package⟩

### 42.1 Renaming some TeX primitives (again)

Having given all the TeX primitives a consistent name, we need to give sensible names to the ones we actually want to use. These will be defined as needed in the appropriate modules, but we do a few now, just to get started.<sup>7</sup>

\if\_true: Then some conditionals.  
\if\_false:  
  \or:  
  \else:  
  \fi:  
\reverse\_if:N  
  \if:w  
\if\_charcode:w  
\if\_catcode:w  
\if\_meaning:w  
1392 \tex\_let:D \if\_true:                   \tex\_iftrue:D  
1393 \tex\_let:D \if\_false:                   \tex\_iffalse:D  
1394 \tex\_let:D \or:                       \tex\_or:D  
1395 \tex\_let:D \else:                      \tex\_else:D  
1396 \tex\_let:D \fi:                       \tex\_fi:D  
1397 \tex\_let:D \reverse\_if:N               \tex\_unless:D  
1398 \tex\_let:D \if:w                       \tex\_if:D  
1399 \tex\_let:D \if\_charcode:w             \tex\_if:D  
1400 \tex\_let:D \if\_catcode:w             \tex\_ifcat:D  
1401 \tex\_let:D \if\_meaning:w           \tex\_ifx:D  
1402 \tex\_let:D \if\_bool:N               \tex\_ifodd:D

(End of definition for \if\_true: and others. These functions are documented on page 28.)

\if\_mode\_math: TeX lets us detect some if its modes.  
\if\_mode\_horizontal:  
  1403 \tex\_let:D \if\_mode\_math:           \tex\_ifemode:D  
\if\_mode\_vertical:  
  1404 \tex\_let:D \if\_mode\_horizontal: \tex\_ifhmode:D  
\if\_mode\_inner:  
  1405 \tex\_let:D \if\_mode\_vertical:   \tex\_ifvmode:D  
  1406 \tex\_let:D \if\_mode\_inner:       \tex\_ifinner:D

(End of definition for \if\_mode\_math: and others. These functions are documented on page 29.)

\if\_cs\_exist:N Building csnames and testing if control sequences exist.  
\if\_cs\_exist:w  
  \cs:w  
  \cs\_end:  
  1407 \tex\_let:D \if\_cs\_exist:N           \tex\_ifdefined:D  
  1408 \tex\_let:D \if\_cs\_exist:w           \tex\_ifcsname:D  
  1409 \tex\_let:D \cs:w                   \tex\_csname:D  
  1410 \tex\_let:D \cs\_end:               \tex\_endcsname:D

---

<sup>7</sup>This renaming gets expensive in terms of csname usage, an alternative scheme would be to just use the \tex\_...:D name in the cases where no good alternative exists.

(End of definition for `\if_cs_exist:N` and others. These functions are documented on page 29.)

`\exp_after:wN` The five `\exp_` functions are used in the `l3expan` module where they are described.

```
1411 \tex_let:D \exp_after:wN      \tex_expandafter:D  
1412 \tex_let:D \exp_not:N        \tex_noexpand:D  
1413 \tex_let:D \exp_not:n       \tex_unexpanded:D  
1414 \tex_let:D \exp:w          \tex_roman numeral:D  
1415 \tex_chardef:D \exp_end: = 0 ~
```

(End of definition for `\exp_after:wN`, `\exp_not:N`, and `\exp_not:n`. These functions are documented on page 39.)

`\token_to_meaning:N` Examining a control sequence or token.

```
1416 \tex_let:D \token_to_meaning:N \tex_meaning:D  
1417 \tex_let:D \cs_meaning:N     \tex_meaning:D
```

(End of definition for `\token_to_meaning:N` and `\cs_meaning:N`. These functions are documented on page 199.)

`\tl_to_str:n` Making strings.

```
1418 \tex_let:D \tl_to_str:n      \tex_detokenize:D  
1419 \tex_let:D \token_to_str:N   \tex_string:D  
1420 \tex_let:D \__kernel_tl_to_str:w \tex_detokenize:D
```

(End of definition for `\tl_to_str:n`, `\token_to_str:N`, and `\__kernel_tl_to_str:w`. These functions are documented on page 114.)

`\scan_stop:` The next three are basic functions for which there also exist versions that are safe inside alignments. These safe versions are defined in the `l3prg` module.

```
1421 \tex_let:D \scan_stop:      \tex_relax:D  
1422 \tex_let:D \group_begin:    \tex_begingroup:D  
1423 \tex_let:D \group_end:     \tex_endgroup:D
```

(End of definition for `\scan_stop:`, `\group_begin:`, and `\group_end:`. These functions are documented on page 13.)

```
1424 <@=int>
```

`\if_int_compare:w` For integers.

```
1425 \tex_let:D \if_int_compare:w  \tex_ifnum:D  
1426 \tex_let:D \__int_to_roman:w \tex_roman numeral:D
```

(End of definition for `\if_int_compare:w` and `\__int_to_roman:w`. This function is documented on page 178.)

`\group_insert_after:N` Adding material after the end of a group.

```
1427 \tex_let:D \group_insert_after:N \tex_aftergroup:D
```

(End of definition for `\group_insert_after:N`. This function is documented on page 14.)

`\exp_args:Nc` Discussed in `l3expan`, but needed much earlier.

```
1428 \tex_long:D \tex_def:D \exp_args:Nc #1#2  
1429 { \exp_after:wN #1 \cs:w #2 \cs_end: }  
1430 \tex_long:D \tex_def:D \exp_args:cc #1#2  
1431 { \cs:w #1 \exp_after:wN \cs_end: \cs:w #2 \cs_end: }
```

(End of definition for `\exp_args:Nc` and `\exp_args:cc`. These functions are documented on page 36.)

\token\_to\_meaning:c A small number of variants defined by hand. Some of the necessary functions (\use\_i:nn, \use\_ii:nn, and \exp\_args:Nc) are not defined at that point yet, but will be defined before those variants are used. The \cs\_meaning:c command must check for an undefined control sequence to avoid defining it mistakenly.

```

1432 \tex_def:D \token_to_str:c { \exp_args:Nc \token_to_str:N }
1433 \tex_long:D \tex_def:D \cs_meaning:c #1
1434 {
1435   \if_cs_exist:w #1 \cs_end:
1436   \exp_after:wN \use_i:nn
1437   \else:
1438   \exp_after:wN \use_ii:nn
1439   \fi:
1440   { \exp_args:Nc \cs_meaning:N {#1} }
1441   { \tl_to_str:n {undefined} }
1442 }
1443 \tex_let:D \token_to_meaning:c = \cs_meaning:c

```

(End of definition for \token\_to\_meaning:N. This function is documented on page 199.)

## 42.2 Defining some constants

\c\_zero\_int We need the constant \c\_zero\_int which is used by some functions in current module. The rest are defined in the l3int module – at least for the ones that can be defined with \tex\_chardef:D or \tex\_mathchardef:D. For other constants the l3int module is required but it can't be used until the allocation has been set up properly!

```
1444 \tex_chardef:D \c_zero_int = 0 ~
```

(End of definition for \c\_zero\_int. This variable is documented on page 177.)

\c\_max\_register\_int This is here as this particular integer is needed in modules loaded before l3int, and is documented in l3int. LuaTeX and those which contain parts of the Omega extensions have more registers available than ε-TeX.

```

1445 \tex_ifdefined:D \tex_luatexversion:D
1446   \tex_chardef:D \c_max_register_int = 65 535 ~
1447 \tex_else:D
1448   \tex_ifdefined:D \tex_omathchardef:D
1449   \tex_omathchardef:D \c_max_register_int = 65535 ~
1450 \tex_else:D
1451   \tex_mathchardef:D \c_max_register_int = 32767 ~
1452 \tex_fi:D
1453 \tex_fi:D

```

(End of definition for \c\_max\_register\_int. This variable is documented on page 177.)

## 42.3 Defining functions

We start by providing functions for the typical definition functions. First the local ones.

All assignment functions in L<sup>A</sup>T<sub>E</sub>X3 should be naturally protected; after all, the T<sub>E</sub>X primitives for assignments are and it can be a cause of problems if others aren't.

```

1454 \tex_let:D \cs_set_nopar:Npn          \tex_def:D
\cs_set_nopar:Npe
\cs_set_nopar:Npx
\cs_set:Npn
\cs_set:Npe
\cs_set:Npx
\cs_set_protected_nopar:Npn
\cs_set_protected_nopar:Npe
\cs_set_protected_nopar:Npx
\cs_set_protected:Npn
\cs_set_protected:Npe
\cs_set_protected:Npx

```

```

1456 \tex_let:D \cs_set_nopar:Npx           \tex_edef:D
1457 \tex_protected:D \tex_long:D \tex_def:D \cs_set:Npn
1458 { \tex_long:D \tex_def:D }
1459 \tex_protected:D \tex_long:D \tex_def:D \cs_set:Npe
1460 { \tex_long:D \tex_edef:D }
1461 \tex_let:D \cs_set:Npx \cs_set:Npe
1462 \tex_protected:D \tex_long:D \tex_def:D \cs_set_protected_nopar:Npn
1463 { \tex_protected:D \tex_def:D }
1464 \tex_protected:D \tex_long:D \tex_def:D \cs_set_protected_nopar:Npe
1465 { \tex_protected:D \tex_edef:D }
1466 \tex_let:D \cs_set_protected_nopar:Npx \cs_set_protected_nopar:Npe

```

(End of definition for `\cs_gset_nopar:Npn` and others. These functions are documented on page 17.)

## 42.4 Selecting tokens

1490 `<@=exp>`

`\l__exp_internal_tl` Scratch token list variable for `\b3exp`, used by `\use:x`, used in defining conditionals. We don't use `tl` methods because `\b3basics` is loaded earlier.

```
1491 \cs_set_nopar:Npn \l__exp_internal_tl { }
```

(End of definition for `\l__exp_internal_tl`.)

`\use:c` This macro grabs its argument and returns a csname from it.

```
1492 \cs_set:Npn \use:c #1 { \cs:w #1 \cs_end: }
```

(End of definition for `\use:c`. This function is documented on page 21.)

\use:x Fully expands its argument and passes it to the input stream. Uses the reserved \l\_\_-exp\_internal\_tl which we've set up above.

```
1493 \cs_set_protected:Npn \use:x #1
1494 {
1495     \cs_set_nopar:Npx \l__exp_internal_tl {#1}
1496     \l__exp_internal_tl
1497 }
```

(End of definition for \use:x.)

```
1498 ⟨@@=use⟩
```

### \use:e

```
1499 \cs_set:Npn \use:e #1 { \tex_expanded:D {#1} }
```

(End of definition for \use:e. This function is documented on page 26.)

```
1500 ⟨@@=exp⟩
```

\use:n These macros grab their arguments and return them back to the input (with outer braces removed).

```
1501 \cs_set:Npn \use:n #1 {#1}
1502 \cs_set:Npn \use:nn #1#2 {#1#2}
1503 \cs_set:Npn \use:nnn #1#2#3 {#1#2#3}
1504 \cs_set:Npn \use:nnnn #1#2#3#4 {#1#2#3#4}
```

(End of definition for \use:n and others. These functions are documented on page 24.)

\use\_i:nn The equivalent to L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub> 's \@firstoftwo and \@secondoftwo.

```
1505 \cs_set:Npn \use_i:nn #1#2 {#1}
1506 \cs_set:Npn \use_i:nn #1#2 {#2}
```

(End of definition for \use\_i:nn and \use\_i:nn. These functions are documented on page 25.)

\use\_i:nnn We also need something for picking up arguments from a longer list.

```
1507 \cs_set:Npn \use_i:nnn #1#2#3 {#1}
1508 \cs_set:Npn \use_i:nnn #1#2#3 {#2}
1509 \cs_set:Npn \use_i:nnn #1#2#3 {#3}
1510 \cs_set:Npn \use_i:nnnn #1#2#3#4 {#1}
1511 \cs_set:Npn \use_i:nnnn #1#2#3#4 {#2}

1541 \cs_set:Npn \use_ii:nnnnnnnnn #1#2#3#4#5#6#7#8#9 {#2}
1542 \cs_set:Npn \use_iii:nnnnnnnnn #1#2#3#4#5#6#7#8#9 {#3}
1543 \cs_set:Npn \use_iv:nnnnnnnnnn #1#2#3#4#5#6#7#8#9 {#4}
1544 \cs_set:Npn \use_v:nnnnnnnnnn #1#2#3#4#5#6#7#8#9 {#5}
1545 \cs_set:Npn \use_vi:nnnnnnnnnn #1#2#3#4#5#6#7#8#9 {#6}
1546 \cs_set:Npn \use_vii:nnnnnnnnnn #1#2#3#4#5#6#7#8#9 {#7}
1547 \cs_set:Npn \use_viii:nnnnnnnnnn #1#2#3#4#5#6#7#8#9 {#8}
1548 \cs_set:Npn \use_ix:nnnnnnnnnn #1#2#3#4#5#6#7#8#9 {#9}

```

(End of definition for `\use_i:nnn` and others. These functions are documented on page 25.)

### `\use_i_ii:nnn`

```
1549 \cs_set:Npn \use_i_ii:nnn #1#2#3 {#1#2}
```

(End of definition for `\use_i_ii:nnn`. This function is documented on page 26.)

### `\use_ii_i:nn`

```
1550 \cs_set:Npn \use_ii_i:nn #1#2 { #2 #1 }
```

(End of definition for `\use_ii_i:nn`. This function is documented on page 26.)

`\use_none_delimit_by_q_nil:w`  
`\use_none_delimit_by_q_stop:w`  
`\use_none_delimit_by_q_recursion_stop:w` Functions that gobble everything until they see either `\q_nil`, `\q_stop`, or `\q_recursion_stop`, respectively.

```

1551 \cs_set:Npn \use_none_delimit_by_q_nil:w #1 \q_nil { }
1552 \cs_set:Npn \use_none_delimit_by_q_stop:w #1 \q_stop { }
1553 \cs_set:Npn \use_none_delimit_by_q_recursion_stop:w #1 \q_recursion_stop { }
```

(End of definition for `\use_none_delimit_by_q_nil:w`, `\use_none_delimit_by_q_stop:w`, and `\use_none_delimit_by_q_recursion_stop:w`. These functions are documented on page 26.)

`\use_i_delimit_by_q_nil:nw`  
`\use_i_delimit_by_q_stop:nw`  
`\use_i_delimit_by_q_recursion_stop:nw` Same as above but execute first argument after gobbling. Very useful when you need to skip the rest of a mapping sequence but want an easy way to control what should be expanded next.

```

1554 \cs_set:Npn \use_i_delimit_by_q_nil:nw #1#2 \q_nil {#1}
1555 \cs_set:Npn \use_i_delimit_by_q_stop:nw #1#2 \q_stop {#1}
1556 \cs_set:Npn \use_i_delimit_by_q_recursion_stop:nw
    #1#2 \q_recursion_stop {#1}
```

(End of definition for `\use_i_delimit_by_q_nil:nw`, `\use_i_delimit_by_q_stop:nw`, and `\use_i_delimit_by_q_recursion_stop:nw`. These functions are documented on page 27.)

## 42.5 Gobbling tokens from input

`\use_none:n` To gobble tokens from the input we use a standard naming convention: the number of tokens gobbled is given by the number of `n`'s following the `:` in the name. Although we could define functions to remove ten arguments or more using separate calls of `\use_none:nnnnn`, this is very non-intuitive to the programmer who will assume that expanding such a function once takes care of gobbling all the tokens in one go.

```
\use_none:nnnnnnn 1558 \cs_set:Npn \use_none:n      #1 { }
\use_none:nnnnnnn 1559 \cs_set:Npn \use_none:nn      #1#2 { }
\use_none:nnnnnnnn 1560 \cs_set:Npn \use_none:nnn     #1#2#3 { }
\use_none:nnnnnnnnn 1561 \cs_set:Npn \use_none:nnnn    #1#2#3#4 { }
\use_none:nnnnnnnnnn 1562 \cs_set:Npn \use_none:nnnnn   #1#2#3#4#5 { }
\use_none:nnnnnnnnnnn 1563 \cs_set:Npn \use_none:nnnnnn  #1#2#3#4#5#6 { }
\use_none:nnnnnnnnnnnn 1564 \cs_set:Npn \use_none:nnnnnnn #1#2#3#4#5#6#7 { }
\use_none:nnnnnnnnnnnnn 1565 \cs_set:Npn \use_none:nnnnnnnn #1#2#3#4#5#6#7#8 { }
\use_none:nnnnnnnnnnnnnn 1566 \cs_set:Npn \use_none:nnnnnnnnn#1#2#3#4#5#6#7#8#9 { }
```

(End of definition for \use\_none:n and others. These functions are documented on page 26.)

## 42.6 Debugging and patching later definitions

1567 <@@=debug>

`\_kernel_if_debug:TF` A more meaningful test of whether debugging is enabled than messing up with guards. We can also more easily change the logic in one place then. This is needed primarily for deprecations.

1568 \cs\_set\_protected:Npn \\_\_kernel\_if\_debug:TF #1#2 {#2}

(End of definition for `\_kernel\_if_debug:TF`.)

\debug on:n Stubs.

```
\debug_off:n 1569 \cs_set_protected:Npn \debug_on:n #1
              1570  {
              1571      \sys_load_debug:
              1572      \debug_on:n {#1}
              1573  }
1574 \cs_set_protected:Npn \debug_off:n #1
              1575  {
              1576      \sys_load_debug:
              1577      \debug_off:n {#1}
              1578 }
```

(End of definition for `\debug_on:n` and `\debug_off:n`. These functions are documented on page 30.)

\debug\_suspend:

```
\debug_resume: 1579 \cs_set_protected:Npn \debug_suspend: { }  
1580 \cs_set_protected:Npn \debug_resume: { }
```

(End of definition for \debug\_suspend: and \debug\_resume:. These functions are documented on page 30.)

```
\_kernel_deprecation_code:nn  
\g__debug_deprecation_on_tl  
\g__debug_deprecation_off_tl
```

Some commands were more recently deprecated and not yet removed; only make these into errors if the user requests it. This relies on two token lists, filled up in `\l3deprecation`.

```
1581 \cs_set_nopar:Npn \g__debug_deprecation_on_tl { }  
1582 \cs_set_nopar:Npn \g__debug_deprecation_off_tl { }  
1583 \cs_set_protected:Npn \_kernel_deprecation_code:nn #1#2  
1584 {  
1585     \tl_gput_right:Nn \g__debug_deprecation_on_tl {#1}  
1586     \tl_gput_right:Nn \g__debug_deprecation_off_tl {#2}  
1587 }
```

(End of definition for `\_kernel_deprecation_code:nn`, `\g__debug_deprecation_on_tl`, and `\g__debug_deprecation_off_tl`.)

## 42.7 Conditional processing and definitions

```
1588 ⟨@=prg⟩
```

Underneath any predicate function (`_p`) or other conditional forms (TF, etc.) is a built-in logic saying that it after all of the testing and processing must return the *(state)* this leaves TeX in. Therefore, a simple user interface could be something like

```
\if_meaning:w #1#2  
    \prg_return_true:  
 \else:  
    \if_meaning:w #1#3  
        \prg_return_true:  
    \else:  
        \prg_return_false:  
    \fi:  
 \fi:
```

Usually, a TeX programmer would have to insert a number of `\exp_after:wN`s to ensure the state value is returned at exactly the point where the last conditional is finished. However, that obscures the code and forces the TeX programmer to prove that he/she knows the  $2^n - 1$  table. We therefore provide the simpler interface.

`\prg_return_true:`  
`\prg_return_false:`

The idea here is that `\exp:w` expands fully any `\else:` and `\fi:` that are waiting to be discarded, before reaching the `\exp_end:` which leaves an empty expansion. The code can then leave either the first or second argument in the input stream. This means that all of the branching code has to contain at least two tokens: see how the logical tests are actually implemented to see this.

```
1589 \cs_set:Npn \prg_return_true:  
1590 { \exp_after:wN \use_i:nn \exp:w }  
1591 \cs_set:Npn \prg_return_false:  
1592 { \exp_after:wN \use_ii:nn \exp:w }
```

An extended state space could be implemented by including a more elaborate function in place of `\use_i:nn`/`\use_ii:nn`. Provided two arguments are absorbed then the code would work.

(End of definition for `\prg_return_true:` and `\prg_return_false:`. These functions are documented on page 65.)

```
_prg_use_none_delimit_by_q_recursion_stop:w
1593 \cs_set:Npn \__prg_use_none_delimit_by_q_recursion_stop:w
1594 #1 \q_prg_recursion_stop { }
```

(End of definition for `\__prg_use_none_delimit_by_q_recursion_stop:w`.)

```
\prg_set_conditional:Npnn
\prg_gset_conditional:Npnn
\prg_new_conditional:Npnn
  \prg_set_protected_conditional:Npnn
  \prg_gset_protected_conditional:Npnn
  \prg_new_protected_conditional:Npnn
\__prg_generate_conditional_parm:NNNpnn
```

The user functions for the types using parameter text from the programmer. The various functions only differ by which function is used for the assignment. For those `Npnn` type functions, we must grab the parameter text, reading everything up to a left brace before continuing. Then split the base function into name and signature, and feed `{<name>}` `{<signature>}` `{<boolean>}` `{<set or new>}` `{<maybe protected>}` `{<parameters>}` `{TF,...}` `{<code>}` to the auxiliary function responsible for defining all conditionals. Note that `e` stands for expandable and `p` for protected.

```
1595 \cs_set_protected:Npn \prg_set_conditional:Npnn
1596 { \__prg_generate_conditional_parm:NNNpnn \cs_set:Npn e }
1597 \cs_set_protected:Npn \prg_gset_conditional:Npnn
1598 { \__prg_generate_conditional_parm:NNNpnn \cs_gset:Npn e }
1599 \cs_set_protected:Npn \prg_new_conditional:Npnn
1600 { \__prg_generate_conditional_parm:NNNpnn \cs_new:Npn e }
1601 \cs_set_protected:Npn \prg_set_protected_conditional:Npnn
1602 { \__prg_generate_conditional_parm:NNNpnn \cs_set_protected:Npn p }
1603 \cs_set_protected:Npn \prg_gset_protected_conditional:Npnn
1604 { \__prg_generate_conditional_parm:NNNpnn \cs_gset_protected:Npn p }
1605 \cs_set_protected:Npn \prg_new_protected_conditional:Npnn
1606 { \__prg_generate_conditional_parm:NNNpnn \cs_new_protected:Npn p }
1607 \cs_set_protected:Npn \__prg_generate_conditional_parm:NNNpnn #1#2#3#4#
1608 {
1609   \use:e
1610   {
1611     \__prg_generate_conditional:nnNNNnnn
1612     \cs_split_function:N #3
1613   }
1614   #1 #2 {#4}
1615 }
```

(End of definition for `\prg_set_conditional:Npnn` and others. These functions are documented on page 63.)

```
\prg_set_conditional:Nnn
\prg_gset_conditional:Nnn
\prg_new_conditional:Nnn
  \prg_set_protected_conditional:Nnn
  \prg_gset_protected_conditional:Nnn
  \prg_new_protected_conditional:Nnn
\__prg_generate_conditional_count:NNNnnn
\__prg_generate_conditional_count:nnNNNnnn
```

The user functions for the types automatically inserting the correct parameter text based on the signature. The various functions only differ by which function is used for the assignment. Split the base function into name and signature. The second auxiliary generates the parameter text from the number of letters in the signature. Then feed `{<name>}` `{<signature>}` `{<boolean>}` `{<set or new>}` `{<maybe protected>}` `{<parameters>}` `{TF,...}` `{<code>}` to the auxiliary function responsible for defining all conditionals. If the `<signature>` has more than 9 letters, the definition is aborted since TeX macros have at most 9 arguments. The erroneous case where the function name contains no colon is captured later.

```
1616 \cs_set_protected:Npn \prg_set_conditional:Nnn
1617 { \__prg_generate_conditional_count:NNNnn \cs_set:Npn e }
1618 \cs_set_protected:Npn \prg_gset_conditional:Nnn
1619 { \__prg_generate_conditional_count:NNNnn \cs_set:Npn e }
1620 \cs_set_protected:Npn \prg_new_conditional:Nnn
1621 { \__prg_generate_conditional_count:NNNnn \cs_new:Npn e }
```

```

1622 \cs_set_protected:Npn \prg_set_protected_conditional:Nnn
1623   { \__prg_generate_conditional_count:NNNnn \cs_set_protected:Npn p }
1624 \cs_set_protected:Npn \prg_gset_protected_conditional:Nnn
1625   { \__prg_generate_conditional_count:NNNnn \cs_gset_protected:Npn p }
1626 \cs_set_protected:Npn \prg_new_protected_conditional:Nnn
1627   { \__prg_generate_conditional_count:NNNnn \cs_new_protected:Npn p }
1628 \cs_set_protected:Npn \__prg_generate_conditional_count:NNNnn #1#2#3
1629   {
1630     \use:e
1631     {
1632       \__prg_generate_conditional_count:nnNNNnnn
1633       \cs_split_function:N #3
1634     }
1635     #1 #2
1636   }
1637 \cs_set_protected:Npn \__prg_generate_conditional_count:nnNNNnnn #1#2#3#4#5
1638   {
1639     \__kernel_cs_parm_from_arg_count:nnF
1640     { \__prg_generate_conditional:nnNNNnnn {#1} {#2} #3 #4 #5 }
1641     { \tl_count:n {#2} }
1642     {
1643       \msg_error:nne { kernel } { bad-number-of-arguments }
1644       { \token_to_str:c { #1 : #2 } }
1645       { \tl_count:n {#2} }
1646       \use_none:nn
1647     }
1648   }

```

(End of definition for `\prg_set_conditional:Nnn` and others. These functions are documented on page 63.)

```
\__prg_generate_conditional:nnNNNnnn
\__prg_generate_conditional:NNnnnnNw
\__prg_generate_conditional_test:w
\__prg_generate_conditional_fast:nw
```

The workhorse here is going through a list of desired forms, *i.e.*, p, TF, T and F. The first three arguments come from splitting up the base form of the conditional, which gives the name, signature and a boolean to signal whether or not there was a colon in the name. In the absence of a colon, we throw an error and don't define any conditional. The fourth and fifth arguments build up the defining function. The sixth is the parameters to use (possibly empty), the seventh is the list of forms to define, the eighth is the replacement text which we will augment when defining the forms. The use of `\tl_to_str:n` makes the later loop more robust.

A large number of our low-level conditionals look like `\prg_return_true: \else: \prg_return_false: \fi:` so we optimize this special case by calling `\__prg_generate_conditional_fast:nw {\langle code\rangle}`. This passes `\use_i:nn` instead of `\use_i:ii:nnn` to functions such as `\__prg_generate_p_form:wNNnnnnN`.

```

1649 \cs_set_protected:Npn \__prg_generate_conditional:nnNNNnnn #1#2#3#4#5#6#7#8
1650   {
1651     \if_meaning:w \c_false_bool #3

1673 \cs_set:Npn \__prg_generate_conditional_fast:nw #1#2 \exp_not:n #3
1674   { \exp_not:n { {#1} \use_i:nn } }

```

Looping through the list of desired forms. First are six arguments and seventh is the form. Use the form to call the correct type. If the form does not exist, the \use:c construction results in \relax, and the error message is displayed (unless the form is empty, to allow for {T, , F}), then \use\_none:nnnnnnnn cleans up. Otherwise, the error message is removed by the variant form.

```

```

How to generate the various forms. Those functions take the following arguments: 1: junk, 2: \cs\_set:Npn or similar, 3: p (for protected conditionals) or e, 4: function name, 5: signature, 6: parameter text, 7: replacement (possibly trimmed by \\_\_prg\_generate\_conditional\_fast:nw), 8: \use\_i\_i:nnn or \use\_i:nn (for “fast” conditionals). Remember that the logic-returning functions expect two arguments to be present after \exp\_end:: notice the construction of the different variants relies on this, and that the TF and F variants will be slightly faster than the T version. The p form is only valid for expandable tests, we check for that by making sure that the second argument is empty. For “fast” conditionals, #7 has an extra \if.... To optimize a bit further we don’t use \exp\_after:wN \use\_i\_i:nnn and similar but instead use \\_\_prg\_TF\_true:w and similar to swap out the macro after \fi:. It would be a tiny bit faster if we directly

grabbed the T and F arguments there, but if those are actually missing, the recovery from the runaway argument would not insert \fi: back, messing up nesting of conditionals.

Split the function to be defined, and setup a manualclist loop over argument #6 of the first auxiliary. The second auxiliary receives twice three arguments coming from splitting the function to be defined and the function to copy. Make sure that both functions contained a colon, otherwise we don't know how to build conditionals, hence abort. Call the looping macro, with arguments {<name<sub>1</sub>>} {<signature<sub>1</sub>>} {<name<sub>2</sub>>} {<signature<sub>2</sub>>} <copying function> and followed by the comma list. At each step in the loop, make sure that the conditional form we copy is defined, and copy it, otherwise abort.

(End of definition for `\__prg_set_eq_conditional:nnNnnNNw` and others.)

All that is left is to define the canonical boolean true and false. I think Michael originated the idea of expandable boolean tests. At first these were supposed to expand into either TT or TF to be tested using `\if:w` but this was later changed to 00 and 01, so they could be used in logical operations. Later again they were changed to being numerical constants with values of 1 for true and 0 for false. We need this from the get-go.

`\c_true_bool` Here are the canonical boolean values.

`\c_false_bool`

```

1796 \tex_chardef:D \c_true_bool = 1 ~
1797 \tex_chardef:D \c_false_bool = 0 ~

```

(End of definition for `\c_true_bool` and `\c_false_bool`. These variables are documented on page 67.)

## 42.8 Dissecting a control sequence

1798 ⟨@=cs⟩

---

`\__cs_count_signature:N` \* `\__cs_count_signature:N` ⟨function⟩

Splits the ⟨function⟩ into the ⟨name⟩ (*i.e.* the part before the colon) and the ⟨signature⟩ (*i.e.* after the colon). The ⟨number⟩ of tokens in the ⟨signature⟩ is then left in the input stream. If there was no ⟨signature⟩ then the result is the marker value `-1`.

---

`\__cs_tmp:w` Function used for various short-term usages, for instance defining functions whose definition involves tokens which are hard to insert normally (spaces, characters with category other).

`\cs_to_str:N`  
`\__cs_to_str:N`  
`\__cs_to_str:w` This converts a control sequence into the character string of its name, removing the leading escape character. This turns out to be a non-trivial matter as there are different cases:

- The usual case of a printable escape character;
- the case of a non-printable escape characters, e.g., when the value of the `\escapechar` is negative;

- when the escape character is a space.

One approach to solve this is to test how many tokens result from `\token_to_str:N \a`. If there are two tokens, then the escape character is printable, while if it is non-printable then only one is present.

However, there is an additional complication: the control sequence itself may start with a space. Clearly that should *not* be lost in the process of converting to a string. So the approach adopted is a little more intricate still. When the escape character is printable, `\token_to_str:N \a` yields the escape character itself and a space. The character codes are different, thus the `\if:w` test is false, and TeX reads `\_cs_to_str:N` after turning the following control sequence into a string; this auxiliary removes the escape character, and stops the expansion of the initial `\tex_roman numeral:D`. The second case is that the escape character is not printable. Then the `\if:w` test is unfinished after reading a the space from `\token_to_str:N \a`, and the auxiliary `\_cs_to_str:w` is expanded, feeding – as a second character for the test; the test is false, and TeX skips to `\fi:`, then performs `\token_to_str:N`, and stops the `\tex_roman numeral:D` with `\c_zero_int`. The last case is that the escape character is itself a space. In this case, the `\if:w` test is true, and the auxiliary `\_cs_to_str:w` comes into play, inserting `-int_value:w`, which expands `\c_zero_int` to the character 0. The initial `\tex_roman numeral:D` then sees 0, which is not a terminated number, followed by the escape character, a space, which is removed, terminating the expansion of `\tex_roman numeral:D`. In all three cases, `\cs_to_str:N` takes two expansion steps to be fully expanded.

```
1799 \cs_set:Npn \cs_to_str:N
1800 {
```

We implement the expansion scheme using `\tex_roman numeral:D` terminating it with `\c_zero_int` rather than using `\exp:w` and `\exp_end:` as we normally do. The reason is that the code heavily depends on terminating the expansion with `\c_zero_int` so we make this dependency explicit.

```
1801 \tex_roman numeral:D
1802   \if:w \token_to_str:N \ \_cs_to_str:w \fi:
1803   \exp_after:wN \_cs_to_str:N \token_to_str:N
1804 }
1805 \cs_set:Npn \_cs_to_str:N #1 { \c_zero_int }
1806 \cs_set:Npn \_cs_to_str:w #1 \_cs_to_str:N
1807 { - \int_value:w \fi: \exp_after:wN \c_zero_int }
```

If speed is a concern we could use `\csstring` in LuaTeX. For the empty csname that primitive gives an empty result while the current `\cs_to_str:N` gives incorrect results in all engines (this is impossible to fix without huge performance hit).

(End of definition for `\cs_to_str:N`, `\_cs_to_str:N`, and `\_cs_to_str:w`. This function is documented on page 22.)

#### `\cs_split_function:N`

```
\_cs_split_function_auxi:w
\_cs_split_function_auxii:w
```

This function takes a function name and splits it into name with the escape char removed and argument specification. In addition to this, a third argument, a boolean `<true>` or `<false>` is returned with `<true>` for when there is a colon in the function and `<false>` if there is not.

First ensure that we actually get a properly evaluated string by expanding `\cs_to_str:N` twice. If the function contained a colon, the auxiliary takes as #1 the function name, delimited by the first colon, then the signature #2, delimited by `\s__cs_mark`, then `\c_true_bool` as #3, and #4 cleans up until `\s__cs_stop`. Otherwise, the #1 contains the function name and `\s__cs_mark \c_true_bool`, #2 is empty, #3 is `\c_false_bool`,

and #4 cleans up. The second auxiliary trims the trailing `\s__cs_mark` from the function name if present (that is, if the original function had no colon).

```

1808 \cs_set_protected:Npn \__cs_tmp:w #1
1809  {
1810    \cs_set:Npn \cs_split_function:N ##1
1811    {
1812      \exp_after:wN \exp_after:wN \exp_after:wN
1813      \__cs_split_function_auxi:w
1814      \cs_to_str:N ##1 \s__cs_mark \c_true_bool
1815      #1 \s__cs_mark \c_false_bool \s__cs_stop
1816    }
1817    \cs_set:Npn \__cs_split_function_auxi:w
1818    ##1 #1 ##2 \s__cs_mark ##3##4 \s__cs_stop
1819    { \__cs_split_function_auxii:w ##1 \s__cs_mark \s__cs_stop {##2} ##3 }
1820    \cs_set:Npn \__cs_split_function_auxii:w ##1 \s__cs_mark ##2 \s__cs_stop
1821    { {##1} }
1822  }
1823 \exp_after:wN \__cs_tmp:w \token_to_str:N :

```

(End of definition for `\cs_split_function:N`, `\__cs_split_function_auxi:w`, and `\__cs_split_function_auxii:w`. This function is documented on page 22.)

## 42.9 Exist or free

A control sequence is said to *exist* (to be used) if has an entry in the hash table and its meaning is different from the primitive `\relax` token. A control sequence is said to be *free* (to be defined) if it does not already exist.

`\cs_if_exist_p:N` Two versions for checking existence. For the N form we firstly check for `\scan_stop:` and then if it is in the hash table. There is no problem when inputting something like `\else:` or `\fi:` as TeX will only ever skip input in case the token tested against is `\scan_stop:`.

`\cs_if_exist:cTF`

```

1824 \prg_set_conditional:Npnn \cs_if_exist:N #1 { p , T , F , TF }
1825  {
1826    \if_meaning:w #1 \scan_stop:
1827    \prg_return_false:
1828    \else:
1829    \if_cs_exist:N #1
1830    \prg_return_true:
1831    \else:
1832    \prg_return_false:
1833    \fi:
1834    \fi:
1835  }

```

For the c form we firstly check if it is in the hash table and then for `\scan_stop:` so that we do not add it to the hash table unless it was already there. Here we have to be careful as the text to be skipped if the first test is false may contain tokens that disturb the scanner. Therefore, we ensure that the second test is performed after the first one has concluded completely.

```

1836 \prg_set_conditional:Npnn \cs_if_exist:c #1 { p , T , F , TF }
1837  {
1838    \if_cs_exist:w #1 \cs_end:
1839    \exp_after:wN \use_i:nn

```

```

1840     \else:
1841         \exp_after:wN \use_i:nn
1842     \fi:
1843     {
1844         \exp_after:wN \if_meaning:w \cs:w #1 \cs_end: \scan_stop:
1845             \prg_return_false:
1846         \else:
1847             \prg_return_true:
1848         \fi:
1849     }
1850     \prg_return_false:
1851 }
```

(End of definition for `\cs_if_exist:NTF`. This function is documented on page 28.)

`\cs_if_free_p:N` The logical reversal of the above.

```

1852 \prg_set_conditional:Npnn \cs_if_free:N #1 { p , T , F , TF }
1853 {
1854     \if_meaning:w #1 \scan_stop:
1855         \prg_return_true:
1856     \else:
1857         \if_cs_exist:N #1
1858             \prg_return_false:
1859         \else:
1860             \prg_return_true:
1861         \fi:
1862     \fi:
1863 }
1864 \prg_set_conditional:Npnn \cs_if_free:c #1 { p , T , F , TF }
1865 {
1866     \if_cs_exist:w #1 \cs_end:
1867         \exp_after:wN \use_i:nn
1868     \else:
1869         \exp_after:wN \use_i:nn
1870     \fi:
1871     {
1872         \exp_after:wN \if_meaning:w \cs:w #1 \cs_end: \scan_stop:
1873             \prg_return_true:
1874         \else:
1875             \prg_return_false:
1876         \fi:
1877     }
1878     { \prg_return_true: }
1879 }
```

(End of definition for `\cs_if_free:NTF`. This function is documented on page 28.)

`\cs_if_exist_use:N` The `\cs_if_exist_use:...` functions cannot be implemented as conditionals because  
`\cs_if_exist_use:c` the true branch must leave both the control sequence itself and the true code in the input  
`\cs_if_exist_use:NTF` stream. For the c variants, we are careful not to put the control sequence in the hash  
`\cs_if_exist_use:cTF` table if it does not exist. In LuaTeX we could use the `\lastnamedcs` primitive.

```

1880 \cs_set:Npn \cs_if_exist_use:NTF #1#2
1881   { \cs_if_exist:NTF #1 { #1 #2 } }
1882 \cs_set:Npn \cs_if_exist_use:NF #1
```

```

1883 { \cs_if_exist:NTF #1 { #1 } }
1884 \cs_set:Npn \cs_if_exist_use:NT #1 #2
1885 { \cs_if_exist:NTF #1 { #1 #2 } { } }
1886 \cs_set:Npn \cs_if_exist_use:N #1
1887 { \cs_if_exist:NTF #1 { #1 } { } }
1888 \cs_set:Npn \cs_if_exist_use:cTF #1#2
1889 { \cs_if_exist:cTF {#1} { \use:c {#1} #2 } }
1890 \cs_set:Npn \cs_if_exist_use:cF #1
1891 { \cs_if_exist:cTF {#1} { \use:c {#1} } }
1892 \cs_set:Npn \cs_if_exist_use:cT #1#2
1893 { \cs_if_exist:cTF {#1} { \use:c {#1} #2 } { } }
1894 \cs_set:Npn \cs_if_exist_use:c #1
1895 { \cs_if_exist:cTF {#1} { \use:c {#1} } { } }

```

(End of definition for `\cs_if_exist_use:NTF`. This function is documented on page 21.)

## 42.10 Preliminaries for new functions

We provide two kinds of functions that can be used to define control sequences. On the one hand we have functions that check if their argument doesn't already exist, they are called `\..._new`. The second type of defining functions doesn't check if the argument is already defined.

Before we can define them, we need some auxiliary macros that allow us to generate error messages. The next few definitions here are only temporary, they will be redefined later on.

`\msg_error:nnee` If an internal error occurs before L<sup>A</sup>T<sub>E</sub>X3 has loaded l3msg then the code should issue a usable if terse error message and halt. This can only happen if a coding error is made by the team, so this is a reasonable response. Setting the `\newlinechar` is needed, to turn `^J` into a proper line break in plain T<sub>E</sub>X.

```

1896 \cs_set_protected:Npn \msg_error:nnee #1#2#3#4
1897 {
1898     \tex_newlinechar:D = '\^J \scan_stop:
1899     \tex_errmessage:D
1900     {
1901         !!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!~! ^J
1902         Argh,~internal~LaTeX3~error! ^J ^J
1903         Module ~ #1 , ~ message~name~"#2": ^J
1904         Arguments~'#3'~and~'#4' ^J ^J
1905         This~is~one~for~The~LaTeX3~Project:~bailing~out
1906     }
1907     \tex_end:D
1908 }
1909 \cs_set_protected:Npn \msg_error:nne #1#2#3
1910 { \msg_error:nnee {#1} {#2} {#3} { } }
1911 \cs_set_protected:Npn \msg_error:nn #1#2
1912 { \msg_error:nnee {#1} {#2} { } { } }

```

(End of definition for `\msg_error:nnnn`. This function is documented on page 84.)

`\msg_line_context:` Another one from l3msg which will be altered later.

```

1913 \cs_set:Npn \msg_line_context:
1914 { on-line~ \tex_the:D \tex_inputlineno:D }

```

(End of definition for `\msg_line_context`. This function is documented on page 82.)

`\iow_log:e` We define a routine to write only to the log file. And a similar one for writing to both the log file and the terminal. These will be redefined later by `\l3file`.

```
1915 \cs_set_protected:Npn \iow_log:e
1916   { \tex_immediate:D \tex_write:D -1 }
1917 \cs_set_protected:Npn \iow_term:e
1918   { \tex_immediate:D \tex_write:D 16 }
```

(End of definition for `\iow_log:n`. This function is documented on page 95.)

`\_kernel_chk_if_free_cs:N` This command is called by `\cs_new_nopar:Npn` and `\cs_new_eq:NN` etc. to make sure that the argument sequence is not already in use. If it is, an error is signalled. It checks if `\csname` is undefined or `\scan_stop`. Otherwise an error message is issued. We have to make sure we don't put the argument into the conditional processing since it may be an `\if...` type function!

```
1919 \cs_set_protected:Npn \_kernel_chk_if_free_cs:N #1
1920   {
1921     \cs_if_free:NF #1
1922     {
1923       \msg_error:nne { kernel } { command-already-defined }
1924       { \token_to_str:N #1 } { \token_to_meaning:N #1 }
1925     }
1926   }
1927 \cs_set_protected:Npn \_kernel_chk_if_free_cs:c
1928   { \exp_args:Nc \_kernel_chk_if_free_cs:N }
```

(End of definition for `\_kernel_chk_if_free_cs:N`.)

## 42.11 Defining new functions

1929 `\@@=cs`

`\cs_new_nopar:Npn` Function which check that the control sequence is free before defining it.

```
1930 \cs_set:Npn \_cs_tmp:w #1#2
1931   {
1932     \cs_set_protected:Npn #1 ##1
1933     {
1934       \_kernel_chk_if_free_cs:N ##1
1935       #2 ##1
1936     }
1937   }
1938 \_cs_tmp:w \cs_new_nopar:Npn           \cs_gset_nopar:Npn
1939 \_cs_tmp:w \cs_new_nopar:Npe          \cs_gset_nopar:Npe
1940 \_cs_tmp:w \cs_new_nopar:Npx          \cs_gset_nopar:Npx
1941 \_cs_tmp:w \cs_new:Npn                \cs_gset:Npn
1942 \_cs_tmp:w \cs_new:Npe                \cs_gset:Npe
1943 \_cs_tmp:w \cs_new:Npx                \cs_gset:Npx
1944 \_cs_tmp:w \cs_new_protected_nopar:Npn \cs_gset_protected_nopar:Npn
1945 \_cs_tmp:w \cs_new_protected_nopar:Npe \cs_gset_protected_nopar:Npe
1946 \_cs_tmp:w \cs_new_protected_nopar:Npx \cs_gset_protected_nopar:Npx
1947 \_cs_tmp:w \cs_new_protected:Npn      \cs_gset_protected:Npn
1948 \_cs_tmp:w \cs_new_protected:Npe      \cs_gset_protected:Npe
1949 \_cs_tmp:w \cs_new_protected:Npx      \cs_gset_protected:Npx
```

(End of definition for `\cs_new_nopar:Npn` and others. These functions are documented on page 15.)

```
\cs_set_nopar:cnp  
\cs_set_nopar:cpe  
\cs_set_nopar:cpx  
\cs_gset_nopar:cpn  
\cs_gset_nopar:cpe  
\cs_gset_nopar:cpx  
\cs_new_nopar:cnp  
\cs_new_nopar:cpe  
\cs_new_nopar:cpx
```

Like `\cs_set_nopar:Npn` and `\cs_new_nopar:Npn`, except that the first argument consists of the sequence of characters that should be used to form the name of the desired control sequence (the c stands for csname argument, see the expansion module). Global versions are also provided.

`\cs_set_nopar:cpn<string><rep-text>` turns `<string>` into a csname and then assigns `<rep-text>` to it by using `\cs_set_nopar:Npn`. This means that there might be a parameter string between the two arguments.

```
1950 \cs_set:Npn __cs_tmp:w #1#2  
1951 { \cs_new_protected_nopar:Npn #1 { \exp_args:Nc #2 } }  
1952 __cs_tmp:w \cs_set_nopar:cpn \cs_set_nopar:Npn  
1953 __cs_tmp:w \cs_set_nopar:cpe \cs_set_nopar:Npe  
1954 __cs_tmp:w \cs_set_nopar:cpx \cs_set_nopar:Npx  
1955 __cs_tmp:w \cs_gset_nopar:cpn \cs_gset_nopar:Npn  
1956 __cs_tmp:w \cs_gset_nopar:cpe \cs_gset_nopar:Npe  
1957 __cs_tmp:w \cs_gset_nopar:cpx \cs_gset_nopar:Npx  
1958 __cs_tmp:w \cs_new_nopar:cpn \cs_new_nopar:Npn  
1959 __cs_tmp:w \cs_new_nopar:cpe \cs_new_nopar:Npe  
1960 __cs_tmp:w \cs_new_nopar:cpx \cs_new_nopar:Npx
```

(End of definition for `\cs_set_nopar:Npn`. This function is documented on page 16.)

```
\cs_set:cnp  
\cs_set:cpe  
\cs_set:cpx  
\cs_gset:cpn  
\cs_gset:cpe  
\cs_gset:cpx  
\cs_new:cnp  
\cs_new:cpe  
\cs_new:cpx
```

Variants of the `\cs_set:Npn` versions which make a csname out of the first arguments. We may also do this globally.

```
1961 __cs_tmp:w \cs_set:cnp \cs_set:Npn  
1962 __cs_tmp:w \cs_set:cpe \cs_set:Npe  
1963 __cs_tmp:w \cs_set:cpx \cs_set:Npx  
1964 __cs_tmp:w \cs_gset:cnp \cs_gset:Npn  
1965 __cs_tmp:w \cs_gset:cpe \cs_gset:Npe  
1966 __cs_tmp:w \cs_gset:cpx \cs_gset:Npx  
1967 __cs_tmp:w \cs_new:cnp \cs_new:Npn  
1968 __cs_tmp:w \cs_new:cpe \cs_new:Npe  
1969 __cs_tmp:w \cs_new:cpx \cs_new:Npx
```

(End of definition for `\cs_set:Npn`. This function is documented on page 16.)

```
\cs_set_protected_nopar:cnp  
\cs_set_protected_nopar:cpe  
\cs_set_protected_nopar:cpx  
\cs_gset_protected_nopar:cnp  
\cs_gset_protected_nopar:cpe  
\cs_gset_protected_nopar:cpx  
\cs_new_protected_nopar:cnp  
\cs_new_protected_nopar:cpe  
\cs_new_protected_nopar:cpx
```

Variants of the `\cs_set_protected_nopar:Npn` versions which make a csname out of the first arguments. We may also do this globally.

```
1970 __cs_tmp:w \cs_set_protected_nopar:cnp \cs_set_protected_nopar:Npn  
1971 __cs_tmp:w \cs_set_protected_nopar:cpe \cs_set_protected_nopar:Npe  
1972 __cs_tmp:w \cs_set_protected_nopar:cpx \cs_set_protected_nopar:Npx  
1973 __cs_tmp:w \cs_gset_protected_nopar:cnp \cs_gset_protected_nopar:Npn  
1974 __cs_tmp:w \cs_gset_protected_nopar:cpe \cs_gset_protected_nopar:Npe  
1975 __cs_tmp:w \cs_gset_protected_nopar:cpx \cs_gset_protected_nopar:Npx  
1976 __cs_tmp:w \cs_new_protected_nopar:cnp \cs_new_protected_nopar:Npn  
1977 __cs_tmp:w \cs_new_protected_nopar:cpe \cs_new_protected_nopar:Npe  
1978 __cs_tmp:w \cs_new_protected_nopar:cpx \cs_new_protected_nopar:Npx
```

(End of definition for `\cs_set_protected_nopar:Npn`. This function is documented on page 16.)

```

\cs_set_protected:cpn Variants of the \cs_set_protected:Npn versions which make a csname out of the first
\cs_set_protected:cpe arguments. We may also do this globally.

1979 \__cs_tmp:w \cs_set_protected:cpn \cs_set_protected:Npn
1980 \__cs_tmp:w \cs_set_protected:cpe \cs_set_protected:Npe
1981 \__cs_tmp:w \cs_set_protected:cpx \cs_set_protected:Npx
1982 \__cs_tmp:w \cs_gset_protected:cpn \cs_gset_protected:Npn
1983 \__cs_tmp:w \cs_gset_protected:cpe \cs_gset_protected:Npe
1984 \__cs_tmp:w \cs_gset_protected:cpx \cs_gset_protected:Npx
1985 \__cs_tmp:w \cs_new_protected:cpn \cs_new_protected:Npn
1986 \__cs_tmp:w \cs_new_protected:cpe \cs_new_protected:Npe
1987 \__cs_tmp:w \cs_new_protected:cpx \cs_new_protected:Npx

```

(End of definition for \cs\_set\_protected:Npn. This function is documented on page 16.)

## 42.12 Copying definitions

```

\cs_set_eq:NN These macros allow us to copy the definition of a control sequence to another control
\cs_set_eq:cN sequence.
\cs_set_eq:Nc The = sign allows us to define funny char tokens like = itself or \ with this function.
\cs_set_eq:cc For the definition of \c_space_char{\~} to work we need the ~ after the =.
\cs_gset_eq:NN \cs_set_eq:NN is long to avoid problems with a literal argument of \par. While
\cs_gset_eq:cN \cs_new_eq:NN will probably never be correct with a first argument of \par, define it
\cs_gset_eq:Nc long in order to throw an “already defined” error rather than “runaway argument”.
\cs_gset_eq:cc
\cs_new_eq:NN
\cs_new_eq:cN
\cs_new_eq:Nc
\cs_new_eq:cc
1988 \cs_new_protected:Npn \cs_set_eq:NN #1 { \tex_let:D #1 =~ }
1989 \cs_new_protected:Npn \cs_set_eq:cN { \exp_args:Nc \cs_set_eq:NN }
1990 \cs_new_protected:Npn \cs_set_eq:Nc { \exp_args:NNc \cs_set_eq:NN }
1991 \cs_new_protected:Npn \cs_set_eq:cc { \exp_args:Ncc \cs_set_eq:NN }
1992 \cs_new_protected:Npn \cs_gset_eq:NN { \tex_global:D \cs_set_eq:NN }
1993 \cs_new_protected:Npn \cs_gset_eq:Nc { \exp_args:NNc \cs_gset_eq:NN }
1994 \cs_new_protected:Npn \cs_gset_eq:cN { \exp_args:Nc \cs_gset_eq:NN }
1995 \cs_new_protected:Npn \cs_gset_eq:cc { \exp_args:Ncc \cs_gset_eq:NN }
1996 \cs_new_protected:Npn \cs_new_eq:NN #1
1997 {
1998     \__kernel_chk_if_free_cs:N #1
1999     \tex_global:D \cs_set_eq:NN #1
2000 }
2001 \cs_new_protected:Npn \cs_new_eq:cN { \exp_args:Nc \cs_new_eq:NN }
2002 \cs_new_protected:Npn \cs_new_eq:Nc { \exp_args:NNc \cs_new_eq:NN }
2003 \cs_new_protected:Npn \cs_new_eq:cc { \exp_args:Ncc \cs_new_eq:NN }

```

(End of definition for \cs\_set\_eq:NN, \cs\_gset\_eq:NN, and \cs\_new\_eq:NN. These functions are documented on page 20.)

## 42.13 Undefining functions

```

\cs_undefine:N The following function is used to free the main memory from the definition of some
\cs_undefine:c function that isn’t in use any longer. The c variant is careful not to add the control
sequence to the hash table if it isn’t there yet, and it also avoids nesting TeX conditionals
in case #1 is unbalanced in this matter. We optimize the case where the command exists
by reducing as much as possible the tokens in the conditional.

```

```
2004 \cs_new_protected:Npn \cs_undefine:N #1
```

```

2005   { \cs_gset_eq:NN #1 \tex_undefined:D }
2006   \cs_new_protected:Npn \cs_undefine:c #1
2007   {
2008     \if_cs_exist:w #1 \cs_end:
2009     \else:
2010       \use_i:nnnn
2011     \fi:
2012     \exp_args:Nc \cs_undefine:N {#1}
2013   }

```

(End of definition for `\cs_undefine:N`. This function is documented on page 20.)

## 42.14 Generating parameter text from argument count

```
2014 <@=cs>
```

```
\_kernel_cs_parm_from_arg_count:nnF
\_\_cs_parm_from_arg_count_test:nnF
```

L<sup>A</sup>T<sub>E</sub>X3 provides shorthands to define control sequences and conditionals with a simple parameter text, derived directly from the signature, or more generally from knowing the number of arguments, between 0 and 9. This function expands to its first argument, untouched, followed by a brace group containing the parameter text `{#1...#n}`, where  $n$  is the result of evaluating the second argument (as described in `\int_eval:n`). If the second argument gives a result outside the range [0,9], the third argument is returned instead, normally an error message. Some of the functions use here are not defined yet, but will be defined before this function is called.

```

2015 \cs_set_protected:Npn \_kernel_cs_parm_from_arg_count:nnF #1#2
2016   {
2017     \exp_args:Ne \_\_cs_parm_from_arg_count_test:nnF
2018     {
2019       \exp_after:wN \exp_not:n
2020       \if_case:w \int_eval:n {#2}
2021         {}
2022         \or: { ##1 }
2023         \or: { ##1##2 }
2024         \or: { ##1##2##3 }
2025         \or: { ##1##2##3##4 }
2026         \or: { ##1##2##3##4##5 }
2027         \or: { ##1##2##3##4##5##6 }
2028         \or: { ##1##2##3##4##5##6##7 }
2029         \or: { ##1##2##3##4##5##6##7##8 }
2030         \or: { ##1##2##3##4##5##6##7##8##9 }
2031         \else: { \c_false_bool }
2032         \fi:
2033     }
2034     {#1}
2035   }
2036 \cs_set_protected:Npn \_\_cs_parm_from_arg_count_test:nnF #1#2
2037   {
2038     \if_meaning:w \c_false_bool #1
2039       \exp_after:wN \use_i:nn
2040     \else:
2041       \exp_after:wN \use_i:nn
2042     \fi:
2043     { #2 {#1} }

```

```
2044 }
```

(End of definition for `\__kernel_cs_parm_from_arg_count:nnF` and `\__cs_parm_from_arg_count-test:nnF`.)

## 42.15 Defining functions from a given number of arguments

```
2045 ⟨@@=cs⟩
```

`\__cs_count_signature:N`  
`\__cs_count_signature:c`  
`\__cs_count_signature:n`  
`\__cs_count_signature:nnN`

Counting the number of tokens in the signature, *i.e.*, the number of arguments the function should take. Since this is not used in any time-critical function, we simply use `\tl_count:n` if there is a signature, otherwise `-1` arguments to signal an error. We need a variant form right away.

```
2046 \cs_new:Npn \__cs_count_signature:N #1
      { \exp_args:Nf \__cs_count_signature:n { \cs_split_function:N #1 } }
2048 \cs_new:Npn \__cs_count_signature:n #1
      { \int_eval:n { \__cs_count_signature:nnN #1 } }
2050 \cs_new:Npn \__cs_count_signature:nnN #1#2#3
      {
2052     \if_meaning:w \c_true_bool #3
2053     \tl_count:n {#2}
2054     \else:
2055     -1
2056     \fi:
2057 }
2058 \cs_new:Npn \__cs_count_signature:c
2059   { \exp_args:Nc \__cs_count_signature:N }
```

(End of definition for `\__cs_count_signature:N`, `\__cs_count_signature:n`, and `\__cs_count_signature:nnN`.)

```
\cs_generate_from_arg_count>NNnn
\cs_generate_from_arg_count:cNnn
\cs_generate_from_arg_count:Ncnn
```

We provide a constructor function for defining functions with a given number of arguments. For this we need to choose the correct parameter text and then use that when defining. Since TeX supports from zero to nine arguments, we use a simple switch to choose the correct parameter text, ensuring the result is returned after finishing the conditional. If it is not between zero and nine, we throw an error.

1: function to define, 2: with what to define it, 3: the number of args it requires and 4: the replacement text

```
2060 \cs_new_protected:Npn \cs_generate_from_arg_count>NNnn #1#2#3#4
2061   {
2062     \__kernel_cs_parm_from_arg_count:nnF { \use:nnn #2 #1 } {#3}
2063     {
2064       \msg_error:nnee { kernel } { bad-number-of-arguments }
2065       { \token_to_str:N #1 } { \int_eval:n {#3} }
2066       \use_none:n
2067     }
2068     {#4}
2069   }
```

A variant form we need right away, plus one which is used elsewhere but which is most logically created here.

```
2070 \cs_new_protected:Npn \cs_generate_from_arg_count:cNnn
2071   { \exp_args:Nc \cs_generate_from_arg_count>NNnn }
```

```

2072 \cs_new_protected:Npn \cs_generate_from_arg_count:Ncnn
2073   { \exp_args:NNc \cs_generate_from_arg_count>NNnn }

```

(End of definition for `\cs_generate_from_arg_count>NNnn`. This function is documented on page 19.)

## 42.16 Using the signature to define functions

```
2074 <@@=cs>
```

We can now combine some of the tools we have to provide a simple interface for defining functions, where the number of arguments is read from the signature. For instance, `\cs_set:Nn \foo_bar:nn {#1,#2}`.

We want to define `\cs_set:Nn` as

```

\cs_set:Nn
\cs_set:Ne
\cs_set:Nx
\cs_set_nopar:Nn
\cs_set_nopar:Ne
\cs_set_nopar:Nx
\cs_set_protected:Nn
\cs_set_protected:Ne
\cs_set_protected:Nx
\cs_set_protected_nopar:Nn
\cs_set_protected_nopar:Ne
\cs_set_protected_nopar:Nx
\cs_gset:Nn
\cs_gset:Ne
\cs_gset:Nx
\cs_gset_nopar:Nn
\cs_gset_nopar:Ne
\cs_gset_nopar:Nx
\cs_gset_protected:Nn
\cs_gset_protected:Ne
\cs_gset_protected:Nx
\cs_gset_protected_nopar:Nn
\cs_gset_protected_nopar:Ne
\cs_gset_protected_nopar:Nx
\cs_new:Nn
\cs_new:Ne
\cs_new:Nx
\cs_new_nopar:Nn
\cs_new_nopar:Ne
\cs_new_nopar:Nx
\cs_new_protected:Nn
\cs_new_protected:Ne
\cs_new_protected:Nx
\cs_new_protected_nopar:Nn
\cs_new_protected_nopar:Ne
\cs_new_protected_nopar:Nx

```

```

\cs_set_protected:Npn \cs_set:Nn #1#2
{
  \cs_generate_from_arg_count>NNnn #1 \cs_set:Npn
  { \@@_count_signature:N #1 } {#2}
}

```

In short, to define `\cs_set:Nn` we need just use `\cs_set:Npn`, everything else is the same for each variant. Therefore, we can make it simpler by temporarily defining a function to do this for us.

```

2075 \cs_set:Npn \__cs_tmp:w #1#2#3
2076   {
2077     \cs_new_protected:cp { cs_ #1 : #2 }
2078     {
2079       \exp_not:N \__cs_generate_from_signature:NNn
2080       \exp_after:wN \exp_not:N \cs:w cs_ #1 : #3 \cs_end:
2081     }
2082   }
2083 \cs_new_protected:Npn \__cs_generate_from_signature:NNn #1#2
2084   {
2085     \use:e
2086     {
2087       \__cs_generate_from_signature:nnNNNn
2088       \cs_split_function:N #2
2089     }
2090     #1 #2
2091   }
2092 \cs_new_protected:Npn \__cs_generate_from_signature:nnNNNn #1#2#3#4#5#6
2093   {
2094     \bool_if:NTF #3
2095     {
2096       \cs_set_nopar:Npx \__cs_tmp:w
2097       { \tl_map_function:nN {#2} \__cs_generate_from_signature:n }
2098       \tl_if_empty:oF \__cs_tmp:w
2099       {
2100         \msg_error:nneee { kernel } { non-base-function }
2101         { \token_to_str:N #5 } {#2} { \__cs_tmp:w }
2102       }
2103       \cs_generate_from_arg_count>NNnn
2104       #5 #4 { \tl_count:n {#2} } {#6}

```

```

2105     }
2106     {
2107         \msg_error:nne { kernel } { missing-colon }
2108         { \token_to_str:N #5 }
2109     }
2110 }
2111 \cs_new:Npn \__cs_generate_from_signature:n #1
2112 {
2113     \if:w n #1 \else: \if:w N #1 \else:
2114     \if:w T #1 \else: \if:w F #1 \else: #1 \fi: \fi: \fi: \fi:
2115 }

```

Then we define the 24 variants beginning with N.

```

2116 \__cs_tmp:w { set } { Nn } { Npn }
2117 \__cs_tmp:w { set } { Ne } { Npe }
2118 \__cs_tmp:w { set } { Nx } { Npx }
2119 \__cs_tmp:w { set_nopar } { Nn } { Npn }
2120 \__cs_tmp:w { set_nopar } { Ne } { Npe }
2121 \__cs_tmp:w { set_nopar } { Nx } { Npx }
2122 \__cs_tmp:w { set_protected } { Nn } { Npn }
2123 \__cs_tmp:w { set_protected } { Ne } { Npe }
2124 \__cs_tmp:w { set_protected } { Nx } { Npx }
2125 \__cs_tmp:w { set_protected_nopar } { Nn } { Npn }
2126 \__cs_tmp:w { set_protected_nopar } { Ne } { Npe }
2127 \__cs_tmp:w { set_protected_nopar } { Nx } { Npx }
2128 \__cs_tmp:w { gset } { Nn } { Npn }
2129 \__cs_tmp:w { gset } { Ne } { Npe }
2130 \__cs_tmp:w { gset } { Nx } { Npx }
2131 \__cs_tmp:w { gset_nopar } { Nn } { Npn }
2132 \__cs_tmp:w { gset_nopar } { Ne } { Npe }
2133 \__cs_tmp:w { gset_nopar } { Nx } { Npx }
2134 \__cs_tmp:w { gset_protected } { Nn } { Npn }
2135 \__cs_tmp:w { gset_protected } { Ne } { Npe }
2136 \__cs_tmp:w { gset_protected } { Nx } { Npx }
2137 \__cs_tmp:w { gset_protected_nopar } { Nn } { Npn }
2138 \__cs_tmp:w { gset_protected_nopar } { Ne } { Npe }
2139 \__cs_tmp:w { gset_protected_nopar } { Nx } { Npx }
2140 \__cs_tmp:w { new } { Nn } { Npn }
2141 \__cs_tmp:w { new } { Ne } { Npe }
2142 \__cs_tmp:w { new } { Nx } { Npx }
2143 \__cs_tmp:w { new_nopar } { Nn } { Npn }
2144 \__cs_tmp:w { new_nopar } { Ne } { Npe }
2145 \__cs_tmp:w { new_nopar } { Nx } { Npx }
2146 \__cs_tmp:w { new_protected } { Nn } { Npn }
2147 \__cs_tmp:w { new_protected } { Ne } { Npe }
2148 \__cs_tmp:w { new_protected } { Nx } { Npx }
2149 \__cs_tmp:w { new_protected_nopar } { Nn } { Npn }
2150 \__cs_tmp:w { new_protected_nopar } { Ne } { Npe }
2151 \__cs_tmp:w { new_protected_nopar } { Nx } { Npx }

```

(End of definition for `\cs_set:Nn` and others. These functions are documented on page 18.)

`\cs_set:cn` The 24 c variants simply use `\exp_args:Nc`.

`\cs_set:ce` 2152 `\cs_set:Npn \__cs_tmp:w #1#2`

`\cs_set:cx` 2153 {

`\cs_set_nopar:cn`

`\cs_set_nopar:ce`

`\cs_set_nopar:cx`

`\cs_set_protected:cn`

`\cs_set_protected:ce`

`\cs_set_protected:cx`

`\cs_set_protected_nopar:cn`

`\cs_set_protected_nopar:ce`

`\cs_set_protected_nopar:cx`

`\cs_gset:cn`

```

2154     \cs_new_protected:cpx { cs_ #1 : c #2 }
2155     {
2156         \exp_not:N \exp_args:Nc
2157         \exp_after:wN \exp_not:N \cs:w cs_ #1 : N #2 \cs_end:
2158     }
2159 }
2160 \__cs_tmp:w { set } { n }
2161 \__cs_tmp:w { set } { e }
2162 \__cs_tmp:w { set } { x }
2163 \__cs_tmp:w { set_nopar } { n }
2164 \__cs_tmp:w { set_nopar } { e }
2165 \__cs_tmp:w { set_nopar } { x }
2166 \__cs_tmp:w { set_protected } { n }
2167 \__cs_tmp:w { set_protected } { e }
2168 \__cs_tmp:w { set_protected } { x }
2169 \__cs_tmp:w { set_protected_nopar } { n }
2170 \__cs_tmp:w { set_protected_nopar } { e }
2171 \__cs_tmp:w { set_protected_nopar } { x }
2172 \__cs_tmp:w { gset } { n }
2173 \__cs_tmp:w { gset } { e }
2174 \__cs_tmp:w { gset } { x }
2175 \__cs_tmp:w { gset_nopar } { n }
2176 \__cs_tmp:w { gset_nopar } { e }
2177 \__cs_tmp:w { gset_nopar } { x }
2178 \__cs_tmp:w { gset_protected } { n }
2179 \__cs_tmp:w { gset_protected } { e }
2180 \__cs_tmp:w { gset_protected } { x }
2181 \__cs_tmp:w { gset_protected_nopar } { n }
2182 \__cs_tmp:w { gset_protected_nopar } { e }
2183 \__cs_tmp:w { gset_protected_nopar } { x }
2184 \__cs_tmp:w { new } { n }
2185 \__cs_tmp:w { new } { e }
2186 \__cs_tmp:w { new } { x }
2187 \__cs_tmp:w { new_nopar } { n }
2188 \__cs_tmp:w { new_nopar } { e }
2189 \__cs_tmp:w { new_nopar } { x }
2190 \__cs_tmp:w { new_protected } { n }
2191 \__cs_tmp:w { new_protected } { e }
2192 \__cs_tmp:w { new_protected } { x }
2193 \__cs_tmp:w { new_protected_nopar } { n }
2194 \__cs_tmp:w { new_protected_nopar } { e }
2195 \__cs_tmp:w { new_protected_nopar } { x }

```

(End of definition for `\cs_set:Nn`. This function is documented on page 18.)

## 42.17 Checking control sequence equality

`\cs_if_eq_p:NN` Check if two control sequences are identical.

```

\cs_if_eq_p:cN 2196 \prg_new_conditional:Npnn \cs_if_eq:NN #1#2 { p , T , F , TF }
\cs_if_eq_p:Nc 2197 {
\cs_if_eq_p:cc 2198     \if_meaning:w #1#2
\cs_if_eq:NNTF 2199     \prg_return_true: \else: \prg_return_false: \fi:
\cs_if_eq:cNTF 2200 }
\cs_if_eq:NcTF
\cs_if_eq:ccTF

```

```

2201 \cs_new:Npn \cs_if_eq_p:cN { \exp_args:Nc \cs_if_eq_p:NN }
2202 \cs_new:Npn \cs_if_eq:cNTF { \exp_args:Nc \cs_if_eq:NNTF }
2203 \cs_new:Npn \cs_if_eq:cNT { \exp_args:Nc \cs_if_eq:NNT }
2204 \cs_new:Npn \cs_if_eq:cNF { \exp_args:Nc \cs_if_eq:NNF }
2205 \cs_new:Npn \cs_if_eq_p:Nc { \exp_args:NNc \cs_if_eq_p:NN }
2206 \cs_new:Npn \cs_if_eq:NcTF { \exp_args:NNc \cs_if_eq:NNTF }
2207 \cs_new:Npn \cs_if_eq:NcT { \exp_args:NNc \cs_if_eq:NNT }
2208 \cs_new:Npn \cs_if_eq:NcF { \exp_args:NNc \cs_if_eq:NNF }
2209 \cs_new:Npn \cs_if_eq_p:cc { \exp_args:Ncc \cs_if_eq_p:NN }
2210 \cs_new:Npn \cs_if_eq:ccTF { \exp_args:Ncc \cs_if_eq:NNTF }
2211 \cs_new:Npn \cs_if_eq:ccT { \exp_args:Ncc \cs_if_eq:NNT }
2212 \cs_new:Npn \cs_if_eq:ccF { \exp_args:Ncc \cs_if_eq:NNF }

```

(End of definition for \cs\_if\_eq:NNTF. This function is documented on page 28.)

## 42.18 Diagnostic functions

2213 ⟨@@=kernel⟩

\\_\_kernel\_chk\_defined:NT Error if the variable #1 is not defined.

```

2214 \cs_new_protected:Npn \__kernel_chk_defined:NT #1#2
2215 {
2216     \cs_if_exist:NTF #1
2217     {#2}
2218     {
2219         \msg_error:nne { kernel } { variable-not-defined }
2220         { \token_to_str:N #1 }
2221     }
2222 }

```

(End of definition for \\_\_kernel\_chk\_defined:NT.)

\\_\_kernel\_register\_show:N Simply using the \show primitive does not allow for line-wrapping, so instead use \tl\_show:n and \tl\_log:n (defined in l3tl and that performs line-wrapping). This displays >~⟨variable⟩=(value). We expand the value before-hand as otherwise some integers (such as \currentgrouplevel or \currentgrouptype) altered by the line-wrapping code would show wrong values.

```

2223 \cs_new_protected:Npn \__kernel_register_show:N
2224     { \__kernel_register_show_aux:NN \tl_show:n }
2225 \cs_new_protected:Npn \__kernel_register_show:c
2226     { \exp_args:Nc \__kernel_register_show:N }
2227 \cs_new_protected:Npn \__kernel_register_log:N
2228     { \__kernel_register_show_aux:NN \tl_log:n }
2229 \cs_new_protected:Npn \__kernel_register_log:c
2230     { \exp_args:Nc \__kernel_register_log:N }
2231 \cs_new_protected:Npn \__kernel_register_show_aux:NN #1#2
2232 {
2233     \__kernel_chk_defined:NT #2
2234     {
2235         \exp_args:No \__kernel_register_show_aux:nNN
2236         { \tex_the:D #2 } #2 #1
2237     }
2238 }
2239 \cs_new_protected:Npn \__kernel_register_show_aux:nNN #1#2#3

```

```
2240 { \exp_args:No #3 { \token_to_str:N #2 = #1 } }
```

(End of definition for `\_kernel_register_show:N` and others.)

```
\cs_show:N  
\cs_show:c  
\cs_log:N  
\cs_log:c  
\_kernel_show>NN
```

Some control sequences have a very long name or meaning. Thus, simply using TeX's primitive `\show` could lead to overlong lines. The output of this primitive is mimicked to some extent, then the re-built string is given to `\tl_show:n` or `\tl_log:n` for line-wrapping. We must expand the meaning before passing it to the wrapping code as otherwise we would wrongly see the definitions that are in place there. To get correct escape characters, set the `\escapechar` in a group; this also localizes the assignment performed by e-expansion. The `\cs_show:c` and `\cs_log:c` commands convert their argument to a control sequence within a group to avoid showing `\relax` for undefined control sequences.

```
2241 \cs_new_protected:Npn \cs_show:N { \_kernel_show>NN \tl_show:n }  
2242 \cs_new_protected:Npn \cs_show:c  
2243 { \group_begin: \exp_args:NNc \group_end: \cs_show:N }  
2244 \cs_new_protected:Npn \cs_log:N { \_kernel_show>NN \tl_log:n }  
2245 \cs_new_protected:Npn \cs_log:c  
2246 { \group_begin: \exp_args:NNc \group_end: \cs_log:N }  
2247 \cs_new_protected:Npn \_kernel_show>NN #1#2  
2248 {  
2249 \group_begin:  
2250 \int_set:Nn \tex_escapechar:D { '\\" }  
2251 \exp_args:NNe  
2252 \group_end:  
2253 #1 { \token_to_str:N #2 = \cs_meaning:N #2 }  
2254 }
```

(End of definition for `\cs_show:N`, `\cs_log:N`, and `\_kernel_show>NN`. These functions are documented on page 20.)

```
\group_show_list:  
\group_log_list:
```

Wrapper around `\showgroups`. Getting TeX to write to the log without interruption the run is done by altering the interaction mode.

```
2255 \cs_new_protected:Npn \group_show_list:  
2256 { \_kernel_group_show>NN \use_none:n 1 }  
2257 \cs_new_protected:Npn \group_log_list:  
2258 { \_kernel_group_show>NN \int_zero:N 0 }  
2259 \cs_new_protected:Npn \_kernel_group_show>NN #1#2  
2260 {  
2261 \use:e  
2262 {  
2263 #1 \tex_interactionmode:D  
2264 \int_set:Nn \tex_tracingonline:D {#2}  
2265 \int_set:Nn \tex_errorcontextlines:D { -1 }  
2266 \exp_not:N \exp_after:wN \scan_stop:  
2267 \tex_showgroups:D  
2268 \int_set:Nn \tex_interactionmode:D  
2269 { \int_use:N \tex_interactionmode:D }  
2270 \int_set:Nn \tex_tracingonline:D  
2271 { \int_use:N \tex_tracingonline:D }  
2272 \int_set:Nn \tex_errorcontextlines:D  
2273 { \int_use:N \tex_errorcontextlines:D }  
2274 }  
2275 }
```

(End of definition for `\group_show_list:`, `\group_log_list:`, and `\_kernel_group_show:NN`. These functions are documented on page 14.)

## 42.19 Decomposing a macro definition

`\cs_prefix_spec:N`  
`\cs_parameter_spec:N`  
`\cs_replacement_spec:N`  
`\_kernel_prefix_arg_replacement:wN`

We sometimes want to test if a control sequence can be expanded to reveal a hidden value. However, we cannot just expand the macro blindly as it may have arguments and none might be present. Therefore we define these functions to pick either the prefix(es), the parameter specification, or the replacement text from a macro. All of this information is returned as characters with catcode 12. If the token in question isn't a macro, the token `\scan_stop:` is returned instead.

```
2276 \use:e
2277 {
2278   \exp_not:n { \cs_new:Npn \_kernel_prefix_arg_replacement:wN #1 }
2279   \tl_to_str:n { macro : } \exp_not:n { #2 -> #3 \s_kernel_stop #4 }
2280 }
2281 { #4 {#1} {#2} {#3} }
2282 \cs_new:Npn \cs_prefix_spec:N #1
2283 {
2284   \token_if_macro:NTF #1
2285   {
2286     \exp_after:wN \_kernel_prefix_arg_replacement:wN
2287     \token_to_meaning:N #1 \s_kernel_stop \use_i:nnn
2288   }
2289   { \scan_stop: }
2290 }
2291 \cs_new:Npn \cs_parameter_spec:N #1
2292 {
2293   \token_if_macro:NTF #1
2294   {
2295     \exp_after:wN \_kernel_prefix_arg_replacement:wN
2296     \token_to_meaning:N #1 \s_kernel_stop \use_ii:nnn
2297   }
2298   { \scan_stop: }
2299 }
2300 \cs_new:Npn \cs_replacement_spec:N #1
2301 {
2302   \token_if_macro:NTF #1
2303   {
2304     \exp_after:wN \_kernel_prefix_arg_replacement:wN
2305     \token_to_meaning:N #1 \s_kernel_stop \use_iii:nnn
2306   }
2307   { \scan_stop: }
2308 }
```

(End of definition for `\cs_prefix_spec:N` and others. These functions are documented on page 22.)

## 42.20 Doing nothing functions

`\prg_do_nothing:` This does not fit anywhere else!

```
2309 \cs_new:Npn \prg_do_nothing: { }
```

(End of definition for `\prg_do_nothing:`. This function is documented on page 13.)

## 42.21 Breaking out of mapping functions

2310 ⟨@=prg⟩

\prg\_break\_point:Nn  
  \prg\_map\_break:Nn

In inline mappings, the nesting level must be reset at the end of the mapping, even when the user decides to break out. This is done by putting the code that must be performed as an argument of \\_\\_prg\\_break\\_point:Nn. The breaking functions are then defined to jump to that point and perform the argument of \\_\\_prg\\_break\\_point:Nn, before the user's code (if any). There is a check that we close the correct loop, otherwise we continue breaking.

```
2311 \cs_new_eq:NN \prg_break_point:Nn \use_i:nn
2312 \cs_new:Npn \prg_map_break:Nn #1#2#3 \prg_break_point:Nn #4#5
2313 {
2314     #5
2315     \if_meaning:w #1 #4
2316         \exp_after:wN \use_i:nn
2317     \fi:
2318     \prg_map_break:Nn #1 {#2}
2319 }
```

(End of definition for \prg\_break\_point:Nn and \prg\_map\_break:Nn. These functions are documented on page 72.)

\prg\_break\_point:  
  \prg\_break:  
  \prg\_break:n

Very simple analogues of \prg\_break\_point:Nn and \prg\_map\_break:Nn, for use in fast short-term recursions which are not mappings, do not need to support nesting, and in which nothing has to be done at the end of the loop.

```
2320 \cs_new_eq:NN \prg_break_point: \prg_do_nothing:
2321 \cs_new:Npn \prg_break: #1 \prg_break_point: { }
2322 \cs_new:Npn \prg_break:n #1#2 \prg_break_point: {#1}
```

(End of definition for \prg\_break\_point:, \prg\_break:, and \prg\_break:n. These functions are documented on page 73.)

## 42.22 Starting a paragraph

\mode\_leave\_vertical:

The approach here is different to that used by L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> or plain T<sub>E</sub>X, which unbox a void box to force horizontal mode. That inserts the \everypar tokens *before* the re-inserted unboxing tokens. The approach here uses a protected macro, equivalent to the \quitvmode primitive. In vertical mode, the \indent primitive is inserted: this will switch to horizontal mode and insert \everypar tokens and nothing else. Unlike the L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> version, the availability of ε-T<sub>E</sub>X means using a mode test can be done at for example the start of an \halign.

```
2323 \cs_new_protected:Npn \mode_leave_vertical:
2324 {
2325     \if_mode_vertical:
2326         \exp_after:wN \tex_indent:D
2327     \fi:
2328 }
```

(End of definition for \mode\_leave\_vertical:. This function is documented on page 29.)

2329 ⟨/package⟩

# Chapter 43

## I3expan implementation

2330 `(*package)`

2331 `(@@=exp)`

\l\_\_exp\_internal\_t1 The `\exp_` module has its private variable to temporarily store the result of x-type argument expansion. This is done to avoid interference with other functions using temporary variables.

(End of definition for `\l__exp_internal_t1`.)

`\exp_after:wN` These are defined in I3basics, as they are needed “early”. This is just a reminder of that fact!

`\exp_not:N`

`\exp_not:n`

(End of definition for `\exp_after:wN`, `\exp_not:N`, and `\exp_not:n`. These functions are documented on page 39.)

### 43.1 General expansion

In this section a general mechanism for defining functions that handle arguments is defined. These general expansion functions are expandable unless x is used. (Any version of x is going to have to use one of the L<sup>A</sup>T<sub>E</sub>X3 names for `\cs_set:Npx` at some point, and so is never going to be expandable.)

The definition of expansion functions with this technique happens in section 43.7. In section 43.2 some common cases are coded by a more direct method for efficiency, typically using calls to `\exp_after:wN`.

\l\_\_exp\_internal\_t1 This scratch token list variable is defined in I3basics.

(End of definition for `\l__exp_internal_t1`.)

This code uses internal functions with names that start with `\:::` to perform the expansions. All macros are `long` since the tokens undergoing expansion may be arbitrary user input.

An argument manipulator `\:::(Z)` always has signature `#1\:::#2#3` where `#1` holds the remaining argument manipulations to be performed, `\:::` serves as an end marker for the list of manipulations, `#2` is the carried over result of the previous expansion steps and `#3` is the argument about to be processed. One exception to this rule is `\:::p`, which has to grab an argument delimited by a left brace.

`\_exp_arg_next:nnn` #1 is the result of an expansion step, #2 is the remaining argument manipulations and #3 is the current result of the expansion chain. This auxiliary function moves #1 back after #3 in the input stream and checks if any expansion is left to be done by calling #2. In by far the most cases we need to add a set of braces to the result of an argument manipulation so it is more effective to do it directly here. Actually, so far only the c of the final argument manipulation variants does not require a set of braces.

```
2332 \cs_new:Npn \_exp_arg_next:nnn #1#2#3 { #2 \::: { #3 {#1} } }
2333 \cs_new:Npn \_exp_arg_next:Nnn #1#2#3 { #2 \::: { #3 #1 } }
```

(End of definition for `\_exp_arg_next:nnn` and `\_exp_arg_next:Nnn`.)

`\:::` The end marker is just another name for the identity function.

```
2334 \cs_new:Npn \::: #1 {#1}
```

(End of definition for `\:::`. This function is documented on page 43.)

`\::n` This function is used to skip an argument that doesn't need to be expanded.

```
2335 \cs_new:Npn \::n #1 \::: #2#3 { #1 \::: { #2 {#3} } }
```

(End of definition for `\::n`. This function is documented on page 43.)

`\::N` This function is used to skip an argument that consists of a single token and doesn't need to be expanded.

```
2336 \cs_new:Npn \::N #1 \::: #2#3 { #1 \::: {#2#3} }
```

(End of definition for `\::N`. This function is documented on page 43.)

`\::p` This function is used to skip an argument that is delimited by a left brace and doesn't need to be expanded. It is not wrapped in braces in the result.

```
2337 \cs_new:Npn \::p #1 \::: #2#3# { #1 \::: {#2#3} }
```

(End of definition for `\::p`. This function is documented on page 43.)

`\::c` This function is used to skip an argument that is turned into a control sequence without expansion.

```
2338 \cs_new:Npn \::c #1 \::: #2#3
2339   { \exp_after:wN \_exp_arg_next:Nnn \cs:w #3 \cs_end: {#1} {#2} }
```

(End of definition for `\::c`. This function is documented on page 43.)

`\::o` This function is used to expand an argument once.

```
2340 \cs_new:Npn \::o #1 \::: #2#3
2341   { \exp_after:wN \_exp_arg_next:nnn \exp_after:wN {#3} {#1} {#2} }
```

(End of definition for `\::o`. This function is documented on page 43.)

`\::e` With the `\expanded` primitive available, just expand.

```
2342 \cs_new:Npn \::e #1 \::: #2#3
2343   { \tex_expanded:D { \exp_not:n { #1 \::: } { \exp_not:n {#2} {#3} } } }
```

(End of definition for `\::e`. This function is documented on page 43.)

**\:::f** This function is used to expand a token list until the first unexpandable token is found. This is achieved through `\exp:w \exp_end_continue_f:w` that expands everything in its way following it. This scanning procedure is terminated once the expansion hits something non-expandable (if that is a space it is removed). We introduce `\exp_stop_f:` to mark such an end-of-expansion marker. For example, f-expanding `\cs_set_eq:Nc \aaa { b \l_tmpa_t1 b }` where `\l_tmpa_t1` contains the characters `lur` gives `\tex_let:D \aaa = \blurb` which then turns out to start with the non-expandable token `\tex_let:D`. Since the expansion of `\exp:w \exp_end_continue_f:w` is empty, we wind up with a fully expanded list, only TeX has not tried to execute any of the non-expandable tokens. This is what differentiates this function from the e and x argument type.

```

2344 \cs_new:Npn \:::f #1 \::: #2#3
2345 {
2346   \exp_after:wN \__exp_arg_next:nnn
2347   \exp_after:wN { \exp:w \exp_end_continue_f:w #3 }
2348   {#1} {#2}
2349 }
2350 \use:nn { \cs_new_eq:NN \exp_stop_f: } { ~ }

```

(End of definition for `\:::f` and `\exp_stop_f:`. These functions are documented on page 43.)

**\:::x** This function is used to expand an argument fully. We build in the expansion of `\__exp_arg_next:nnn`.

```

2351 \cs_new_protected:Npn \:::x #1 \::: #2#3
2352 {
2353   \cs_set_nopar:Npe \l__exp_internal_t1
2354   { \exp_not:n { #1 \::: } { \exp_not:n {#2} {#3} } }
2355   \l__exp_internal_t1
2356 }

```

(End of definition for `\:::x`. This function is documented on page 43.)

**\:::v** These functions return the value of a register, i.e., one of `tl`, `clist`, `int`, `skip`, `dim`, **\:::V** `muskip`, or built-in TeX register. The V version expects a single token whereas v like c creates a csname from its argument given in braces and then evaluates it as if it was a V. The `\exp:w` sets off an expansion similar to an f-type expansion, which we terminate using `\exp_end:.` The argument is returned in braces.

```

2357 \cs_new:Npn \:::V #1 \::: #2#3
2358 {
2359   \exp_after:wN \__exp_arg_next:nnn
2360   \exp_after:wN { \exp:w \__exp_eval_register:N #3 }
2361   {#1} {#2}
2362 }
2363 \cs_new:Npn \:::v #1 \::: #2#3
2364 {
2365   \exp_after:wN \__exp_arg_next:nnn
2366   \exp_after:wN { \exp:w \__exp_eval_register:c {#3} }
2367   {#1} {#2}
2368 }

```

(End of definition for `\:::v` and `\:::V`. These functions are documented on page 43.)

\\_\\_exp\\_eval\\_register:N This function evaluates a register. Now a register might exist as one of two things: A parameter-less macro or a built-in TeX register such as \count. For the TeX registers we have to utilize a \the whereas for the macros we merely have to expand them once. The trick is to find out when to use \the and when not to. What we want here is to find out whether the token expands to something else when hit with \exp\\_after:wN. The technique is to compare the meaning of the token in question when it has been prefixed with \exp\\_not:N and the token itself. If it is a macro, the prefixed \exp\\_not:N temporarily turns it into the primitive \scan\_stop::

```
2369 \cs_new:Npn \_\_exp_eval_register:N #1
2370   {
2371     \exp_after:wN \if_meaning:w \exp_not:N #1 #1
```

If the token was not a macro it may be a malformed variable from a c expansion in which case it is equal to the primitive \scan\_stop:. In that case we throw an error. We could let TeX do it for us but that would result in the rather obscure

```
! You can't use '\relax' after \the.
```

which while quite true doesn't give many hints as to what actually went wrong. We provide something more sensible.

```
2372   \if_meaning:w \scan_stop: #1
2373     \_\_exp_eval_error_msg:w
2374   \fi:
```

The next bit requires some explanation. The function must be initiated by \exp:w and we want to terminate this expansion chain by inserting the \exp\_end: token. However, we have to expand the register #1 before we do that. If it is a TeX register, we need to execute the sequence \exp\_after:wN \exp\_end: \tex\_the:D #1 and if it is a macro we need to execute \exp\_after:wN \exp\_end: #1. We therefore issue the longer of the two sequences and if the register is a macro, we remove the \tex\_the:D.

```
2375   \else:
2376     \exp_after:wN \use_i_ii:nnn
2377   \fi:
2378   \exp_after:wN \exp_end: \tex_the:D #1
2379 }
2380 \cs_new:Npn \_\_exp_eval_register:c #1
2381   { \exp_after:wN \_\_exp_eval_register:N \cs:w #1 \cs_end: }
```

Clean up nicely, then call the undefined control sequence. The result is an error message looking like this:

```
! Undefined control sequence.
<argument> \LaTeX3 error:
                    Erroneous variable used!
1.55 \tl_set:Nv \l_tmpa_tl {undefined_t1}

2382 \cs_new:Npn \_\_exp_eval_error_msg:w #1 \tex_the:D #2
2383   {
2384     \fi:
2385   \fi:
2386   \msg_expandable_error:nnn { kernel } { bad-variable } {#2}
2387   \exp_end:
2388 }
```

(End of definition for \\_\\_exp\_eval\_register:N and \\_\\_exp\_eval\_error\_msg:w.)

## 43.2 Hand-tuned definitions

One of the most important features of these functions is that they are fully expandable.

\exp\_args:Nc

\exp\_args:cc

(End of definition for \exp\_args:Nc and \exp\_args:cc. These functions are documented on page 36.)

\exp\_args:NNc

\exp\_args:Ncc

\exp\_args:Nccc

Here are the functions that turn their argument into csnames but are expandable.

```
2389 \cs_new:Npn \exp_args>NNc #1#2#3
2390   { \exp_after:wN #1 \exp_after:wN #2 \cs:w # 3\cs_end: }
2391 \cs_new:Npn \exp_args:Ncc #1#2#3
2392   { \exp_after:wN #1 \cs:w #2 \exp_after:wN \cs_end: \cs:w #3 \cs_end: }
2393 \cs_new:Npn \exp_args:Nccc #1#2#3#4
2394   {
2395     \exp_after:wN #
2396       \cs:w #2 \exp_after:wN \cs_end:
2397       \cs:w #3 \exp_after:wN \cs_end:
2398       \cs:w #4 \cs_end:
2399 }
```

(End of definition for \exp\_args:NNc, \exp\_args:Ncc, and \exp\_args:Nccc. These functions are documented on page 37.)

\exp\_args:No

\exp\_args:NNo

\exp\_args:NNNo

Those lovely runs of expansion!

```
2400 \cs_new:Npn \exp_args:No #1#2 { \exp_after:wN #1 \exp_after:wN {#2} }
2401 \cs_new:Npn \exp_args:NNo #1#2#3
2402   { \exp_after:wN #1 \exp_after:wN #2 \exp_after:wN {#3} }
2403 \cs_new:Npn \exp_args:NNNo #1#2#3#4
2404   { \exp_after:wN #1 \exp_after:wN#2 \exp_after:wN #3 \exp_after:wN {#4} }
```

(End of definition for \exp\_args:No, \exp\_args:NNo, and \exp\_args:NNNo. These functions are documented on page 36.)

\exp\_args:Ne

When the \expanded primitive is available, use it.

```
2405 \cs_new:Npn \exp_args:Ne #1#2
2406   { \exp_after:wN #1 \tex_expanded:D {#2} } 
```

(End of definition for \exp\_args:Ne. This function is documented on page 36.)

\exp\_args:Nf

\exp\_args:NV

\exp\_args:Nv

```
2407 \cs_new:Npn \exp_args:Nf #1#2
2408   { \exp_after:wN #1 \exp_after:wN { \exp:w \exp_end_continue_f:w #2 } }
2409 \cs_new:Npn \exp_args:NV #1#2
2410   {
2411     \exp_after:wN #1 \exp_after:wN
2412       { \exp:w \__exp_eval_register:c {#2} }
2413   }
2414 \cs_new:Npn \exp_args:Nv #1#2
2415   {
2416     \exp_after:wN #1 \exp_after:wN
2417       { \exp:w \__exp_eval_register:N #2 } 
```

(End of definition for \exp\_args:Nf, \exp\_args:NV, and \exp\_args:Nv. These functions are documented on page 36.)

`\exp_args:NNV` Some more hand-tuned function with three arguments. If we forced that an o argument always has braces, we could implement `\exp_args:Nco` with less tokens and only two arguments.  
`\exp_args:NNv`  
`\exp_args:NNe`  
`\exp_args:Nf`  
`\exp_args:Nco`  
`\exp_args:NcV`  
`\exp_args:Ncv`  
`\exp_args:Ncf`  
`\exp_args:NVV`

```

2419 \cs_new:Npn \exp_args:NNV #1#2#3
2420 {
2421     \exp_after:wN #1
2422     \exp_after:wN #2
2423     \exp_after:wN { \exp:w \_exp_eval_register:N #3 }
2424 }
2425 \cs_new:Npn \exp_args:NNv #1#2#3
2426 {
2427     \exp_after:wN #1
2428     \exp_after:wN #2
2429     \exp_after:wN { \exp:w \_exp_eval_register:c {#3} }
2430 }
2431 \cs_new:Npn \exp_args:NNe #1#2#3
2432 {
2433     \exp_after:wN #1
2434     \exp_after:wN #2
2435     \tex_expanded:D { {#3} }
2436 }
2437 \cs_new:Npn \exp_args:NNf #1#2#3
2438 {
2439     \exp_after:wN #1
2440     \exp_after:wN #2
2441     \exp_after:wN { \exp:w \exp_end_continue_f:w #3 }
2442 }
2443 \cs_new:Npn \exp_args:Nco #1#2#3
2444 {
2445     \exp_after:wN #1
2446     \cs:w #2 \exp_after:wN \cs_end:
2447     \exp_after:wN {#3}
2448 }
2449 \cs_new:Npn \exp_args:NcV #1#2#3
2450 {
2451     \exp_after:wN #1
2452     \cs:w #2 \exp_after:wN \cs_end:
2453     \exp_after:wN { \exp:w \_exp_eval_register:N #3 }
2454 }
2455 \cs_new:Npn \exp_args:Ncv #1#2#3
2456 {
2457     \exp_after:wN #1
2458     \cs:w #2 \exp_after:wN \cs_end:
2459     \exp_after:wN { \exp:w \_exp_eval_register:c {#3} }
2460 }
2461 \cs_new:Npn \exp_args:Ncf #1#2#3
2462 {
2463     \exp_after:wN #1
2464     \cs:w #2 \exp_after:wN \cs_end:
2465     \exp_after:wN { \exp:w \exp_end_continue_f:w #3 }
2466 }
2467 \cs_new:Npn \exp_args:NVV #1#2#3
2468 {
2469     \exp_after:wN #1

```

```

2470     \exp_after:wN { \exp:w \exp_after:wN
2471         \_exp_eval_register:N \exp_after:wN #2 \exp_after:wN }
2472     \exp_after:wN { \exp:w \_exp_eval_register:N #3 }
2473 }

```

(End of definition for `\exp_args:NNNV` and others. These functions are documented on page 37.)

`\exp_args:NNNV` A few more that we can hand-tune.

```

\exp_args:NNNV
\exp_args:NNNv
\exp_args:NNNe
\exp_args:NcNc
\exp_args:NcNo
\exp_args:Ncco
2474 \cs_new:Npn \exp_args:NNNV #1#2#3#4
2475 {
2476     \exp_after:wN #1
2477     \exp_after:wN #2
2478     \exp_after:wN #3
2479     \exp_after:wN { \exp:w \_exp_eval_register:N #4 }
2480 }
2481 \cs_new:Npn \exp_args:NNNv #1#2#3#4
2482 {
2483     \exp_after:wN #1
2484     \exp_after:wN #2
2485     \exp_after:wN #3
2486     \exp_after:wN { \exp:w \_exp_eval_register:c {#4} }
2487 }
2488 \cs_new:Npn \exp_args:NNNe #1#2#3#4
2489 {
2490     \exp_after:wN #1
2491     \exp_after:wN #2

2512     \cs:w #2 \exp_after:wN \cs_end:
2513     \cs:w #3 \exp_after:wN \cs_end:
2514     \exp_after:wN {#4}
2515 }

```

(End of definition for `\exp_args:NNNV` and others. These functions are documented on page 37.)

`\exp_args:Nx`

```

2516 \cs_new_protected:Npn \exp_args:Nx #1#2
2517   { \use:x { \exp_not:N #1 {#2} } }

```

(End of definition for `\exp_args:Nx`. This function is documented on page 36.)

### 43.3 Last-unbraced versions

There are a few places where the last argument needs to be available unbraced. First some helper macros.

```

2518 \cs_new:Npn \__exp_arg_last_unbraced:nn #1#2 { #2#1 }
2519 \cs_new:Npn \:::unbraced \::: #1#2
2520   { \exp_after:wN \__exp_arg_last_unbraced:nn \exp_after:wN {#2} {#1} }
2521 \cs_new:Npn \:::V_unbraced \::: #1#2
2522   {
2523     \exp_after:wN \__exp_arg_last_unbraced:nn
2524       \exp_after:wN { \exp:w \__exp_eval_register:N #2 } {#1}
2525   }
2526 \cs_new:Npn \:::v_unbraced \::: #1#2
2527   {
2528     \exp_after:wN \__exp_arg_last_unbraced:nn
2529       \exp_after:wN { \exp:w \__exp_eval_register:c {#2} } {#1}
2530   }
2531 \cs_new:Npn \:::e_unbraced \::: #1#2
2532   { \tex_expanded:D { \exp_not:n {#1} #2 } }
2533 \cs_new:Npn \:::f_unbraced \::: #1#2
2534   {
2535     \exp_after:wN \__exp_arg_last_unbraced:nn
2536       \exp_after:wN { \exp:w \exp_end_continue_f:w #2 } {#1}
2537   }
2538 \cs_new_protected:Npn \:::x_unbraced \::: #1#2
2539   {
2540     \cs_set_nopar:Npe \l__exp_internal_tl { \exp_not:n {#1} #2 }
2541     \l__exp_internal_tl
2542   }

```

(End of definition for `\__exp_arg_last_unbraced:nn` and others. These functions are documented on page 43.)

Now the business end: most of these are hand-tuned for speed, but the general system is in place.

```

2543 \cs_new:Npn \exp_last_unbraced:No #1#2 { \exp_after:wN #1 #2 }
2544 \cs_new:Npn \exp_last_unbraced:NV #1#2

2603  }
2604 \cs_new_protected:Npn \exp_last_unbraced:Nx { ::x_unbraced :: }

```

(End of definition for `\exp_last_unbraced:No` and others. These functions are documented on page 38.)

`\exp_last_two_unbraced:Noo` If #2 is a single token then this can be implemented as  
`\__exp_last_two_unbraced:noN`

```

\cs_new:Npn \exp_last_two_unbraced:Noo #1 #2 #3
  { \exp_after:wN \exp_after:wN \exp_after:wN #1 \exp_after:wN #2 #3 }

```

However, for robustness this is not suitable. Instead, a bit of a shuffle is used to ensure that #2 can be multiple tokens.

```

2605 \cs_new:Npn \exp_last_two_unbraced:Noo #1#2#3
2606   { \exp_after:wN \_exp_last_two_unbraced:noN \exp_after:wN {#3} {#2} #1 }
2607 \cs_new:Npn \_exp_last_two_unbraced:noN #1#2#3
2608   { \exp_after:wN #3 #2 #1 }

```

(End of definition for `\exp_last_two_unbraced:Noo` and `\_exp_last_two_unbraced:noN`. This function is documented on page 39.)

## 43.4 Preventing expansion

`\_kernel_exp_not:w` At the kernel level, we need the primitive behaviour to allow expansion *before* the brace group.

```
2609 \cs_new_eq:NN \_kernel_exp_not:w \tex_unexpanded:D
```

(End of definition for `\_kernel_exp_not:w`.)

`\exp_not:c` All these except `\exp_not:c` call the kernel-internal `\_kernel_exp_not:w` namely  
`\exp_not:o`  
`\exp_not:e`  
`\exp_not:f`  
`\exp_not:v`  
`\exp_not:v`

```

2610 \cs_new:Npn \exp_not:c #1 { \exp_after:wN \exp_not:N \cs:w #1 \cs_end: }
2611 \cs_new:Npn \exp_not:o #1 { \_kernel_exp_not:w \exp_after:wN {#1} }
2612 \cs_new:Npn \exp_not:e #1
2613   { \_kernel_exp_not:w \tex_expanded:D {#1} }
2614 \cs_new:Npn \exp_not:f #1
2615   { \_kernel_exp_not:w \exp_after:wN { \exp:w \exp_end_continue_f:w #1 } }
2616 \cs_new:Npn \exp_not:v #1
2617   {
2618     \_kernel_exp_not:w \exp_after:wN
2619     { \exp:w \_exp_eval_register:N #1 }
2620   }
2621 \cs_new:Npn \exp_not:v #1
2622   {
2623     \_kernel_exp_not:w \exp_after:wN
2624     { \exp:w \_exp_eval_register:c {#1} }
2625   }

```

(End of definition for `\exp_not:c` and others. These functions are documented on page 39.)

## 43.5 Controlled expansion

`\exp:w`  
`\exp_end:`  
`\exp_end_continue_f:w`  
`\exp_end_continue_f:nw` To trigger a sequence of “arbitrarily” many expansions we need a method to invoke TeX’s expansion mechanism in such a way that (a) we are able to stop it in a controlled manner and (b) the result of what triggered the expansion in the first place is null, i.e., that we do not get any unwanted side effects. There aren’t that many possibilities in TeX; in fact the one explained below might well be the only one (as normally the result of expansion is not null).

The trick here is to make use of the fact that `\tex_roman numeral:D` expands the tokens following it when looking for a number and that its expansion is null if that number

turns out to be zero or negative. So we use that to start the expansion sequence: `\exp:w` is set equal to `\tex_roman numeral:D` in `\3basics`. To stop the expansion sequence in a controlled way all we need to provide is a constant integer zero as part of expanded tokens. As this is an integer constant it immediately stops `\tex_roman numeral:`'s search for a number. Again, the definition of `\exp_end:` as the integer constant zero is in `\3basics`. (Note that according to our specification all tokens we expand initiated by `\exp:w` are supposed to be expandable (as well as their replacement text in the expansion) so we will not encounter a “number” that actually result in a roman numeral being generated. Or if we do then the programmer made a mistake.)

If on the other hand we want to stop the initial expansion sequence but continue with an f-type expansion we provide the alphabetic constant ‘`^~@`’ that also represents 0 but this time TeX’s syntax for a `<number>` continues searching for an optional space (and it continues expansion doing that) — see `TeXbook` page 269 for details.

```
2626 \group_begin:
2627   \tex_catcode:D '``@ = 13
2628   \cs_new_protected:Npn \exp_end_continue_f:w { ``@ }
```

If the above definition ever appears outside its proper context the active character `^~@` will be executed so we turn this into an error. The test for existence covers the (unlikely) case that some other code has already defined `^~@`: this is true for example for `xmltex.tex`.

```
2629   \if_cs_exist:N ```@
2630   \else:
2631     \cs_new:Npn ``@ {
2632       \msg_expandable_error:nn { kernel } { bad-exp-end-f } }
2633   \fi:
```

The same but grabbing an argument to remove spaces and braces.

```
2634   \cs_new:Npn \exp_end_continue_f:nw #1 { ``@ #1 }
2635 \group_end:
```

(End of definition for `\exp:w` and others. These functions are documented on page 41.)

## 43.6 Defining function variants

```
2636 <@@=cs>
```

`\s__cs_mark` Internal scan marks. No l3quark yet, so do things by hand.

```
2637 \cs_new_eq:NN \s__cs_mark \scan_stop:
2638 \cs_new_eq:NN \s__cs_stop \scan_stop:
```

(End of definition for `\s__cs_mark` and `\s__cs_stop`.)

`\q__cs_recursion_stop` Internal recursion quarks. No l3quark yet, so do things by hand.

```
2639 \cs_new:Npn \q__cs_recursion_stop { \q__cs_recursion_stop }
```

(End of definition for `\q__cs_recursion_stop`.)

Internal scan marks.

```
2640 \cs_new:Npn \__cs_use_none_delimit_by_s_stop:w #1 \s__cs_stop { }
2641 \cs_new:Npn \__cs_use_i_delimit_by_s_stop:nw #1 #2 \s__cs_stop {#1}
2642 \cs_new:Npn \__cs_use_none_delimit_by_q_recursion_stop:w
2643   #1 \q__cs_recursion_stop { }
```

(End of definition for `\_cs_use_none_delimit_by_s_stop:w`, `\_cs_use_i_delimit_by_s_stop:nw`, and `\_cs_use_none_delimit_by_q_recursion_stop:w`.)

```
\cs_generate_variant:Nn #1 : Base form of a function; e.g., \tl_set:Nn
\cs_generate_variant:cn #2 : One or more variant argument specifiers; e.g., {Nx,c,cx}
```

After making sure that the base form exists, test whether it is protected or not and define `\_cs_tmp:w` as either `\cs_new:Npe` or `\cs_new_protected:Npe`, which is then used to define all the variants (except those involving x-expansion, always protected). Split up the original base function only once, to grab its name and signature. Then we wish to iterate through the comma list of variant argument specifiers, which we first convert to a string: the reason is explained later.

```
2644 \cs_new_protected:Npn \cs_generate_variant:Nn #1#2
2645   {
2646     \_cs_generate_variant:N #1
2647     \use:e
2648     {
2649       \_cs_generate_variant:nnNN
2650       \cs_split_function:N #1
2651       \exp_not:N #1
2652       \tl_to_str:n {#2} ,
2653       \exp_not:N \scan_stop: ,
2654       \exp_not:N \q__cs_recursion_stop
2655     }
2656   }
2657 \cs_new_protected:Npn \cs_generate_variant:cn
2658   { \exp_args:Nc \cs_generate_variant:Nn }
```

(End of definition for `\cs_generate_variant:Nn`. This function is documented on page 33.)

`\_cs_generate_variant:N` The goal here is to pick up protected parent functions. There are four cases: the parent function can be a primitive or a macro, and can be expandable or not. For non-expandable primitives, all variants should be protected; skipping the `\else:` branch is safe because non-expandable primitives cannot be TeX conditionals.

The other case where variants should be protected is when the parent function is a protected macro: then `protected` appears in the meaning before the first occurrence of `macro`. The `ww` auxiliary removes everything in the meaning string after the first `ma`. We use `ma` rather than the full `macro` because the meaning of the `\firstmark` primitive (and four others) can contain an arbitrary string after a leading `firstmark:`. Then, look for `pr` in the part we extracted: no need to look for anything longer: the only strings we can have are an empty string, `\long`, `\protected`, `\protected\long`, `\first`, `\top`, `\bot`, `\splittop`, or `\splitbot`, with `\` replaced by the appropriate escape character. If `pr` appears in the part before `ma`, the first `\s__cs_mark` is taken as an argument of the `wwNw` auxiliary, and `#3` is `\cs_new_protected:Npe`, otherwise it is `\cs_new:Npe`.

```
2659 \cs_new_protected:Npe \_cs_generate_variant:N #1
2660   {
2661     \exp_not:N \exp_after:wN \exp_not:N \if_meaning:w
2662     \exp_not:N \exp_not:N #1 #1
2663     \cs_set_eq:NN \exp_not:N \_cs_tmp:w \cs_new_protected:Npe
2664     \exp_not:N \else:
2665     \exp_not:N \exp_after:wN \exp_not:N \_cs_generate_variant:ww
2666     \exp_not:N \token_to_meaning:N #1 \tl_to_str:n { ma }
2667     \s__cs_mark
```

```

2668      \s__cs_mark \cs_new_protected:Npe
2669      \tl_to_str:n { pr }
2670      \s__cs_mark \cs_new:Npe
2671      \s__cs_stop
2672      \exp_not:N \fi:
2673  }
2674 \exp_last_unbraced:NNNNo
2675   \cs_new_protected:Npn \__cs_generate_variant:ww
2676     #1 { \tl_to_str:n { ma } } #2 \s__cs_mark
2677     { \__cs_generate_variant:wwNw #1 }
2678 \exp_last_unbraced:NNNNo
2679   \cs_new_protected:Npn \__cs_generate_variant:wwNw
2680     #1 { \tl_to_str:n { pr } } #2 \s__cs_mark #3 #4 \s__cs_stop
2681     { \cs_set_eq:NN \__cs_tmp:w #3 }

(End of definition for \__cs_generate_variant:N, \__cs_generate_variant:ww, and \__cs_generate_variant:wwNw.)

```

\\_\_cs\_generate\_variant:nnNN  
#1 : Base name.  
#2 : Base signature.  
#3 : Boolean.  
#4 : Base function.

If the boolean is \c\_false\_bool, the base function has no colon and we abort with an error; otherwise, set off a loop through the desired variant forms. The original function is retained as #4 for efficiency.

```

2682 \cs_new_protected:Npn \__cs_generate_variant:nnNN #1#2#3#4
2683  {
2684    \if_meaning:w \c_false_bool #3
2685      \msg_error:nne { kernel } { missing-colon }
2686      { \token_to_str:c {#1} }
2687      \exp_after:wN \__cs_use_none_delimit_by_q_recursion_stop:w
2688    \fi:
2689    \__cs_generate_variant:Nnnw #4 {#1}{#2}
2690  }

```

(End of definition for \\_\_cs\_generate\_variant:nnNN.)

\\_\_cs\_generate\_variant:Nnnw  
#1 : Base function.  
#2 : Base name.  
#3 : Base signature.  
#4 : Beginning of variant signature.

First check whether to terminate the loop over variant forms. Then, for each variant form, construct a new function name using the original base name, the variant signature consisting of  $l$  letters and the last  $k - l$  letters of the base signature (of length  $k$ ). For example, for a base function \prop\_put:Nnn which needs a cV variant form, we want the new signature to be cVn.

There are further subtleties:

- In \cs\_generate\_variant:Nn \foo:nnTF {xxTF}, we must define \foo:xxTF using \exp\_args:Nxx, rather than a hypothetical \exp\_args:NxxTF. Thus, we wish to trim a common trailing part from the base signature and the variant signature.
- In \cs\_generate\_variant:Nn \foo:on {ox}, the function \foo:ox must be defined using \exp\_args:Nnx, not \exp\_args:Nox, to avoid double o expansion.

- Lastly, `\cs_generate_variant:Nn \foo:on {xn}` must trigger an error, because we do not have a means to replace o-expansion by x-expansion. More generally, we can only convert N to c, or convert n to V, v, o, e, f, or x.

All this boils down to a few rules. Only n and N-type arguments can be replaced by `\cs_generate_variant:Nn`. Other argument types are allowed to be passed unchanged from the base form to the variant: in the process they are changed to n except for N and p-type arguments. A common trailing part is ignored.

We compare the base and variant signatures one character at a time within e-expansion. The result is given to `\_cs_generate_variant:wwNN` (defined later) in the form `<processed variant signature> \s__cs_mark <errors> \s__cs_stop <base function> <new function>`. If all went well, `<errors>` is empty; otherwise, it is a kernel error message and some clean-up code.

Note the space after #3 and after the following brace group. Those are ignored by TeX when fetching the last argument for `\_cs_generate_variant_loop:nNwN`, but can be used as a delimiter for `\_cs_generate_variant_loop_end:nwwwNNnn`.

```

2691 \cs_new_protected:Npn \_cs_generate_variant:Nnnw #1#2#3#4 ,
2692   {
2693     \if_meaning:w \scan_stop: #4
2694       \exp_after:wN \_cs_use_none_delimit_by_q_recursion_stop:w
2695     \fi:
2696     \use:e
2697     {
2698       \exp_not:N \_cs_generate_variant:wwNN
2699       \_cs_generate_variant_loop:nNwN { }
2700         #4
2701       \_cs_generate_variant_loop_end:nwwwNNnn
2702       \s__cs_mark
2703         #3 ~
2704       { ~ { } \fi: \_cs_generate_variant_loop_long:wNNnn } ~
2705       { }
2706       \s__cs_stop
2707       \exp_not:N #1 {#2} {#4}
2708     }
2709     \_cs_generate_variant:Nnnw #1 {#2} {#3}
2710   }

```

(End of definition for `\_cs_generate_variant:Nnnw`.)

```

\_cs_generate_variant_loop:nNwN
\_cs_generate_variant_loop_base:N
\_cs_generate_variant_loop_same:w
\_cs_generate_variant_loop_end:nwwwNNnn
\_cs_generate_variant_loop_long:wNNnn
\_cs_generate_variant_loop_invalid>NNwNNnn
\_cs_generate_variant_loop_special>NNwNNnn

```

#1 : Last few consecutive letters common between the base and variant (more precisely, `\_cs_generate_variant_same:N <letter>` for each letter).  
#2 : Next variant letter.  
#3 : Remainder of variant form.  
#4 : Next base letter.

The first argument is populated by `\_cs_generate_variant_loop_same:w` when a variant letter and a base letter match. It is flushed into the input stream whenever the two letters are different: if the loop ends before, the argument is dropped, which means that trailing common letters are ignored.

The case where the two letters are different is only allowed if the base is N and the variant is c, or when the base is n and the variant is V, v, o, e, f, or x. Otherwise, call `\_cs_generate_variant_loop_invalid>NNwNNnn` to remove the end of the loop, get arguments at the end of the loop, and place an appropriate error message as a second

argument of `\__cs_generate_variant:wwNN`. If the letters are distinct and the base letter is indeed `n` or `N`, leave in the input stream whatever argument #1 was collected, and the next variant letter #2, then loop by calling `\__cs_generate_variant_loop:nNwN`.

The loop can stop in three ways.

- If the end of the variant form is encountered first, #2 is `\__cs_generate_variant_loop_end:nwwwNNnn` (expanded by the conditional `\if:w`), which inserts some tokens to end the conditional; grabs the *base name* as #7, the *variant signature* #8, the *next base letter* #1 and the part #3 of the base signature that wasn't read yet; and combines those into the *new function* to be defined.
- If the end of the base form is encountered first, #4 is `\fi:` which ends the conditional (with an empty expansion), followed by `\__cs_generate_variant_loop_long:wNNnn`, which places an error as the second argument of `\__cs_generate_variant:wwNN`.
- The loop can be interrupted early if the requested expansion is unavailable, namely when the variant and base letters differ and the base is not the right one (`n` or `N` to support the variant). In that case too an error is placed as the second argument of `\__cs_generate_variant:wwNN`.

Note that if the variant form has the same length as the base form, #2 is as described in the first point, and #4 as described in the second point above. The `\__cs_generate_variant_loop_end:nwwwNNnn` breaking function takes the empty brace group in #4 as its first argument: this empty brace group produces the correct signature for the full variant.

```

```

(End of definition for `\__cs_generate_variant_loop:nNwN` and others.)

`\__cs_generate_variant_same:N`

When the base and variant letters are identical, don't do any expansion. For most argument types, we can use the `n`-type no-expansion, but the `N` and `p` types require a slightly different behaviour with respect to braces. For `V`-type this function could output `N` to avoid adding useless braces but that is not a problem.

```

2804 \cs_new:Npn \__cs_generate_variant_same:N #1
2805     {
2806         \if:w N #1 #1 \else:
2807             \if:w p #1 #1 \else:
2808                 \token_to_str:N n
2809                 \if:w n #1 \else:
2810                     \__cs_generate_variant_loop_special:NNwNNnn #1#1
2811                 \fi:
2812             \fi:
2813         \fi:
2814     }

```

(End of definition for `\__cs_generate_variant_same:N`.)

`\__cs_generate_variant:wwNN`

If the variant form has already been defined, log its existence (provided `log-functions` is active). Otherwise, make sure that the `\exp_args:N #3` form is defined, and if it contains `x`, change `\__cs_tmp:w` locally to `\cs_new_protected:Npe`. Then define the variant by combining the `\exp_args:N #3` variant and the base function.

```

2815 \cs_new_protected:Npn \__cs_generate_variant:wwNN
2816     #1 \s__cs_mark #2 \s__cs_stop #3#4
2817     {
2818         #2
2819         \cs_if_free:NT #4
2820         {
2821             \group_begin:
2822                 \__cs_generate_internal_variant:n {#1}
2823                 \__cs_tmp:w #4 { \exp_not:c { \exp_args:N #1 } \exp_not:N #3 }
2824             \group_end:
2825         }
2826     }

```

(End of definition for `\__cs_generate_variant:wwNN`.)

`\__cs_generate_internal_variant:n`

`\__cs_generate_internal_variant_loop:n`

First test for the presence of `x` (this is where working with strings makes our lives easier), as the result should be protected, and the next variant to be defined using that internal variant should be protected (done by setting `\__cs_tmp:w`). Then

call `\__cs_generate_internal_variant:NNn` with arguments `\cs_new_protected:cpn \use:x` (for protected) or `\cs_new:cpn \tex_expanded:D` (expandable) and the signature. If p appears in the signature, or if the function to be defined is expandable and the primitive `\expanded` is not available, or if there are more than 8 arguments, call some fall-back code that just puts the appropriate `\::` commands. Otherwise, call `\__cs_generate_internal_one_go:NNn` to construct the `\exp_args:N...` function as a macro taking up to 9 arguments and expanding them using `\use:x` or `\tex_expanded:D`.

2928   { #5 { exp_args:N #7 } #3 { #6 { \exp_not:n {#1} {#2} } } }

```

This command grabs char by char outputting `\:::#1` (not expanded further). We avoid tests by putting a trailing `: \use_i:nn`, which leaves `\cs_end:` and removes the looping macro. The colon is in fact also turned into `\:::` so that the required structure for `\exp_args:N...` commands is correctly terminated.

```

2929 \cs_new:Npn \__cs_generate_internal_variant_loop:n #1
2930   {

```

(End of definition for `\prg_generate_conditional_variant:Nnn` and others. This function is documented on page 65.)

### \exp\_args\_generate:n

This function is not used in the kernel hence we can use functions that are defined in later modules. It also does not need to be fast so use inline mappings. For each requested variant we check that there are no characters besides NnpcofVvx, in particular that there are no spaces. Then we just call the internal function.

```

2980 \cs_new_protected:Npn \exp_args_generate:n #1
2981   {
2982     \exp_args:No \clist_map_inline:nn { \tl_to_str:n {#1} }
2983     {
2984       \str_map_inline:nn {##1}
2985       {
2986         \str_if_in:nnF { NnpcofVvx } {####1}
2987         {
2988           \msg_error:nnnn { kernel } { invalid-exp-args }
2989           {####1} {##1}
2990           \str_map_break:n { \use_none:nn }
2991         }
2992       }
2993       \__cs_generate_internal_variant:n {##1}
2994     }
2995   }

```

(End of definition for `\exp_args_generate:n`. This function is documented on page 34.)

## 43.7 Definitions with the automated technique

Some of these could be done more efficiently, but the complexity of coding then becomes an issue. Notice that the auto-generated functions actually take no arguments themselves.

```

\exp_args:Nnc
\exp_args:Nno
\exp_args:Nnv
\exp_args:Nnv
\exp_args:Nne
\exp_args:Nnf
\exp_args:Noc
\exp_args:Noo
\exp_args:Nof
\exp_args:Nvo
\exp_args:Nfo
\exp_args:Nff
\exp_args:Nee
\exp_args:NNx
\exp_args:Ncx
\exp_args:Nnx
\exp_args:Nox
\exp_args:Nxo
\exp_args:Nxx

```

Here are the actual function definitions, using the helper functions above. The group is used because `\__cs_generate_internal_variant:n` redefines `\__cs_tmp:w` locally.

```

2996 \cs_set_protected:Npn \__cs_tmp:w #1
2997   {
2998     \group_begin:
2999       \exp_args:No \__cs_generate_internal_variant:n
3000         { \tl_to_str:n {#1} }
3001     \group_end:
3002   }
3003 \__cs_tmp:w { nc }
3004 \__cs_tmp:w { no }
3005 \__cs_tmp:w { nV }
3006 \__cs_tmp:w { nv }

```

```

3007 \__cs_tmp:w { ne }
3008 \__cs_tmp:w { nf }
3009 \__cs_tmp:w { oc }
3010 \__cs_tmp:w { oo }
3011 \__cs_tmp:w { of }
3012 \__cs_tmp:w { Vo }
3013 \__cs_tmp:w { fo }
3014 \__cs_tmp:w { ff }
3015 \__cs_tmp:w { ee }
3016 \__cs_tmp:w { Nx }
3017 \__cs_tmp:w { cx }
3018 \__cs_tmp:w { nx }
3019 \__cs_tmp:w { ox }
3020 \__cs_tmp:w { xo }
3021 \__cs_tmp:w { xx }

```

(End of definition for `\exp_args:Nnc` and others. These functions are documented on page 37.)

## 43.8 Held-over variant generation

`\cs_generate_from_arg_count:NNno` A couple of variants that are from early functions.

```

\cs_replacement_spec:c
3047 \cs_generate_variant:Nn \cs_generate_from_arg_count:NNnn { NNno }
3048 \cs_generate_variant:Nn \cs_replacement_spec:N { c }

```

*(End of definition for \cs\_generate\_from\_arg\_count:NNnn and \cs\_replacement\_spec:N. These functions are documented on page 19.)*

3049 ⟨/package⟩

# Chapter 44

## I3sort implementation

```
3050  <*package>
3051  <@@=sort>
```

### 44.1 Variables

\g\_\_sort\_internal\_seq     Sorting happens in a group; the result is stored in those global variables before being copied outside the group to the proper places. For seq and tl this is more efficient than using \use:e (or some \exp\_args:NNNe) to smuggle the definition outside the group since TeX does not need to re-read tokens. For clist we don't gain anything since the result is converted from seq to clist anyways.

```
3052  \seq_new:N \g__sort_internal_seq
3053  \tl_new:N \g__sort_internal_tl
```

(End of definition for \g\_\_sort\_internal\_seq and \g\_\_sort\_internal\_tl.)

\l\_\_sort\_length\_int     The sequence has \l\_\_sort\_length\_int items and is stored from \l\_\_sort\_min\_int to \l\_\_sort\_top\_int - 1. While reading the sequence in memory, we check that \l\_\_sort\_top\_int remains at most \l\_\_sort\_max\_int, precomputed by \\_\_sort\_compute\_range:. That bound is such that the merge sort only uses \toks registers less than \l\_\_sort\_true\_max\_int, namely those that have not been allocated for use in other code: the user's comparison code could alter these.

```
3054  \int_new:N \l__sort_length_int
3055  \int_new:N \l__sort_min_int
3056  \int_new:N \l__sort_top_int
3057  \int_new:N \l__sort_max_int
3058  \int_new:N \l__sort_true_max_int
```

(End of definition for \l\_\_sort\_length\_int and others.)

\l\_\_sort\_block\_int     Merge sort is done in several passes. In each pass, blocks of size \l\_\_sort\_block\_int are merged in pairs. The block size starts at 1, and, for a length in the range  $[2^k + 1, 2^{k+1}]$ , reaches  $2^k$  in the last pass.

```
3059  \int_new:N \l__sort_block_int
```

(End of definition for \l\_\_sort\_block\_int.)

\l\_\_sort\_begin\_int When merging two blocks, \l\_\_sort\_begin\_int marks the lowest index in the two blocks, and \l\_\_sort\_end\_int marks the highest index, plus 1.

```
3060 \int_new:N \l__sort_begin_int
3061 \int_new:N \l__sort_end_int
```

(End of definition for \l\_\_sort\_begin\_int and \l\_\_sort\_end\_int.)

\l\_\_sort\_A\_int \l\_\_sort\_B\_int \l\_\_sort\_C\_int When merging two blocks (whose end-points are beg and end), A starts from the high end of the low block, and decreases until reaching beg. The index B starts from the top of the range and marks the register in which a sorted item should be put. Finally, C points to the copy of the high block in the interval of registers starting at \l\_\_sort\_length\_int, upwards. C starts from the upper limit of that range.

```
3062 \int_new:N \l__sort_A_int
3063 \int_new:N \l__sort_B_int
3064 \int_new:N \l__sort_C_int
```

(End of definition for \l\_\_sort\_A\_int, \l\_\_sort\_B\_int, and \l\_\_sort\_C\_int.)

\s\_\_sort\_mark Internal scan marks.

```
3065 \scan_new:N \s__sort_mark
3066 \scan_new:N \s__sort_stop
```

(End of definition for \s\_\_sort\_mark and \s\_\_sort\_stop.)

## 44.2 Finding available \toks registers

\\_\\_sort\_shrink\_range: After \\_\\_sort\_compute\_range: (defined below) determines that \toks registers between \l\_\_sort\_min\_int (included) and \l\_\_sort\_true\_max\_int (excluded) have not yet been assigned, \\_\\_sort\_shrink\_range: computes \l\_\_sort\_max\_int to reflect the need for a buffer when merging blocks in the merge sort. Given  $2^n \leq A \leq 2^n + 2^{n-1}$  registers we can sort  $\lfloor A/2 \rfloor + 2^{n-2}$  items while if we have  $2^n + 2^{n-1} \leq A \leq 2^{n+1}$  registers we can sort  $A - 2^{n-1}$  items. We first find out a power  $2^n$  such that  $2^n \leq A \leq 2^{n+1}$  by repeatedly halving \l\_\_sort\_block\_int, starting at  $2^{15}$  or  $2^{14}$  namely half the total number of registers, then we use the formulas and set \l\_\_sort\_max\_int.

```
3067 \cs_new_protected:Npn \_\_sort_shrink_range:
3068 {
3069     \int_set:Nn \l__sort_A_int
3070     { \l__sort_true_max_int - \l__sort_min_int + 1 }
3071     \int_set:Nn \l__sort_block_int { \c_max_register_int / 2 }
3072     \_\_sort_shrink_range_loop:
3073     \int_set:Nn \l__sort_max_int
3074     {
3075         \int_compare:nNnTF
3076         { \l__sort_block_int * 3 / 2 } > \l__sort_A_int
3077         {
3078             \l__sort_min_int
3079             + ( \l__sort_A_int - 1 ) / 2
3080             + \l__sort_block_int / 4
3081             - 1
3082         }
3083         { \l__sort_true_max_int - \l__sort_block_int / 2 }
3084     }
```

```

3085     }
3086 \cs_new_protected:Npn \__sort_shrink_range_loop:
3087 {
3088     \if_int_compare:w \l__sort_A_int < \l__sort_block_int
3089     \tex_divide:D \l__sort_block_int 2 \exp_stop_f:
3090     \exp_after:wN \__sort_shrink_range_loop:
3091     \fi:
3092 }

```

(End of definition for `\__sort_shrink_range:` and `\__sort_shrink_range_loop::`)

`\__sort_compute_range:`  
`\__sort_redefine_compute_range:`  
`\c_max_length_int`

First find out what `\toks` have not yet been assigned. There are many cases. In L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  with no package, available `\toks` range from `\count15+1` to `\c_max_register_int` included (this was not altered despite the 2015 changes). When `\loctoks` is defined, namely in plain (e)T<sub>E</sub>X, or when the package etex is loaded in L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub> , redefine `\__sort_compute_range:` to use the range `\count265` to `\count275 - 1`. The elocalloc package also defines `\loctoks` but uses yet another number for the upper bound, namely `\e@alloc@top` (minus one). We must check for `\loctoks` every time a sorting function is called, as etex or elocalloc could be loaded.

In ConT<sub>E</sub>Xt MkIV the range is from `\c_syst_last_allocated_toks+1` to `\c_max_register_int`, and in MkII it is from `\lastallocatedtoks+1` to `\c_max_register_int`. In all these cases, call `\__sort_shrink_range::`.

```

3093 \cs_new_protected:Npn \__sort_compute_range:
3094 {
3095     \int_set:Nn \l__sort_min_int { \tex_count:D 15 + 1 }
3096     \int_set:Nn \l__sort_true_max_int { \c_max_register_int + 1 }

3136      }
3137  }

```

(End of definition for `\__sort_compute_range:`, `\__sort_redefine_compute_range:`, and `\c__sort_max_length_int`.)

### 44.3 Protected user commands

`\__sort_main:NNNn`

Sorting happens in three steps. First store items in `\toks` registers ranging from `\l__sort_min_int` to `\l__sort_top_int - 1`, while checking that the list is not too long. If we reach the maximum length, that's an error; exit the group. Secondly, sort the array of `\toks` registers, using the user-defined sorting function: `\__sort_level:` calls `\__sort_compare:nn` as needed. Finally, unpack the `\toks` registers (now sorted) into the target `tl`, or into `\g__sort_internal_seq` for seq and `clist`. This is done by `\__sort_seq:NNNNn` and `\__sort_tl:NNn`.

```

3138  \cs_new_protected:Npn \__sort_main:NNNn #1#2#3#4
3139  {
3140      \__sort_disable_toksdef:
3141      \__sort_compute_range:
3142      \int_set_eq:NN \l__sort_top_int \l__sort_min_int
3143      #1 #3
3144      {
3145          \if_int_compare:w \l__sort_top_int = \l__sort_max_int
3146              \__sort_too_long_error>NNw #2 #3
3147          \fi:
3148          \tex_toks:D \l__sort_top_int {##1}
3149          \int_incr:N \l__sort_top_int
3150      }
3151      \int_set:Nn \l__sort_length_int
3152      { \l__sort_top_int - \l__sort_min_int }
3153      \cs_set:Npn \__sort_compare:nn ##1 ##2 {#4}
3154      \int_set:Nn \l__sort_block_int { 1 }
3155      \__sort_level:
3156  }

```

(End of definition for `\__sort_main:NNNn`.)

`\tl_sort:Nn`

`\tl_sort:cn`

`\tl_gsort:Nn`

`\tl_gsort:cn`

`\__sort_tl:NNn`

`\__sort_tl_toks:w`

Call the main sorting function then unpack `\toks` registers outside the group into the target token list. The unpacking is done by `\__sort_tl_toks:w`; registers are numbered from `\l__sort_min_int` to `\l__sort_top_int - 1`. For expansion behaviour we need

a couple of primitives. The `\tl_gclear:N` reduces memory usage. The `\prg_break_point:` is used by `\_sort_main:NNNn` when the list is too long.

```

3157 \cs_new_protected:Npn \tl_sort:Nn { \_sort_tl:NNn \tl_set_eq:NN }
3158 \cs_generate_variant:Nn \tl_sort:Nn { c }
3159 \cs_new_protected:Npn \tl_gsort:Nn { \_sort_tl:NNn \tl_gset_eq:NN }
3160 \cs_generate_variant:Nn \tl_gsort:Nn { c }
3161 \cs_new_protected:Npn \_sort_tl:NNn #1#2#3
3162 {
3163     \group_begin:
3164         \_sort_main:NNNn \tl_map_inline:Nn \tl_map_break:n #2 {#3}
3165         \kernel_tl_gset:Nx \g__sort_internal_tl
3166         { \_sort_tl_toks:w \l__sort_min_int ; }
3167     \group_end:
3168     #1 #2 \g__sort_internal_tl
3169     \tl_gclear:N \g__sort_internal_tl
3170     \prg_break_point:
3171 }
3172 \cs_new:Npn \_sort_tl_toks:w #1 ;
3173 {
3174     \if_int_compare:w #1 < \l__sort_top_int
3175     { \tex_the:D \tex_toks:D #1 }
3176     \exp_after:wN \_sort_tl_toks:w
3177     \int_value:w \int_eval:n { #1 + 1 } \exp_after:wN ;
3178     \fi:
3179 }
```

(End of definition for `\tl_sort:Nn` and others. These functions are documented on page 122.)

`\seq_sort:Nn`  
`\seq_sort:cn`  
`\seq_gsort:Nn`  
`\seq_gsort:cn`  
`\clist_sort:Nn`  
`\clist_sort:cn`  
`\clist_gsort:Nn`  
`\clist_gsort:cn`  
`\_sort_seq:NNNN`

Use the same general framework for seq and clist. Apply the general sorting code, then unpack `\toks` into `\g__sort_internal_seq`. Outside the group copy or convert (for clist) the data to the target variable. The `\seq_gclear:N` reduces memory usage. The `\prg_break_point:` is used by `\_sort_main:NNNn` when the list is too long.

```

3180 \cs_new_protected:Npn \seq_sort:Nn
3181 { \_sort_seq:NNNNn \seq_map_inline:Nn \seq_map_break:n \seq_set_eq:NN }
3182 \cs_generate_variant:Nn \seq_sort:Nn { c }
3183 \cs_new_protected:Npn \seq_gsort:Nn
3184 { \_sort_seq:NNNNn \seq_map_inline:Nn \seq_map_break:n \seq_gset_eq:NN }
3185 \cs_generate_variant:Nn \seq_gsort:Nn { c }
3186 \cs_new_protected:Npn \clist_sort:Nn
3187 {
3188     \_sort_seq:NNNNn \clist_map_inline:Nn \clist_map_break:n
3189     \clist_set_from_seq:NN
3190 }
3191 \cs_generate_variant:Nn \clist_sort:Nn { c }
3192 \cs_new_protected:Npn \clist_gsort:Nn
3193 {
3194     \_sort_seq:NNNNn \clist_map_inline:Nn \clist_map_break:n
3195     \clist_gset_from_seq:NN
3196 }
3197 \cs_generate_variant:Nn \clist_gsort:Nn { c }
3198 \cs_new_protected:Npn \_sort_seq:NNNNn #1#2#3#4#5
3199 {
3200     \group_begin:
3201         \_sort_main:NNNn #1 #2 #4 {#5}
```

```

3202   \seq_gclear:N \g__sort_internal_seq
3203   \int_step_inline:nnn
3204     \l__sort_min_int { \l__sort_top_int - 1 }
3205   {
3206     \seq_gput_right:Ne \g__sort_internal_seq
3207     { \tex_the:D \tex_toks:D ##1 }
3208   }
3209   \group_end:
3210   #3 #4 \g__sort_internal_seq
3211   \seq_gclear:N \g__sort_internal_seq
3212   \prg_break_point:
3213 }

```

(End of definition for `\seq_sort:Nn` and others. These functions are documented on page 156.)

## 44.4 Merge sort

- `\__sort_level:` This function is called once blocks of size `\l__sort_block_int` (initially 1) are each sorted. If the whole list fits in one block, then we are done (this also takes care of the case of an empty list or a list with one item). Otherwise, go through pairs of blocks starting from 0, then double the block size, and repeat.

```

3214 \cs_new_protected:Npn \__sort_level:
3215   {
3216     \if_int_compare:w \l__sort_block_int < \l__sort_length_int
3217       \l__sort_end_int \l__sort_min_int
3218       \__sort_merge_blocks:
3219       \tex_advance:D \l__sort_block_int \l__sort_block_int
3220       \exp_after:wN \__sort_level:
3221     \fi:
3222   }

```

(End of definition for `\__sort_level:..`)

- `\__sort_merge_blocks:` This function is called to merge a pair of blocks, starting at the last value of `\l__sort_end_int` (end-point of the previous pair of blocks). If shifting by one block to the right we reach the end of the list, then this pass has ended: the end of the list is sorted already. Otherwise, store the result of that shift in `A`, which indexes the first block starting from the top end. Then locate the end-point (maximum) of the second block: shift `end` upwards by one more block, but keeping it  $\leq \text{top}$ . Copy this upper block of `\toks` registers in registers above `length`, indexed by `C`: this is covered by `\__sort_copy_block:..`. Once this is done we are ready to do the actual merger using `\__sort_merge_blocks_aux:..`, after shifting `A`, `B` and `C` so that they point to the largest index in their respective ranges rather than pointing just beyond those ranges. Of course, once that pair of blocks is merged, move on to the next pair.

```

3223 \cs_new_protected:Npn \__sort_merge_blocks:
3224   {
3225     \l__sort_begin_int \l__sort_end_int
3226     \tex_advance:D \l__sort_end_int \l__sort_block_int
3227     \if_int_compare:w \l__sort_end_int < \l__sort_top_int
3228       \l__sort_A_int \l__sort_end_int
3229       \tex_advance:D \l__sort_end_int \l__sort_block_int
3230       \if_int_compare:w \l__sort_end_int > \l__sort_top_int

```

```

3231      \l__sort_end_int \l__sort_top_int
3232  \fi:
3233  \l__sort_B_int \l__sort_A_int
3234  \l__sort_C_int \l__sort_top_int
3235  \__sort_copy_block:
3236  \int_decr:N \l__sort_A_int
3237  \int_decr:N \l__sort_B_int
3238  \int_decr:N \l__sort_C_int
3239  \exp_after:wN \__sort_merge_blocks_aux:
3240  \exp_after:wN \__sort_merge_blocks:
3241  \fi:
3242 }

```

(End of definition for `\__sort_merge_blocks::`)

`\__sort_copy_block:` We wish to store a copy of the “upper” block of `\toks` registers, ranging between the initial value of `\l__sort_B_int` (included) and `\l__sort_end_int` (excluded) into a new range starting at the initial value of `\l__sort_C_int`, namely `\l__sort_top_int`.

```

3243 \cs_new_protected:Npn \__sort_copy_block:
3244 {
3245     \tex_toks:D \l__sort_C_int \tex_toks:D \l__sort_B_int
3246     \int_incr:N \l__sort_C_int
3247     \int_incr:N \l__sort_B_int
3248     \if_int_compare:w \l__sort_B_int = \l__sort_end_int
3249         \use_i:nn
3250     \fi:
3251     \__sort_copy_block:
3252 }

```

(End of definition for `\__sort_copy_block::`)

`\__sort_merge_blocks_aux:` At this stage, the first block starts at `\l__sort_begin_int`, and ends at `\l__sort_A_int`, and the second block starts at `\l__sort_top_int` and ends at `\l__sort_C_int`. The result of the merger is stored at positions indexed by `\l__sort_B_int`, which starts at `\l__sort_end_int - 1` and decreases down to `\l__sort_begin_int`, covering the full range of the two blocks. In other words, we are building the merger starting with the largest values. The comparison function is defined to return either `swapped` or `same`. Of course, this means the arguments need to be given in the order they appear originally in the list.

```

3253 \cs_new_protected:Npn \__sort_merge_blocks_aux:
3254 {
3255     \exp_after:wN \__sort_compare:nn \exp_after:wN
3256     { \tex_the:D \tex_toks:D \exp_after:wN \l__sort_A_int \exp_after:wN }
3257     \exp_after:wN { \tex_the:D \tex_toks:D \l__sort_C_int }
3258     \prg_do_nothing:
3259     \__sort_return_mark:w
3260     \__sort_return_mark:w
3261     \s__sort_mark

3263 }

```

(End of definition for `\__sort_merge_blocks_aux::`)

```

\sort_return_same:
\sort_return_swapped:
\__sort_return_mark:w
\__sort_return_none_error:
\__sort_return_two_error:

```

Each comparison should call \sort\_return\_same: or \sort\_return\_swapped: exactly once. If neither is called, \\_\_sort\_return\_none\_error: is called, since the return\_mark removes tokens until \s\_\_sort\_mark. If one is called, the return\_mark auxiliary removes everything except \\_\_sort\_return\_same:w (or its swapped analogue) followed by \\_\_sort\_return\_none\_error:. Finally if two or more are called, \\_\_sort\_return\_two\_error: ends up before any \\_\_sort\_return\_mark:w, so that it produces an error.

```

3289     { \tex_the:D \tex_toks:D \l__sort_C_int }
3290     \__sort_return_same:w \__sort_return_none_error:
3291 }
3292 \cs_new_protected:Npn \__sort_return_two_error:
3293 {
3294     \msg_error:nnee { sort } { return-two }
3295     { \tex_the:D \tex_toks:D \l__sort_A_int }
3296     { \tex_the:D \tex_toks:D \l__sort_C_int }
3297 }

```

(End of definition for \sort\_return\_same: and others. These functions are documented on page 45.)

\\_\_sort\_return\_same:w If the comparison function returns same, then the second argument fed to \\_\_sort\_compare:nn should remain to the right of the other one. Since we build the merger starting from the right, we copy that \toks register into the allotted range, then shift the pointers  $B$  and  $C$ , and go on to do one more step in the merger, unless the second block has been exhausted: then the remainder of the first block is already in the correct registers and we are done with merging those two blocks.

```

3298 \cs_new_protected:Npn \__sort_return_same:w #1 \__sort_return_none_error:
3299 {
3300     \tex_toks:D \l__sort_B_int \tex_toks:D \l__sort_C_int
3301     \int_decr:N \l__sort_B_int

```

```

3302     \int_decr:N \l__sort_C_int
3303     \if_int_compare:w \l__sort_C_int < \l__sort_top_int
3304         \use_i:nn
3305     \fi:
3306     \__sort_merge_blocks_aux:
3307 }

```

(End of definition for `\__sort_return_same:w`)

`\__sort_return_swapped:w`

If the comparison function returns `swapped`, then the next item to add to the merger is the first argument, contents of the `\toks` register *A*. Then shift the pointers *A* and *B* to the left, and go for one more step for the merger, unless the left block was exhausted (*A* goes below the threshold). In that case, all remaining `\toks` registers in the second block, indexed by *C*, are copied to the merger by `\__sort_merge_blocks_end`:

```

3308 \cs_new_protected:Npn \__sort_return_swapped:w #1 \__sort_return_none_error:
3309 {
3310     \tex_toks:D \l__sort_B_int \tex_toks:D \l__sort_A_int
3311     \int_decr:N \l__sort_B_int
3312     \int_decr:N \l__sort_A_int
3313     \if_int_compare:w \l__sort_A_int < \l__sort_begin_int
3314         \__sort_merge_blocks_end: \use_i:nn
3315     \fi:
3316     \__sort_merge_blocks_aux:
3317 }

```

(End of definition for `\__sort_return_swapped:w`)

`\__sort_merge_blocks_end:`

This function's task is to copy the `\toks` registers in the block indexed by *C* to the merger indexed by *B*. The end can equally be detected by checking when *B* reaches the threshold `begin`, or when *C* reaches `top`.

```

3318 \cs_new_protected:Npn \__sort_merge_blocks_end:
3319 {
3320     \tex_toks:D \l__sort_B_int \tex_toks:D \l__sort_C_int
3321     \int_decr:N \l__sort_B_int
3322     \int_decr:N \l__sort_C_int
3323     \if_int_compare:w \l__sort_B_int < \l__sort_begin_int
3324         \use_i:nn
3325     \fi:
3326     \__sort_merge_blocks_end:
3327 }

```

(End of definition for `\__sort_merge_blocks_end`)

## 44.5 Expandable sorting

Sorting expandably is very different from sorting and assigning to a variable. Since tokens cannot be stored, they must remain in the input stream, and be read through at every step. It is thus necessarily much slower (at best  $O(n^2 \ln n)$ ) than non-expandable sorting functions ( $O(n \ln n)$ ).

A prototypical version of expandable quicksort is as follows. If the argument has no item, return nothing, otherwise partition, using the first item as a pivot (argument #4 of `\__sort:nnNnn`). The arguments of `\__sort:nnNnn` are 1. items less than #4, 2. items greater or equal to #4, 3. comparison, 4. pivot, 5. next item to test. If #5 is the tail of

the list, call `\tl_sort:nN` on #1 and on #2, placing #4 in between; `\use:ff` expands the parts to make `\tl_sort:nN` f-expandable. Otherwise, compare #4 and #5 using #3. If they are ordered, place #5 amongst the “greater” items, otherwise amongst the “lesser” items, and continue partitioning.

```
\cs_new:Npn \tl_sort:nN #1#2
{
    \tl_if_blank:nF {#1}
    {
        \__sort:nnNnn { } { } #2
        #1 \q__sort_recursion_tail \q__sort_recursion_stop
    }
}
\cs_new:Npn \__sort:nnNnn #1#2#3#4#5
{
    \quark_if_recursion_tail_stop_do:nn {#5}
    { \use:ff { \tl_sort:nN {#1} #3 {#4} } { \tl_sort:nN {#2} #3 } }
    #3 {#4} {#5}
    { \__sort:nnNnn {#1} { #2 {#5} } #3 {#4} }
    { \__sort:nnNnn { #1 {#5} } {#2} #3 {#4} }
}
\cs_generate_variant:Nn \use:nn { ff }
```

There are quite a few optimizations available here: the code below is less legible, but more than twice as fast.

In the simple version of the code, `\__sort:nnNnn` is called  $O(n \ln n)$  times on average (the number of comparisons required by the quicksort algorithm). Hence most of our focus is on optimizing that function.

The first speed up is to avoid testing for the end of the list at every call to `\__sort:nnNnn`. For this, the list is prepared by changing each `\langle item \rangle` of the original token list into `\langle command \rangle \{ \langle item \rangle \}`, just like sequences are stored. We arrange things such that the `\langle command \rangle` is the `\langle conditional \rangle` provided by the user: the loop over the `\langle prepared tokens \rangle` then looks like

```
\cs_new:Npn \__sort_loop:wNn ... #6#7
{
    #6 {\langle pivot \rangle} {#7} \langle loop big \rangle \langle loop small \rangle
    \langle extra arguments \rangle
}
\__sort_loop:wNn ... \langle prepared tokens \rangle
\end-loop \} \s__sort_stop
```

In this example, which matches the structure of `\__sort_quick_split_i:NnnnnNn` and a few other functions below, the `\__sort_loop:wNn` auxiliary normally receives the user’s `\langle conditional \rangle` as #6 and an `\langle item \rangle` as #7. This is compared to the `\langle pivot \rangle` (the argument #5, not shown here), and the `\langle conditional \rangle` leaves the `\langle loop big \rangle` or `\langle loop small \rangle` auxiliary, which both have the same form as `\__sort_loop:wNn`, receiving the next pair `\langle conditional \rangle \{ \langle item \rangle \}` as #6 and #7. At the end, #6 is the `\langle end-loop \rangle` function, which terminates the loop.

The second speed up is to minimize the duplicated tokens between the `true` and `false` branches of the conditional. For this, we introduce two versions of `\__sort:nnNnn`,

which receive the new item as #1 and place it either into the list #2 of items less than the pivot #4 or into the list #3 of items greater or equal to the pivot.

```
\cs_new:Npn \__sort_i:n:nnnnNn #1#2#3#4#5#6
{
    #5 {#4} {#6} \__sort_ii:n:nnnnNn \__sort_i:n:nnnnNn
        {#6} {#2 {#1}} {#3} {#4}
}
\cs_new:Npn \__sort_ii:n:nnnnNn #1#2#3#4#5#6
{
    #5 {#4} {#6} \__sort_ii:n:nnnnNn \__sort_i:n:nnnnNn
        {#6} {#2} {#3 {#1}} {#4}
}
```

Note that the two functions have the form of `\__sort_loop:wNn` above, receiving as #5 the conditional or a function to end the loop. In fact, the lists #2 and #3 must be made of pairs  $\langle\text{conditional}\rangle\{\langle\text{item}\rangle\}$ , so we have to replace {#6} above by {#5 {#6}}, and {#1} by #1. The actual functions have one more argument, so all argument numbers are shifted compared to this code.

The third speed up is to avoid `\use:ff` using a continuation-passing style: `\__sort_quick_split:NnNn` expects a list followed by `\s__sort_mark {\langle\text{code}\rangle}`, and expands to  $\langle\text{code}\rangle\langle\text{sorted list}\rangle$ . Sorting the two parts of the list around the pivot is done with

```
\__sort_quick_split:NnNn #2 ... \s__sort_mark
{
\__sort_quick_split:NnNn #1 ... \s__sort_mark {\langle\text{code}\rangle}
{\langle\text{pivot}\rangle}
}
```

Items which are larger than the  $\langle\text{pivot}\rangle$  are sorted, then placed after code that sorts the smaller items, and after the (braced)  $\langle\text{pivot}\rangle$ .

The fourth speed up is avoid the recursive call to `\tl_sort:nN` with an empty first argument. For this, we introduce functions similar to the `\__sort_i:n:nnnnNn` of the last example, but aware of whether the list of  $\langle\text{conditional}\rangle\{\langle\text{item}\rangle\}$  read so far that are less than the pivot, and the list of those greater or equal, are empty or not: see `\__sort_quick_split:NnNn` and functions defined below. Knowing whether the lists are empty or not is useless if we do not use distinct ending codes as appropriate. The splitting auxiliaries communicate to the  $\langle\text{end-loop}\rangle$  function (that is initially placed after the “prepared” list) by placing a specific ending function, ignored when looping, but useful at the end. In fact, the  $\langle\text{end-loop}\rangle$  function does nothing but place the appropriate ending function in front of all its arguments. The ending functions take care of sorting non-empty sublists, placing the pivot in between, and the continuation before.

The final change in fact slows down the code a little, but is required to avoid memory issues: schematically, when TeX encounters

```
\use:n { \use:n { \use:n { ... } ... } ... }
```

the argument of the first `\use:n` is not completely read by the second `\use:n`, hence must remain in memory; then the argument of the second `\use:n` is not completely read when grabbing the argument of the third `\use:n`, hence must remain in memory, and so on. The memory consumption grows quadratically with the number of nested `\use:n`. In

practice, this means that we must read everything until a trailing `\s__sort_stop` once in a while, otherwise sorting lists of more than a few thousand items would exhaust a typical TeX's memory.

#### `\tl_sort:nN`

```
\__sort_quick_prepare:Nnnn
  \__sort_quick_prepare_end:NNNnw
\__sort_quick_cleanup:w
```

The code within the `\exp_not:f` sorts the list, leaving in most cases a leading `\exp_not:f`, which stops the expansion, letting the result be return within `\exp_not:n`. We filter out the case of a list with no item, which would otherwise cause problems. Then prepare the token list #1 by inserting the conditional #2 before each item. The `prepare` auxiliary receives the conditional as #1, the prepared token list so far as #2, the next prepared item as #3, and the item after that as #4. The loop ends when #4 contains `\prg_break_point:`, then the `prepare_end` auxiliary finds the prepared token list as #4. The scene is then set up for `\__sort_quick_split:NnNn`, which sorts the prepared list and perform the post action placed after `\s__sort_mark`, namely removing the trailing `\s__sort_stop` and `\s__sort_stop` and leaving `\exp_stop_f:` to stop f-expansion.

```
3328 \cs_new:Npn \tl_sort:nN #1#2
3329 {
3330   \exp_not:f
3331   {
3332     \tl_if_blank:nF {#1}
3333     {
3334       \__sort_quick_prepare:Nnnn #2 { } { }
3335       #1
3336       { \prg_break_point: \__sort_quick_prepare_end:NNNnw }
3337       \s__sort_stop
3338     }
3339   }
3340 }
3341 \cs_new:Npn \__sort_quick_prepare:Nnnn #1#2#3#4
3342 {
3343   \prg_break: #4 \prg_break_point:
3344   \__sort_quick_prepare:Nnnn #1 { #2 #3 } { #1 {#4} }
3345 }
3346 \cs_new:Npn \__sort_quick_prepare_end:NNNnw #1#2#3#4#5 \s__sort_stop
3347 {
3348   \__sort_quick_split:NnNn #4 \__sort_quick_end:nnTFNn { }
3349   \s__sort_mark { \__sort_quick_cleanup:w \exp_stop_f: }
3350   \s__sort_mark \s__sort_stop
3351 }
3352 \cs_new:Npn \__sort_quick_cleanup:w #1 \s__sort_mark \s__sort_stop {#1}
```

(End of definition for `\tl_sort:nN` and others. This function is documented on page 122.)

```
\__sort_quick_split:NnNn
\__sort_quick_only_i:NnnnnNn
  \__sort_quick_only_ii:NnnnnNn
  \__sort_quick_split_i:NnnnnNn
\__sort_quick_split_ii:NnnnnNn
```

The `only_i`, `only_ii`, `split_i` and `split_ii` auxiliaries receive a useless first argument, the new item #2 (that they append to either one of the next two arguments), the list #3 of items less than the pivot, bigger items #4, the pivot #5, a `\langle function \rangle` #6, and an item #7. The `\langle function \rangle` is the user's `\langle conditional \rangle` except at the end of the list where it is `\__sort_quick_end:nnTFNn`. The comparison is applied to the `\langle pivot \rangle` and the `\langle item \rangle`, and calls the `only_i` or `split_i` auxiliaries if the `\langle item \rangle` is smaller, and the `only_ii` or `split_ii` auxiliaries otherwise. In both cases, the next auxiliary goes to work right away, with no intermediate expansion that would slow down operations. Note that the argument #2 left for the next call has the form `\langle conditional \rangle \{ \langle item \rangle \}`, so that the lists #3 and #4 keep the right form to be fed to the next sorting function. The `split` auxiliary

differs from these in that it is missing three of the arguments, which would be empty, and its first argument is always the user's *(conditional)* rather than an ending function.

```

3353 \cs_new:Npn \__sort_quick_split:NnNn #1#2#3#4

```
\__sort_quick_end:nnTFNn
\__sort_quick_single_end:nnnw
\__sort_quick_only_i_end:nnnw
\__sort_quick_only_ii_end:nnnw
\__sort_quick_split_end:nnnw
```

The `\__sort_quick_end:nnTFNn` appears instead of the user's conditional, and receives as its arguments the pivot #1, a fake item #2, a `true` and a `false` branches #3 and #4, followed by an ending function #5 (one of the four auxiliaries here) and another copy #6 of the fake item. All those are discarded except the function #5. This function receives lists #1 and #2 of items less than or greater than the pivot #3, then a continuation code #5 just after `\s__sort_mark`. To avoid a memory problem described earlier, all of the ending functions read #6 until `\s__sort_stop` and place #6 back into the input stream. When the lists #1 and #2 are empty, the `single` auxiliary simply places the continuation #5 before the pivot {#3}. When #2 is empty, #1 is sorted and placed before the pivot {#3}, taking care to feed the continuation #5 as a continuation for the function sorting #1. When #1 is empty, #2 is sorted, and the continuation argument is used to place the continuation #5 and the pivot {#3} before the sorted result. Finally, when both

lists are non-empty, items larger than the pivot are sorted, then items less than the pivot, and the continuations are done in such a way to place the pivot in between.

```

# Chapter 45

## I3tl-analysis implementation

3473  $\langle @@=t1 \rangle$

### 45.1 Internal functions

- `\s__t1` The format used to store token lists internally uses the scan mark `\s__t1` as a delimiter.  
(*End of definition for `\s__t1`.*)

### 45.2 Internal format

The task of the I3tl-analysis module is to convert token lists to an internal format which allows us to extract all the relevant information about individual tokens (category code, character code), as well as reconstruct the token list quickly. This internal format is used in I3regex where we need to support arbitrary tokens, and it is used in conversion functions in I3str-convert, where we wish to support clusters of characters instead of single tokens.

We thus need a way to encode any  $\langle token \rangle$  (even begin-group and end-group character tokens) in a way amenable to manipulating tokens individually. The best we can do is to find  $\langle tokens \rangle$  which both o-expand and e/x-expand to the given  $\langle token \rangle$ . Collecting more information about the category code and character code is also useful for regular expressions, since most regexes are catcode-agnostic. The internal format thus takes the form of a succession of items of the form

$\langle tokens \rangle \backslash s__t1 \langle catcode \rangle \langle char code \rangle \backslash s__t1$

The  $\langle tokens \rangle$  o- and e/x-expand to the original token in the token list or to the cluster of tokens corresponding to one Unicode character in the given encoding (for I3str-convert). The  $\langle catcode \rangle$  is given as a single hexadecimal digit, 0 for control sequences. The  $\langle char code \rangle$  is given as a decimal number, -1 for control sequences.

Using delimited arguments lets us build the  $\langle tokens \rangle$  progressively when doing an encoding conversion in I3str-convert. On the other hand, the delimiter `\s__t1` may not appear unbraced in  $\langle tokens \rangle$ . This is not a problem because we are careful to wrap control sequences in braces (as an argument to `\exp_not:n`) when converting from a general token list to the internal format.

The current rule for converting a  $\langle token \rangle$  to a balanced set of  $\langle tokens \rangle$  which both o-expands and e/x-expands to it is the following.

- A control sequence `\cs` becomes `\exp_not:n { \cs } \s__tl 0 -1 \s__tl`.
- A begin-group character `{` becomes `\exp_after:wN { \if_false: } \fi: \s__tl 1 <char code> \s__tl`.
- An end-group character `}` becomes `\if_false: { \fi: } \s__tl 2 <char code> \s__tl`.
- A character with any other category code becomes `\exp_not:n {<character>} \s__tl <hex catcode> <char code> \s__tl`.

In contrast, for `\peek_analysis_map_inline:n` we must allow for an input stream containing `\outer` macros, so that wrapping all control sequences in `\exp_not:n` is unsafe. Instead, we write the more elaborate `\_kernel_exp_not:w \exp_after:wN { \exp_not:N \cs }`. (On the other hand we make a better effort by avoiding `\exp_not:n` for characters other than active and macro parameters.)

3474 `(*package)`

### 45.3 Variables and helper functions

<code>\s__tl</code>	The scan mark <code>\s__tl</code> is used as a delimiter in the internal format. This is more practical than using a quark, because we would then need to control expansion much more carefully: compare <code>\int_value:w '#1 \s__tl</code> with <code>\int_value:w '#1 \exp_stop_f: \exp_not:N \q_mark</code> to extract a character code followed by the delimiter in an e-expansion.
	<small>3475 <code>\scan_new:N \s__tl</code></small>
	<i>(End of definition for <code>\s__tl</code>.)</i>
<code>\l__tl_analysis_token</code> <code>\l__tl_analysis_char_token</code> <code>\l__tl_analysis_next_token</code>	The tokens in the token list are probed with the TeX primitive <code>\futurelet</code> . We use <code>\l__tl_analysis_token</code> in that construction. In some cases, we convert the following token to a string before probing it: then the token variable used is <code>\l__tl_analysis_char_token</code> . When getting tokens from the input stream we may need to look two tokens ahead, for which we use <code>\l__tl_analysis_next_token</code> .
	<small>3476 <code>\cs_new_eq:NN \l__tl_analysis_token ?</code></small>
	<small>3477 <code>\cs_new_eq:NN \l__tl_analysis_char_token ?</code></small>
	<small>3478 <code>\cs_new_eq:NN \l__tl_analysis_next_token ?</code></small>
	<i>(End of definition for <code>\l__tl_analysis_token</code>, <code>\l__tl_analysis_char_token</code>, and <code>\l__tl_analysis_next_token</code>.)</i>
<code>\l__tl_peek_code_t1</code>	Holds some code to be run once the next token has been fully analysed in <code>\peek_analysis_map_inline:n</code> .
	<small>3479 <code>\tl_new:N \l__tl_peek_code_t1</code></small>
	<i>(End of definition for <code>\l__tl_peek_code_t1</code>.)</i>
<code>\c__tl_peek_catcodes_t1</code>	A token list containing the character number 32 (space) with all possible category codes except 1 and 2 (begin-group and end-group). Why 32? Because some LuaTeX versions only allow creation of catcode 10 (space) tokens with this character code, so that we decided to make <code>\char_generate:nn</code> refuse to create such weird spaces as well. We do not include the macro parameter case (catcode 6) because it cannot be used as a macro delimiter.

```

3480 \group_begin:
3481   \char_set_active_eq:NN \ \scan_stop:
3482   \tl_const:Nn \c__tl_peek_catcodes_tl
3483   {

3520 { \exp_after:wN ; \int_value:w \str_count_ignore_spaces:n {#1} ; }
```

(End of definition for `\_tl_analysis_cs_space_count:NN`, `\_tl_analysis_cs_space_count:w`, and `\_tl_analysis_cs_space_count_end:w.`)

## 45.4 Plan of attack

Our goal is to produce a token list of the form roughly

```
token 1 \s__tl catcode 1 char code 1 \s__tl
token 2 \s__tl catcode 2 char code 2 \s__tl
... token N \s__tl catcode N char code N \s__tl
```

Most but not all tokens can be grabbed as an undelimited (N-type) argument by TeX. The plan is to have a two pass system. In the first pass, locate special tokens, and store them in various `\toks` registers. In the second pass, which is done within an e-expanding assignment, normal tokens are taken in as N-type arguments, and special tokens are retrieved from the `\toks` registers, and removed from the input stream by some means. The whole process takes linear time, because we avoid building the result one item at a time.

We make the escape character printable (backslash, but this later oscillates between slash and backslash): this allows us to distinguish characters from control sequences.

A token has two characteristics: its `\meaning`, and what it looks like for TeX when it is in scanning mode (*e.g.*, when capturing parameters for a macro). For our purposes, we distinguish the following meanings:

- begin-group token (category code 1), either space (character code 32), or non-space;
- end-group token (category code 2), either space (character code 32), or non-space;
- space token (category code 10, character code 32);

- anything else (then the token is always an N-type argument).

The token itself can “look like” one of the following

- a non-active character, in which case its meaning is automatically that associated to its character code and category code, we call it “true” character;
- an active character;
- a control sequence.

The only tokens which are not valid N-type arguments are true begin-group characters, true end-group characters, and true spaces. We detect those characters by scanning ahead with `\futurelet`, then distinguishing true characters from control sequences set equal to them using the `\string` representation.

The second pass is a simple exercise in expandable loops.

`\_\_tl\_analysis:n` Everything is done within a group, and all definitions are local. We use `\group_align_safe_begin/end`: to avoid problems in case `\_\_tl\_analysis:n` is used within an alignment and its argument contains alignment tab tokens.

```

3521 \cs_new_protected:Npn \_\_tl\_analysis:n #1
3522   {
3523     \group_begin:
3524     \group_align_safe_begin:
3525       \_\_tl\_analysis_a:n {#1}
3526       \_\_tl\_analysis_b:n {#1}
3527     \group_align_safe_end:
3528   \group_end:
3529 }
```

(End of definition for `\_\_tl\_analysis:n`.)

## 45.5 Disabling active characters

`\_\_tl\_analysis_disable:n` Active characters can cause problems later on in the processing, so we provide a way to disable them, by setting them to `undefined`. Since Unicode contains too many characters to loop over all of them, we instead do this whenever we encounter a character. For pTeX and upTeX we skip characters beyond [0, 255] because `\lccode` only allows those values.

```

3530 \group_begin:
3531   \char_set_catcode_active:N \^\^@ 
3532   \cs_new_protected:Npn \_\_tl\_analysis_disable:n #1
3533   {
3534     \tex_lccode:D 0 = #1 \exp_stop_f:
3535     \tex_lowercase:D { \tex_let:D ^\^\^@ } \tex_undefined:D
3536   }
3537   \bool_lazy_or:nnT
3538   { \sys_if_engine_ptex_p: }
3539   { \sys_if_engine_uptex_p: }
3540   {
3541     \cs_gset_protected:Npn \_\_tl\_analysis_disable:n #1
3542     {
3543       \if_int_compare:w 256 > #1 \exp_stop_f:
3544         \tex_lccode:D 0 = #1 \exp_stop_f:
```

```

3545           \tex_lowercase:D { \tex_let:D ^^@ } \tex_undefined:D
3546       \fi:
3547   }
3548 }
3549 \group_end:

(End of definition for \__tl_analysis_disable:n)

```

\\_\_tl\_analysis\_disable\_char:N

Similar to \\_\_tl\_analysis\_disable:n, but it receives a normal character token, tests if that token is active (by turning it into a space: the active space has been undefined at this point), and if so, disables it. Even if the character is active and set equal to a primitive conditional, nothing blows up. Again, in pTeX and upTeX we skip characters beyond [0, 255], which cannot be active anyways.

```

3550 \group_begin:
3551   \char_set_catcode_active:N \^^@
3552   \cs_new_protected:Npn \__tl_analysis_disable_char:N #1
3553   {
3554     \tex_lccode:D '#1 = 32 \exp_stop_f:
3555     \tex_lowercase:D { \if_meaning:w #1 } \tex_undefined:D
3556     \tex_let:D #1 \tex_undefined:D
3557     \fi:
3558   }
3559 \bool_lazy_or:nnT
3560 { \sys_if_engine_ptex_p: }
3561 { \sys_if_engine_uptex_p: }
3562 {
3563   \cs_gset_protected:Npn \__tl_analysis_disable_char:N #1
3564   {
3565     \if_int_compare:w 256 > '#1 \exp_stop_f:
3566     \tex_lccode:D '#1 = 32 \exp_stop_f:
3567     \tex_lowercase:D { \if_meaning:w #1 } \tex_undefined:D
3568     \tex_let:D #1 \tex_undefined:D
3569     \fi:
3570   }
3571 }
3572 }
3573 \group_end:

(End of definition for \__tl_analysis_disable_char:N.)

```

## 45.6 First pass

The goal of this pass is to detect special (non-N-type) tokens, and count how many N-type tokens lie between special tokens. Also, we wish to store some representation of each special token in a \toks register.

We have 11 types of tokens:

1. a true non-space begin-group character;
2. a true space begin-group character;
3. a true non-space end-group character;
4. a true space end-group character;

5. a true space blank space character;
6. an active character;
7. any other true character;
8. a control sequence equal to a begin-group token (category code 1);
9. a control sequence equal to an end-group token (category code 2);
10. a control sequence equal to a space token (character code 32, category code 10);
11. any other control sequence.

Our first tool is `\futurelet`. This cannot distinguish case 8 from 1 or 2, nor case 9 from 3 or 4, nor case 10 from case 5. Those cases are later distinguished by applying the `\string` primitive to the following token, after possibly changing the escape character to ensure that a control sequence's string representation cannot be mistaken for the true character.

In cases 6, 7, and 11, the following token is a valid N-type argument, so we grab it and distinguish the case of a character from a control sequence: in the latter case, `\str_tail:n {<token>}` is non-empty, because the escape character is printable.

`\__tl_analysis_a:n` We read tokens one by one using `\futurelet`. While performing the loop, we keep track of the number of true begin-group characters minus the number of true end-group characters in `\l__tl_analysis_nesting_int`. This reaches  $-1$  when we read the closing brace.

```

3574 \cs_new_protected:Npn \__tl_analysis_a:n #1
3575   {
3576     \__tl_analysis_disable:n { 32 }
3577     \int_set:Nn \tex_escapechar:D { 92 }
3578     \int_zero:N \l__tl_analysis_normal_int
3579     \int_zero:N \l__tl_analysis_index_int
3580     \int_zero:N \l__tl_analysis_nesting_int
3581     \if_false: { \fi: \__tl_analysis_a_loop:w #1 }
3582     \int_decr:N \l__tl_analysis_index_int
3583   }

```

(End of definition for `\__tl_analysis_a:n`.)

`\__tl_analysis_a_loop:w` Read one character and check its type.

```

3584 \cs_new_protected:Npn \__tl_analysis_a_loop:w
3585   { \tex_futurelet:D \l__tl_analysis_token \__tl_analysis_a_type:w }

```

(End of definition for `\__tl_analysis_a_loop:w`.)

`\__tl_analysis_a_type:w` At this point, `\l__tl_analysis_token` holds the meaning of the following token. We store in `\l__tl_analysis_type_int` information about the meaning of the token ahead:

- 0 space token;
- 1 begin-group token;
- -1 end-group token;
- 2 other.

The values 0, 1, -1 correspond to how much a true such character changes the nesting level (2 is used only here, and is irrelevant later). Then call the auxiliary for each case. Note that nesting conditionals here is safe because we only skip over `\l__tl_analysis_token` if it matches with one of the character tokens (hence is not a primitive conditional).

```

3586 \cs_new_protected:Npn \__tl_analysis_a_type:w
3587 {
3588     \l__tl_analysis_type_int =
3589     \if_meaning:w \l__tl_analysis_token \c_space_token
3590         0
3591     \else:
3592         \if_catcode:w \exp_not:N \l__tl_analysis_token \c_group_begin_token
3593             1
3594         \else:
3595             \if_catcode:w \exp_not:N \l__tl_analysis_token \c_group_end_token
3596                 - 1
3597             \else:
3598                 2
3599             \fi:
3600         \fi:
3601     \fi:
3602     \exp_stop_f:
3603     \if_case:w \l__tl_analysis_type_int
3604         \exp_after:wN \__tl_analysis_a_space:w
3605     \or: \exp_after:wN \__tl_analysis_a_bgroup:w
3606     \or: \exp_after:wN \__tl_analysis_a_safe:N
3607     \else: \exp_after:wN \__tl_analysis_a_egroup:w
3608     \fi:
3609 }

```

(End of definition for `\__tl_analysis_a_type:w`.)

```
\__tl_analysis_a_space:w
\__tl_analysis_a_space_test:w
```

In this branch, the following token's meaning is a blank space. Apply `\string` to that token: a true blank space gives a space, a control sequence gives a result starting with the escape character, an active character gives something else than a space since we disabled the space. We grab as `\l__tl_analysis_char_token` the first character of the string representation then test it in `\__tl_analysis_a_space_test:w`. Also, since `\__tl_analysis_a_store:` expects the special token to be stored in the relevant `\toks` register, we do that. The extra `\exp_not:n` is unnecessary of course, but it makes the treatment of all tokens more homogeneous. If we discover that the next token was actually a control sequence or an active character instead of a true space, then we step the counter of normal tokens. We now have in front of us the whole string representation of the control sequence, including potential spaces; those will appear to be true spaces later in this pass. Hence, all other branches of the code in this first pass need to consider the string representation, so that the second pass does not need to test the meaning of tokens, only strings.

```

The token is most likely a true character token with catcode 1 or 2, but it might be a control sequence, or an active character. Optimizing for the first case, we store in a toks register some code that expands to that token. Since we will turn what follows into a string, we make sure the escape character is different from the current character code (by switching between solidus and backslash). To detect the special case of an active character let to the catcode 1 or 2 character with the same character code, we disable the active character with that character code and re-test: if the following token has become undefined we can in fact safely grab it. We are finally ready to turn what follows to a string and test it. This is one place where we need `\l__tl_analysis_char_token` to be a separate control sequence from `\l__tl_analysis_token`, to compare them.

(End of definition for `\__tl_analysis_a_bgroup:w` and others.)

`\__tl_analysis_a_store:` This function is called each time we meet a special token; at this point, the `\toks` register `\l__tl_analysis_index_int` holds a token list which expands to the given special token. Also, the value of `\l__tl_analysis_type_int` indicates which case we are in:

- -1 end-group character;
- 0 space character;
- 1 begin-group character.

We need to distinguish further the case of a space character (code 32) from other character codes, because those behave differently in the second pass. Namely, after testing the `\lccode` of 0 (which holds the present character code) we change the cases above to

- -2 space end-group character;
- -1 non-space end-group character;
- 0 space blank space character;
- 1 non-space begin-group character;
- 2 space begin-group character.

This has the property that non-space characters correspond to odd values of `\l__tl_analysis_type_int`. The number of normal tokens until here and the type of special token are packed into a `\skip` register. Finally, we check whether we reached the last closing brace, in which case we stop by disabling the looping function (locally).

```

This should be the simplest case: since the upcoming token is safe, we can simply grab it in a second pass. If the token is a single character (including space), the `\if_charcode:w` test yields true; we disable a potentially active character (that could otherwise masquerade as the true character in the next pass) and we count one “normal” token. On the other hand, if the token is a control sequence, we should replace it by its string representation for compatibility with other code branches. Instead of slowly looping through the characters with the main code, we use the knowledge of how the second pass works: if the control sequence name contains no space, count that token as a number of normal tokens equal to its string length. If the control sequence contains spaces, they should be registered as special characters by increasing `\l_tl_analysis_index_int` (no need to carefully count character between each space), and all characters after the last space should be counted in the following sequence of “normal” tokens.

## 45.7 Second pass

The second pass is an exercise in expandable loops. All the necessary information is stored in `\skip` and `\toks` registers.

```
\_tl_analysis_b:n  
\_tl_analysis_b_loop:w
```

Start the loop with the index 0. No need for an end-marker: the loop stops by itself when the last index is read. We repeatedly oscillate between reading long stretches of normal tokens, and reading special tokens.

```

3712 \cs_new_protected:Npn \__tl_analysis_b:n #1
3713 {
3714     \__kernel_tl_gset:Nx \g__tl_analysis_result_tl
3715     {
3716         \__tl_analysis_b_loop:w 0; #1
3717         \prg_break_point:
3718     }
3719 }
3720 \cs_new:Npn \__tl_analysis_b_loop:w #1;
3721 {
3722     \exp_after:wN \__tl_analysis_b_normals:ww
3723     \int_value:w \tex_skip:D #1 ; #1 ;
3724 }

```

(End of definition for `\__tl_analysis_b:n` and `\__tl_analysis_b_loop:w`.)

`\__tl_analysis_b_normals:ww`  
`\__tl_analysis_b_normal:wwN`

The first argument is the number of normal tokens which remain to be read, and the second argument is the index in the array produced in the first step. A character's string representation is always one character long, while a control sequence is always longer (we have set the escape character to a printable value). In both cases, we leave `\exp_not:n`  $\{\langle token \rangle\}$  `\s__tl` in the input stream (after e-expansion). Here, `\exp_not:n` is used rather than `\exp_not:N` because #3 could be a macro parameter character or could be `\s__tl` (which must be hidden behind braces in the result).

```

3725 \cs_new:Npn \__tl_analysis_b_normals:ww #1;

## 45.8 Mapping through the analysis

`\tl_analysis_map_inline:Nn`  
`\tl_analysis_map_inline:nn`

`\_tl_analysis_map:Nn`  
`\_tl_analysis_map:NwNw`

First obtain the analysis of the token list into `\g__tl_analysis_result_tl`. To allow nested mappings, increase the nesting depth `\g__kernel_prg_map_int` (shared between all modules), then define the payload macro, which runs the user code and has a name specific to that nesting depth. The looping macro grabs the `(tokens)`, `(catcode)` and `(char code)`; it checks for the end of the loop with `\use_none:n ##2`, normally empty, but which becomes `\tl_map_break:` at the end; it then calls the payload macro with the arguments in the correct order (this is the reason why we cannot directly use the same macro for

looping and payload), and loops by calling itself. When the loop ends, remember to decrease the nesting depth.

```

Save the user's code in a control sequence that is suitable for nested maps. We may wish to pass to this function an `\outer` control sequence or active character; for this we will undefine potentially-`\outer` tokens within a group, closed after the function reads its arguments (for an `\outer` active character there is no good alternative). This user's code function also calls the loop auxiliary, and includes the trailing `\prg_break_point:Nn` for when the user wants to stop the loop. The loop auxiliary must remove that break point because it must look at the input stream.

```

```

Expandable tokens (which are automatically N-type) can be `\outer` macros, hence the need for `\exp_after:wN` and `\exp_not:N` in the code above, which allows the next function to safely grab the token as an argument. We run some code that is expanded using the primitive `\cs_set_nopar:Npe` rather than `\tl_set:Nn` to avoid grabbing it as an argument as `#1` may be `\outer`. To allow `#1` as an argument of the user's function (stored in `\l__tl_peek_code_tl`), we set it equal to `\scan_stop:`, but we do it at the last minute because `#1` may be some pretty important function such as `\exp_after:wN`. Then we put the user's function and the elaborate first argument `\__kernel_exp_not:w \exp_-after:wN { \exp_not:N #1 }`: indeed we cannot use `\exp_not:n {#1}` as this breaks for an `\outer` macro and we cannot use `\exp_not:N #1`, as o-expanding this yields a "notexpanded" token equal to (a weird) `\relax`, which would have the wrong value for primitive TeX conditionals such as `\if_meaning:w`.

Then we must add `{-1}0` if the token is a control sequence and `{(charcode})D` otherwise. Distinguishing the two cases is easy: since we have made the escape character printable, `\token_to_str:N` gives at least two characters for a control sequence versus a single one for an active character (possibly being a space). Producing the right outcome is trickier, as `#1` cannot appear in either branch of the conditional (it could be `\outer`, or simply a TeX conditional), and can only be safely discarded by `\use_none:n` if it is

first hit with \exp\_not:N.

```

For normal non-expandable tokens we must distinguish characters (including active ones and macro parameter characters) from control sequences (whose string representation is more than one character because we made the escape character printable). For a control sequence call the user code with suitable arguments, wrapping #1 within \exp\_not:n just in case it happens to be equal to a macro parameter character. We do not skip \exp\_not:n when unnecessary, because there might be situations where the argument could be used by the user after further redefinitions of the token, and it seems more convenient to know that \exp\_not:n is always used.

```

4042 { \l__tl_peek_code_tl { \exp_not:n {#1} } { -1 } 0 }
```

For normal characters we must determine their catcode. The main difficulty is that the character may be an active character masquerading as (i.e., set equal to) itself with a different catcode. Two approaches based on \lowercase can detect this. One could make

an active character with the same catcode as #1 and change its definition before testing the catcode of #1, but in some Unicode engine this fills up the hash table uselessly. Instead, we lowercase #1 itself, changing its character code to 32, namely space (because LuaTEX cannot turn catcode 10 characters to anything else than character code 32), then we apply `\__tl_analysis_b_char:Nn`, which detects active characters by comparing them to `\tex_undefined:D`, and we must have undefined the active space for this test to work —we use an e-expanding assignment to get the active space in the right place. Finally `\__tl_peek_analysis_char:w` puts the arguments in the correct order, including `\exp_not:n` for macro parameter characters and active characters (the latter could be macro parameter characters, and it seems more uniform to always put `\exp_not:n`).

```

For special characters the idea is to eventually act with `\token_to_str:N`, then pick up one by one the characters of this string representation until hitting the token that follows. First determine the character code of (the meaning of) the `\langle token\rangle` (which we know is a special token), make sure the escape character is different from it, normalize the meanings of two active characters and the empty control sequence, and filter out these cases in `\__tl_peek_analysis_retest:`.

```

4098 }

```

At this point we know the meaning of the  $\langle token \rangle$  in the input stream is  $\backslash l\_peek\_token$ , either a space (32, 10) or a begin-group or end-group token (catcode 1 or 2), and we excluded a few cases that would be difficult later (empty control sequence, active character with the same character code as its meaning or as the escape character). Now look at the  $\langle next\ token \rangle$  following it using a combination of  $\backslash afterassignment$  and  $\backslash futurelet$ . (In fact look twice to reset an internal TeX flag in case the  $\langle next\ token \rangle$  had been hit with  $\backslash exp\_not:N$ .) The syntax of this primitive is  $\backslash futurelet \langle peek\ token \rangle \langle first\ token \rangle \langle next\ token \rangle$ , and it sets  $\langle peek\ token \rangle$  equal to  $\langle next\ token \rangle$ . Traditionally, one takes  $\langle first\ token \rangle$  to be some macro that regains control of the code and, e.g., analyses  $\langle peek\ token \rangle$ . Here, both  $\langle first\ token \rangle$  and  $\langle next\ token \rangle$  are mostly unknown tokens in the input stream (but we know the  $\langle first\ token \rangle$  has catcode 1, 2 or 10), where  $\langle first\ token \rangle$  was already stored as  $\backslash l\_peek\_token$ , and we regain control using  $\backslash afterassignment$ , which inserts its argument after the assignment, hence after  $\langle peek\ token \rangle$  but before  $\langle first\ token \rangle$ .

4101   \tl_if_empty:oT { \tex_the:D \tex_everyeof:D }
4102     { \tex_everyeof:D { \scan_stop: } }
4103   \tex_afterassignment:D \__tl_peek_analysis_nextii:
4104   \tex_futurelet:D \l__tl_analysis_next_token
4105   }
4106 \cs_new_protected:Npn \__tl_peek_analysis_nextii:
4107 {
4108   \tex_afterassignment:D \__tl_peek_analysis_str:
4109   \tex_futurelet:D \l__tl_analysis_next_token
4110 }

```

We then hit the  $\langle first\ token \rangle$  with  $\backslash token\_to\_str:N$  and grab characters until finding  $\backslash l\_tl\_analysis\_next\_token$ . More precisely, by looking at the first character in the string representation of the  $\langle first\ token \rangle$  we distinguish three cases: a stringified control sequence starts with the escape character; for an explicit character we find that same character; for an explicit character we find anything else (we made sure to exclude the

case of an active character whose string representation coincides with the other two cases).

```

4111 \cs_new_protected:Npn \__tl_peek_analysis_str:
4112   {
4113     \exp_after:wN \tex_futurelet:D
4114     \exp_after:wN \l__tl_analysis_token
4115     \exp_after:wN \__tl_peek_analysis_str:w
4116     \token_to_str:N
4117   }
4118 \cs_new_protected:Npn \__tl_peek_analysis_str:w
4119   { \__tl_analysis_char_arg:Nw \__tl_peek_analysis_str:n }
4120 \cs_new_protected:Npn \__tl_peek_analysis_str:n #1
4121   {
4122     \int_case:nnF { '#1' }
4123     {
4124       { \l__tl_peekCharCode_int }
4125       { \__tl_peek_analysis_explicit:n {#1} }
4126       { \tex_escapechar:D } { \__tl_peek_analysis_escape: }
4127     }
4128     { \__tl_peek_analysis_active_str:n {#1} }
4129   }

```

When #1 is a stringified active character we pass appropriate arguments to the user's code; thankfully \char\_generate:nn can make active characters.

```

4130 \cs_new_protected:Npn \__tl_peek_analysis_active_str:n #1
4131   {
4132     \tl_put_right:Ne \l__tl_peek_code_tl
4133     {
4134       { \char_generate:nn { '#1' } { 13 } }
4135       { \int_value:w '#1' }
4136       \token_to_str:N D
4137     }
4138     \l__tl_peek_code_tl
4139   }

```

When #1 matches the character we had extracted from the meaning of \l\_peek\_token, the token was an explicit character, which can be a standard space, or a begin-group or end-group character with some character code. In the latter two cases we call \char\_generate:nn with suitable arguments and put suitable \if\_false: \fi: constructions to make the result balanced and such that o-expanding or e/x-expanding gives back a single (unbalanced) begin-group or end-group character.

```

4140 \cs_new_protected:Npn \__tl_peek_analysis_explicit:n #1
4141   {
4142     \tl_put_right:Ne \l__tl_peek_code_tl
4143     {
4144       \if_meaning:w \l_peek_token \c_space_token
4145       { ~ } { 32 } \token_to_str:N A
4146     \else:
4147       \if_catcode:w \l_peek_token \c_group_begin_token
4148       {
4149         \exp_not:N \exp_after:wN
4150         \char_generate:nn { '#1' } { 1 }
4151         \exp_not:N \if_false:
4152         \if_false: { \fi: }
4153         \exp_not:N \fi:

```

```

4154     }
4155     { \int_value:w '#1 }
4156     1
4157 \else:
4158   {
4159     \exp_not:N \if_false:
4160     { \if_false: } \fi:
4161     \exp_not:N \fi:
4162     \char_generate:nn { '#1 } { 2 }
4163   }
4164   { \int_value:w '#1 }
4165   2
4166   \fi:
4167   \fi:
4168 }
4169 \l__tl_peek_code_tl
4170 }
```

Finally there is the case of a special token whose string representation starts with an escape character, namely the token was a control sequence. In that case we could have grabbed the token directly as an N-type argument, but of course we couldn't know that until we had run all the various tests including stringifying the token. We are thus left with the hard work of picking up one by one the characters in the csname (being careful about spaces), until finding a token that matches the *<next token>* picked up earlier (which was not stringified), such that the control sequence that we found so far indeed has the expected meaning `\l_peek_token`. This comparison with `\l_peek_token` catches a reasonably common case like `\c_group_begin_token _` in which the trailing `_` has category code other: without comparison of the constructed csname with `\l_peek_token` collection would stop at `\c`, which is wrong.

```

4171 \cs_new_protected:Npn \__tl_peek_analysis_escape:
4172   {
4173     \tl_clear:N \l__tl_internal_a_tl

# Chapter 46

## I3regex implementation

4219 `<*package>`

4220 `<@@=regex>`

### 46.1 Plan of attack

Most regex engines use backtracking. This allows to provide very powerful features (back-references come to mind first), but it is costly, and raises the problem of catastrophic backtracking. Since TEX is not first and foremost a programming language, complicated code tends to run slowly, and we must use faster, albeit slightly more restrictive, techniques, coming from automata theory.

Given a regular expression of  $n$  characters, we do the following:

- (Compiling.) Analyse the regex, finding invalid input, and convert it to an internal representation.
- (Building.) Convert the compiled regex to a non-deterministic finite automaton (NFA) with  $O(n)$  states which accepts precisely token lists matching that regex.
- (Matching.) Loop through the query token list one token (one “position”) at a time, exploring in parallel every possible path (“active thread”) through the NFA, considering active threads in an order determined by the quantifiers’ greediness.

We use the following vocabulary in the code comments (and in variable names).

- *Group*: index of the capturing group,  $-1$  for non-capturing groups.
- *Position*: each token in the query is labelled by an integer  $\langle position \rangle$ , with  $\min\_pos - 1 \leq \langle position \rangle \leq \max\_pos$ . The lowest and highest positions  $\min\_pos - 1$  and  $\max\_pos$  correspond to imaginary begin and end markers (with non-existent category code and character code).  $\max\_pos$  is only set quite late in the processing.
- *Query*: the token list to which we apply the regular expression.
- *State*: each state of the NFA is labelled by an integer  $\langle state \rangle$  with  $\min\_state \leq \langle state \rangle < \max\_state$ .
- *Active thread*: state of the NFA that is reached when reading the query token list for the matching. Those threads are ordered according to the greediness of quantifiers.

- *Step*: used when matching, starts at 0, incremented every time a character is read, and is not reset when searching for repeated matches. The integer `\l_regex-step_int` is a unique id for all the steps of the matching algorithm.

We use `I3intarray` to manipulate arrays of integers. We also abuse TeX's `\toks` registers, by accessing them directly by number rather than tying them to control sequence using the `\newtoks` allocation functions. Specifically, these arrays and `\toks` are used as follows. When building, `\toks<state>` holds the tests and actions to perform in the `<state>` of the NFA. When matching,

- `\g_regex_state_active_intarray` holds the last `<step>` in which each `<state>` was active.
- `\g_regex_thread_info_intarray` consists of blocks for each `<thread>` (with  $\min\_thread \leq <thread> < \max\_thread$ ). Each block has  $1+2\l_regex_capturing_group_int$  entries: the `<state>` in which the `<thread>` currently is, followed by the beginnings of all submatches, and then the ends of all submatches. The `<threads>` are ordered starting from the best to the least preferred.
- `\g_regex_submatch_prev_intarray`, `\g_regex_submatch_begin_intarray` and `\g_regex_submatch_end_intarray` hold, for each submatch (as would be extracted by `\regex_extract_all:nnN`), the place where the submatch started to be looked for and its two end-points. For historical reasons, the minimum index is twice `max_state`, and the used registers go up to `\l_regex_submatch_int`. They are organized in blocks of `\l_regex_capturing_group_int` entries, each block corresponding to one match with all its submatches stored in consecutive entries.

When actually building the result,

- `\toks<position>` holds `<tokens>` which o- and e-expand to the `<position>`-th token in the query.
- `\g_regex_balance_intarray` holds the balance of begin-group and end-group character tokens which appear before that point in the token list.

The code is structured as follows. Variables are introduced in the relevant section. First we present some generic helper functions. Then comes the code for compiling a regular expression, and for showing the result of the compilation. The building phase converts a compiled regex to NFA states, and the automaton is run by the code in the following section. The only remaining brick is parsing the replacement text and performing the replacement. We are then ready for all the user functions. Finally, messages, and a little bit of tracing code.

## 46.2 Helpers

- `\_regex_int_eval:w` Access the primitive: performance is key here, so we do not use the slower route via `\int_eval:n`.
- ```
4221 \cs_new_eq:NN \_regex_int_eval:w \tex_numexpr:D
(End of definition for \_regex_int_eval:w.)
```
- `\_regex_standard_escapechar:` Make the `\escapechar` into the standard backslash.
- ```
4222 \cs_new_protected:Npn \_regex_standard_escapechar:
4223   { \int_set:Nn \tex_escapechar:D { '\\" } }
```

(End of definition for `\_regex_standard_escapechar:.`)

`\_regex_toks_use:w` Unpack a `\toks` given its number.

```
4224 \cs_new:Npn \_regex_toks_use:w { \tex_the:D \tex_toks:D }
```

(End of definition for `\_regex_toks_use:w.`)

`\_regex_toks_clear:N` Empty a `\toks` or set it to a value, given its number.

```
4225 \cs_new_protected:Npn \_regex_toks_clear:N #1
4226   { \tex_toks:D #1 = { } }
4227 \cs_new_eq:NN \_regex_toks_set:Nn \tex_toks:D
4228 \cs_new_protected:Npn \_regex_toks_set:No #1
4229   { \tex_toks:D #1 = \exp_after:wN }
```

(End of definition for `\_regex_toks_clear:N` and `\_regex_toks_set:Nn.`)

`\_regex_toks_memcpy>NNn` Copy #3 `\toks` registers from #2 onwards to #1 onwards, like C's `memcpy`.

```
4230 \cs_new_protected:Npn \_regex_toks_memcpy>NNn #1#2#3
4231   {
4232     \prg_replicate:nn {#3}
4233     {
4234       \tex_toks:D #1 = \tex_toks:D #2
4235       \int_incr:N #1
4236       \int_incr:N #2
4237     }
4238 }
```

(End of definition for `\_regex_toks_memcpy>NNn.`)

`\_regex_toks_put_left:Ne`

During the building phase we wish to add e-expanded material to `\toks`, either to the left or to the right. The expansion is done “by hand” for optimization (these operations are used quite a lot). The `Nn` version of `\_regex_toks_put_right:Ne` is provided because it is more efficient than e-expanding with `\exp_not:n`.

```
4239 \cs_if_exist:NTF \tex_etokspre:D
4240   { \cs_new_eq:NN \_regex_toks_put_left:Ne \tex_etokspre:D }
4241   {
4242     \cs_new_protected:Npn \_regex_toks_put_left:Ne #1#2
4243     { \tex_toks:D #1 = \tex_expanded:D { { \tex_the:D \tex_toks:D #1 } } }
4244   }
4245 \cs_if_exist:NTF \tex_etoksapp:D
4246   { \cs_new_eq:NN \_regex_toks_put_right:Ne \tex_etoksapp:D }
4247   {
4248     \cs_new_protected:Npn \_regex_toks_put_right:Ne #1#2
4249     { \tex_toks:D #1 = \tex_expanded:D { { \tex_the:D \tex_toks:D #1 #2 } } }
4250   }
4251 \cs_if_exist:NTF \tex_toksapp:D
4252   { \cs_new_eq:NN \_regex_toks_put_right:Nn \tex_toksapp:D }
4253   {
4254     \cs_new_protected:Npn \_regex_toks_put_right:Nn #1#2
4255     { \tex_toks:D #1 = \exp_after:wN { \tex_the:D \tex_toks:D #1 #2 } }
4256   }
```

(End of definition for `\_regex_toks_put_left:Ne` and `\_regex_toks_put_right:Ne.`)

\\_\\_regex\\_curr\\_cs\\_to\\_str: Expands to the string representation of the token (known to be a control sequence) at the current position \l\\_\\_regex\\_curr\\_pos\\_int. It should only be used in e/x-expansion to avoid losing a leading space.

```

4257 \cs_new:Npn \_\_regex_curr_cs_to_str:
4258 {
4259     \exp_after:wN \exp_after:wN \exp_after:wN \cs_to_str:N
4260     \l\_\_regex_curr_token_tl
4261 }
```

(End of definition for \\_\\_regex\\_curr\\_cs\\_to\\_str:.)

\\_\\_regex\\_intarray\\_item:NnF Item of intarray, with a default value.

```

4262 \cs_new:Npn \_\_regex_intarray_item:NnF #1#2
4263 { \exp_args:No \_\_regex_intarray_item_aux:nNF { \tex_the:D \_\_regex_int_eval:w #2 } #1 }
4264 \cs_new:Npn \_\_regex_intarray_item_aux:nNF #1#2
4265 {
4266     \if_int_compare:w #1 > \c_zero_int
4267         \exp_after:wN \use_i:nnn
4268     \fi:
4269     \use_i:nn { \_\_kernel_intarray_item:Nn #2 {#1} }
4270 }
```

(End of definition for \\_\\_regex\\_intarray\\_item:NnF and \\_\\_regex\\_intarray\\_item\\_aux:nNF.)

\\_\\_regex\\_maplike\\_break: Analogous to \tl\_map\_break:, this correctly exits \tl\_map\_inline:nn and similar constructions and jumps to the matching \prg\_break\_point:Nn \\_\\_regex\\_maplike\\_break:{ }.

```

4271 \cs_new:Npn \_\_regex_maplike_break:
4272 { \prg_map_break:Nn \_\_regex_maplike_break: { } }
```

(End of definition for \\_\\_regex\\_maplike\\_break:.)

\\_\\_regex\\_tl\\_odd\\_items:n Map through a token list one pair at a time, leaving the odd-numbered or even-numbered items (the first item is numbered 1).

```

4273 \cs_new:Npn \_\_regex_tl_odd_items:n #1 { \_\_regex_tl_even_items:n { ? #1 } }
4274 \cs_new:Npn \_\_regex_tl_even_items:n #1
4275 {
4276     \_\_regex_tl_even_items_loop:nn #1 \q_\_\_regex_nil \q_\_\_regex_nil
4277     \prg_break_point:
4278 }
4279 \cs_new:Npn \_\_regex_tl_even_items_loop:nn #1#2
4280 {
4281     \_\_regex_use_none_delimit_by_q_nil:w #2 \prg_break: \q_\_\_regex_nil
4282     { \exp_not:n {#2} }
4283     \_\_regex_tl_even_items_loop:nn
4284 }
```

(End of definition for \\_\\_regex\\_tl\\_odd\\_items:n, \\_\\_regex\\_tl\\_even\\_items:n, and \\_\\_regex\\_tl\\_even\\_items\\_loop:nn.)

### 46.2.1 Constants and variables

\\_\\_regex\\_tmp:w Temporary function used for various short-term purposes.

4285 \cs\_new:Npn \\_\\_regex\\_tmp:w { }

(End of definition for \\_\\_regex\\_tmp:w.)

\l\\_\\_regex\\_internal\_a\_tl Temporary variables used for various purposes.

4286 \tl\_new:N \l\\_\\_regex\\_internal\_a\_tl  
4287 \tl\_new:N \l\\_\\_regex\\_internal\_b\_tl  
4288 \int\_new:N \l\\_\\_regex\\_internal\_a\_int  
4289 \int\_new:N \l\\_\\_regex\\_internal\_b\_int  
4290 \int\_new:N \l\\_\\_regex\\_internal\_c\_int  
4291 \bool\_new:N \l\\_\\_regex\\_internal\_bool  
4292 \seq\_new:N \l\\_\\_regex\\_internal\_seq  
4293 \tl\_new:N \g\\_\\_regex\\_internal\_tl

(End of definition for \l\\_\\_regex\\_internal\_a\_tl and others.)

\l\\_\\_regex\\_build\_tl This temporary variable is specifically for use with the `tl_build` machinery.

4294 \tl\_new:N \l\\_\\_regex\\_build\_tl

(End of definition for \l\\_\\_regex\\_build\_tl.)

\c\\_\\_regex\\_no\\_match\\_regex This regular expression matches nothing, but is still a valid regular expression. We could use a failing assertion, but I went for an empty class. It is used as the initial value for regular expressions declared using `\regex_new:N`.

4295 \tl\_const:Nn \c\\_\\_regex\\_no\\_match\\_regex  
4296 {  
4297 \\_\_regex\_branch:n  
4298 { \\_\_regex\_class:NnnN \c\_true\_bool { } { 1 } { 0 } \c\_true\_bool }  
4299 }

(End of definition for \c\\_\\_regex\\_no\\_match\\_regex.)

\l\\_\\_regex\\_balance\\_int During this phase, `\l\_\_regex\_balance\_int` counts the balance of begin-group and end-group character tokens which appear before a given point in the token list. This variable is also used to keep track of the balance in the replacement text.

4300 \int\_new:N \l\\_\\_regex\\_balance\\_int

(End of definition for \l\\_\\_regex\\_balance\\_int.)

### 46.2.2 Testing characters

\c\\_\\_regex\\_ascii\\_min\\_int

\c\\_\\_regex\\_ascii\\_max\\_control\\_int

\c\\_\\_regex\\_ascii\\_max\\_int

4301 \int\_const:Nn \c\\_\\_regex\\_ascii\\_min\\_int { 0 }

4302 \int\_const:Nn \c\\_\\_regex\\_ascii\\_max\\_control\\_int { 31 }

4303 \int\_const:Nn \c\\_\\_regex\\_ascii\\_max\\_int { 127 }

(End of definition for \c\\_\\_regex\\_ascii\\_min\\_int, \c\\_\\_regex\\_ascii\\_max\\_control\\_int, and \c\\_\\_regex\\_ascii\\_max\\_int.)

\c\\_\\_regex\\_ascii\\_lower\\_int

4304 \int\_const:Nn \c\\_\\_regex\\_ascii\\_lower\\_int { 'a' - 'A' }

(End of definition for \c\\_\\_regex\\_ascii\\_lower\\_int.)

### 46.2.3 Internal auxiliaries

\q\_regex_recursion_stop	Internal recursion quarks.

\_regex_quark_if_nil_p:n \_regex_quark_if_nil:nTF	Branching quark conditional.
	4312 \_kernel_quark_new_conditional:Nn \_regex_quark_if_nil:N { F }
	(End of definition for \_regex_quark_if_nil:nTF.)
\_regex_break_point:TF \_regex_break_true:w	When testing whether a character of the query token list matches a given character class in the regular expression, we often have to test it against several ranges of characters, checking if any one of those matches. This is done with a structure like
	$\langle test_1 \rangle \dots \langle test_n \rangle \\ \_regex_break_point:TF \{ \langle true code \rangle \} \{ \langle false code \rangle \}$
	If any of the tests succeeds, it calls \_regex_break_true:w, which cleans up and leaves <i>true code</i> in the input stream. Otherwise, \_regex_break_point:TF leaves the <i>false code</i> in the input stream.
	4313 \cs_new_protected:Npn \_regex_break_true:w 4314 #1 \_regex_break_point:TF #2 #3 {#2} 4315 \cs_new_protected:Npn \_regex_break_point:TF #1 #2 { #2 }
	(End of definition for \_regex_break_point:TF and \_regex_break_true:w.)
\_regex_item_reverse:n	This function makes showing regular expressions easier, and lets us define \D in terms of \d for instance. There is a subtlety: the end of the query is marked by -2, and thus matches \D and other negated properties; this case is caught by another part of the code.
	4316 \cs_new_protected:Npn \_regex_item_reverse:n #1 4317 { 4318 #1 4319 \_regex_break_point:TF { } \_regex_break_true:w 4320 }
	(End of definition for \_regex_item_reverse:n.)

4436  }

```

(End of definition for `\__regex_item_cs:n`.)

#### 46.2.4 Character property tests

`\__regex_prop_d:` Character property tests for `\d`, `\W`, etc. These character properties are not affected by the `(?i)` option. The characters recognized by each one are as follows: `\d=[0-9]`,  
`\__regex_prop_h:`  
`\__regex_prop_s:`  
`\__regex_prop_v:`  
`\__regex_prop_w:`  
`\__regex_prop_N:`

`\w=[0-9A-Z_a-z]`, `\s=[\u\^\^I\^\^J\^\^L\^\^M]`, `\h=[\u\^\^I]`, `\v=[\^\^J-\^\^M]`, and the upper case counterparts match anything that the lower case does not match. The order in which the various tests appear is optimized for usual mostly lower case letter text.

```

4437 \cs_new_protected:Npn \__regex_prop_d:
4438   { \__regex_item_caseful_range:nn { '0 } { '9 } }
4439 \cs_new_protected:Npn \__regex_prop_h:

### 46.2.5 Simple character escape

Before actually parsing the regular expression or the replacement text, we go through them once, converting `\n` to the character 10, *etc.* In this pass, we also convert any special character (\*, ?, {, etc.) or escaped alphanumeric character into a marker indicating that this was a special sequence, and replace escaped special characters and non-escaped alphanumeric characters by markers indicating that those were “raw” characters. The rest of the code can then avoid caring about escaping issues (those can become quite complex to handle in combination with ranges in character classes).

Usage: `\__regex_escape_use:nnnn` *inline 1* *inline 2* *inline 3* {*token list*}

The *token list* is converted to a string, then read from left to right, interpreting backslashes as escaping the next character. Unescaped characters are fed to the function *inline 1*, and escaped characters are fed to the function *inline 2* within an e-expansion context (typically those functions perform some tests on their argument to decide how to output them). The escape sequences `\a`, `\e`, `\f`, `\n`, `\r`, `\t` and `\x` are recognized, and those are replaced by the corresponding character, then fed to *inline 3*. The result is then left in the input stream. Spaces are ignored unless escaped.

The conversion is done within an e-expanding assignment.

`\__regex_escape_use:nnnn` The result is built in `\l__regex_internal_a_t1`, which is then left in the input stream. Tracing code is added as appropriate inside this token list. Go through #4 once, applying #1, #2, or #3 as relevant to each character (after de-escaping it).

```

4512 \cs_new_protected:Npn \__regex_escape_use:nnnn #1#2#3#4
4513 {
4514     \group_begin:
4515         \tl_clear:N \l__regex_internal_a_tl
4516         \cs_set:Npn \__regex_escape_unescaped:N ##1 { #1 }
4517         \cs_set:Npn \__regex_escape_escaped:N ##1 { #2 }
4518         \cs_set:Npn \__regex_escape_raw:N ##1 { #3 }
4519         \__regex_standard_escapechar:
4520         \__kernel_tl_gset:Nx \g__regex_internal_tl
4521             { \__kernel_str_to_other_fast:n {#4} }
4522         \tl_put_right:Ne \l__regex_internal_a_tl
4523             {
4524                 \exp_after:wN \__regex_escape_loop:N \g__regex_internal_tl
4525                 \scan_stop: \prg_break_point:
4526             }
4527         \exp_after:wN
4528     \group_end:
4529     \l__regex_internal_a_tl
4530 }

```

(End of definition for `\__regex_escape_use:nnnn`.)

`\__regex_escape_loop:N` `\__regex_escape_loop:N` reads one character: if it is special (space, backslash, or end-marker), perform the associated action, otherwise it is simply an unescaped character. After a backslash, the same is done, but unknown characters are “escaped”.

```

4531 \cs_new:Npn \__regex_escape_loop:N #1
4532 {
4533     \cs_if_exist_use:cF { __regex_escape_\token_to_str:N #1:w }
4534         { \__regex_escape_unescaped:N #1 }
4535         \__regex_escape_loop:N
4536     }
4537 \cs_new:cpn { __regex_escape_ \c_backslash_str :w }
4538     \__regex_escape_loop:N #1
4539     {
4540         \cs_if_exist_use:cF { __regex_escape_/\token_to_str:N #1:w }
4541             { \__regex_escape_escaped:N #1 }
4542             \__regex_escape_loop:N
4543     }

```

(End of definition for `\__regex_escape_loop:N` and `\__regex_escape_\:w`.)

`\__regex_escape_unescaped:N` Those functions are never called before being given a new meaning, so their definitions here don’t matter.

```

4544 \cs_new_eq:NN \__regex_escape_unescaped:N ?
4545 \cs_new_eq:NN \__regex_escape_escaped:N ?
4546 \cs_new_eq:NN \__regex_escape_raw:N ?

```

(End of definition for `\__regex_escape_unescaped:N`, `\__regex_escape_escaped:N`, and `\__regex_escape_raw:N`.)

`\__regex_escape_\scan_stop:w` The loop is ended upon seeing the end-marker “`break`”, with an error if the string ended in a backslash. Spaces are ignored, and `\a`, `\e`, `\f`, `\n`, `\r`, `\t` take their meaning here.

```

4547 \cs_new_eq:cN { __regex_escape_ \iow_char:N \scan_stop: :w } \prg_break:
4548 \cs_new:cpn { __regex_escape_/\iow_char:N \scan_stop: :w }

```

```

4549  {
4550    \msg_expandable_error:nn { regex } { trailing-backslash }
4551    \prg_break:
4552  }
4553 \cs_new:cpn { __regex_escape_~:w } { }
4554 \cs_new:cpe { __regex_escape_/a:w }
4555   { \exp_not:N \__regex_escape_raw:N \iow_char:N \^G }
4556 \cs_new:cpe { __regex_escape/_t:w }
4557   { \exp_not:N \__regex_escape_raw:N \iow_char:N \^I }
4558 \cs_new:cpe { __regex_escape/_n:w }
4559   { \exp_not:N \__regex_escape_raw:N \iow_char:N \^J }
4560 \cs_new:cpe { __regex_escape/_f:w }
4561   { \exp_not:N \__regex_escape_raw:N \iow_char:N \^L }
4562 \cs_new:cpe { __regex_escape/_r:w }
4563   { \exp_not:N \__regex_escape_raw:N \iow_char:N \^M }
4564 \cs_new:cpe { __regex_escape/_e:w }
4565   { \exp_not:N \__regex_escape_raw:N \iow_char:N \^ [ }

```

(End of definition for `\__regex_escape_\scan_stop::w` and others.)

`\__regex_escape/_x:w` When `\x` is encountered, `\__regex_escape_x_test:N` is responsible for grabbing some hexadecimal digits, and feeding the result to `\__regex_escape_x_end:w`. If the number is too big interrupt the assignment and produce an error, otherwise call `\__regex_escape_raw:N` on the corresponding character token.

```

4566 \cs_new:cpn { __regex_escape/_x:w } \__regex_escape_loop:N
4567  {
4568    \exp_after:wN \__regex_escape_x_end:w
4569    \int_value:w "0 \__regex_escape_x_test:N
4570  }
4571 \cs_new:Npn \__regex_escape_x_end:w #1 ;
4572  {
4573    \int_compare:nNnTF {#1} > \c_max_char_int
4574    {
4575      \msg_expandable_error:nnff { regex } { x-overflow }
4576      {#1} { \int_to_Hex:n {#1} }
4577    }
4578    {
4579      \exp_last_unbraced:Nf \__regex_escape_raw:N
4580      { \char_generate:nn {#1} { 12 } }
4581    }
4582  }

```

(End of definition for `\__regex_escape/_x:w`, `\__regex_escape_x_end:w`, and `\__regex_escape_x_large:n`.)

`\__regex_escape_x_test:N` Find out whether the first character is a left brace (allowing any number of hexadecimal digits), or not (allowing up to two hexadecimal digits). We need to check for the end-of-string marker. Eventually, call either `\__regex_escape_x_loop:N` or `\__regex_escape_x:N`.

```

4583 \cs_new:Npn \__regex_escape_x_test:N #1
4584  {
4585    \if_meaning:w \scan_stop: #1
4586    \exp_after:wN \use_i:nnn \exp_after:wN ;
4587    \fi:

```

```

4588   \use:n
4589   {
4590     \if_charcode:w \c_space_token #1
4591       \exp_after:wN \__regex_escape_x_test:N
4592     \else:
4593       \exp_after:wN \__regex_escape_x_testii:N
4594       \exp_after:wN #1
4595     \fi:
4596   }
4597 }
4598 \cs_new:Npn \__regex_escape_x_testii:N #1
4599 {
4600   \if_charcode:w \c_left_brace_str #1
4601     \exp_after:wN \__regex_escape_x_loop:N
4602   \else:
4603     \__regex_hexadecimal_use:NTF #1
4604     { \exp_after:wN \__regex_escape_x:N }
4605     { ; \exp_after:wN \__regex_escape_loop:N \exp_after:wN #1 }
4606   \fi:
4607 }

```

(End of definition for `\__regex_escape_x_test:N` and `\__regex_escape_x_testii:N`.)

`\__regex_escape_x:N` This looks for the second digit in the unbraced case.

```

4608 \cs_new:Npn \__regex_escape_x:N #1
4609 {
4610   \if_meaning:w \scan_stop: #1
4611     \exp_after:wN \use_i:nnn \exp_after:wN ;
4612   \fi:
4613   \use:n
4614   {
4615     \__regex_hexadecimal_use:NTF #1
4616     { ; \__regex_escape_loop:N }
4617     { ; \__regex_escape_loop:N #1 }
4618   }
4619 }

```

(End of definition for `\__regex_escape_x:N`.)

`\__regex_escape_x_loop:N` Grab hexadecimal digits, skip spaces, and at the end, check that there is a right brace, otherwise raise an error outside the assignment.

```

4620 \cs_new:Npn \__regex_escape_x_loop:N #1
4621 {
4622   \if_meaning:w \scan_stop: #1
4623     \exp_after:wN \use_ii:nnn
4624   \fi:
4625   \use_ii:nn
4626   { ; \__regex_escape_x_loop_error:n { } {#1} }
4627   {
4628     \__regex_hexadecimal_use:NTF #1
4629     { \__regex_escape_x_loop:N }
4630     {
4631       \token_if_eq_charcode:NNTF \c_space_token #1
4632       { \__regex_escape_x_loop:N }

```

```

4633   {
4634     ;
4635     \exp_after:wN
4636     \token_if_eq_charcode:NNTF \c_right_brace_str #1
4637     { \__regex_escape_loop:N }
4638     { \__regex_escape_x_loop_error:n {#1} }
4639   }
4640 }
4641 }
4642 \cs_new:Npn \__regex_escape_x_loop_error:n #1
4643 {
4644   \msg_expandable_error:nnn { regex } { x-missing-rbrace } {#1}
4645   \__regex_escape_loop:N #1
4646 }
4647 }
```

(End of definition for `\__regex_escape_x_loop:N` and `\__regex_escape_x_loop_error:.`)

`\__regex_hexadecimal_use:NTF` TEX detects uppercase hexadecimal digits for us but not the lowercase letters, which we need to detect and replace by their uppercase counterpart.

```

4648 \cs_new:Npn \__regex_hexadecimal_use:NTF #1
4649 {
4650   \if_int_compare:w \c_one_int < "1 \token_to_str:N #1 \exp_stop_f:
4651   #1
4652 \else:
4653   \if_case:w
4654     \__regex_int_eval:w \exp_after:wN ` \token_to_str:N #1 - 'a \scan_stop:
4655     A
4656     \or: B
4657     \or: C
4658     \or: D
4659     \or: E
4660     \or: F
4661   \else:
4662     \exp_after:wN \exp_after:wN \exp_after:wN \use_iii:nnn
4663   \fi:
4664 \fi:
4665   \use_i:nn
4666 }
```

(End of definition for `\__regex_hexadecimal_use:NTF.`)

`\__regex_char_if_alphanumeric:NTF` These two tests are used in the first pass when parsing a regular expression. That pass is responsible for finding escaped and non-escaped characters, and recognizing which ones have special meanings and which should be interpreted as “raw” characters. Namely,

- alphanumerics are “raw” if they are not escaped, and may have a special meaning when escaped;
- non-alphanumeric printable ascii characters are “raw” if they are escaped, and may have a special meaning when not escaped;
- characters other than printable ascii are always “raw”.

The code is ugly, and highly based on magic numbers and the ascii codes of characters. This is mostly unavoidable for performance reasons. Maybe the tests can be optimized a little bit more. Here, “alphanumeric” means 0–9, A–Z, a–z; “special” character means non-alphanumeric but printable ascii, from space (hex 20) to del (hex 7E).

```

4667 \prg_new_conditional:Npnn \__regex_char_if_special:N #1 { TF }
4668   {
4669     \if:w
4670       T

4721 }
```

(End of definition for `\_regex_char_if_alphanumeric:NTF` and `\_regex_char_if_special:NTF`.)

## 46.3 Compiling

A regular expression starts its life as a string of characters. In this section, we convert it to internal instructions, resulting in a “compiled” regular expression. This compiled expression is then turned into states of an automaton in the building phase. Compiled regular expressions consist of the following:

- `\_regex_class:NnnnN`  $\langle\text{boolean}\rangle$   $\{\langle\text{tests}\rangle\}$   $\{\langle\text{min}\rangle\}$   $\{\langle\text{more}\rangle\}$   $\langle\text{lazyness}\rangle$
- `\_regex_group:nnnN`  $\{\langle\text{branches}\rangle\}$   $\{\langle\text{min}\rangle\}$   $\{\langle\text{more}\rangle\}$   $\langle\text{lazyness}\rangle$ , also `\_regex_group_no_capture:nnnN` and `\_regex_group_resetting:nnnN` with the same syntax.
- `\_regex_branch:n`  $\{\langle\text{contents}\rangle\}$
- `\_regex_command_K`:
- `\_regex_assertion:Nn`  $\langle\text{boolean}\rangle$   $\{\langle\text{assertion test}\rangle\}$ , where the  $\langle\text{assertion test}\rangle$  is `\_regex_b_test:` or `\_regex_Z_test:` or `\_regex_A_test:` or `\_regex_G_test:`

Tests can be the following:

- `\_regex_item_caseful_equal:n`  $\{\langle\text{char code}\rangle\}$
- `\_regex_item_caseless_equal:n`  $\{\langle\text{char code}\rangle\}$
- `\_regex_item_caseful_range:nn`  $\{\langle\text{min}\rangle\}$   $\{\langle\text{max}\rangle\}$
- `\_regex_item_caseless_range:nn`  $\{\langle\text{min}\rangle\}$   $\{\langle\text{max}\rangle\}$
- `\_regex_item_catcode:nT`  $\{\langle\text{catcode bitmap}\rangle\}$   $\{\langle\text{tests}\rangle\}$
- `\_regex_item_catcode_reverse:nT`  $\{\langle\text{catcode bitmap}\rangle\}$   $\{\langle\text{tests}\rangle\}$
- `\_regex_item_reverse:n`  $\{\langle\text{tests}\rangle\}$
- `\_regex_item_exact:nn`  $\{\langle\text{catcode}\rangle\}$   $\{\langle\text{char code}\rangle\}$
- `\_regex_item_exact_cs:n`  $\{\langle\text{csnames}\rangle\}$ , more precisely given as  $\langle\text{csname}\rangle \backslash\text{scan\_stop}: \langle\text{csname}\rangle \backslash\text{scan\_stop}: \langle\text{csname}\rangle$  and so on in a brace group.
- `\_regex_item_cs:n`  $\{\langle\text{compiled regex}\rangle\}$

### 46.3.1 Variables used when compiling

`\l__regex_group_level_int`

4722 `\int_new:N \l__regex_group_level_int`

(End of definition for `\l__regex_group_level_int`.)

`\l__regex_mode_int`  
`\c__regex_cs_in_class_mode_int`  
`\c__regex_cs_mode_int`  
`\c__regex_outer_mode_int`  
`\c__regex_catcode_mode_int`  
`\c__regex_class_mode_int`  
`\c__regex_catcode_in_class_mode_int`

4723 `\int_new:N \l__regex_mode_int`  
 4724 `\int_const:Nn \c__regex_cs_in_class_mode_int { -6 }`  
 4725 `\int_const:Nn \c__regex_cs_mode_int { -2 }`  
 4726 `\int_const:Nn \c__regex_outer_mode_int { 0 }`  
 4727 `\int_const:Nn \c__regex_catcode_mode_int { 2 }`  
 4728 `\int_const:Nn \c__regex_class_mode_int { 3 }`  
 4729 `\int_const:Nn \c__regex_catcode_in_class_mode_int { 6 }`

(End of definition for `\l__regex_mode_int` and others.)

`\l__regex_catcodes_int`  
`\l__regex_default_catcodes_int`  
`\l__regex_catcodes_bool`

We wish to allow constructions such as `\c[^BE](.. \cL[a-z] ..)`, where the outer catcode test applies to the whole group, but is superseded by the inner catcode test. For this to work, we need to keep track of lists of allowed category codes: `\l__regex_catcodes_int` and `\l__regex_default_catcodes_int` are bitmaps, sums of  $4^c$ , for all allowed catcodes  $c$ . The latter is local to each capturing group, and we reset `\l__regex_catcodes_int` to that value after each character or class, changing it only when encountering a `\c` escape. The boolean records whether the list of categories of a catcode test has to be inverted: compare `\c[^BE]` and `\c[BE]`.

4730 `\int_new:N \l__regex_catcodes_int`  
 4731 `\int_new:N \l__regex_default_catcodes_int`  
 4732 `\bool_new:N \l__regex_catcodes_bool`

(End of definition for `\l__regex_catcodes_int`, `\l__regex_default_catcodes_int`, and `\l__regex_catcodes_bool`.)

`\c__regex_catcode_C_int`  
`\c__regex_catcode_B_int`  
`\c__regex_catcode_E_int`  
`\c__regex_catcode_M_int`  
`\c__regex_catcode_T_int`  
`\c__regex_catcode_P_int`  
`\c__regex_catcode_U_int`  
`\c__regex_catcode_D_int`  
`\c__regex_catcode_S_int`  
`\c__regex_catcode_L_int`  
`\c__regex_catcode_O_int`  
`\c__regex_catcode_A_int`  
`\c__regex_all_catcodes_int`

4733 `\int_const:Nn \c__regex_catcode_C_int { "1" }`  
 4734 `\int_const:Nn \c__regex_catcode_B_int { "4" }`  
 4735 `\int_const:Nn \c__regex_catcode_E_int { "10" }`  
 4736 `\int_const:Nn \c__regex_catcode_M_int { "40" }`  
 4737 `\int_const:Nn \c__regex_catcode_T_int { "100" }`  
 4738 `\int_const:Nn \c__regex_catcode_P_int { "1000" }`  
 4739 `\int_const:Nn \c__regex_catcode_U_int { "4000" }`  
 4740 `\int_const:Nn \c__regex_catcode_D_int { "10000" }`  
 4741 `\int_const:Nn \c__regex_catcode_S_int { "100000" }`  
 4742 `\int_const:Nn \c__regex_catcode_L_int { "400000" }`  
 4743 `\int_const:Nn \c__regex_catcode_O_int { "1000000" }`  
 4744 `\int_const:Nn \c__regex_catcode_A_int { "4000000" }`  
 4745 `\int_const:Nn \c__regex_all_catcodes_int { "5515155" }`

(End of definition for `\c__regex_catcode_C_int` and others.)

`\l__regex_internal_regex`

The compilation step stores its result in this variable.

4746 `\cs_new_eq:NN \l__regex_internal_regex \c__regex_no_match_regex`

(End of definition for `\l__regex_internal_regex`.)

\l\_\_regex\_show\_prefix\_seq This sequence holds the prefix that makes up the line displayed to the user. The various items must be removed from the right, which is tricky with a token list, hence we use a sequence.

```
4747 \seq_new:N \l__regex_show_prefix_seq
```

(End of definition for \l\_\_regex\_show\_prefix\_seq.)

\l\_\_regex\_show\_lines\_int A hack. To know whether a given class has a single item in it or not, we count the number of lines when showing the class.

```
4748 \int_new:N \l__regex_show_lines_int
```

(End of definition for \l\_\_regex\_show\_lines\_int.)

### 46.3.2 Generic helpers used when compiling

\\_regex\_two\_if\_eq:NNNNTF Used to compare pairs of things like \\_regex\_compile\_special:N ? together. It's often inconvenient to get the catcodes of the character to match so we just compare the character code. Besides, the expanding behaviour of \if:w is very useful as that means we can use \c\_left\_brace\_str and the like.

```
4749 \cs_new:Npn \_regex_two_if_eq:NNNNTF #1#2#3#4
4750 {
4751     \if_meaning:w #1 #3
4752     \if:w #2 #4
4753     \exp_after:wN \exp_after:wN \exp_after:wN \use_i:nn
4754     \fi:
4755     \fi:
4756     \use_i:nn
4757 }
```

(End of definition for \\_regex\_two\_if\_eq:NNNNTF.)

\\_regex\_get\_digits:NTFw If followed by some raw digits, collect them one by one in the integer variable #1, and take the **true** branch. Otherwise, take the **false** branch.

```
4758 \cs_new_protected:Npn \_regex_get_digits:NTFw #1#2#3#4#5
4759 {
4760     \_regex_if_raw_digit:NNTF #4 #5
4761     { #1 = #5 \_regex_get_digits_loop:nw {#2} }
4762     { #3 #4 #5 }
4763 }
4764 \cs_new:Npn \_regex_get_digits_loop:nw #1#2#3
4765 {
4766     \_regex_if_raw_digit:NNTF #2 #3
4767     { #3 \_regex_get_digits_loop:nw {#1} }
4768     { \scan_stop: #1 #2 #3 }
4769 }
```

(End of definition for \\_regex\_get\_digits:NTFw and \\_regex\_get\_digits\_loop:w.)

\\_regex\_if\_raw\_digit:NNTF Test used when grabbing digits for the {m,n} quantifier. It only accepts non-escaped digits.

```
4770 \cs_new:Npn \_regex_if_raw_digit:NNTF #1#2
4771 {
4772     \if_meaning:w \_regex_compile_raw:N #1
4773     \if_int_compare:w \c_one_int < 1 #2 \exp_stop_f:
```

```

4774      \exp_after:wN \exp_after:wN \exp_after:wN \use_i:nnn
4775      \fi:
4776      \fi:
4777      \use_i:nn
4778  }

```

(End of definition for `\_regex_if_raw_digit:NNTF.`)

### 46.3.3 Mode

When compiling the NFA corresponding to a given regex string, we can be in ten distinct modes, which we label by some magic numbers:

- 6 `[\c{...}]` control sequence in a class,
- 2 `\c{...}` control sequence,
- 0 ... outer,
- 2 `\c...` catcode test,
- 6 `[\c...]` catcode test in a class,
- 63 `[\c{[...]}]` class inside mode -6,
- 23 `\c{[...]}` class inside mode -2,
- 3 `[...]` class inside mode 0,
- 23 `\c[...]` class inside mode 2,
- 63 `[\c[...]]` class inside mode 6.

This list is exhaustive, because `\c` escape sequences cannot be nested, and character classes cannot be nested directly. The choice of numbers is such as to optimize the most useful tests, and make transitions from one mode to another as simple as possible.

- Even modes mean that we are not directly in a character class. In this case, a left bracket appends 3 to the mode. In a character class, a right bracket changes the mode as  $m \rightarrow (m - 15)/13$ , truncated.
- Grouping, assertion, and anchors are allowed in non-positive even modes (0, -2, -6), and do not change the mode. Otherwise, they trigger an error.
- A left bracket is special in even modes, appending 3 to the mode; in those modes, quantifiers and the dot are recognized, and the right bracket is normal. In odd modes (within classes), the left bracket is normal, but the right bracket ends the class, changing the mode from  $m$  to  $(m - 15)/13$ , truncated; also, ranges are recognized.
- In non-negative modes, left and right braces are normal. In negative modes, however, left braces trigger a warning; right braces end the control sequence, going from -2 to 0 or -6 to 3, with error recovery for odd modes.
- Properties (such as the `\d` character class) can appear in any mode.

\\_\\_regex\\_if\\_in\\_class:TF Test whether we are directly in a character class (at the innermost level of nesting). There, many escape sequences are not recognized, and special characters are normal. Also, for every raw character, we must look ahead for a possible raw dash.

```

4779 \prg_new_conditional:Npnn \_\_regex_if_in_class: { TF }
4780   {
4781     \if_int_odd:w \l__regex_mode_int
4782       \prg_return_true:
4783     \else:
4784       \prg_return_false:
4785     \fi:
4786   }

```

(End of definition for \\_\\_regex\\_if\\_in\\_class:TF.)

\\_\\_regex\\_if\\_in\\_cs:TF Right braces are special only directly inside control sequences (at the inner-most level of nesting, not counting groups).

```

4787 \cs_new:Npn \_\_regex_if_in_cs:TF
4788   {
4789     \if_int_odd:w \l__regex_mode_int
4790     \else:
4791       \if_int_compare:w \l__regex_mode_int < \c__regex_outer_mode_int
4792         \exp_after:wN \exp_after:wN \exp_after:wN \use_i:nnn
4793       \fi:
4794     \fi:
4795     \use_i:nn
4796   }

```

(End of definition for \\_\\_regex\\_if\\_in\\_cs:TF.)

\\_\\_regex\\_if\\_in\\_class\\_or\\_catcode:TF Assertions are only allowed in modes 0, -2, and -6, i.e., even, non-positive modes.

```

4797 \cs_new:Npn \_\_regex_if_in_class_or_catcode:TF
4798   {
4799     \if_int_odd:w \l__regex_mode_int
4800     \else:
4801       \if_int_compare:w \l__regex_mode_int > \c__regex_outer_mode_int
4802       \else:
4803         \exp_after:wN \exp_after:wN \exp_after:wN \use_iii:nnn
4804       \fi:
4805     \fi:
4806     \use_i:nn
4807   }

```

(End of definition for \\_\\_regex\\_if\\_in\\_class\\_or\\_catcode:TF.)

\\_\\_regex\\_if\\_within\\_catcode:TF This test takes the true branch if we are in a catcode test, either immediately following it (modes 2 and 6) or in a class on which it applies (modes 23 and 63). This is used to tweak how left brackets behave in modes 2 and 6.

```

4808 \prg_new_conditional:Npnn \_\_regex_if_within_catcode: { TF }
4809   {
4810     \if_int_compare:w \l__regex_mode_int > \c__regex_outer_mode_int
4811       \prg_return_true:
4812     \else:
4813       \prg_return_false:
4814     \fi:
4815   }

```

(End of definition for `\_regex_if_within_catcode:TF`.)

`\_regex_chk_c_allowed:T` The `\c` escape sequence is only allowed in modes 0 and 3, i.e., not within any other `\c` escape sequence.

```
4816 \cs_new_protected:Npn \_regex_chk_c_allowed:T
4817 {
4818     \if_int_compare:w \l__regex_mode_int = \c__regex_outer_mode_int
4819     \else:
4820         \if_int_compare:w \l__regex_mode_int = \c__regex_class_mode_int
4821         \else:
4822             \msg_error:nn { regex } { c-bad-mode }
4823             \exp_after:wN \use_i:nnn
4824         \fi:
4825     \fi:
4826     \use:n
4827 }
```

(End of definition for `\_regex_chk_c_allowed:T`.)

`\_regex_mode_quit_c:` This function changes the mode as it is needed just after a catcode test.

```
4828 \cs_new_protected:Npn \_regex_mode_quit_c:
4829 {
4830     \if_int_compare:w \l__regex_mode_int = \c__regex_catcode_mode_int
4831         \int_set_eq:NN \l__regex_mode_int \c__regex_outer_mode_int
4832     \else:
4833         \if_int_compare:w \l__regex_mode_int =
4834             \c__regex_catcode_in_class_mode_int
4835             \int_set_eq:NN \l__regex_mode_int \c__regex_class_mode_int
4836         \fi:
4837     \fi:
4838 }
```

(End of definition for `\_regex_mode_quit_c`.)

#### 46.3.4 Framework

`\_regex_compile:w` Used when compiling a user regex or a regex for the `\c{...}` escape sequence within another regex. Start building a token list within a group (with e-expansion at the outset), and set a few variables (group level, catcodes), then start the first branch. At the end, make sure there are no dangling classes nor groups, close the last branch: we are done building `\l__regex_internal_regex`.

```
4839 \cs_new_protected:Npn \_regex_compile:w
4840 {
4841     \group_begin:
4842         \tl_build_begin:N \l__regex_build_tl
4843         \int_zero:N \l__regex_group_level_int
4844         \int_set_eq:NN \l__regex_default_catcodes_int
4845             \c__regex_all_catcodes_int
4846         \int_set_eq:NN \l__regex_catcodes_int \l__regex_default_catcodes_int
4847         \cs_set:Npn \_regex_item_equal:n { \_regex_item_caseful_equal:n }
4848         \cs_set:Npn \_regex_item_range:nn { \_regex_item_caseful_range:nn }
4849         \tl_build_put_right:Nn \l__regex_build_tl
4850             { \_regex_branch:n { \if_false: } \fi: }
4851 }
```

```

4852 \cs_new_protected:Npn \__regex_compile_end:
4853 {
4854     \__regex_if_in_class:TF

4880     \tl_build_end:N \l__regex_build_tl
4881     \exp_args:NNNe
4882 \group_end:
4883     \tl_set:Nn \l__regex_internal_regex { \l__regex_build_tl }
4884 }

```

(End of definition for \\_\\_regex\\_compile:w and \\_\\_regex\\_compile\_end:.)

`\_regex_compile:n` The compilation is done between `\_regex_compile:w` and `\_regex_compile_end:`, starting in mode 0. Then `\_regex_escape_use:nnnn` distinguishes special characters, escaped alphanumerics, and raw characters, interpreting `\a`, `\x` and other sequences. The 4 trailing `\prg_do_nothing:` are needed because some functions defined later look up to 4 tokens ahead. Before ending, make sure that any `\c{...}` is properly closed. No need to check that brackets are closed properly since `\_regex_compile_end:` does that. However, catch the case of a trailing `\cL` construction.

```
4885 \cs_new_protected:Npn \__regex_compile:n #1
4886 {
4887     \__regex_compile:w
4888     \__regex_standard_escapechar:
4889     \int_set_eq:NN \l__regex_mode_int \c__regex_outer_mode_int
4890     \__regex_escape_use:nnnn
4891     {
4892         \__regex_char_if_special:NTF ##1
4893             \__regex_compile_special:N \__regex_compile_raw:N ##1
4894     }
4895 }
```

```

4896     \_\_regex\_char\_if\_alphanumeric:NTF ##1
4897         \_\_regex\_compile\_escaped:N \_\_regex\_compile\_raw:N ##1
4898     }
4899     { \_\_regex\_compile\_raw:N ##1 }
4900     { #1 }
4901     \prg\_do\_nothing: \prg\_do\_nothing:
4902     \prg\_do\_nothing: \prg\_do\_nothing:
4903     \int\_compare:nNnT \l\_\_regex\_mode\_int = \c\_\_regex\_catcode\_mode\_int
4904         { \msg\_error:nn { regex } { c-trailing } }
4905     \int\_compare:nNnT \l\_\_regex\_mode\_int < \c\_\_regex\_outer\_mode\_int
4906         {
4907             \msg\_error:nn { regex } { c-missing-rbrace }
4908             \_\_regex\_compile\_end\_cs:
4909             \prg\_do\_nothing: \prg\_do\_nothing:
4910             \prg\_do\_nothing: \prg\_do\_nothing:
4911         }
4912     \_\_regex\_compile\_end:
4913 }
```

(End of definition for `\_\_regex\_compile:n`.)

`\_\_regex\_compile\_use:n` Use a regex, regardless of whether it is given as a string (in which case we need to compile) or as a regex variable. This is used for `\regex\_match\_case:nn` and related functions to allow a mixture of explicit regex and regex variables.

```

4914 \cs\_new\_protected:Npn \_\_regex\_compile\_use:n #1
4915     {
4916         \tl\_if\_single\_token:nT {#1}
4917         {
4918             \exp\_after:wN \_\_regex\_compile\_use\_aux:w
4919             \token\_to\_meaning:N #1 ~ \q\_\_regex\_nil
4920         }
4921         \_\_regex\_compile:n {#1} \l\_\_regex\_internal\_regex
4922     }
4923 \cs\_new\_protected:Npn \_\_regex\_compile\_use\_aux:w #1 ~ #2 \q\_\_regex\_nil
4924     {
4925         \str\_if\_eq:nnT { #1 ~ } { macro:->\_\_regex\_branch:n }
4926         { \use\_ii:nnn }
4927     }
```

(End of definition for `\_\_regex\_compile\_use:n`.)

`\_\_regex\_compile\_escaped:N` If the special character or escaped alphanumeric has a particular meaning in regexes, `\_\_regex\_compile\_special:N` the corresponding function is used. Otherwise, it is interpreted as a raw character. We distinguish special characters from escaped alphanumeric characters because they behave differently when appearing as an end-point of a range.

```

4928 \cs\_new\_protected:Npn \_\_regex\_compile\_special:N #1
4929     {
4930         \cs\_if\_exist\_use:cF { \_\_regex\_compile\_#1: }
4931         { \_\_regex\_compile\_raw:N #1 }
4932     }
4933 \cs\_new\_protected:Npn \_\_regex\_compile\_escaped:N #1
4934     {
4935         \cs\_if\_exist\_use:cF { \_\_regex\_compile\_/#1: }
4936         { \_\_regex\_compile\_raw:N #1 }
4937     }
```

(End of definition for `\_regex_compile escaped:N` and `\_regex_compile special:N`.)

`\_regex_compile_one:n` This is used after finding one “test”, such as `\d`, or a raw character. If that followed a catcode test (*e.g.*, `\cL`), then restore the mode. If we are not in a class, then the test is “standalone”, and we need to add `\_regex_class:NnnnN` and search for quantifiers. In any case, insert the test, possibly together with a catcode test if appropriate.

```
4938 \cs_new_protected:Npn \_regex_compile_one:n #1
4939 {
4940     \_regex_mode_quit_c:
4941     \_regex_if_in_class:TF { }
4942     {
4943         \tl_build_put_right:Nn \l__regex_build_tl
4944         { \_regex_class:NnnnN \c_true_bool { \if_false: } \fi: }
4945     }
4946     \tl_build_put_right:Ne \l__regex_build_tl
4947     {
4948         \if_int_compare:w \l__regex_catcodes_int <
4949             \c__regex_all_catcodes_int
4950             \_regex_item_catcode:nT { \int_use:N \l__regex_catcodes_int }
4951             { \exp_not:N \exp_not:n {#1} }
4952     \else:
4953         \exp_not:N \exp_not:n {#1}
4954     \fi:
4955 }
4956 \int_set_eq:NN \l__regex_catcodes_int \l__regex_default_catcodes_int
4957 \_regex_if_in_class:TF { } { \_regex_compile_quantifier:w }
4958 }
```

(End of definition for `\_regex_compile_one:n`.)

`\_regex_compile_abort_tokens:n` This function places the collected tokens back in the input stream, each as a raw character. Spaces are not preserved.

```
4959 \cs_new_protected:Npn \_regex_compile_abort_tokens:n #1
4960 {
4961     \use:e
4962     {
4963         \exp_args:No \tl_map_function:nN { \tl_to_str:n {#1} }
4964         \_regex_compile_raw:N
4965     }
4966 }
4967 \cs_generate_variant:Nn \_regex_compile_abort_tokens:n { e }
```

(End of definition for `\_regex_compile_abort_tokens:n`.)

### 46.3.5 Quantifiers

`\_regex_compile_if_quantifier:TFw` This looks ahead and checks whether there are any quantifier (special character equal to either of `?+*{}`). This is useful for the `\u` and `\ur` escape sequences.

```
4968 \cs_new_protected:Npn \_regex_compile_if_quantifier:TFw #1#2#3#4
4969 {
4970     \token_if_eq_meaning:NNTF #3 \_regex_compile_special:N
4971     { \cs_if_exist:cTF { \_regex_compile_quantifier_#4:w } }
4972     { \use_i:nn }
4973     {#1} {#2} #3 #4
```

```
4974 }
```

(End of definition for `\_\_regex_compile_if_quantifier:TFw.`)

`\_\_regex_compile_quantifier:w` This looks ahead and finds any quantifier (special character equal to either of `?+*{}`).

```
4975 \cs_new_protected:Npn \_\_regex_compile_quantifier:w #1#2
4976 {
4977     \token_if_eq_meaning:NNTF #1 \_\_regex_compile_special:N
4978     {
4979         \cs_if_exist_use:c { \_\_regex_compile_quantifier_#2:w }
4980         { \_\_regex_compile_quantifier_none: #1 #2 }
4981     }
4982     { \_\_regex_compile_quantifier_none: #1 #2 }
4983 }
```

(End of definition for `\_\_regex_compile_quantifier:w.`)

`\_\_regex_compile_quantifier_none:` Those functions are called whenever there is no quantifier, or a braced construction is invalid (equivalent to no quantifier, and whatever characters were grabbed are left raw).

```
4984 \cs_new_protected:Npn \_\_regex_compile_quantifier_none:
4985 {
4986     \tl_build_put_right:Nn \l__regex_build_tl
4987     { \if_false: { \fi: } { 1 } { 0 } \c_false_bool }
4988 }
4989 \cs_new_protected:Npn \_\_regex_compile_quantifier_abort:eNN #1#2#3
4990 {
4991     \_\_regex_compile_quantifier_none:
4992     \msg_warning:nnee { regex } { invalid-quantifier } {#1} {#3}
4993     \_\_regex_compile_abort_tokens:e {#1}
4994     #2 #3
4995 }
```

(End of definition for `\_\_regex_compile_quantifier_none:` and `\_\_regex_compile_quantifier_abort:eNN.`)

`\_\_regex_compile_quantifier_lazyness:nnNN` Once the “main” quantifier (`?, *, +` or a braced construction) is found, we check whether it is lazy (followed by a question mark). We then add to the compiled regex a closing brace (ending `\_\_regex_class:NnnnN` and friends), the start-point of the range, its end-point, and a boolean, `true` for lazy and `false` for greedy operators.

```
4996 \cs_new_protected:Npn \_\_regex_compile_quantifier_lazyness:nnNN #1#2#3#4
4997 {
4998     \_\_regex_two_if_eq:NNNTF #3 #4 \_\_regex_compile_special:N ?
4999     {
5000         \tl_build_put_right:Nn \l__regex_build_tl
5001         { \if_false: { \fi: } { #1 } { #2 } \c_true_bool }
5002     }
5003     {
5004         \tl_build_put_right:Nn \l__regex_build_tl
5005         { \if_false: { \fi: } { #1 } { #2 } \c_false_bool }
5006         #3 #4
5007     }
5008 }
```

(End of definition for `\_\_regex_compile_quantifier_lazyness:nnNN.`)

`\_regex_compile_quantifier_?:w`  
`\_regex_compile_quantifier_*:w`  
`\_regex_compile_quantifier_+:w`

For each “basic” quantifier, ?, \*, +, feed the correct arguments to `\_regex_compile_quantifier_lazyness:nnNN`, -1 means that there is no upper bound on the number of repetitions.

```

5009 \cs_new_protected:cpn { __regex_compile_quantifier_?:w }
5010   { __regex_compile_quantifier_lazyness:nnNN { 0 } { 1 } }
5011 \cs_new_protected:cpn { __regex_compile_quantifier_*:w }
5012   { __regex_compile_quantifier_lazyness:nnNN { 0 } { -1 } }
5013 \cs_new_protected:cpn { __regex_compile_quantifier_+:w }
5014   { __regex_compile_quantifier_lazyness:nnNN { 1 } { -1 } }
```

(End of definition for `\_regex_compile_quantifier_?:w`, `\_regex_compile_quantifier_*:w`, and `\_regex_compile_quantifier_+:w`)

`\_regex_compile_quantifier_{:w}`  
`\_regex_compile_quantifier_braced_auxi:w`  
`\_regex_compile_quantifier_braced_auxii:w`  
`\_regex_compile_quantifier_braced_auxiii:w`

Three possible syntaxes: `{(int)}`, `{(int),}`, or `{(int),(int)}`. Any other syntax causes us to abort and put whatever we collected back in the input stream, as raw characters, including the opening brace. Grab a number into `\l__regex_internal_a_int`. If the number is followed by a right brace, the range is  $[a, a]$ . If followed by a comma, grab one more number, and call the `_ii` or `_iii` auxiliary. Those auxiliaries check for a closing brace, leading to the range  $[a, \infty]$  or  $[a, b]$ , encoded as  $\{a\}{-1}$  and  $\{a\}{b - a}$ .

```

5015 \cs_new_protected:cpn { __regex_compile_quantifier_ \c_left_brace_str :w }
5016   {
5017     __regex_get_digits:NTFw \l__regex_internal_a_int
5018     { __regex_compile_quantifier_braced_auxi:w }
5019     { __regex_compile_quantifier_abort:eNN { \c_left_brace_str } }
5020   }
5021 \cs_new_protected:Npn __regex_compile_quantifier_braced_auxi:w #1#2
5022   {
5023     \str_case_e:nnF { #1 #2 }
5024     {

5082     }

```

(End of definition for `\__regex_compile_quantifier_{:w}` and others.)

#### 46.3.6 Raw characters

- `\__regex_compile_raw_error:N` Within character classes, and following catcode tests, some escaped alphanumeric sequences such as `\b` do not have any meaning. They are replaced by a raw character, after spitting out an error.

```

5083 \cs_new_protected:Npn \__regex_compile_raw_error:N #1
5084     {
5085         \msg_error:nne { regex } { bad-escape } {#1}
5086         \__regex_compile_raw:N #1
5087     }

```

(End of definition for `\__regex_compile_raw_error:N`.)

- `\__regex_compile_raw:N` If we are in a character class and the next character is an unescaped dash, this denotes a range. Otherwise, the current character `#1` matches itself.

```

5088 \cs_new_protected:Npn \__regex_compile_raw:N #1#2#3
5089     {
5090         \__regex_if_in_class:TF

```

```

5091 {
5092     \_\_regex\_two\_if\_eq:NNNNTF #2 #3 \_\_regex\_compile\_special:N -
5093     { \_\_regex\_compile\_range:Nw #1 }
5094     {
5095         \_\_regex\_compile\_one:n
5096         { \_\_regex\_item\_equal:n { \int\_value:w '#1 } }
5097         #2 #3
5098     }
5099 }
5100 {
5101     \_\_regex\_compile\_one:n
5102     { \_\_regex\_item\_equal:n { \int\_value:w '#1 } }
5103     #2 #3
5104 }
5105 }
```

(End of definition for `\_\_regex\_compile\_raw:N`.)

`\_\_regex\_compile\_range:Nw`  
`\_\_regex\_if\_end\_range:NNTF`

We have just read a raw character followed by a dash; this should be followed by an end-point for the range. Valid end-points are: any raw character; any special character, except a right bracket. In particular, escaped characters are forbidden.

```

5106 \cs_new_protected:Npn \_\_regex_if_end_range:NNTF #1#2
5107 {
5108     \if_meaning:w \_\_regex_compile_raw:N #1

5141         \tl_build_put_right:Ne \l__regex_build_tl
5142             {
5143                 \__regex_item_equal:n { \int_value:w '#1 \exp_stop_f: }
5144                 \__regex_item_equal:n { \int_value:w '- \exp_stop_f: }
5145             }
5146             #2#3
5147         }
5148     }

```

(End of definition for `\__regex_compile_range:Nw` and `\__regex_if_end_range:NNTF`.)

#### 46.3.7 Character properties

`\__regex_compile_..:` In a class, the dot has no special meaning. Outside, insert `\__regex_prop_..:`, which matches any character or control sequence, and refuses `-2` (end-marker).

```

5149 \cs_new_protected:cpe { __regex_compile_..: }
5150   {
5151     \exp_not:N \__regex_if_in_class:TF
5152       { \__regex_compile_raw:N . }
5153       { \__regex_compile_one:n \exp_not:c { __regex_prop_..: } }
5154   }
5155 \cs_new_protected:cpn { __regex_prop_..: }
5156   {
5157     \if_int_compare:w \l__regex_curr_char_int > - 2 \exp_stop_f:
5158       \exp_after:wn \__regex_break_true:w
5159     \fi:
5160   }

```

(End of definition for `\__regex_compile_..:` and `\__regex_prop_..:..`)

`\__regex_compile/_d:` The constants `\__regex_prop_d:`, etc. hold a list of tests which match the corresponding character class, and jump to the `\__regex_break_point:TF` marker. As for a normal character, we check for quantifiers.

```

5161 \cs_set_protected:Npn \__regex_tmp:w #1#2
5162   {
5163     \cs_new_protected:cpe { __regex_compile_/#1: }
5164       { \__regex_compile_one:n \exp_not:c { __regex_prop_#1: } }
5165     \cs_new_protected:cpe { __regex_compile_/#2: }
5166       {
5167         \__regex_compile_one:n
5168           { \__regex_item_reverse:n { \exp_not:c { __regex_prop_#1: } } }
5169       }
5170   }
5171 \__regex_tmp:w d D
5172 \__regex_tmp:w h H
5173 \__regex_tmp:w s S
5174 \__regex_tmp:w v V
5175 \__regex_tmp:w w W
5176 \cs_new_protected:cpn { __regex_compile/_N: }
5177   { \__regex_compile_one:n \__regex_prop_N: }

```

(End of definition for `\__regex_compile/_d:` and others.)

### 46.3.8 Anchoring and simple assertions

`\_regex_compile_anchor_letter>NNN`  
`\_regex_compile/_A:`  
`\_regex_compile/_G:`  
`\_regex_compile/_Z:`  
`\_regex_compile/_z:`  
`\_regex_compile/_b:`  
`\_regex_compile/_B:`  
`\_regex_compile/_^:`  
`\_regex_compile/_$:`

In modes where assertions are forbidden, anchors such as `\A` produce an error (`\A` is invalid in classes); otherwise they add an `\_regex_assertion:Nn` test as appropriate (the only negative assertion is `\B`). The test functions are defined later. The implementation for `$` and `^` is only different from `\A` etc because these are valid in a class.

```

5178 \cs_new_protected:Npn \_regex_compile_anchor_letter:NNN #1#2#3
5179   {
5200     \_regex_if_in_class_or_catcode:TF { \_regex_compile_raw_error:N #1 }
5201     {
5202       \tl_build_put_right:Nn \l__regex_build_tl
5203       { \_regex_assertion:Nn #2 {#3} }
5204     }
5205   }
5206 \cs_new_protected:cpn { __regex_compile/_A: }
5207   { \_regex_compile_anchor_letter:NNN A \c_true_bool \_regex_A_test: }
5208 \cs_new_protected:cpn { __regex_compile/_G: }
5209   { \_regex_compile_anchor_letter:NNN G \c_true_bool \_regex_G_test: }
5210 \cs_new_protected:cpn { __regex_compile/_Z: }
5211   { \_regex_compile_anchor_letter:NNN Z \c_true_bool \_regex_Z_test: }
5212 \cs_new_protected:cpn { __regex_compile/_z: }
5213   { \_regex_compile_anchor_letter:NNN z \c_true_bool \_regex_Z_test: }
5214 \cs_new_protected:cpn { __regex_compile/_b: }
5215   { \_regex_compile_anchor_letter:NNN b \c_true_bool \_regex_b_test: }
5216 \cs_new_protected:cpn { __regex_compile/_B: }
5217   { \_regex_compile_anchor_letter:NNN B \c_false_bool \_regex_b_test: }
5218 \cs_set_protected:Npn \_regex_tmp:w #1#2
5219   {
5220     \cs_new_protected:cpn { __regex_compile:#1: }
5221     {
5222       \_regex_if_in_class_or_catcode:TF { \_regex_compile_raw:N #1 }
5223       {
5224         \tl_build_put_right:Nn \l__regex_build_tl
5225         { \_regex_assertion:Nn \c_true_bool {#2} }
5226       }
5227     }
5228   }
5229 \exp_args:Ne \_regex_tmp:w { \iow_char:N \^ } { \_regex_A_test: }
5230 \exp_args:Ne \_regex_tmp:w { \iow_char:N \$ } { \_regex_Z_test: }

```

(End of definition for `\_regex_compile_anchor_letter:NNN` and others.)

### 46.3.9 Character classes

`\_regex_compile_[]:` Outside a class, right brackets have no meaning. In a class, change the mode ( $m \rightarrow (m - 15)/13$ , truncated) to reflect the fact that we are leaving the class. Look for quantifiers, unless we are still in a class after leaving one (the case of `[...]\cL[...]`). quantifiers.

```

5211 \cs_new_protected:cpn { __regex_compile_[]: }
5212   {
5213     \_regex_if_in_class:TF
5214     {
5215       \if_int_compare:w \l__regex_mode_int >
5216         \c__regex_catcode_in_class_mode_int
5217       \tl_build_put_right:Nn \l__regex_build_tl { \if_false: { \fi: } }

```

```

5218     \fi:
5219     \tex_advance:D \l__regex_mode_int - 15 \exp_stop_f:
5220     \tex_divide:D \l__regex_mode_int 13 \exp_stop_f:
5221     \if_int_odd:w \l__regex_mode_int \else:
5222         \exp_after:wN \__regex_compile_quantifier:w
5223     \fi:
5224 }
5225 { \__regex_compile_raw:N }
5226 }

```

(End of definition for `\__regex_compile_[]::`)

- `\__regex_compile_[:]`: In a class, left brackets might introduce a POSIX character class, or mean nothing. Immediately following `\c{category}`, we must insert the appropriate catcode test, then parse the class; we pre-expand the catcode as an optimization. Otherwise (modes 0, -2 and -6) just parse the class. The mode is updated later.

```

5227 \cs_new_protected:cpn { \__regex_compile_[:]
5228 {
5229     \__regex_if_in_class:TF
5230     { \__regex_compile_class_posix_test:w }
5231     {
5232         \__regex_if_within_catcode:TF
5233         {
5234             \exp_after:wN \__regex_compile_class_catcode:w
5235             \int_use:N \l__regex_catcodes_int ;
5236         }
5237         { \__regex_compile_class_normal:w }
5238     }
5239 }

```

(End of definition for `\__regex_compile_[]::`)

- `\__regex_compile_class_normal:w`: In the “normal” case, we insert `\__regex_class:NnnnN` *<boolean>* in the compiled code. The *<boolean>* is true for positive classes, and false for negative classes, characterized by a leading `^`. The auxiliary `\__regex_compile_class:TFNN` also checks for a leading `]` which has a special meaning.

```

5240 \cs_new_protected:Npn \__regex_compile_class_normal:w
5241 {
5242     \__regex_compile_class:TFNN
5243     { \__regex_class:NnnnN \c_true_bool }
5244     { \__regex_class:NnnnN \c_false_bool }
5245 }

```

(End of definition for `\__regex_compile_class_normal:w`.)

- `\__regex_compile_class_catcode:w`: This function is called for a left bracket in modes 2 or 6 (catcode test, and catcode test within a class). In mode 2 the whole construction needs to be put in a class (like single character). Then determine if the class is positive or negative, inserting `\__regex_item_catcode:nT` or the `reverse` variant as appropriate, each with the current catcodes bitmap #1 as an argument, and reset the catcodes.

```

5246 \cs_new_protected:Npn \__regex_compile_class_catcode:w #1;
5247 {
5248     \if_int_compare:w \l__regex_mode_int = \c__regex_catcode_mode_int
5249         \tl_build_put_right:Nn \l__regex_build_tl

```

```

5250     { \__regex_class:NnnnN \c_true_bool { \if_false: } \fi: }
5251 \fi:
5252 \int_set_eq:NN \l__regex_catcodes_int \l__regex_default_catcodes_int
5253 \__regex_compile_class:TFNN
5254     { \__regex_item_catcode:nT {#1} }
5255     { \__regex_item_catcode_reverse:nT {#1} }
5256 }
```

(End of definition for `\__regex_compile_class_catcode:w`.)

`\__regex_compile_class:TFNN` If the first character is `^`, then the class is negative (use #2), otherwise it is positive (use #1). If the next character is a right bracket, then it should be changed to a raw one.

```

5257 \cs_new_protected:Npn \__regex_compile_class:TFNN #1#2#3#4
5258 {
5259     \l__regex_mode_int = \int_value:w \l__regex_mode_int 3 \exp_stop_f:
5260     \__regex_two_if_eq:NNNTF #3 #4 \__regex_compile_special:N "
5261     {
5262         \tl_build_put_right:Nn \l__regex_build_tl { #2 { \if_false: } \fi: }
5263         \__regex_compile_class:NN
5264     }
5265     {
5266         \tl_build_put_right:Nn \l__regex_build_tl { #1 { \if_false: } \fi: }
5267         \__regex_compile_class:NN #3 #4
5268     }
5269 }
5270 \cs_new_protected:Npn \__regex_compile_class:NN #1#2
5271 {
5272     \token_if_eq_charcode:NNTF #2 ]
5273     { \__regex_compile_raw:N #2 }
5274     { #1 #2 }
5275 }
```

(End of definition for `\__regex_compile_class:TFNN` and `\__regex_compile_class:NN`.)

`\__regex_compile_class_posix_test:w` Here we check for a syntax such as `[:alpha:]`. We also detect `[=` and `[.` which have a meaning in POSIX regular expressions, but are not implemented in l3regex. In case we see `[:`, grab raw characters until hopefully reaching `:]`. If that's missing, or the POSIX class is unknown, abort. If all is right, add the test to the current class, with an extra `\__regex_item_reverse:n` for negative classes (we make sure to wrap its argument in braces otherwise `\regex_show:N` would not recognize the regex as valid).

```

5276 \cs_new_protected:Npn \__regex_compile_class_posix_test:w #1#2
5277 {
5278     \token_if_eq_meaning:NNT \__regex_compile_special:N #1
5279     {
5280         \str_case:nn { #2 }
5281         {
5282             : { \__regex_compile_class_posix:NNNNw }
5283             = {
5284                 \msg_warning:nne { regex }
5285                 { posix-unsupported } { = }
5286             }
5287             . {
5288                 \msg_warning:nne { regex }
5289                 { posix-unsupported } { . }
5290 }
```

```

5290         }
5291     }
5292   }
5293 \__regex_compile_raw:N [ #1 #2
5294 ]
5295 \cs_new_protected:Npn \__regex_compile_class_posix:NNNw #1#2#3#4#5#6
5296 {

### 46.3.10 Groups and alternations

```
\_\_regex_compile_group_begin:N
\_\_regex_compile_group_end:
```

The contents of a regex group are turned into compiled code in `\l_\_regex_build_t1`, which ends up with items of the form `\_\_regex_branch:n {<concatenation>}`. This construction is done using `\tl_build_...` functions within a T<sub>E</sub>X group, which automatically makes sure that options (case-sensitivity and default catcode) are reset at the end of the group. The argument #1 is `\_\_regex_group:nnN` or a variant thereof. A small subtlety to support `\cL(abc)` as a shorthand for `(\cLa\cLb\cLc)`: exit any pending catcode test, save the category code at the start of the group as the default catcode for that group, and make sure that the catcode is restored to the default outside the group.

```

5346 \cs_new_protected:Npn \_\_regex_compile_group_begin:N #1
5347 {
5348     \tl_build_put_right:Nn \l_\_regex_build_t1 { #1 { \if_false: } \fi: }
5349     \_\_regex_mode_quit_c:
5350     \group_begin:
5351         \tl_build_begin:N \l_\_regex_build_t1
5352         \int_set_eq:NN \l_\_regex_default_catcodes_int \l_\_regex_catcodes_int
5353         \int_incr:N \l_\_regex_group_level_int
5354         \tl_build_put_right:Nn \l_\_regex_build_t1
5355             { \_\_regex_branch:n { \if_false: } \fi: }
5356     }
5357 \cs_new_protected:Npn \_\_regex_compile_group_end:
5358 {
5359     \if_int_compare:w \l_\_regex_group_level_int > \c_zero_int
5360         \tl_build_put_right:Nn \l_\_regex_build_t1 { \if_false: { \fi: } }
5361         \tl_build_end:N \l_\_regex_build_t1
5362         \exp_args:NNNe

### 46.3.11 Catcodes and csnames

\\_\_regex\_compile/\_c:  
\\_\_regex\_compile\_c\_test:NN

The \c escape sequence can be followed by a capital letter representing a character category, by a left bracket which starts a list of categories, or by a brace group holding a regular expression for a control sequence name. Otherwise, raise an error.

```
5456 \cs_new_protected:cpn { __regex_compile/_c: }
```

```

5457 { \__regex_chk_c_allowed:T { \__regex_compile_c_test:NN } }
5458 \cs_new_protected:Npn \__regex_compile_c_test:NN #1#2
5459 {
5460     \token_if_eq_meaning:NNTF #1 \__regex_compile_raw:N
5461     {
5462         \int_if_exist:cTF { c__regex_catcode_#2_int }
5463         {
5464             \int_set_eq:Nc \l__regex_catcodes_int
5465                 { c__regex_catcode_#2_int }
5466             \l__regex_mode_int
5467                 = \if_case:w \l__regex_mode_int
5468                     \c__regex_catcode_mode_int
5469                 \else:
5470                     \c__regex_catcode_in_class_mode_int
5471                 \fi:
5472             \token_if_eq_charcode:NNT C #2 { \__regex_compile_c_C:NN }
5473         }
5474     }
5475     { \cs_if_exist_use:cF { __regex_compile_c_#2:w } }
5476     {
5477         \msg_error:nne { regex } { c-missing-category } {#2}
5478         #1 #2
5479     }
5480 }

```

(End of definition for `\__regex_compile_c:` and `\__regex_compile_c_test:NN`.)

`\__regex_compile_c_C:NN` If `\cc` is not followed by `.` or `(...)` then complain because that construction cannot match anything, except in cases like `\cC[\c{...}]`, where it has no effect.

```

5481 \cs_new_protected:Npn \__regex_compile_c_C:NN #1#2
5482 {
5483     \token_if_eq_meaning:NNTF #1 \__regex_compile_special:N

5547 }

```

(End of definition for `\__regex_compile_c_[:w]` and others.)

`\__regex_compile_c_{}`: The case of a left brace is easy, based on what we have done so far: in a group, compile the regular expression, after changing the mode to forbid nesting `\c{}`. Additionally, disable submatch tracking since groups don't escape the scope of `\c{...}`.

```
5548 \cs_new_protected:cpx { __regex_compile_c_ \c_left_brace_str :w }
```

```

5549   {
5550     \_\_regex\_compile:w
5551       \_\_regex\_disable\_submatches:
5552         \l\_\_regex\_mode\_int
5553           = \if_case:w \l\_\_regex\_mode\_int
5554             \c\_\_regex\_cs\_mode\_int
5555           \else:
5556             \c\_\_regex\_cs\_in\_class\_mode\_int
5557           \fi:
5558   }

```

(End of definition for `\_\_regex\_compile_c_{:..}`)

`\_\_regex\_compile_{:..}`: We forbid unescaped left braces inside a `\c{...}` escape because they otherwise lead to the confusing question of whether the first right brace in `\c{{}x}` should end `\c` or whether one should match braces.

```

5559 \cs_new_protected:cpn { \_\_regex_compile_ \c_left_brace_str : }
5560   {
5561     \_\_regex_if_in_cs:TF
5562       { \msg_error:n { regex } { cu-lbrace } { c } }
5563       { \exp_after:wN \_\_regex_compile_raw:N \c_left_brace_str }
5564   }

```

(End of definition for `\_\_regex_compile_f_{:..}`)

`\l\_\_regex\_cs\_flag`  
`\_\_regex_compile_{:..}`:  
`\_\_regex_compile_end_cs:`  
`\_\_regex_compile_cs_aux:Nn`  
`\_\_regex_compile_cs_aux:NnnnN`

Non-escaped right braces are only special if they appear when compiling the regular expression for a csname, but not within a class: `\c{{}}` matches the control sequences `\{` and `\}`. So, end compiling the inner regex (this closes any dangling class or group). Then insert the corresponding test in the outer regex. As an optimization, if the control sequence test simply consists of several explicit possibilities (branches) then use `\_\_regex_item_exact_cs:n` with an argument consisting of all possibilities separated by `\scan_stop:`.

### 46.3.12 Raw token lists with \u

`\__regex_compile/_u:` The `\u` escape is invalid in classes and directly following a catcode test. Otherwise test for a following `r` (for `\ur`), and call an auxiliary responsible for finding the variable name.

```

5630 \cs_new_protected:cpn { __regex_compile/_u: } #1#2
5631 {
5632     \__regex_if_in_class_or_catcode:TF
5633     { \__regex_compile_raw_error:N u #1 #2 }

```

```

5634 {
5635   \_\_regex\_two\_if\_eq:NNNNTF #1 #2 \_\_regex\_compile\_raw:N r
5636   { \_\_regex\_compile\_u\_brace:NNN \_\_regex\_compile\_ur\_end: }
5637   { \_\_regex\_compile\_u\_brace:NNN \_\_regex\_compile\_u\_end: #1 #2 }
5638 }
5639 }
```

(End of definition for `\_\_regex\_compile\_u::`)

`\_\_regex\_compile\_u\_brace:NNN` This enforces the presence of a left brace, then starts a loop to find the variable name.

```

5640 \cs_new:Npn \_\_regex\_compile\_u\_brace:NNN #1#2#3
5641 {
5642   \_\_regex\_two\_if\_eq:NNNNTF #2 #3 \_\_regex\_compile\_special:N \c_left\_brace\_str
5643   {
5644     \tl_set:Nn \l\_\_regex\_internal\_b\_tl {#1}
5645     \_\_kernel\_tl\_set:Nx \l\_\_regex\_internal\_a\_tl { \if_false: } \fi:
5646     \_\_regex\_compile\_u\_loop:NN
5647   }
5648   {
5649     \msg_error:nn { regex } { u-missing-lbrace }
5650     \token_if_eq_meaning:NNTF #1 \_\_regex\_compile\_ur\_end:
5651     { \_\_regex\_compile\_raw:N u \_\_regex\_compile\_raw:N r }
5652     { \_\_regex\_compile\_raw:N u }
5653     #2 #3
5654   }
5655 }
```

(End of definition for `\_\_regex\_compile\_u\_brace:NNN`.)

`\_\_regex\_compile\_u\_loop:NN` We collect the characters for the argument of \u within an e-expanding assignment. In principle we could just wait to encounter a right brace, but this is unsafe: if the right brace was missing, then we would reach the end-markers of the regex, and continue, leading to obscure fatal errors. Instead, we only allow raw and special characters, and stop when encountering a special right brace, any escaped character, or the end-marker.

```

5656 \cs_new:Npn \_\_regex\_compile\_u\_loop:NN #1#2
5657 {
5658   \token_if_eq_meaning:NNTF #1 \_\_regex\_compile\_raw:N

5671           \_\_regex\_compile\_u\_loop:NN
5672         }
5673       }
5674       {
5675         \if_false: { \fi: }
```

```

5676         \msg_error:nne { regex } { u-missing-rbrace } {#2}
5677         \l__regex_internal_b_tl
5678         #1 #2
5679     }
5680 }
5681 }
```

(End of definition for `\_regex_compile_u_loop:NN`.)

`\_regex_compile_ur_end:` For the `\ur{...}` construction, once we have extracted the variable's name, we replace all groups by non-capturing groups in the compiled regex (passed as the argument of `\_regex_compile_ur:n`). If that has a single branch (namely `\tl_if_empty:oTF` is false) and there is no quantifier, then simply insert the contents of this branch (obtained by `\use_i:nn`, which is expanded later). In all other cases, insert a non-capturing group and look for quantifiers to determine the number of repetition etc.

```

5682 \cs_new_protected:Npn \_regex_compile_ur_end:
5683 {
5684     \group_begin:
5685         \cs_set:Npn \_regex_group:nnnN { \_regex_group_no_capture:nnnN }
5686         \cs_set:Npn \_regex_group_resetting:nnnN { \_regex_group_no_capture:nnnN }
5687         \exp_args:NNe
5688     \group_end:
5689     \_regex_compile_ur:n { \use:c { \l__regex_internal_a_tl } }
5690 }
5691 \cs_new_protected:Npn \_regex_compile_ur:n #
5692 {
5693     \tl_if_empty:oTF { \_regex_compile_ur_aux:w #1 {} ? ? \q__regex_nil }
5694     { \_regex_compile_if_quantifier:TFw }
5695     { \use_i:nn }
5696     {
5697         \tl_build_put_right:Nn \l__regex_build_tl
5698             { \_regex_group_no_capture:nnnN { \if_false: } \fi: #1 }
5699         \_regex_compile_quantifier:w
5700     }
5701     { \tl_build_put_right:Nn \l__regex_build_tl { \use_i:nn #1 } }
5702 }
5703 \cs_new:Npn \_regex_compile_ur_aux:w \_regex_branch:n #1#2#3 \q__regex_nil {#2}
```

(End of definition for `\_regex_compile_ur_end:`, `\_regex_compile_ur:n`, and `\_regex_compile_ur_aux:w`.)

`\_regex_compile_u_end:` Once we have extracted the variable's name, we check for quantifiers, in which case we set up a non-capturing group with a single branch. Inside this branch (we omit it and the group if there is no quantifier), `\_regex_compile_u_payload:` puts the right tests corresponding to the contents of the variable, which we store in `\l__regex_internal_a_tl`. The behaviour of `\u` then depends on whether we are within a `\c{...}` escape (in this case, the variable is turned to a string), or not.

```

5704 \cs_new_protected:Npn \_regex_compile_u_end:
5705 {
5706     \_regex_compile_if_quantifier:TFw
5707     {
5708         \tl_build_put_right:Nn \l__regex_build_tl
5709             {
5710                 \_regex_group_no_capture:nnnN { \if_false: } \fi:
```

```

5711           \__regex_branch:n { \if_false: } \fi:
5712       }
5713   \__regex_compile_u_payload:
5714   \tl_build_put_right:Nn \l__regex_build_tl { \if_false: { \fi: } }
5715   \__regex_compile_quantifier:w
5716 }
5717 { \__regex_compile_u_payload: }
5718 }
5719 \cs_new_protected:Npn \__regex_compile_u_payload:
5720 {
5721     \tl_set:Nv \l__regex_internal_a_tl { \l__regex_internal_a_tl }

5758         \else:
5759             \_\_regex\_item\_exact:nn { \int_value:w ##3 } { ##2 }
5760         \fi:
5761     }
5762     { 1 } { 0 } \c_false_bool
5763 }
5764 }
5765 }
```

(End of definition for `\_\_regex_compile_u_not_cs:..`)

### 46.3.13 Other

`\_\_regex_compile_K:` The `\K` control sequence is currently the only “command”, which performs some action, rather than matching something. It is allowed in the same contexts as `\b`. At the compilation stage, we leave it as a single control sequence, defined later.

```

5766 \cs_new_protected:cpn { \_\_regex_compile_K: }
5767 {
5768     \int_compare:nNnTF \l_\_regex_mode_int = \c_\_regex_outer_mode_int
5769         { \tl_build_put_right:Nn \l_\_regex_build_tl { \_\_regex_command_K: } }
5770         { \_\_regex_compile_raw_error:N K }
5771 }
```

(End of definition for `\_\_regex_compile_K:..`)

### 46.3.14 Showing regexes

`\_\_regex_clean_bool:n` `\_\_regex_clean_int:n` `\_\_regex_clean_int_aux:N` `\_\_regex_clean_regex:n` `\_\_regex_clean_regex_loop:w` `\_\_regex_clean_branch:n` `\_\_regex_clean_branch_loop:n` `\_\_regex_clean_assertion:Nn` `\_\_regex_clean_class:NnnnN` `\_\_regex_clean_group:nnnN` `\_\_regex_clean_class:n` `\_\_regex_clean_class_loop:nnn` `\_\_regex_clean_exact_cs:n` `\_\_regex_clean_exact_cs:w` Before showing a regex we check that it is “clean” in the sense that it has the correct internal structure. We do this (in the implementation of `\regex_show:N` and `\regex_log:N`) by comparing it with a cleaned-up version of the same regex. Along the way we also need similar functions for other types: all `\_\_regex_clean_<type>:n` functions produce valid `<type>` tokens (bool, explicit integer, etc.) from arbitrary input, and the output coincides with the input if that was valid.

```

5772 \cs_new:Npn \_\_regex_clean_bool:n #1

5986 \tl_set:Nn \l__regex_internal_a_tl { \l__regex_build_tl }
5987 }

```

(End of definition for `\__regex_show:N`.)

`\__regex_show_char:n` Show a single character, together with its ascii representation if available. This could be

extended to beyond ascii. It is not ideal for parentheses themselves.

```
5988 \cs_new:Npn \__regex_show_char:n #1
5989 {
5990     \int_eval:n {#1}
5991     \int_compare:nT { 32 <= #1 <= 126 }
5992         { ~ ( \char_generate:nn {#1} {12} ) }
5993 }
```

(End of definition for `\__regex_show_char:n`.)

`\__regex_show_one:n` Every part of the final message go through this function, which adds one line to the output, with the appropriate prefix.

```
5994 \cs_new_protected:Npn \__regex_show_one:n #1
5995 {
5996     \int_incr:N \l__regex_show_lines_int
5997     \tl_build_put_right:Ne \l__regex_build_tl
5998     {
5999         \exp_not:N \iow_newline:
6000         \seq_map_function:NN \l__regex_show_prefix_seq \use:n
6001             #1
6002     }
6003 }
```

(End of definition for `\__regex_show_one:n`.)

`\__regex_show_push:n` `\__regex_show_pop:` Enter and exit levels of nesting. The `scope` function prints its first argument as an “introduction”, then performs its second argument in a deeper level of nesting.

```
5004 \cs_new_protected:Npn \__regex_show_push:n #1
5005     { \seq_put_right:Ne \l__regex_show_prefix_seq { #1 ~ } }
5006 \cs_new_protected:Npn \__regex_show_pop:
5007     { \seq_pop_right:NN \l__regex_show_prefix_seq \l__regex_internal_a_tl }
5008 \cs_new_protected:Npn \__regex_show_scope:nn #1#2
5009     {
5010         \__regex_show_one:n {#1}
5011         \__regex_show_push:n { ~ }
5012         #2
5013         \__regex_show_pop:
5014     }
```

(End of definition for `\__regex_show_push:n`, `\__regex_show_pop:`, and `\__regex_show_scope:nn`.)

`\__regex_show_group_aux:nnnn` We display all groups in the same way, simply adding a message, (no capture) or (resetting), to special groups. The odd `\use_ii:nn` avoids printing a spurious `+branch` for the first branch.

```
6015 \cs_new_protected:Npn \__regex_show_group_aux:nnnnN #1#2#3#4#5
6016 {
6017     \__regex_show_one:n { ,-group~begin #1 }
6018     \__regex_show_push:n { | }
6019     \use_ii:nn #2
6020     \__regex_show_pop:
6021     \__regex_show_one:n
6022         { '-group~end \__regex_msg_repeated:nnN {#3} {#4} #5 }
6023 }
```

(End of definition for `\__regex_show_group_aux:nnnnN`.)

```
\_regex_show_class:NnnN
```

I'm entirely unhappy about this function: I couldn't find a way to test if a class is a single test. Instead, collect the representation of the tests in the class. If that had more than one line, write `Match` or `Don't match` on its own line, with the repeating information if any. Then the various tests on lines of their own, and finally a line. Otherwise, we need to evaluate the representation of the tests again (since the prefix is incorrect). That's clunky, but not too expensive, since it's only one test.

```
6024 \cs_set:Npn \_regex_show_class:NnnN #1#2#3#4#5
6025 {
6026   \group_begin:

## 46.4 Building

### 46.4.1 Variables used while building

`\l__regex_min_state_int`  
`\l__regex_max_state_int`

The last state that was allocated is `\l__regex_max_state_int - 1`, so that `\l__regex_max_state_int` always points to a free state. The `min_state` variable is 1 to begin with, but gets shifted in nested calls to the matching code, namely in `\c{...}` constructions.

```

6081 \int_new:N \l__regex_min_state_int
6082 \int_set:Nn \l__regex_min_state_int { 1 }
6083 \int_new:N \l__regex_max_state_int
```

(End of definition for `\l__regex_min_state_int` and `\l__regex_max_state_int.`)

`\l__regex_left_state_int`  
`\l__regex_right_state_int`  
`\l__regex_left_state_seq`  
`\l__regex_right_state_seq`

Alternatives are implemented by branching from a `left` state into the various choices, then merging those into a `right` state. We store information about those states in two sequences. Those states are also used to implement group quantifiers. Most often, the left and right pointers only differ by 1.

```

6084 \int_new:N \l__regex_left_state_int
6085 \int_new:N \l__regex_right_state_int
6086 \seq_new:N \l__regex_left_state_seq
6087 \seq_new:N \l__regex_right_state_seq
```

(End of definition for `\l__regex_left_state_int` and others.)

`\l__regex_capturing_group_int`

`\l__regex_capturing_group_int` is the next ID number to be assigned to a capturing group. This starts at 0 for the group enclosing the full regular expression, and groups are counted in the order of their left parenthesis, except when encountering `resetting` groups.

```
6088 \int_new:N \l__regex_capturing_group_int
```

(End of definition for `\l__regex_capturing_group_int.`)

#### 46.4.2 Framework

This phase is about going from a compiled regex to an NFA. Each state of the NFA is stored in a `\toks`. The operations which can appear in the `\toks` are

- `\__regex_action_start_wildcard:N <boolean>` inserted at the start of the regular expression, where a `true <boolean>` makes it unanchored.
- `\__regex_action_success`: marks the exit state of the NFA.
- `\__regex_action_cost:n {<shift>}` is a transition from the current `<state>` to `<state> + <shift>`, which consumes the current character: the target state is saved and will be considered again when matching at the next position.
- `\__regex_action_free:n {<shift>}`, and `\__regex_action_free_group:n {<shift>}` are free transitions, which immediately perform the actions for the state `<state> + <shift>` of the NFA. They differ in how they detect and avoid infinite loops. For now, we just need to know that the `group` variant must be used for transitions back to the start of a group.
- `\__regex_action_submatch:nN {<group>} <key>` where the `<key>` is `<` or `>` for the beginning or end of group numbered `<group>`. This causes the current position in the query to be stored as the `<key>` submatch boundary.
- One of these actions, within a conditional.

We strive to preserve the following properties while building.

- The current capturing group is `capturing_group - 1`, and if a group opened now it would be labelled `capturing_group`.
- The last allocated state is `max_state - 1`, so `max_state` is a free state.
- The `left_state` points to a state to the left of the current group or of the last class.
- The `right_state` points to a newly created, empty state, with some transitions leading to it.
- The `left/right` sequences hold a list of the corresponding end-points of nested groups.

`\__regex_build:n` The `n`-type function first compiles its argument. Reset some variables. Allocate two states, and put a wildcard in state 0 (transitions to state 1 and 0 state). Then build the regex within a (capturing) group numbered 0 (current value of `capturing_group`). Finally, if the match reaches the last state, it is successful. A `false` boolean for argument `#1` for the auxiliaries will suppress the wildcard and make the match anchored: used for `\peek_regex:nTF` and similar.

```

6160     \int_incr:N \l\_regex_max_state_int
6161 }

```

(End of definition for `\_\_regex_case_build:n`, `\_\_regex_case_build_aux:Nn`, and `\_\_regex_case-build_loop:n`.)

`\_\_regex_build_for_cs:n` The matching code relies on some global intarray variables, but only uses a range of their entries. Specifically,

- `\g\_regex_state_active_intarray` from `\l\_regex_min_state_int` to `\l\_regex_max_state_int`;

Here, in this nested call to the matching code, we need the new versions of this range to involve completely new entries of the intarray variables, so we begin by setting (the new) `\l\_regex_min_state_int` to (the old) `\l\_regex_max_state_int` to use higher entries.

When using a regex to match a cs, we don't insert a wildcard, we anchor at the end, and since we ignore submatches, there is no need to surround the expression with a group. However, for branches to work properly at the outer level, we need to put the appropriate left and right states in their sequence.

```

6162 \cs_new_protected:Npn \_\_regex_build_for_cs:n #1
6163 {
6164     \int_set_eq:NN \l\_regex_min_state_int \l\_regex_max_state_int
6165     \_\_regex_build_new_state:
6166     \_\_regex_build_new_state:
6167     \_\_regex_push_lr_states:
6168         #1
6169     \_\_regex_pop_lr_states:
6170     \_\_regex_toks_put_right:Nn \l\_regex_right_state_int
6171         {
6172             \if_int_compare:w -2 = \l\_regex_curr_char_int

```

```

6173           \exp_after:wN \__regex_action_success:
6174       \fi:
6175   }
6176 }
```

(End of definition for `\__regex_build_for_cs:n`.)

#### 46.4.3 Helpers for building an nfa

`\__regex_push_lr_states:` When building the regular expression, we keep track of pointers to the left-end and right-end of each group without help from TeX's grouping.

```

6177 \cs_new_protected:Npn \__regex_push_lr_states:
6178 {
6179     \seq_push:No \l__regex_left_state_seq
6180     { \int_use:N \l__regex_left_state_int }
6181     \seq_push:No \l__regex_right_state_seq
6182     { \int_use:N \l__regex_right_state_int }
6183 }
6184 \cs_new_protected:Npn \__regex_pop_lr_states:
6185 {
6186     \seq_pop:NN \l__regex_left_state_seq \l__regex_internal_a_tl
6187     \int_set:Nn \l__regex_left_state_int \l__regex_internal_a_tl
6188     \seq_pop:NN \l__regex_right_state_seq \l__regex_internal_a_tl
6189     \int_set:Nn \l__regex_right_state_int \l__regex_internal_a_tl
6190 }
```

(End of definition for `\__regex_push_lr_states:` and `\__regex_pop_lr_states:..`)

`\__regex_build_transition_left:NNN`  
`\__regex_build_transition_right:nNn` Add a transition from #2 to #3 using the function #1. The `left` function is used for higher priority transitions, and the `right` function for lower priority transitions (which should be performed later). The signatures differ to reflect the differing usage later on. Both functions could be optimized.

```

6191 \cs_new_protected:Npn \__regex_build_transition_left:NNN #1#2#3
6192     { \__regex_toks_put_left:Ne #2 { #1 { \tex_the:D \__regex_int_eval:w #3 - #2 } } }
6193 \cs_new_protected:Npn \__regex_build_transition_right:nNn #1#2#3
6194     { \__regex_toks_put_right:Ne #2 { #1 { \tex_the:D \__regex_int_eval:w #3 - #2 } } }
```

(End of definition for `\__regex_build_transition_left:NNN` and `\__regex_build_transition_right:nNn`.)

`\__regex_build_new_state:` Add a new empty state to the NFA. Then update the `left`, `right`, and `max` states, so that the `right` state is the new empty state, and the `left` state points to the previously “current” state.

```

6195 \cs_new_protected:Npn \__regex_build_new_state:
6196 {
6197     \__regex_toks_clear:N \l__regex_max_state_int
6198     \int_set_eq:NN \l__regex_left_state_int \l__regex_right_state_int
6199     \int_set_eq:NN \l__regex_right_state_int \l__regex_max_state_int
6200     \int_incr:N \l__regex_max_state_int
6201 }
```

(End of definition for `\__regex_build_new_state:..`)

```
\_\_regex\_build\_transitions_lazyness>NNNNN
```

This function creates a new state, and puts two transitions starting from the old current state. The order of the transitions is controlled by #1, true for lazy quantifiers, and false for greedy quantifiers.

```
6202 \cs_new_protected:Npn \_\_regex_build_transitions_lazyness:NNNNN #1#2#3#4#5
6203 {
6204     \_\_regex_build_new_state:
6205     \_\_regex_toks_put_right:Ne \l_\_regex_left_state_int
6206     {
6207         \if_meaning:w \c_true_bool #1
6208             #2 { \tex_the:D \_\_regex_int_eval:w #3 - \l_\_regex_left_state_int }
6209             #4 { \tex_the:D \_\_regex_int_eval:w #5 - \l_\_regex_left_state_int }
6210         \else:
6211             #4 { \tex_the:D \_\_regex_int_eval:w #5 - \l_\_regex_left_state_int }
6212             #2 { \tex_the:D \_\_regex_int_eval:w #3 - \l_\_regex_left_state_int }
6213         \fi:
6214     }
6215 }
```

(End of definition for \\_\\_regex\_build\_transitions\_lazyness:NNNNN.)

#### 46.4.4 Building classes

```
\_\_regex_class:NnnnN
```

The arguments are:  $\langle\text{boolean}\rangle \{\langle\text{tests}\rangle\} \{\langle\text{min}\rangle\} \{\langle\text{more}\rangle\} \langle\text{lazyness}\rangle$ . First store the tests with a trailing \\_\\_regex\_action\_cost:n, in the true branch of \\_\\_regex\_break\_point:TF for positive classes, or the false branch for negative classes. The integer  $\langle\text{more}\rangle$  is 0 for fixed repetitions, -1 for unbounded repetitions, and  $\langle\text{max}\rangle - \langle\text{min}\rangle$  for a range of repetitions.

```
6216 \cs_new_protected:Npn \_\_regex_class:NnnnN #1#2#3#4#5
6217 {
6218     \cs_set:Npe \_\_regex_tests_action_cost:n ##1
6219     {
6220         \exp_not:n { \exp_not:n {#2} }
6221         \bool_if:NTF #1
6222             { \_\_regex_break_point:TF { \_\_regex_action_cost:n {##1} } { } }
6223             { \_\_regex_break_point:TF { } { \_\_regex_action_cost:n {##1} } }
6224     }
6225     \if_case:w - #4 \exp_stop_f:
6226         \_\_regex_class_repeat:n {#3}
6227     \or: \_\_regex_class_repeat:nN {#3} #5
6228     \else: \_\_regex_class_repeat:nnN {#3} {#4} #5
6229     \fi:
6230 }
6231 \cs_new:Npn \_\_regex_tests_action_cost:n { \_\_regex_action_cost:n }
```

(End of definition for \\_\\_regex\_class:NnnnN and \\_\\_regex\_tests\_action\_cost:n.)

```
\_\_regex_class_repeat:n
```

This is used for a fixed number of repetitions. Build one state for each repetition, with a transition controlled by the tests that we have collected. That works just fine for #1 = 0 repetitions: nothing is built.

```
6232 \cs_new_protected:Npn \_\_regex_class_repeat:n #1
6233 {
6234     \prg_replicate:nn {#1}
6235 }
```

```

6236     \_\_regex\_build\_new\_state:
6237     \_\_regex\_build\_transition\_right:nNn \_\_regex\_tests\_action\_cost:n
6238         \l\_\_regex\_left\_state\_int \l\_\_regex\_right\_state\_int
6239     }
6240 }

```

(End of definition for `\_\_regex\_class\_repeat:n.`)

`\_\_regex\_class\_repeat:nN`

This implements unbounded repetitions of a single class (*e.g.* the \* and + quantifiers). If the minimum number #1 of repetitions is 0, then build a transition from the current state to itself governed by the tests, and a free transition to a new state (hence skipping the tests). Otherwise, call `\_\_regex\_class\_repeat:n` for the code to match #1 repetitions, and add free transitions from the last state to the previous one, and to a new one. In both cases, the order of transitions is controlled by the lazyness boolean #2.

```

6241 \cs_new_protected:Npn \_\_regex\_class\_repeat:nN #1#2
6242 {
6243     \if_int_compare:w #1 = \c_zero_int
6244         \_\_regex\_build\_transitions\_lazyness:NNNNN #2
6245         \_\_regex\_action\_free:n \l\_\_regex\_right\_state\_int
6246         \_\_regex\_tests\_action\_cost:n \l\_\_regex\_left\_state\_int
6247     \else:
6248         \_\_regex\_class\_repeat:n {#1}
6249         \int_set_eq:NN \l\_\_regex\_internal_a_int \l\_\_regex\_left\_state\_int
6250         \_\_regex\_build\_transitions\_lazyness:NNNNN #2
6251         \_\_regex\_action\_free:n \l\_\_regex\_right\_state\_int
6252         \_\_regex\_action\_free:n \l\_\_regex\_internal_a_int
6253     \fi:
6254 }

```

(End of definition for `\_\_regex\_class\_repeat:nN.`)

`\_\_regex\_class\_repeat:nnN`

We want to build the code to match from #1 to #1 + #2 repetitions. Match #1 repetitions (can be 0). Compute the final state of the next construction as a. Build #2 > 0 states, each with a transition to the next state governed by the tests, and a transition to the final state a. The computation of a is safe because states are allocated in order, starting from `max_state`.

```

6255 \cs_new_protected:Npn \_\_regex\_class\_repeat:nnN #1#2#3
6256 {
6257     \_\_regex\_class\_repeat:n {#1}
6258     \int_set:Nn \l\_\_regex\_internal_a_int
6259         { \l\_\_regex\_max\_state\_int + #2 - \c_one_int }
6260     \prg_replicate:nn { #2 }
6261     {
6262         \_\_regex\_build\_transitions\_lazyness:NNNNN #3
6263         \_\_regex\_action\_free:n \l\_\_regex\_internal_a_int
6264         \_\_regex\_tests\_action\_cost:n \l\_\_regex\_right\_state\_int
6265     }
6266 }

```

(End of definition for `\_\_regex\_class\_repeat:nnN.`)

#### 46.4.5 Building groups

\\_\\_regex\\_group\\_aux:nnnnN

Arguments: {*label*} {*contents*} {*min*} {*more*} {*lazyness*}. If *min* is 0, we need to add a state before building the group, so that the thread which skips the group does not also set the start-point of the submatch. After adding one more state, the **left\_state** is the left end of the group, from which all branches stem, and the **right\_state** is the right end of the group, and all branches end their course in that state. We store those two integers to be queried for each branch, we build the NFA states for the contents #2 of the group, and we forget about the two integers. Once this is done, perform the repetition: either exactly #3 times, or #3 or more times, or between #3 and #3 + #4 times, with lazyness #5. The *label* #1 is used for submatch tracking. Each of the three auxiliaries expects **left\_state** and **right\_state** to be set properly.

```

6267 \cs_new_protected:Npn \_\_regex_group_aux:nnnnN #1#2#3#4#5
6268 {
6269   \if_int_compare:w #3 = \c_zero_int
6270     \_\_regex_build_new_state:
6271     \_\_regex_build_transition_right:nNn \_\_regex_action_free_group:n
6272       \l_\_regex_left_state_int \l_\_regex_right_state_int
6273   \fi:
6274   \_\_regex_build_new_state:
6275   \_\_regex_push_lr_states:
6276     #2
6277   \_\_regex_pop_lr_states:
6278   \if_case:w - #4 \exp_stop_f:
6279     \_\_regex_group_repeat:nn {#1} {#3}
6280   \or: \_\_regex_group_repeat:nnN {#1} {#3} #5
6281   \else: \_\_regex_group_repeat:nnnN {#1} {#3} {#4} #5
6282   \fi:
6283 }
```

(End of definition for \\_\\_regex\_group\_aux:nnnnN.)

\\_\\_regex\_group:nnN

Hand to \\_\\_regex\_group\_aux:nnnnN the label of that group (expanded), and the group itself, with some extra commands to perform.

```

6284 \cs_new_protected:Npn \_\_regex_group:nnN #1
6285 {
6286   \exp_args:No \_\_regex_group_aux:nnnnN
6287   { \int_use:N \l_\_regex_capturing_group_int }
6288   {
6289     \int_incr:N \l_\_regex_capturing_group_int
6290     #1
6291   }
6292 }
6293 \cs_new_protected:Npn \_\_regex_group_no_capture:nnN
6294 { \_\_regex_group_aux:nnnnN { -1 } }
```

(End of definition for \\_\\_regex\_group:nnN and \\_\\_regex\_group\_no\_capture:nnN.)

\\_\\_regex\_group\_resetting:nnN  
\\_\\_regex\_group\_resetting\_loop:nnN

Again, hand the label *-1* to \\_\\_regex\_group\_aux:nnnnN, but this time we work a little bit harder to keep track of the maximum group label at the end of any branch, and to reset the group number at each branch. This relies on the fact that a compiled regex always is a sequence of items of the form \\_\\_regex\_branch:n {*branch*}.

```
6295 \cs_new_protected:Npn \_\_regex_group_resetting:nnN #1
```

```

6296  {
6297      \_\_regex\_group\_aux:nnnnN { -1 }
6298      {
6299          \exp\_args:Noo \_\_regex\_group\_resetting\_loop:nnNn
6300          { \int\_use:N \l\_\_regex\_capturing\_group\_int }
6301          { \int\_use:N \l\_\_regex\_capturing\_group\_int }
6302          #1
6303          { ?? \prg\_break:n } { }
6304          \prg\_break\_point:
6305      }
6306  }
6307 \cs\_new\_protected:Npn \_\_regex\_group\_resetting\_loop:nnNn #1#2#3#4
6308  {
6309      \use\_none:nn #3 { \int\_set:Nn \l\_\_regex\_capturing\_group\_int {#1} }
6310      \int\_set:Nn \l\_\_regex\_capturing\_group\_int {#2}
6311      #3 {#4}
6312      \exp\_args:Ne \_\_regex\_group\_resetting\_loop:nnNn
6313      { \int\_max:nn {#1} \l\_\_regex\_capturing\_group\_int }
6314      {#2}
6315  }

```

(End of definition for `\_\_regex\_group\_resetting:nnN` and `\_\_regex\_group\_resetting\_loop:nnNn`.)

`\_\_regex\_branch:n` Add a free transition from the left state of the current group to a brand new state, starting point of this branch. Once the branch is built, add a transition from its last state to the right state of the group. The left and right states of the group are extracted from the relevant sequences.

```

6316 \cs\_new\_protected:Npn \_\_regex\_branch:n #1
6317  {
6318      \_\_regex\_build\_new\_state:
6319      \seq\_get:NN \l\_\_regex\_left\_state\_seq \l\_\_regex\_internal\_a\_tl
6320      \int\_set:Nn \l\_\_regex\_left\_state\_int \l\_\_regex\_internal\_a\_tl
6321      \_\_regex\_build\_transition\_right:nNn \_\_regex\_action\_free:
6322          \l\_\_regex\_left\_state\_int \l\_\_regex\_right\_state\_int
6323          #1
6324      \seq\_get:NN \l\_\_regex\_right\_state\_seq \l\_\_regex\_internal\_a\_tl
6325      \_\_regex\_build\_transition\_right:nNn \_\_regex\_action\_free:
6326          \l\_\_regex\_right\_state\_int \l\_\_regex\_internal\_a\_tl
6327  }

```

(End of definition for `\_\_regex\_branch:n`.)

`\_\_regex\_group\_repeat:nn` This function is called to repeat a group a fixed number of times `#2`; if this is 0 we remove the group altogether (but don't reset the `\_\_regex\_capturing\_group` label). Otherwise, the auxiliary `\_\_regex\_group\_repeat\_aux:n` copies `#2` times the `\toks` for the group, and leaves `internal_a` pointing to the left end of the last repetition. We only record the submatch information at the last repetition. Finally, add a state at the end (the transition to it has been taken care of by the replicating auxiliary).

```

6328 \cs\_new\_protected:Npn \_\_regex\_group\_repeat:nn #1#2
6329  {
6330      \if\_int\_compare:w #2 = \c\_zero\_int
6331          \int\_set:Nn \l\_\_regex\_max\_state\_int
6332              { \l\_\_regex\_left\_state\_int - \c\_one\_int }
6333      \_\_regex\_build\_new\_state:

```

```

6334     \else:
6335         \_\_regex\_group\_repeat\_aux:n {#2}
6336         \_\_regex\_group\_submatches:nNN {#1}
6337             \l\_\_regex\_internal\_a\_int \l\_\_regex\_right\_state\_int
6338             \_\_regex\_build\_new\_state:
6339     \fi:
6340 }

```

(End of definition for `\_\_regex\_group\_repeat:nn`.)

`\_\_regex\_group\_submatches:nNN`

This inserts in states #2 and #3 the code for tracking submatches of the group #1, unless inhibited by a label of -1.

```

6341 \cs_new_protected:Npn \_\_regex_group_submatches:nNN #1#2#3
6342 {
6343     \if_int_compare:w #1 > - \c_one_int
6344         \_\_regex_toks_put_left:Ne #2 { \_\_regex_action_submatch:nN {#1} < }
6345         \_\_regex_toks_put_left:Ne #3 { \_\_regex_action_submatch:nN {#1} > }
6346     \fi:
6347 }

```

(End of definition for `\_\_regex_group_submatches:nNN`.)

`\_\_regex_group_repeat_aux:n`

Here we repeat `\toks` ranging from `left_state` to `max_state`,  $#1 > 0$  times. First add a transition so that the copies “chain” properly. Compute the shift `c` between the original copy and the last copy we want. Shift the `right_state` and `max_state` to their final values. We then want to perform `c` copy operations. At the end, `b` is equal to the `max_state`, and `a` points to the left of the last copy of the group.

```

6348 \cs_new_protected:Npn \_\_regex_group_repeat_aux:n #1
6349 {
6350     \_\_regex_build_transition_right:nNn \_\_regex_action_free:n
6351         \l\_\_regex_right_state_int \l\_\_regex_max_state_int
6352         \int_set_eq:NN \l\_\_regex_internal_a_int \l\_\_regex_left_state_int
6353         \int_set_eq:NN \l\_\_regex_internal_b_int \l\_\_regex_max_state_int
6354         \if_int_compare:w \_\_regex_int_eval:w #1 > \c_one_int
6355             \int_set:Nn \l\_\_regex_internal_c_int
6356                 {
6357                     ( #1 - \c_one_int )
6358                     * ( \l\_\_regex_internal_b_int - \l\_\_regex_internal_a_int )
6359                 }
6360             \int_add:Nn \l\_\_regex_right_state_int \l\_\_regex_internal_c_int
6361             \int_add:Nn \l\_\_regex_max_state_int \l\_\_regex_internal_c_int
6362             \_\_regex_toks_memcpy:NNn
6363                 \l\_\_regex_internal_b_int
6364                 \l\_\_regex_internal_a_int
6365                 \l\_\_regex_internal_c_int
6366         \fi:
6367 }

```

(End of definition for `\_\_regex_group_repeat_aux:n`.)

`\_\_regex_group_repeat:nnN`

This function is called to repeat a group at least  $n$  times; the case  $n = 0$  is very different from  $n > 0$ . Assume first that  $n = 0$ . Insert submatch tracking information at the start and end of the group, add a free transition from the right end to the “true” left state `a`.

(remember: in this case we had added an extra state before the left state). This forms the loop, which we break away from by adding a free transition from `a` to a new state.

Now consider the case  $n > 0$ . Repeat the group  $n$  times, chaining various copies with a free transition. Add submatch tracking only to the last copy, then add a free transition from the right end back to the left end of the last copy, either before or after the transition to move on towards the rest of the NFA. This transition can end up before submatch tracking, but that is irrelevant since it only does so when going again through the group, recording new matches. Finally, add a state; we already have a transition pointing to it from `\_regex_group_repeat_aux:n`.

```

6368 \cs_new_protected:Npn \_regex_group_repeat:nnN #1#2#3
6369 {
6370     \if_int_compare:w #2 = \c_zero_int

`\_regex_group_repeat:nnnN`

We wish to repeat the group between `#2` and  $\#2 + \#3$  times, with a laziness controlled by `#4`. We insert submatch tracking up front: in principle, we could avoid recording submatches for the first `#2` copies of the group, but that forces us to treat specially the case  $\#2 = 0$ . Repeat that group with submatch tracking  $\#2 + \#3$  times (the maximum number of repetitions). Then our goal is to add `#3` transitions from the end of the `#2`-th group, and each subsequent groups, to the end. For a lazy quantifier, we add those transitions to the left states, before submatch tracking. For the greedy case, we add the transitions to the right states, after submatch tracking and the transitions which go on with more repetitions. In the greedy case with  $\#2 = 0$ , the transition which skips over all

copies of the group must be added separately, because its starting state does not follow the normal pattern: we had to add it “by hand” earlier.

#### 46.4.6 Others

`\__regex_assertion:Nn` Usage: `\__regex_assertion:Nn ⟨boolean⟩ {⟨test⟩}`, where the `⟨test⟩` is either of the two other functions. Add a free transition to a new state, conditionally to the assertion test. The `\__regex_b_test:` test is used by the `\b` and `\B` escape: check if the last character was a word character or not, and do the same to the current character. The boundary-markers of the string are non-word characters for this purpose.

```

6433 \cs_new_protected:Npn \__regex_assertion:Nn #1#2
6434 {
6435     \__regex_build_new_state:
6436     \__regex_toks_put_right:Ne \l__regex_left_state_int
6437     {

6491     }
6492 }
```

(End of definition for `\_regex_command_K:.`)

## 46.5 Matching

We search for matches by running all the execution threads through the NFA in parallel, reading one token of the query at each step. The NFA contains “free” transitions to other states, and transitions which “consume” the current token. For free transitions, the instruction at the new state of the NFA is performed immediately. When a transition consumes a character, the new state is appended to a list of “active states”, stored in `\g__regex_thread_info_intarray` (together with submatch information): this thread is made active again when the next token is read from the query. At every step (for each token in the query), we unpack that list of active states and the corresponding submatch props, and empty those.

If two paths through the NFA “collide” in the sense that they reach the same state after reading a given token, then they only differ in how they previously matched, and any future execution would be identical for both. (Note that this would be wrong in the presence of back-references.) Hence, we only need to keep one of the two threads: the thread with the highest priority. Our NFA is built in such a way that higher priority actions always come before lower priority actions, which makes things work.

The explanation in the previous paragraph may make us think that we simply need to keep track of which states were visited at a given step: after all, the loop generated when matching `(a?)*` against `a` is broken, isn’t it? No. The group first matches `a`, as it should, then repeats; it attempts to match `a` again but fails; it skips `a`, and finds out that this state has already been seen at this position in the query: the match stops. The capturing group is (wrongly) `a`. What went wrong is that a thread collided with itself, and the later version, which has gone through the group one more times with an empty match, should have a higher priority than not going through the group.

We solve this by distinguishing “normal” free transitions `\_regex_action_free:n` from transitions `\_regex_action_free_group:n` which go back to the start of the group. The former keeps threads unless they have been visited by a “completed” thread, while the latter kind of transition also prevents going back to a state visited by the current thread.

### 46.5.1 Variables used when matching

The tokens in the query are indexed from `min_pos` for the first to `max_pos - 1` for the last, and their information is stored in several arrays and `\toks` registers with those numbers. We match without backtracking, keeping all threads in lockstep at the `curr_pos` in the query. The starting point of the current match attempt is `start_pos`, and `success_pos`, updated whenever a thread succeeds, is used as the next starting position.

```

6493 \int_new:N \l__regex_min_pos_int
6494 \int_new:N \l__regex_max_pos_int
6495 \int_new:N \l__regex_curr_pos_int
6496 \int_new:N \l__regex_start_pos_int
6497 \int_new:N \l__regex_success_pos_int
```

(End of definition for `\l__regex_min_pos_int` and others.)

```
\l__regex_curr_char_int
\l__regex_curr_catcode_int
\l__regex_curr_token_tl
\l__regex_last_char_int
\l__regex_last_char_success_int
\l__regex_case_changed_char_int
```

The character and category codes of the token at the current position and a token list expanding to that token; the character code of the token at the previous position; the character code of the token just before a successful match; and the character code of the result of changing the case of the current token ( $A-Z \leftrightarrow a-z$ ). This last integer is only computed when necessary, and is otherwise `\c_max_int`. The `curr_char` variable is also used in various other phases to hold a character code.

```
6498 \int_new:N \l__regex_curr_char_int
6499 \int_new:N \l__regex_curr_catcode_int
6500 \tl_new:N \l__regex_curr_token_tl
6501 \int_new:N \l__regex_last_char_int
6502 \int_new:N \l__regex_last_char_success_int
6503 \int_new:N \l__regex_case_changed_char_int
```

(End of definition for `\l__regex_curr_char_int` and others.)

```
\l__regex_curr_state_int
```

For every character in the token list, each of the active states is considered in turn. The variable `\l__regex_curr_state_int` holds the state of the NFA which is currently considered: transitions are then given as shifts relative to the current state.

```
6504 \int_new:N \l__regex_curr_state_int
```

(End of definition for `\l__regex_curr_state_int`.)

```
\l__regex_curr_submatches_tl
\l__regex_success_submatches_tl
```

The submatches for the thread which is currently active are stored in the `curr_submatches` list, which is almost a comma list, but ends with a comma. This list is stored by `\__regex_store_state:n` into an intarray variable, to be retrieved when matching at the next position. When a thread succeeds, this list is copied to `\l__regex_success_submatches_tl`: only the last successful thread remains there.

```
6505 \tl_new:N \l__regex_curr_submatches_tl
6506 \tl_new:N \l__regex_success_submatches_tl
```

(End of definition for `\l__regex_curr_submatches_tl` and `\l__regex_success_submatches_tl`.)

```
\l__regex_step_int
```

This integer, always even, is increased every time a character in the query is read, and not reset when doing multiple matches. We store in `\g__regex_state_active_intarray` the last step in which each `\langle state \rangle` in the NFA was encountered. This lets us break infinite loops by not visiting the same state twice in the same step. In fact, the step we store is equal to `step` when we have started performing the operations of `\toks(state)`, but not finished yet. However, once we finish, we store `step + 1` in `\g__regex_state_active_intarray`. This is needed to track submatches properly (see building phase). The `step` is also used to attach each set of submatch information to a given iteration (and automatically discard it when it corresponds to a past step).

```
6507 \int_new:N \l__regex_step_int
```

(End of definition for `\l__regex_step_int`.)

```
\l__regex_min_thread_int
\l__regex_max_thread_int
```

All the currently active threads are kept in order of precedence in `\g__regex_thread_info_intarray` together with the corresponding submatch information. Data in this intarray is organized as blocks from `min_thread` (included) to `max_thread` (excluded). At the start of every step, the whole array is unpacked, so that the space can immediately be reused, and `max_thread` is reset to `min_thread`, effectively clearing the array.

```
6508 \int_new:N \l__regex_min_thread_int
6509 \int_new:N \l__regex_max_thread_int
```

(End of definition for `\l__regex_min_thread_int` and `\l__regex_max_thread_int`.)

`\g__regex_state_active_intarray` stores the last `<step>` in which each `<state>` was active. `\g__regex_thread_info_intarray` stores threads to be considered in the next step, more precisely the states in which these threads are.

```
6510 \intarray_new:Nn \g__regex_state_active_intarray { 65536 }
6511 \intarray_new:Nn \g__regex_thread_info_intarray { 65536 }
```

(End of definition for `\g__regex_state_active_intarray` and `\g__regex_thread_info_intarray`.)

`\l__regex_matched_analysis_tl` and `\l__regex_curr_analysis_tl` The list `\l__regex_curr_analysis_tl` consists of a brace group containing three brace groups corresponding to the current token, with the same syntax as `\tl_analysis_map_inline:nn`. The list `\l__regex_matched_analysis_tl` (constructed under the `tl-build` machinery) has one item for each token that has already been treated so far in a given match attempt: each item consists of three brace groups with the same syntax as `\tl_analysis_map_inline:nn`.

```
6512 \tl_new:N \l__regex_matched_analysis_tl
6513 \tl_new:N \l__regex_curr_analysis_tl
```

(End of definition for `\l__regex_matched_analysis_tl` and `\l__regex_curr_analysis_tl`.)

`\l__regex_every_match_tl` Every time a match is found, this token list is used. For single matching, the token list is empty. For multiple matching, the token list is set to repeat the matching, after performing some operation which depends on the user function. See `\_regex_single_match:` and `\_regex_multi_match:n`.

```
6514 \tl_new:N \l__regex_every_match_tl
```

(End of definition for `\l__regex_every_match_tl`.)

`\l__regex_fresh_thread_bool`, `\l__regex_empty_success_bool` and `\_regex_if_two_empty_matches:F` When doing multiple matches, we need to avoid infinite loops where each iteration matches the same empty token list. When an empty token list is matched, the next successful match of the same empty token list is suppressed. We detect empty matches by setting `\l__regex_fresh_thread_bool` to `true` for threads which directly come from the start of the regex or from the `\K` command, and testing that boolean whenever a thread succeeds. The function `\_regex_if_two_empty_matches:F` is redefined at every match attempt, depending on whether the previous match was empty or not: if it was, then the function must cancel a purported success if it is empty and at the same spot as the previous match; otherwise, we definitely don't have two identical empty matches, so the function is `\use:n`.

```
6515 \bool_new:N \l__regex_fresh_thread_bool
6516 \bool_new:N \l__regex_empty_success_bool
6517 \cs_new_eq:NN \_regex_if_two_empty_matches:F \use:n
```

(End of definition for `\l__regex_fresh_thread_bool`, `\l__regex_empty_success_bool`, and `\_regex_if_two_empty_matches:F`.)

`\g__regex_success_bool`, `\l__regex_saved_success_bool` and `\l__regex_match_success_bool` The boolean `\l__regex_match_success_bool` is true if the current match attempt was successful, and `\g__regex_success_bool` is true if there was at least one successful match. This is the only global variable in this whole module, but we would need it to be local when matching a control sequence with `\c{...}`. This is done by saving the global variable into `\l__regex_saved_success_bool`, which is local, hence not affected by the changes due to inner regex functions.

```
6518 \bool_new:N \g__regex_success_bool
6519 \bool_new:N \l__regex_saved_success_bool
6520 \bool_new:N \l__regex_match_success_bool
```

(End of definition for `\g__regex_success_bool`, `\l__regex_saved_success_bool`, and `\l__regex_match_success_bool`.)

#### 46.5.2 Matching: framework

`\__regex_match:n` Initialize the variables that should be set once for each user function (even for multiple matches). Namely, the overall matching is not yet successful; none of the states should be marked as visited (`\g__regex_state_active_intarray`), and we start at step 0; we pretend that there was a previous match ending at the start of the query, which was not empty (to avoid smothering an empty match at the start). Once all this is set up, we are ready for the ride. Find the first match.

6562 }
```

(End of definition for `\_regex_match:n`, `\_regex_match_cs:n`, and `\_regex_match_init:..`)

`\_regex_match_once_init:` This function resets various variables used when finding one match. It is called before the loop through characters, and every time we find a match, before searching for another match (this is controlled by the `every_match` token list).

First initialize some variables: set the conditional which detects identical empty matches; this match attempt starts at the previous `success_pos`, is not yet successful, and has no submatches yet; clear the array of active threads, and put the starting state 0 in it. We are then almost ready to read our first token in the query, but we actually start one position earlier than the start because `\_regex_match_one_token:nnN` increments `\l_regex_curr_pos_int` and saves `\l_regex_curr_char_int` as the `last_char` so that word boundaries can be correctly identified.

```
6563 \cs_new_protected:Npn \_regex_match_once_init:
6564 {
6565     \if_meaning:w \c_true_bool \l_regex_empty_success_bool

6614     }
6615 }

```

(End of definition for `\__regex_single_match:` and `\__regex_multi_match:n`.)

`\__regex_match_one_token:nnN`  
`\__regex_match_one_active:n`

At each new position, set some variables and get the new character and category from the query. Then unpack the array of active threads, and clear it by resetting its length (`max_thread`). This results in a sequence of `\__regex_use_state_and_submatches:w`  $\langle state \rangle, \langle submatch-clist \rangle$ ; and we consider those states one by one in order. As soon as a thread succeeds, exit the step, and, if there are threads to consider at the next position, and we have not reached the end of the string, repeat the loop. Otherwise, the last thread that succeeded is the match. We explain the `fresh_thread` business when describing `\__regex_action_wildcard::`.

```

6653  }

```

(End of definition for `\__regex_match_one_token:nnN` and `\__regex_match_one_active:n`.)

#### 46.5.3 Using states of the nfa

`\__regex_use_state:` Use the current NFA instruction. The state is initially marked as belonging to the current `step`: this allows normal free transition to repeat, but group-repeating transitions won't. Once we are done exploring all the branches it spawned, the state is marked as `step + 1`: any thread hitting it at that point will be terminated.

```

6654 \cs_new_protected:Npn \__regex_use_state:
6655  {
6656      \__kernel_intarray_gset:Nnn \g__regex_state_active_intarray
6657      \l__regex_curr_state_int \l__regex_step_int
6658      \__regex_toks_use:w \l__regex_curr_state_int
6659      \__kernel_intarray_gset:Nnn \g__regex_state_active_intarray
6660      \l__regex_curr_state_int
6661      { \__regex_int_eval:w \l__regex_step_int + \c_one_int \scan_stop: }
6662  }

```

(End of definition for `\__regex_use_state:..`)

`\__regex_use_state_and_submatches:w` This function is called as one item in the array of active threads after that array has been unpacked for a new step. Update the `curr_state` and `curr_submatches` and use the state if it has not yet been encountered at this step.

```

6663 \cs_new_protected:Npn \__regex_use_state_and_submatches:w #1 , #2 ;
6664  {
6665      \int_set:Nn \l__regex_curr_state_int {#1}
6666      \if_int_compare:w
6667          \__kernel_intarray_item:Nn \g__regex_state_active_intarray
6668          \l__regex_curr_state_int
6669          < \l__regex_step_int
6670          \tl_set:Nn \l__regex_curr_submatches_t1 { #2 , }
6671          \exp_after:wN \__regex_use_state:
6672      \fi:
6673      \scan_stop:
6674  }

```

(End of definition for `\__regex_use_state_and_submatches:w`.)

#### 46.5.4 Actions when matching

\\_regex\_action\_start\_wildcard:N

For an unanchored match, state 0 has a free transition to the next and a costly one to itself, to repeat at the next position. To catch repeated identical empty matches, we need to know if a successful thread corresponds to an empty match. The instruction resetting \l\_\_regex\_fresh\_thread\_bool may be skipped by a successful thread, hence we had to add it to \\_regex\_match\_one\_token:nnN too.

```

6675 \cs_new_protected:Npn \_regex_action_start_wildcard:N #1
6676 {
6677     \bool_set_true:N \l__regex_fresh_thread_bool
6678     \_regex_action_free:n {1}
6679     \bool_set_false:N \l__regex_fresh_thread_bool
6680     \bool_if:NT #1 { \_regex_action_cost:n {0} }
6681 }
```

(End of definition for \\_regex\_action\_start\_wildcard:N.)

\\_regex\_action\_free:n

\\_regex\_action\_free\_group:n

\\_regex\_action\_free\_aux:nn

These functions copy a thread after checking that the NFA state has not already been used at this position. If not, store submatches in the new state, and insert the instructions for that state in the input stream. Then restore the old value of \l\_\_regex\_curr\_state\_int and of the current submatches. The two types of free transitions differ by how they test that the state has not been encountered yet: the group version is stricter, and will not use a state if it was used earlier in the current thread, hence forcefully breaking the loop, while the “normal” version will revisit a state even within the thread itself.

```

6682 \cs_new_protected:Npn \_regex_action_free:
6683 {
6684     \_regex_action_free_aux:nn { > \l__regex_step_int \else: } }
6685 \cs_new_protected:Npn \_regex_action_free_group:n
6686 {
6687     \_regex_action_free_aux:nn { < \l__regex_step_int } }
6688 \cs_new_protected:Npn \_regex_action_free_aux:nn #1#2
6689 {
6690     \use:e
6691     {
6692         \int_add:Nn \l__regex_curr_state_int {#2}
6693         \exp_not:n
6694         {
6695             \if_int_compare:w
6696                 \_kernel_intarray_item:Nn \g__regex_state_active_intarray
6697                 \l__regex_curr_state_int
6698                 #1
6699                 \exp_after:wN \_regex_use_state:
6700             \fi:
6701         }
6702         \int_set:Nn \l__regex_curr_state_int
6703         {
6704             \int_use:N \l__regex_curr_state_int
6705             \tl_set:Nn \exp_not:N \l__regex_curr_submatches_tl
6706             {
6707                 \exp_not:o \l__regex_curr_submatches_tl
6708             }
6709         }
6710 }
```

(End of definition for \\_regex\_action\_free:n, \\_regex\_action\_free\_group:n, and \\_regex\_action\_free\_aux:nn.)

\\_regex\_action\_cost:n

A transition which consumes the current character and shifts the state by #1. The resulting state is stored in the appropriate array for use at the next position, and we also store the current submatches.

```

6706 \cs_new_protected:Npn \__regex_action_cost:n #1
6707  {
6708      \exp_args:No \__regex_store_state:n
6709      { \tex_the:D \__regex_int_eval:w \l__regex_curr_state_int + #1 }
6710  }

```

(End of definition for `\__regex_action_cost:n`.)

`\__regex_store_state:n`  
`\__regex_store_submatches:` Put the given state and current submatch information in `\g__regex_thread_info_intarray`, and increment the length of the array.

```

6711 \cs_new_protected:Npn \__regex_store_state:n #1
6712  {
6713      \exp_args:No \__regex_store_submatches:nn
6714      \l__regex_curr_submatches_tl {#1}
6715      \int_incr:N \l__regex_max_thread_int
6716  }
6717 \cs_new_protected:Npn \__regex_store_submatches:nn #1#2
6718  {
6719      \__kernel_intarray_gset_range_from_clist:Nnn
6720      \g__regex_thread_info_intarray
6721      {
6722          \__regex_int_eval:w
6723          \c_one_int + \l__regex_max_thread_int *
6724          (\l__regex_capturing_group_int * 2 + \c_one_int)
6725      }
6726      { #2 , #1 }
6727  }

```

(End of definition for `\__regex_store_state:n` and `\__regex_store_submatches:..`)

`\__regex_disable_submatches:` Some user functions don't require tracking submatches. We get a performance improvement by simply defining the relevant functions to remove their argument and do nothing with it.

```

6728 \cs_new_protected:Npn \__regex_disable_submatches:
6729  {
6730      \cs_set_protected:Npn \__regex_store_submatches:n ##1 { }
6731      \cs_set_protected:Npn \__regex_action_submatch:nN ##1##2 { }
6732  }

```

(End of definition for `\__regex_disable_submatches:..`)

`\__regex_action_submatch:nN`  
`\__regex_action_submatch_aux:w` Update the current submatches with the information from the current position. Maybe a bottleneck.

```

6733 \cs_new_protected:Npn \__regex_action_submatch:nN #1#2
6734  {
6735      \exp_after:wN \__regex_action_submatch_aux:w
6736      \l__regex_curr_submatches_tl ; {#1} #2
6737  }
6738 \cs_new_protected:Npn \__regex_action_submatch_aux:w #1 ; #2#3
6739  {
6740      \tl_set:Ne \l__regex_curr_submatches_tl
6741      {
6742          \prg_replicate:nn
6743          { #2 \if_meaning:w > #3 + \l__regex_capturing_group_int \fi: }

```

```

6744     { \_\_regex\_action\_submatch\_auxii:w }
6745     \_\_regex\_action\_submatch\_auxiii:w
6746     #1
6747   }
6748 }
6749 \cs_new:Npn \_\_regex\_action\_submatch\_auxii:w
6750   #1 \_\_regex\_action\_submatch\_auxiii:w #2 ,
6751   { #2 , #1 \_\_regex\_action\_submatch\_auxiii:w }
6752 \cs_new:Npn \_\_regex\_action\_submatch\_auxiii:w #1 ,
6753   { \int_use:N \l\_regex\_curr\_pos\_int , }

```

(End of definition for `\_\_regex\_action\_submatch:nN` and others.)

`\_\_regex\_action\_success:`: There is a successful match when an execution path reaches the last state in the NFA, unless this marks a second identical empty match. Then mark that there was a successful match; it is empty if it is “fresh”; and we store the current position and submatches. The current step is then interrupted with `\prg_break:`, and only paths with higher precedence are pursued further. The values stored here may be overwritten by a later success of a path with higher precedence.

```

6754 \cs_new_protected:Npn \_\_regex\_action\_success:
6755   {
6756     \_\_regex_if_two_empty_matches:F
6757     {
6758       \bool_set_true:N \l\_regex_match_success_bool
6759       \bool_set_eq:NN \l\_regex_empty_success_bool
6760         \l\_regex_fresh_thread_bool
6761       \int_set_eq:NN \l\_regex_success_pos_int \l\_regex_curr_pos_int
6762       \int_set_eq:NN \l\_regex_last_char_success_int \l\_regex_last_char_int
6763       \tl_build_begin:N \l\_regex_matched_analysis_tl
6764       \tl_set_eq:NN \l\_regex_success_submatches_tl
6765         \l\_regex_curr_submatches_tl
6766       \prg_break:
6767     }
6768   }

```

(End of definition for `\_\_regex\_action\_success:..`)

## 46.6 Replacement

### 46.6.1 Variables and helpers used in replacement

`\l\_regex_replacement_csnames_int`: The behaviour of closing braces inside a replacement text depends on whether a sequences `\c{` or `\u{` has been encountered. The number of “open” such sequences that should be closed by `}` is stored in `\l\_regex_replacement_csnames_int`, and decreased by 1 by each `..`.

```
6769 \int_new:N \l\_regex_replacement_csnames_int
```

(End of definition for `\l\_regex_replacement_csnames_int`.)

`\l\_regex_replacement_category_tl` `\l\_regex_replacement_category_seq`: This sequence of letters is used to correctly restore categories in nested constructions such as `\cL(abc\cD(..)d)`.

```

6770 \tl_new:N \l\_regex_replacement_category_tl
6771 \seq_new:N \l\_regex_replacement_category_seq

```

*(End of definition for \l\_\_regex\_replacement\_category\_t1 and \l\_\_regex\_replacement\_category-seq.)*

\g\_\_regex\_balance\_t1 This token list holds the replacement text for \\_\_regex\_replacement\_balance\_one-match:n while it is being built incrementally.

6772 \tl\_new:N \g\_\_regex\_balance\_t1

*(End of definition for \g\_\_regex\_balance\_t1.)*

\\_\_regex\_replacement\_balance\_one\_match:n This expects as an argument the first index of a set of entries in \g\_\_regex\_submatch\_begin\_intarray (and related arrays) which hold the submatch information for a given match. It can be used within an integer expression to obtain the brace balance incurred by performing the replacement on that match. This combines the braces lost by removing the match, braces added by all the submatches appearing in the replacement, and braces appearing explicitly in the replacement. Even though it is always redefined before use, we initialize it as for an empty replacement. An important property is that concatenating several calls to that function must result in a valid integer expression (hence a leading + in the actual definition).

6773 \cs\_new:Npn \\_\_regex\_replacement\_balance\_one\_match:n #1  
6774 { - \\_\_regex\_submatch\_balance:n {#1} }

*(End of definition for \\_\_regex\_replacement\_balance\_one\_match:n.)*

\\_\_regex\_replacement\_do\_one\_match:n The input is the same as \\_\_regex\_replacement\_balance\_one\_match:n. This function is redefined to expand to the part of the token list from the end of the previous match to a given match, followed by the replacement text. Hence concatenating the result of this function with all possible arguments (one call for each match), as well as the range from the end of the last match to the end of the string, produces the fully replaced token list. The initialization does not matter, but (as an example) we set it as for an empty replacement.

6775 \cs\_new:Npn \\_\_regex\_replacement\_do\_one\_match:n #1  
6776 {  
6777 \\_\_regex\_query\_range:nn  
6778 { \\_\_kernel\_intarray\_item:Nn \g\_\_regex\_submatch\_prev\_intarray {#1} }  
6779 { \\_\_kernel\_intarray\_item:Nn \g\_\_regex\_submatch\_begin\_intarray {#1} }  
6780 }

*(End of definition for \\_\_regex\_replacement\_do\_one\_match:n.)*

\\_\_regex\_replacement\_exp\_not:N This function lets us navigate around the fact that the primitive \exp\_not:n requires a braced argument. As far as I can tell, it is only needed if the user tries to include in the replacement text a control sequence set equal to a macro parameter character, such as \c\_parameter\_token. Indeed, within an e/x-expanding assignment, \exp\_not:N # behaves as a single #, whereas \exp\_not:n {#} behaves as a doubled ##.

6781 \cs\_new:Npn \\_\_regex\_replacement\_exp\_not:N #1 { \exp\_not:n {#1} }

*(End of definition for \\_\_regex\_replacement\_exp\_not:N.)*

\\_\_regex\_replacement\_exp\_not:V This is used for the implementation of \u, and it gets redefined for \peek\_regex\_replace\_once:nnTF.

6782 \cs\_new\_eq:NN \\_\_regex\_replacement\_exp\_not:V \exp\_not:V

*(End of definition for \\_\_regex\_replacement\_exp\_not:V.)*

### 46.6.2 Query and brace balance

`\__regex_query_range:nn`  
`\__regex_query_range_loop:ww`

When it is time to extract submatches from the token list, the various tokens are stored in `\toks` registers numbered from `\l__regex_min_pos_int` inclusive to `\l__regex_max_pos_int` exclusive. The function `\__regex_query_range:nn {<min>} {<max>}` unpacks registers from the position `<min>` to the position `<max> - 1` included. Once this is expanded, a second e-expansion results in the actual tokens from the query. That second expansion is only done by user functions at the very end of their operation, after checking (and correcting) the brace balance first.

```

6783 \cs_new:Npn \__regex_query_range:nn #1#2
6784 {
6785   \exp_after:wN \__regex_query_range_loop:ww
6786   \int_value:w \__regex_int_eval:w #1 \exp_after:wN ;
6787   \int_value:w \__regex_int_eval:w #2 ;
6788   \prg_break_point:
6789 }
6790 \cs_new:Npn \__regex_query_range_loop:ww #1 ; #2 ;
6791 {
6792   \if_int_compare:w #1 < #2 \exp_stop_f:
6793   \else:
6794     \prg_break:n
6795   \fi:
6796   \__regex_toks_use:w #1 \exp_stop_f:
6797   \exp_after:wN \__regex_query_range_loop:ww
6798   \int_value:w \__regex_int_eval:w #1 + \c_one_int ; #2 ;
6799 }
```

(End of definition for `\__regex_query_range:nn` and `\__regex_query_range:ww`.)

`\__regex_query_submatch:n` Find the start and end positions for a given submatch (of a given match).

```

6800 \cs_new:Npn \__regex_query_submatch:n #1
6801 {
6802   \__regex_query_range:nn
6803   { \__kernel_intarray_item:Nn \g__regex_submatch_begin_intarray {#1} }
6804   { \__kernel_intarray_item:Nn \g__regex_submatch_end_intarray {#1} }
6805 }
```

(End of definition for `\__regex_query_submatch:n`.)

`\__regex_submatch_balance:n` Every user function must result in a balanced token list (unbalanced token lists cannot be stored by TeX). When we unpacked the query, we kept track of the brace balance, hence the contribution from a given range is the difference between the brace balances at the `<max pos>` and `<min pos>`. These two positions are found in the corresponding “submatch” arrays.

```

6806 \cs_new_protected:Npn \__regex_submatch_balance:n #1
6807 {
6808   \tex_the:D \__regex_int_eval:w
6809   \__regex_intarray_item:NnF \g__regex_balance_intarray
6810   {
6811     \__kernel_intarray_item:Nn
6812     \g__regex_submatch_end_intarray {#1}
6813   }
6814   \c_zero_int
6815 }
```

```

6816   \_\_regex\_intarray\_item:NnF \g\_\_regex\_balance\_intarray
6817   {
6818     \_\_kernel\_intarray\_item:Nn
6819       \g\_\_regex\_submatch\_begin\_intarray {\#1}
6820     }
6821     \c\_zero\_int
6822   \scan\_stop:
6823 }
```

(End of definition for `\_\_regex\_submatch\_balance:n.`)

### 46.6.3 Framework

`\_\_regex\_replacement:n`  
`\_\_regex\_replacement:e`  
`\_\_regex\_replacement\_apply:Nn`  
`\_\_regex\_replacement\_set:n`

The replacement text is built incrementally. We keep track in `\l\_\_regex\_balance\_int` of the balance of explicit begin- and end-group tokens and we store in `\g\_\_regex\_balance\_tl` some code to compute the brace balance from submatches (see its description). Detect unescaped right braces, and escaped characters, with trailing `\prg\_do\_nothing`: because some of the later function look-ahead. Once the whole replacement text has been parsed, make sure that there is no open csname. Finally, define the `balance\_one\_match` and `do\_one\_match` functions.

```

6824 \cs\_new\_protected:Npn \_\_regex\_replacement:n
6825   { \_\_regex\_replacement\_apply:Nn \_\_regex\_replacement\_set:n }
6826 \cs\_new\_protected:Npn \_\_regex\_replacement\_apply:Nn #1#2

(End of definition for `\__regex_case_replacement:n`.)

`\__regex_replacement_put:n` This gets redefined for `\peek_regex_replace_once:nnTF`.

```

6916 \cs_new_protected:Npn \__regex_replacement_put:n
6917   { \tl_build_put_right:Nn \l__regex_build_tl }

```

(End of definition for `\__regex_replacement_put:n`.)

`\__regex_replacement_normal:n`  
`\__regex_replacement_normal_aux:N`

Most characters are simply sent to the output by `\tl_build_put_right:Nn`, unless a particular category code has been requested: then `\__regex_replacement_c_A:w` or a similar auxiliary is called. One exception is right parentheses, which restore the category code in place before the group started. Note that the sequence is non-empty there: it contains an empty entry corresponding to the initial value of `\l__regex_replacement_category_tl`. The argument `#1` is a single character (including the case of a catcode-other space). In case no specific catcode is requested, we take into account the current catcode regime (at the time the replacement is performed) as much as reasonable, with all impossible catcodes (escape, newline, etc.) being mapped to “other”.

```

6918 \cs_new_protected:Npn \__regex_replacement_normal:n #1
6919   {
6920     \int_compare:nNnTF \l__regex_replacement_cnames_int > \c_zero_int

6961 }
6962 ? #1
6963 }

```

(End of definition for `\_\_regex_replacement_normal:n` and `\_\_regex_replacement_normal_aux:N`.)

`\_\_regex_replacement_escaped:N` As in parsing a regular expression, we use an auxiliary built from #1 if defined. Otherwise, check for escaped digits (standing from submatches from 0 to 9): anything else is a raw character.

```

6964 \cs_new_protected:Npn \_\_regex_replacement_escaped:N #1
6965 {
6966     \cs_if_exist_use:cF { \_\_regex_replacement_#1:w }
6967     {
6968         \if_int_compare:w \c_one_int < 1#1 \exp_stop_f:
6969             \_\_regex_replacement_put_submatch:n {#1}
6970         \else:
6971             \_\_regex_replacement_normal:n {#1}
6972         \fi:
6973     }
6974 }

```

(End of definition for `\_\_regex_replacement_escaped:N`.)

#### 46.6.4 Submatches

`\_\_regex_replacement_put_submatch:n` Insert a submatch in the replacement text. This is dropped if the submatch number is larger than the number of capturing groups. Unless the submatch appears inside a `\c{...}` or `\u{...}` construction, it must be taken into account in the brace balance. Later on, `##1` will be replaced by a pointer to the 0-th submatch for a given match.

```

6975 \cs_new_protected:Npn \_\_regex_replacement_put_submatch:n #1
6976 {
6977     \if_int_compare:w #1 < \l_\_regex_capturing_group_int
6978         \_\_regex_replacement_put_submatch_aux:n {#1}
6979     \else:
6980         \msg_expandable_error:nnff { regex } { submatch-too-big }
6981             {#1} { \int_eval:n { \l_\_regex_capturing_group_int - \c_one_int } }
6982     \fi:

```

```

6983     }
6984 \cs_new_protected:Npn \__regex_replacement_put_submatch_aux:n #1
6985 {
6986     \tl_build_put_right:Nn \l__regex_build_tl
6987     { \__regex_query_submatch:n { \__regex_int_eval:w #1 + ##1 \scan_stop: } }
6988     \if_int_compare:w \l__regex_replacement_csnames_int = \c_zero_int
6989         \tl_gput_right:Nn \g__regex_balance_tl
6990         { + \__regex_submatch_balance:n { \__regex_int_eval:w #1 + ##1 \scan_stop: } }
6991     \fi:
6992 }

```

(End of definition for `\__regex_replacement_put_submatch:n` and `\__regex_replacement_put_submatch_aux:n`.)

`\__regex_replacement_g:w`  
`\__regex_replacement_g_digits>NN`

Grab digits for the `\g` escape sequence in a primitive assignment to the integer `\l__regex_internal_a_int`. At the end of the run of digits, check that it ends with a right brace.

```

6993 \cs_new_protected:Npn \__regex_replacement_g:w #1#2
6994 {
6995     \token_if_eq_meaning:NNTF #1 \__regex_replacement_lbrace:N
6996     { \l__regex_internal_a_int = \__regex_replacement_g_digits>NN }
6997     { \__regex_replacement_error:NNN g #1 #2 }
6998 }
6999 \cs_new:Npn \__regex_replacement_g_digits>NN #1#2
7000 {
7001     \token_if_eq_meaning:NNTF #1 \__regex_replacement_normal:n
7002     {
7003         \if_int_compare:w \c_one_int < 1#2 \exp_stop_f:
7004             #2
7005             \exp_after:wN \use_i:nnn
7006             \exp_after:wN \__regex_replacement_g_digits>NN
7007         \else:
7008             \exp_stop_f:
7009             \exp_after:wN \__regex_replacement_error:NNN
7010             \exp_after:wN g
7011         \fi:
7012     }
7013 {
7014     \exp_stop_f:
7015     \if_meaning:w \__regex_replacement_rbrace:N #1
7016         \exp_args:No \__regex_replacement_put_submatch:n
7017         { \int_use:N \l__regex_internal_a_int }
7018         \exp_after:wN \use_none:nn
7019     \else:
7020         \exp_after:wN \__regex_replacement_error:NNN
7021         \exp_after:wN g
7022     \fi:
7023 }
7024 #1 #2
7025 }

```

(End of definition for `\__regex_replacement_g:w` and `\__regex_replacement_g_digits>NN`.)

#### 46.6.5 Csnames in replacement

`\_\_regex_replacement_c:w`  $\backslash c$  may only be followed by an unescaped character. If followed by a left brace, start a control sequence by calling an auxiliary common with `\u`. Otherwise test whether the category is known; if it is not, complain.

```

7026 \cs_new_protected:Npn \_\_regex_replacement_c:w #1#2
7027   {
7028     \token_if_eq_meaning:NNTF #1 \_\_regex_replacement_normal:n
7029     {
7030       \cs_if_exist:cTF { \_\_regex_replacement_c:#2:w }
7031       { \_\_regex_replacement_cat:NNN #2 }
7032       { \_\_regex_replacement_error:NNN c #1#2 }
7033     }
7034   {
7035     \token_if_eq_meaning:NNTF #1 \_\_regex_replacement_lbrace:N
7036     { \_\_regex_replacement_cu_aux:Nw \_\_regex_replacement_exp_not:N }
7037     { \_\_regex_replacement_error:NNN c #1#2 }
7038   }
7039 }
```

(End of definition for `\_\_regex_replacement_c:w`.)

`\_\_regex_replacement_cu_aux:Nw` Start a control sequence with `\cs:w`, protected from expansion by #1 (either `\_\_regex_replacement_exp_not:N` or `\exp_not:V`), or turned to a string by `\tl_to_str:V` if inside another csname construction `\c` or `\u`. We use `\tl_to_str:V` rather than `\tl_to_str:N` to deal with integers and other registers.

```

7040 \cs_new_protected:Npn \_\_regex_replacement_cu_aux:Nw #1
7041   {
7042     \if_case:w \l_\_regex_replacement_csnames_int
7043       \tl_build_put_right:Nn \l_\_regex_build_tl
7044       { \exp_not:n { \exp_after:wN #1 \cs:w } }
7045     \else:
7046       \tl_build_put_right:Nn \l_\_regex_build_tl
7047       { \exp_not:n { \exp_after:wN \tl_to_str:V \cs:w } }
7048     \fi:
7049     \int_incr:N \l_\_regex_replacement_csnames_int
7050   }
```

(End of definition for `\_\_regex_replacement_cu_aux:Nw`.)

`\_\_regex_replacement_u:w` Check that `\u` is followed by a left brace. If so, start a control sequence with `\cs:w`, which is then unpacked either with `\exp_not:V` or `\tl_to_str:V` depending on the current context.

```

7051 \cs_new_protected:Npn \_\_regex_replacement_u:w #1#2
7052   {
7053     \token_if_eq_meaning:NNTF #1 \_\_regex_replacement_lbrace:N
7054     { \_\_regex_replacement_cu_aux:Nw \_\_regex_replacement_exp_not:V }
7055     { \_\_regex_replacement_error:NNN u #1#2 }
7056 }
```

(End of definition for `\_\_regex_replacement_u:w`.)

\\_regex\_replacement\_rbrace:N Within a \c{...} or \u{...} construction, end the control sequence, and decrease the brace count. Otherwise, this is a raw right brace.

```

7057 \cs_new_protected:Npn \_regex_replacement_rbrace:N #1
7058 {
7059     \if_int_compare:w \l__regex_replacement_csnames_int > \c_zero_int
7060         \tl_build_put_right:Nn \l__regex_build_tl { \cs_end: }
7061         \int_decr:N \l__regex_replacement_csnames_int
7062     \else:
7063         \_regex_replacement_normal:n {#1}
7064     \fi:
7065 }
```

(End of definition for \\_regex\_replacement\_rbrace:N.)

\\_regex\_replacement\_lbrace:N Within a \c{...} or \u{...} construction, this is forbidden. Otherwise, this is a raw left brace.

```

7066 \cs_new_protected:Npn \_regex_replacement_lbrace:N #1
7067 {
7068     \if_int_compare:w \l__regex_replacement_csnames_int > \c_zero_int
7069         \msg_error:nnn { regex } { cu-lbrace } { u }
7070     \else:
7071         \_regex_replacement_normal:n {#1}
7072     \fi:
7073 }
```

(End of definition for \\_regex\_replacement\_lbrace:N.)

#### 46.6.6 Characters in replacement

\\_regex\_replacement\_cat:NNN Here, #1 is a letter among BEMTPUDSLOA and #2#3 denote the next character. Complain if we reach the end of the replacement or if the construction appears inside \c{...} or \u{...}, and detect the case of a parenthesis. In that case, store the current category in a sequence and switch to a new one.

```

7074 \cs_new_protected:Npn \_regex_replacement_cat:NNN #1#2#3
7075 {
7076     \token_if_eq_meaning:NNTF \prg_do_nothing: #3
7077     { \msg_error:nn { regex } { replacement-catcode-end } }
7078     {
7079         \int_compare:nNnTF \l__regex_replacement_csnames_int > \c_zero_int
7080             {
7081                 \msg_error:nnnn
7082                     { regex } { replacement-catcode-in-cs } {#1} {#3}
7083                     #2 #3
7084             }
7085             {
7086                 \_regex_two_if_eq:NNNNTF #2 #3 \_regex_replacement_normal:n (
7087                     {
7088                         \seq_push:NV \l__regex_replacement_category_seq
7089                             \l__regex_replacement_category_tl
7090                             \tl_set:Nn \l__regex_replacement_category_tl {#1}
7091                     }
7092                     {
7093                         \token_if_eq_meaning:NNT #2 \_regex_replacement_escaped:N
```

```

7094      {
7095          \__regex_char_if_alphanumeric:NTF #3
7096          {
7097              \msg_error:nnnn
7098                  { regex } { replacement-catcode-escaped }
7099                  {#1} {#3}
7100          }
7101          { }
7102      }
7103      \use:c { __regex_replacement_c_#1:w } #2 #3
7104  }
7105  }
7106  }
7107  }

```

(End of definition for `\__regex_replacement_cat:NNN`.)

We now need to change the category code of the null character many times, hence work in a group. The catcode-specific macros below are defined in alphabetical order; if you are trying to understand the code, start from the end of the alphabet as those categories are simpler than active or begin-group.

```
7108 \group_begin:
```

`\__regex_replacement_char:nNN`

The only way to produce an arbitrary character–catcode pair is to use the `\lowercase` or `\uppercase` primitives. This is a wrapper for our purposes. The first argument is the null character with various catcodes. The second and third arguments are grabbed from the input stream: #3 is the character whose character code to reproduce. We could use `\char_generate:nn` but only for some catcodes (active characters and spaces are not supported).

```

7109   \cs_new_protected:Npn \__regex_replacement_char:nNN #1#2#3
7110   {
7111       \tex_lccode:D \c_zero_int = '#3 \scan_stop:
7112       \tex_lowercase:D { \__regex_replacement_put:n {#1} }
7113   }

```

(End of definition for `\__regex_replacement_char:nNN`.)

`\__regex_replacement_c_A:w`

For an active character, expansion must be avoided, twice because we later do two e-expansions, to unpack `\toks` for the query, and to expand their contents to tokens of the query.

```

7114   \char_set_catcode_active:N \^^@ 
7115   \cs_new_protected:Npn \__regex_replacement_c_A:w
7116   { \__regex_replacement_char:nNN { \exp_not:n { \exp_not:N \^\^@ } } }

```

(End of definition for `\__regex_replacement_c_A:w`.)

`\__regex_replacement_c_B:w`

An explicit begin-group token increases the balance, unless within a `\cf{...}` or `\uf{...}` construction. Add the desired begin-group character, using the standard `\if_false:` trick. We eventually e-expand twice. The first time must yield a balanced token list, and the second one gives the bare begin-group token. The `\exp_after:wN` is not strictly needed, but is more consistent with l3tl-analysis.

```

7117   \char_set_catcode_group_begin:N \^^@ 
7118   \cs_new_protected:Npn \__regex_replacement_c_B:w
7119   { 

```

```

7120   \if_int_compare:w \l__regex_replacement_csnames_int = \c_zero_int
7121     \int_incr:N \l__regex_balance_int
7122   \fi:
7123   \_regex_replacement_char:nNN
7124     { \exp_not:n { \exp_after:wN ^^@ \if_false: } \fi: } }
7125   }

```

(End of definition for `\_regex_replacement_c_B:w`.)

`\_regex_replacement_c_C:w`

This is not quite catcode-related: when the user requests a character with category “control sequence”, the one-character control symbol is returned. As for the active character, we prepare for two e-expansions.

```

7126   \cs_new_protected:Npn \_regex_replacement_c_C:w #1#2
7127   {
7128     \tl_build_put_right:Nn \l__regex_build_tl
7129     { \exp_not:N \_regex_replacement_exp_not:N \exp_not:c {#2} }
7130   }

```

(End of definition for `\_regex_replacement_c_C:w`.)

`\_regex_replacement_c_D:w`

Subscripts fit the mould: \lowercase the null byte with the correct category.

```

7131   \char_set_catcode_math_subscript:N ^^@
7132   \cs_new_protected:Npn \_regex_replacement_c_D:w
7133     { \_regex_replacement_char:nNN { ^^@ } }

```

(End of definition for `\_regex_replacement_c_D:w`.)

`\_regex_replacement_c_E:w`

Similar to the begin-group case, the second e-expansion produces the bare end-group token.

```

7134   \char_set_catcode_group_end:N ^^@
7135   \cs_new_protected:Npn \_regex_replacement_c_E:w
7136   {
7137     \if_int_compare:w \l__regex_replacement_csnames_int = \c_zero_int
7138       \int_decr:N \l__regex_balance_int
7139     \fi:
7140     \_regex_replacement_char:nNN
7141       { \exp_not:n { \if_false: { \fi: ^^@ } } }
7142   }

```

(End of definition for `\_regex_replacement_c_E:w`.)

`\_regex_replacement_c_L:w`

Simply \lowercase a letter null byte to produce an arbitrary letter.

```

7143   \char_set_catcode_letter:N ^^@
7144   \cs_new_protected:Npn \_regex_replacement_c_L:w
7145     { \_regex_replacement_char:nNN { ^^@ } }

```

(End of definition for `\_regex_replacement_c_L:w`.)

`\_regex_replacement_c_M:w`

No surprise here, we lowercase the null math toggle.

```

7146   \char_set_catcode_math_toggle:N ^^@
7147   \cs_new_protected:Npn \_regex_replacement_c_M:w
7148     { \_regex_replacement_char:nNN { ^^@ } }

```

(End of definition for `\_regex_replacement_c_M:w`.)

\\_\\_regex\\_replacement\\_c\\_0:w Lowercase an other null byte.

```
7149   \char_set_catcode_other:N \^{\^@}
7150   \cs_new_protected:Npn \_\_regex\_replacement_c_0:w
7151     { \_\_regex\_replacement_char:nNN { ^{\^@} } }
```

(End of definition for \\_\\_regex\\_replacement\\_c\\_0:w.)

\\_\\_regex\\_replacement\\_c\\_P:w For macro parameters, expansion is a tricky issue. We need to prepare for two e-expansions and passing through various macro definitions. Note that we cannot replace one \exp\_not:n by doubling the macro parameter characters because this would misbehave if a mischievous user asks for \c{\cP\#}, since that macro parameter character would be doubled.

```
7152   \char_set_catcode_parameter:N \^{\^@}
7153   \cs_new_protected:Npn \_\_regex\_replacement_c_P:w
7154     {
7155       \_\_regex\_replacement_char:nNN
7156         { \exp_not:n { \exp_not:n { ^{\^@} \^{\^@} \^{\^@} \^{\^@} } } }
7157     }
```

(End of definition for \\_\\_regex\\_replacement\\_c\\_P:w.)

\\_\\_regex\\_replacement\\_c\\_S:w Spaces are normalized on input by TeX to have character code 32. It is in fact impossible to get a token with character code 0 and category code 10. Hence we use 32 instead of 0 as our base character.

```
7158   \cs_new_protected:Npn \_\_regex\_replacement_c_S:w #1#2
7159     {
7160       \if_int_compare:w '#2 = \c_zero_int
7161         \msg_error:nn { regex } { replacement-null-space }
7162       \fi:
7163       \tex_lccode:D '\ = '#2 \scan_stop:
7164       \tex_lowercase:D { \_\_regex\_replacement_put:n {~} }
7165     }
```

(End of definition for \\_\\_regex\\_replacement\\_c\\_S:w.)

\\_\\_regex\\_replacement\\_c\\_T:w No surprise for alignment tabs here. Those are surrounded by the appropriate braces whenever necessary, hence they don't cause trouble in alignment settings.

```
7166   \char_set_catcode_alignment:N \^{\^@}
7167   \cs_new_protected:Npn \_\_regex\_replacement_c_T:w
7168     { \_\_regex\_replacement_char:nNN { ^{\^@} } }
```

(End of definition for \\_\\_regex\\_replacement\\_c\\_T:w.)

\\_\\_regex\\_replacement\\_c\\_U:w Simple call to \\_\\_regex\\_replacement\\_char:nNN which lowers the math superscript ^{\^@}.

```
7169   \char_set_catcode_math_superscript:N \^{\^@}
7170   \cs_new_protected:Npn \_\_regex\_replacement_c_U:w
7171     { \_\_regex\_replacement_char:nNN { ^{\^@} } }
```

(End of definition for \\_\\_regex\\_replacement\\_c\\_U:w.)

Restore the catcode of the null byte.

```
7172 \group_end:
```

### 46.6.7 An error

`\_regex_replacement_error:NNN` Simple error reporting by calling one of the messages `replacement-c`, `replacement-g`, or `replacement-u`.

```
7173 \cs_new_protected:Npn \_regex_replacement_error:NNN #1#2#3
7174 {
7175     \msg_error:nne { regex } { replacement-#1 } {#3}
7176     #2 #3
7177 }
```

(End of definition for `\_regex_replacement_error:NNN`.)

## 46.7 User functions

`\regex_new:N` Before being assigned a sensible value, a regex variable matches nothing.

```
7178 \cs_new_protected:Npn \regex_new:N #1
7179 { \cs_new_eq:NN #1 \c_regex_no_match_regex }
```

(End of definition for `\regex_new:N`. This function is documented on page 55.)

`\l_tmpa_regex` The usual scratch space.

```
7180 \regex_new:N \l_tmpa_regex
7181 \regex_new:N \l_tmpb_regex
7182 \regex_new:N \g_tmpa_regex
7183 \regex_new:N \g_tmpb_regex
```

(End of definition for `\l_tmpa_regex` and others. These variables are documented on page 60.)

`\regex_set:Nn` Compile, then store the result in the user variable with the appropriate assignment function.

```
7184 \cs_new_protected:Npn \regex_set:Nn #1#2
7185 {
7186     \__regex_compile:n {#2}
7187     \tl_set_eq:NN #1 \l__regex_internal_regex
7188 }
7189 \cs_new_protected:Npn \regex_gset:Nn #1#2
7190 {
7191     \__regex_compile:n {#2}
7192     \tl_gset_eq:NN #1 \l__regex_internal_regex
7193 }
7194 \cs_new_protected:Npn \regex_const:Nn #1#2
7195 {
7196     \__regex_compile:n {#2}
7197     \tl_const:Ne #1 { \exp_not:o \l__regex_internal_regex }
7198 }
```

(End of definition for `\regex_set:Nn`, `\regex_gset:Nn`, and `\regex_const:Nn`. These functions are documented on page 55.)

`\regex_show:n` User functions: the `n` variant requires compilation first. Then show the variable with some appropriate text. The auxiliary `\__regex_show:N` is defined in a different section.

```
7199 \cs_new_protected:Npn \regex_show:n { \__regex_show:Nn \msg_show:nneeee }
7200 \cs_new_protected:Npn \regex_log:n { \__regex_show:Nn \msg_log:nneeee }
7201 \cs_new_protected:Npn \__regex_show:Nn #1#2
```

`\__regex_show>NN`

```

7202  {
7203    \_\_regex\_compile:n {#2}
7204    \_\_regex\_show:N \l\_\_regex\_internal\_regex
7205    #1 { regex } { show }
7206    { \tl\_to\_str:n {#2} } { }
7207    { \l\_\_regex\_internal\_a\_tl } { }
7208  }
7209  \cs\_new\_protected:Npn \regex\_show:N { \_\_regex\_show:NN \msg\_show:nneeee }
7210  \cs\_new\_protected:Npn \regex\_log:N { \_\_regex\_show:NN \msg\_log:nneeee }
7211  \cs\_new\_protected:Npn \_\_regex\_show:NN #1#2
7212  {
7213    \_\_kernel\_chk\_tl\_type:NnnT #2 { regex }
7214    { \exp\_args:No \_\_regex\_clean\_regex:n {#2} }
7215    {
7216      \_\_regex\_show:N #2
7217      #1 { regex } { show }
7218      { } { \token\_to\_str:N #2 }
7219      { \l\_\_regex\_internal\_a\_tl } { }
7220    }
7221  }

```

(End of definition for `\regex_show:n` and others. These functions are documented on page 55.)

**\regex\_match:nnTF** Those conditionals are based on a common auxiliary defined later. Its first argument builds the NFA corresponding to the regex, and the second argument is the query token list. Once we have performed the match, convert the resulting boolean to `\prg_return_true:` or `false`.

```

7222  \prg\_new\_protected\_conditional:Npnn \regex\_match:nn #1#2 { T , F , TF }
7223  {
7224    \_\_regex\_if\_match:nn { \_\_regex\_build:n {#1} } {#2}
7225    \_\_regex\_return:
7226  }
7227  \prg\_generate\_conditional\_variant:Nnn \regex\_match:nn { nV } { T , F , TF }
7228  \prg\_new\_protected\_conditional:Npnn \regex\_match:Nn #1#2 { T , F , TF }
7229  {
7230    \_\_regex\_if\_match:nn { \_\_regex\_build:N #1 } {#2}
7231    \_\_regex\_return:
7232  }
7233  \prg\_generate\_conditional\_variant:Nnn \regex\_match:Nn { NV } { T , F , TF }

```

(End of definition for `\regex_match:nnTF` and `\regex_match:NnTF`. These functions are documented on page 56.)

**\regex\_count:nnN** Again, use an auxiliary whose first argument builds the NFA.

```

7234  \cs\_new\_protected:Npn \regex\_count:nnN #1
7235  { \_\_regex\_count:nnN { \_\_regex\_build:n {#1} } }
7236  \cs\_new\_protected:Npn \regex\_count:NnN #1
7237  { \_\_regex\_count:nnN { \_\_regex\_build:N #1 } }
7238  \cs\_generate\_variant:Nn \regex\_count:nnN { nV }
7239  \cs\_generate\_variant:Nn \regex\_count:NnN { NV }

```

(End of definition for `\regex_count:nnN` and `\regex_count:NnN`. These functions are documented on page 56.)

`\regex_match_case:nn`  
`\regex_match_case:nnTF`

The auxiliary errors if #1 has an odd number of items, and otherwise it sets `\g__regex_case_int` according to which case was found (zero if not found). The `true` branch leaves the corresponding code in the input stream.

```
7240 \cs_new_protected:Npn \regex_match_case:nnTF #1#2#3
7241 {
7242     \__regex_match_case:nnTF {#1} {#2}
7243     {
7244         \tl_item:nn {#1} { 2 * \g__regex_case_int }
7245         #3
7246     }
7247 }
7248 \cs_new_protected:Npn \regex_match_case:nn #1#2
7249     { \regex_match_case:nnTF {#1} {#2} { } { } }
7250 \cs_new_protected:Npn \regex_match_case:nnT #1#2#3
7251     { \regex_match_case:nnTF {#1} {#2} {#3} { } }
7252 \cs_new_protected:Npn \regex_match_case:nnF #1#2
7253     { \regex_match_case:nnTF {#1} {#2} { } }
```

(End of definition for `\regex_match_case:nnTF`. This function is documented on page 56.)

`\regex_extract_once:nnN`  
`\regex_extract_once:nVN`  
`\regex_extract_once:nnNTF`  
`\regex_extract_once:nVNTF`  
`\regex_extract_once:NnN`  
`\regex_extract_once:NVN`  
`\regex_extract_once:NnNTF`  
`\regex_extract_once:NVNTF`  
`\regex_extract_all:nnN`  
`\regex_extract_all:nVN`  
`\regex_extract_all:nnNTF`  
`\regex_extract_all:nVNTF`  
`\regex_extract_all:NnN`  
`\regex_extract_all:NVN`  
`\regex_extract_all:NnNTF`  
`\regex_extract_all:NVNTF`  
`\regex_replace_once:nnN`  
`\regex_replace_once:nVN`  
`\regex_replace_once:nnNTF`  
`\regex_replace_once:nVNTF`  
`\regex_replace_all:NnN`  
`\regex_replace_all:NVN`  
`\regex_replace_all:NnNTF`  
`\regex_replace_all:nVNTF`  
`\regex_replace_all:nnN`  
`\regex_replace_all:nVN`  
`\regex_replace_all:nNTF`  
`\regex_replace_all:NNTF`  
`\regex_replace_all:nVNTF`

We define here 40 user functions, following a common pattern in terms of `:nnN` auxiliaries, defined in the coming subsections. The auxiliary is handed `\__regex_build:n` or `\__regex_build:N` with the appropriate regex argument, then all other necessary arguments (replacement text, token list, etc. The conditionals call `\__regex_return:` to return either `true` or `false` once matching has been performed.

```
7254 \cs_set_protected:Npn \__regex_tmp:w #1#2#3
7255 {
7256     \cs_new_protected:Npn #2 ##1 { #1 { \__regex_build:n {##1} } }
7257     \cs_new_protected:Npn #3 ##1 { #1 { \__regex_build:N ##1 } }
7258     \prg_new_protected_conditional:Npnn #2 ##1##2##3 { T , F , TF }
7259     { #1 { \__regex_build:n {##1} } {##2} ##3 \__regex_return: }
7260     \prg_new_protected_conditional:Npnn #3 ##1##2##3 { T , F , TF }
7261     { #1 { \__regex_build:N ##1 } {##2} ##3 \__regex_return: }
7262     \cs_generate_variant:Nn #2 { nV }
7263     \prg_generate_conditional_variant:Nnn #2 { nV } { T , F , TF }
7264     \cs_generate_variant:Nn #3 { NV }
7265     \prg_generate_conditional_variant:Nnn #3 { NV } { T , F , TF }
7266 }
7267 \__regex_tmp:w \__regex_extract_once:nnN
7268     \regex_extract_once:nnN \regex_extract_once:NnN
7269 \__regex_tmp:w \__regex_extract_all:nnN
7270     \regex_extract_all:nnN \regex_extract_all:NnN
7271 \__regex_tmp:w \__regex_replace_once:nnN
7272     \regex_replace_once:nnN \regex_replace_once:NnN
7273 \__regex_tmp:w \__regex_replace_all:nnN
7274     \regex_replace_all:nnN \regex_replace_all:NnN
7275 \__regex_tmp:w \__regex_split:nnN \regex_split:nnN \regex_split:NnN
```

(End of definition for `\regex_extract_once:nnNTF` and others. These functions are documented on page 57.)

If the input is bad (odd number of items) then take the false branch. Otherwise, use the same auxiliary as `\regex_replace_once:nnN`, but with more complicated code to

`\regex_replace_all:NnN`  
`\regex_replace_all:NVN`  
`\regex_replace_case_once:nVN`  
`\regex_replace_case_once:nNTF`  
`\regex_replace_case_all:NNTF`  
`\regex_replace_all:NVNTF`  
`\regex_replace_all:nnN`  
`\regex_replace_all:nVN`  
`\regex_replace_all:nNTF`  
`\regex_replace_all:NNTF`  
`\regex_replace_all:nVNTF`

build the automaton, and to find what replacement text to use. The `\tl_item:nn` is only expanded once we know the value of `\g__regex_case_int`, namely which case matched.

```

7276 \cs_new_protected:Npn \regex_replace_case_once:nNTF #1#2
7277 {
7278     \int_if_odd:nTF { \tl_count:n {#1} }
7279     {
7280         \msg_error:nneeee { regex } { case-odd }
7281         { \token_to_str:N \regex_replace_case_once:nN(TF) } { code }
7282         { \tl_count:n {#1} } { \tl_to_str:n {#1} }
7283         \use_i:nn
7284     }
7285     {
7286         \__regex_replace_once_aux:nnN
7287         { \__regex_case_build:e { \__regex_tl_odd_items:n {#1} } }
7288         { \__regex_replacement:e { \tl_item:nn {#1} { 2 * \g__regex_case_int } } }
7289         #2
7290         \bool_if:NTF \g__regex_success_bool
7291     }
7292 }
7293 \cs_new_protected:Npn \regex_replace_case_once:nN #1#2
7294     { \regex_replace_case_once:nNTF {#1} {#2} { } { } }
7295 \cs_new_protected:Npn \regex_replace_case_once:nNT #1#2#3
7296     { \regex_replace_case_once:nNTF {#1} {#2} {#3} { } }
7297 \cs_new_protected:Npn \regex_replace_case_once:nNF #1#2
7298     { \regex_replace_case_once:nNTF {#1} {#2} { } }
```

(End of definition for `\regex_replace_case_once:nNTF`. This function is documented on page 59.)

**\regex\_replace\_case\_all:nN**  
**\regex\_replace\_case\_all:nNTF**

If the input is bad (odd number of items) then take the false branch. Otherwise, use the same auxiliary as `\regex_replace_all:nnN`, but with more complicated code to build the automaton, and to find what replacement text to use.

```

7299 \cs_new_protected:Npn \regex_replace_case_all:nNTF #1#2
7300 {
7301     \int_if_odd:nTF { \tl_count:n {#1} }
7302     {
7303         \msg_error:nneeee { regex } { case-odd }
7304         { \token_to_str:N \regex_replace_case_all:nN(TF) } { code }
7305         { \tl_count:n {#1} } { \tl_to_str:n {#1} }
7306         \use_i:nn
7307     }
7308     {
7309         \__regex_replace_all_aux:nnN
7310         { \__regex_case_build:e { \__regex_tl_odd_items:n {#1} } }
7311         { \__regex_case_replacement:e { \__regex_tl_even_items:n {#1} } }
7312         #2
7313         \bool_if:NTF \g__regex_success_bool
7314     }
7315 }
7316 \cs_new_protected:Npn \regex_replace_case_all:nN #1#2
7317     { \regex_replace_case_all:nNTF {#1} {#2} { } { } }
7318 \cs_new_protected:Npn \regex_replace_case_all:nNT #1#2#3
7319     { \regex_replace_case_all:nNTF {#1} {#2} {#3} { } }
7320 \cs_new_protected:Npn \regex_replace_case_all:nNF #1#2
7321     { \regex_replace_case_all:nNTF {#1} {#2} { } }
```

(End of definition for `\regex_replace_case_all:nNTF`. This function is documented on page 59.)

#### 46.7.1 Variables and helpers for user functions

`\l__regex_match_count_int`

The number of matches found so far is stored in `\l__regex_match_count_int`. This is only used in the `\regex_count:nnN` functions.

7322 `\int_new:N \l__regex_match_count_int`

(End of definition for `\l__regex_match_count_int`.)

`\l__regex_begin_flag`  
`\l__regex_end_flag`

Those flags are raised to indicate begin-group or end-group tokens that had to be added when extracting submatches.

7323 `\flag_new:N \l__regex_begin_flag`  
7324 `\flag_new:N \l__regex_end_flag`

(End of definition for `\l__regex_begin_flag` and `\l__regex_end_flag`.)

`\l__regex_min_submatch_int`  
`\l__regex_submatch_int`  
`\l__regex_zeroth_submatch_int`

The end-points of each submatch are stored in two arrays whose index `<submatch>` ranges from `\l__regex_min_submatch_int` (inclusive) to `\l__regex_submatch_int` (exclusive). Each successful match comes with a 0-th submatch (the full match), and one match for each capturing group: submatches corresponding to the last successful match are labelled starting at `zeroth_submatch`. The entry `\l__regex_zeroth_submatch_int` in `\g__regex_submatch_prev_intarray` holds the position at which that match attempt started: this is used for splitting and replacements.

7325 `\int_new:N \l__regex_min_submatch_int`  
7326 `\int_new:N \l__regex_submatch_int`  
7327 `\int_new:N \l__regex_zeroth_submatch_int`

(End of definition for `\l__regex_min_submatch_int`, `\l__regex_submatch_int`, and `\l__regex_zeroth_submatch_int`.)

`\g__regex_submatch_prev_intarray`  
`\g__regex_submatch_begin_intarray`  
`\g__regex_submatch_end_intarray`  
`\g__regex_submatch_case_intarray`

Hold the place where the match attempt begun, the end-points of each submatch, and which regex case the match corresponds to, respectively.

7328 `\intarray_new:Nn \g__regex_submatch_prev_intarray { 65536 }`  
7329 `\intarray_new:Nn \g__regex_submatch_begin_intarray { 65536 }`  
7330 `\intarray_new:Nn \g__regex_submatch_end_intarray { 65536 }`  
7331 `\intarray_new:Nn \g__regex_submatch_case_intarray { 65536 }`

(End of definition for `\g__regex_submatch_prev_intarray` and others.)

`\g__regex_balance_intarray`

The first thing we do when matching is to store the balance of begin-group/end-group characters into `\g__regex_balance_intarray`.

7332 `\intarray_new:Nn \g__regex_balance_intarray { 65536 }`

(End of definition for `\g__regex_balance_intarray`.)

`\l__regex_added_begin_int`  
`\l__regex_added_end_int`

Keep track of the number of left/right braces to add when performing a regex operation such as a replacement.

7333 `\int_new:N \l__regex_added_begin_int`  
7334 `\int_new:N \l__regex_added_end_int`

(End of definition for `\l__regex_added_begin_int` and `\l__regex_added_end_int`.)

\\_\\_regex\\_return: This function triggers either \prg\\_return\\_false: or \prg\\_return\\_true: as appropriate to whether a match was found or not. It is used by all user conditionals.

```

7335 \cs_new_protected:Npn \_\_regex_return:
7336 {
7337     \if_meaning:w \c_true_bool \g__regex_success_bool
7338         \prg_return_true:
7339     \else:
7340         \prg_return_false:
7341     \fi:
7342 }
```

(End of definition for \\_\\_regex\\_return:.)

\\_\\_regex\\_query\\_set:n To easily extract subsets of the input once we found the positions at which to cut, store the input tokens one by one into successive \toks registers. Also store the brace balance (used to check for overall brace balance) in an array.

```

7343 \cs_new_protected:Npn \_\_regex_query_set:n #1
7344 {
7345     \int_zero:N \l__regex_balance_int
7346     \int_zero:N \l__regex_curr_pos_int
7347     \_\_regex_query_set_aux:nN { } F
7348     \tl_analysis_map_inline:nn {#1}
7349         { \_\_regex_query_set_aux:nN {##1} ##3 }
7350     \_\_regex_query_set_aux:nN { } F
7351     \int_set_eq:NN \l__regex_max_pos_int \l__regex_curr_pos_int
7352 }
7353 \cs_new_protected:Npn \_\_regex_query_set_aux:nN #1#2
7354 {
7355     \int_incr:N \l__regex_curr_pos_int
7356     \_\_regex_toks_set:Nn \l__regex_curr_pos_int {#1}
7357     \_\_kernel_intarray_gset:Nnn \g__regex_balance_intarray
7358         \l__regex_curr_pos_int \l__regex_balance_int
7359     \if_case:w "#2 \exp_stop_f:
7360     \or: \int_incr:N \l__regex_balance_int
7361     \or: \int_decr:N \l__regex_balance_int
7362     \fi:
7363 }
```

(End of definition for \\_\\_regex\\_query\\_set:n and \\_\\_regex\\_query\\_set\\_aux:nN.)

### 46.7.2 Matching

\\_\\_regex\_if\_match:nn We don't track submatches, and stop after a single match. Build the NFA with #1, and perform the match on the query #2.

```

7364 \cs_new_protected:Npn \_\_regex_if_match:nn #1#2
7365 {
7366     \group_begin:
7367         \_\_regex_disable_submatches:
7368         \_\_regex_single_match:
7369             #1
7370             \_\_regex_match:n {#2}
7371     \group_end:
7372 }
```

(End of definition for `\_\_regex_if_match:nn`.)

`\_\_regex_match_case:nnTF`  
`\_\_regex_match_case_aux:nn`

The code would get badly messed up if the number of items in #1 were not even, so we catch this case, then follow the same code as `\regex_match:nnTF` but using `\_\_regex_case_build:n` and without returning a result.

```
7373 \cs_new_protected:Npn \_\_regex_match_case:nnTF #1#2
7374  {
7375   \int_if_odd:nTF { \tl_count:n {#1} }
7376   {
7377     \msg_error:nneeee { regex } { case-odd }
7378     { \token_to_str:N \regex_match_case:nn(TF) } { code }
7379     { \tl_count:n {#1} } { \tl_to_str:n {#1} }
7380     \use_i:nn
7381   }
7382   {
7383     \_\_regex_if_match:nn
7384     { \_\_regex_case_build:e { \_\_regex_tl_odd_items:n {#1} } }
7385     {#2}
7386     \bool_if:NTF \g_\_regex_success_bool
7387   }
7388 }
7389 \cs_new:Npn \_\_regex_match_case_aux:nn #1#2 { \exp_not:n { {#1} } }
```

(End of definition for `\_\_regex_match_case:nnTF` and `\_\_regex_match_case_aux:nn`.)

`\_\_regex_count:nnN`

Again, we don't care about submatches. Instead of aborting after the first "longest match" is found, we search for multiple matches, incrementing `\l_\_regex_match_count_int` every time to record the number of matches. Build the NFA and match. At the end, store the result in the user's variable.

```
7390 \cs_new_protected:Npn \_\_regex_count:nnN #1#2#3
7391  {
7392   \group_begin:
7393   \_\_regex_disable_submatches:
7394   \int_zero:N \l_\_regex_match_count_int
7395   \_\_regex_multi_match:n { \int_incr:N \l_\_regex_match_count_int }
7396   #1
7397   \_\_regex_match:n {#2}
7398   \exp_args:NNNo
7399   \group_end:
7400   \int_set:Nn #3 { \int_use:N \l_\_regex_match_count_int }
7401 }
```

(End of definition for `\_\_regex_count:nnN`.)

### 46.7.3 Extracting submatches

`\_\_regex_extract_once:nnN`  
`\_\_regex_extract_all:nnN`

Match once or multiple times. After each match (or after the only match), extract the submatches using `\_\_regex_extract::`. At the end, store the sequence containing all the submatches into the user variable #3 after closing the group.

```
7402 \cs_new_protected:Npn \_\_regex_extract_once:nnN #1#2#3
7403  {
7404   \group_begin:
7405   \_\_regex_single_match:
```

```

7406      #1
7407      \__regex_match:n {#2}
7408      \__regex_extract:
7409      \__regex_query_set:n {#2}
7410      \__regex_group_end_extract_seq:N #3
7411    }
7412 \cs_new_protected:Npn \__regex_extract_all:nnN #1#2#3
7413  {
7414    \group_begin:
7415    \__regex_multi_match:n { \__regex_extract: }
7416    #1
7417    \__regex_match:n {#2}
7418    \__regex_query_set:n {#2}
7419    \__regex_group_end_extract_seq:N #3
7420  }

```

(End of definition for `\__regex_extract_once:nnN` and `\__regex_extract_all:nnN`.)

`\__regex_split:nnN` Splitting at submatches is a bit more tricky. For each match, extract all submatches, and replace the zeroth submatch by the part of the query between the start of the match attempt and the start of the zeroth submatch. This is inhibited if the delimiter matched an empty token list at the start of this match attempt. After the last match, store the last part of the token list, which ranges from the start of the match attempt to the end of the query. This step is inhibited if the last match was empty and at the very end: decrement `\l__regex_submatch_int`, which controls which matches will be used.

```

7421 \cs_new_protected:Npn \__regex_split:nnN #1#2#3
7422  {
7423    \group_begin:
7424    \__regex_multi_match:n
7425    {
7426      \if_int_compare:w
7427        \l__regex_start_pos_int < \l__regex_success_pos_int
7428        \__regex_extract:
7429        \__kernel_intarray_gset:Nnn \g__regex_submatch_prev_intarray
7430          \l__regex_zeroth_submatch_int \c_zero_int
7431        \__kernel_intarray_gset:Nnn \g__regex_submatch_end_intarray
7432          \l__regex_zeroth_submatch_int
7433        {
7434          \__kernel_intarray_item:Nn \g__regex_submatch_begin_intarray
7435            \l__regex_zeroth_submatch_int
7436        }
7437        \__kernel_intarray_gset:Nnn \g__regex_submatch_begin_intarray
7438          \l__regex_zeroth_submatch_int
7439          \l__regex_start_pos_int
7440      \fi:
7441    }
7442    #1
7443    \__regex_match:n {#2}
7444    \__regex_query_set:n {#2}
7445    \__kernel_intarray_gset:Nnn \g__regex_submatch_prev_intarray
7446      \l__regex_submatch_int \c_zero_int
7447    \__kernel_intarray_gset:Nnn \g__regex_submatch_end_intarray
7448      \l__regex_submatch_int
7449      \l__regex_max_pos_int

```

```

7450   \_kernel_intarray_gset:Nnn \g__regex_submatch_begin_intarray
7451     \l__regex_submatch_int
7452     \l__regex_start_pos_int
7453   \int_incr:N \l__regex_submatch_int
7454   \if_meaning:w \c_true_bool \l__regex_empty_success_bool
7455     \if_int_compare:w \l__regex_start_pos_int = \l__regex_max_pos_int
7456     \int_decr:N \l__regex_submatch_int
7457   \fi:
7458   \fi:
7459   \_regex_group_end_extract_seq:N #3
7460 }

```

(End of definition for `\_regex_split:nnN`.)

```

\_regex_group_end_extract_seq:N
\_regex_extract_seq:N
\_regex_extract_seq>NNn
\_\_regex_extract_seq_loop:Nw

```

The end-points of submatches are stored as entries of two arrays from `\l__regex_min_submatch_int` to `\l__regex_submatch_int` (exclusive). Extract the relevant ranges into `\g__regex_internal_tl`, separated by `\_\_regex_tmp:w {}`. We keep track in the two flags `\_regex_begin` and `\_regex_end` of the number of begin-group or end-group tokens added to make each of these items overall balanced. At this step, `{}{}` is counted as being balanced (same number of begin-group and end-group tokens). This problem is caught by `\_\_regex_extract_check:w`, explained later. After complaining about any begin-group or end-group tokens we had to add, we are ready to construct the user's sequence outside the group.

```

7461 \cs_new_protected:Npn \_\_regex_group_end_extract_seq:N #1
7462 {
7463   \flag_clear:N \l__regex_begin_flag

7522     \prg_replicate:nn {#1}
7523   {
7524     \flag_raise:N \l__regex_end_flag
7525     \exp_not:n { \if_false: { \fi: } }
7526   }
7527   \fi:
7528 }
```

(End of definition for `\__regex_extract_seq_aux:n` and `\__regex_extract_seq_aux:ww`.)

```
\__regex_extract_check:w
\__regex_extract_check:n
  \__regex_extract_check_loop:w
\__regex_extract_check_end:w
```

In `\__regex_group_end_extract_seq:N` we had to expand `\g__regex_internal_tl` to turn `\if_false:` constructions into actual begin-group and end-group tokens. This is done with a `\__kernel_tl_gset:Nx` assignment, and `\__regex_extract_check:w` is run immediately after this assignment ends, thanks to the `\afterassignment` primitive. If all of the items were properly balanced (enough begin-group tokens before end-group tokens, so `{` is not) then `\__regex_extract_check:w` is called just before the closing brace of the `\__kernel_tl_gset:Nx` (thanks to our sneaky `\if_false: { \fi: }` construction), and finds that there is nothing left to expand. If any of the items is unbalanced, the

assignment gets ended early by an extra end-group token, and our check finds more tokens needing to be expanded in a new `\_kernel_tl_gset:Nx` assignment. We need to add a begin-group and an end-group tokens to the unbalanced item, namely to the last item found so far, which we reach through a loop.

```

7529 \cs_new_protected:Npn \__regex_extract_check:w
7530   {
7531     \exp_after:wN \__regex_extract_check:n
7532     \exp_after:wN { \if_false: } \fi:
7533   }
7534 \cs_new_protected:Npn \__regex_extract_check:n #1
7535   {
7536     \tl_if_empty:nF {#1}
7537     {
7538       \int_incr:N \l__regex_added_begin_int
7539       \int_incr:N \l__regex_added_end_int
7540       \tex_afterassignment:D \__regex_extract_check:w
7541       \_kernel_tl_gset:Nx \g__regex_internal_tl
7542       {
7543         \exp_after:wN \__regex_extract_check_loop:w
7544         \g__regex_internal_tl
7545         \__regex_tmp:w \__regex_extract_check_end:w
7546         #1
7547       }
7548     }
7549   }
7550 \cs_new:Npn \__regex_extract_check_loop:w #1 \__regex_tmp:w #2
7551   {
7552     #2
7553     \exp_not:o {#1}
7554     \__regex_tmp:w { }
7555     \__regex_extract_check_loop:w \prg_do_nothing:
7556   }

```

Arguments of `\__regex_extract_check_end:w` are: #1 is the part of the item before the extra end-group token; #2 is junk; #3 is `\prg_do_nothing:` followed by the not-yet-expanded part of the item after the extra end-group token. In the replacement text, the first brace and the `\if_false: { \fi: }` construction are the added begin-group and end-group tokens (the latter being not-yet expanded, just like #3), while the closing brace after `\exp_not:o {#1}` replaces the extra end-group token that had ended the assignment early. In particular this means that the character code of that end-group token is lost.

```

7557 \cs_new:Npn \__regex_extract_check_end:w
7558   \exp_not:o #1#2 \__regex_extract_check_loop:w #3 \__regex_tmp:w
7559   {
7560     { \exp_not:o {#1} }
7561     #3
7562     \if_false: { \fi: }
7563     \__regex_tmp:w
7564   }

```

(End of definition for `\__regex_extract_check:w` and others.)

`\__regex_extract:` Our task here is to store the list of end-points of submatches, and store them in appropriate array entries, from `\l__regex_zeroth_submatch_int` upwards. First, we store in `\g__regex_submatch_prev_intarray` the position at which the match attempt started.

We extract the rest from the comma list `\l__regex_success_submatches_tl`, which starts with entries to be stored in `\g__regex_submatch_begin_intarray` and continues with entries for `\g__regex_submatch_end_intarray`.

```

#### 46.7.4 Replacement

`\__regex_replace_once:nnN`  
`\__replace_once_aux:nnN`

Build the NFA and the replacement functions, then find a single match. If the match failed, simply exit the group. Otherwise, we do the replacement. Extract submatches. Compute the brace balance corresponding to replacing this match by the replacement (this depends on submatches). Prepare the replaced token list: the replacement function produces the tokens from the start of the query to the start of the match and the replacement text for

this match; we need to add the tokens from the end of the match to the end of the query. Finally, store the result in the user's variable after closing the group: this step involves an additional `e`-expansion, and checks that braces are balanced in the final result.

```

7605 \cs_new_protected:Npn \__regex_replace_once:nnN #1#2
7606   { \__regex_replace_once_aux:nnN {#1} { \__regex_replacement:n {#2} } }
7607 \cs_new_protected:Npn \__regex_replace_once_aux:nnN #1#2#3
7608   {
7609     \group_begin:
7610       \__regex_single_match:
7611       #1
7612       \exp_args:No \__regex_match:n {#3}
7613     \bool_if:NTF \g__regex_success_bool
7614     {
7615       \__regex_extract:
7616       \exp_args:No \__regex_query_set:n {#3}
7617       #2
7618       \int_set:Nn \l__regex_balance_int
7619         { \__regex_replacement_balance_one_match:n \l__regex_zeroth_submatch_int }
7620       \__kernel_tl_set:Nx \l__regex_internal_a_tl
7621       {
7622         \__regex_replacement_do_one_match:n \l__regex_zeroth_submatch_int
7623         \__regex_query_range:nn
7624         {
7625           \__kernel_intarray_item:Nn \g__regex_submatch_end_intarray
7626             \l__regex_zeroth_submatch_int
7627         }
7628         \l__regex_max_pos_int
7629       }
7630       \__regex_group_end_replace:N #3
7631     }
7632   { \group_end: }
7633 }
```

(End of definition for `\__regex_replace_once:nnN` and `\__regex_replace_once_aux:nnN`.)

`\__regex_replace_all:nnN` Match multiple times, and for every match, extract submatches and additionally store the position at which the match attempt started. The entries from `\l__regex_min_submatch_int` to `\l__regex_submatch_int` hold information about submatches of every match in order; each match corresponds to `\l__regex_capturing_group_int` consecutive entries. Compute the brace balance corresponding to doing all the replacements: this is the sum of brace balances for replacing each match. Join together the replacement texts for each match (including the part of the query before the match), and the end of the query.

```

7634 \cs_new_protected:Npn \__regex_replace_all:nnN #1#2
7635   { \__regex_replace_all_aux:nnN {#1} { \__regex_replacement:n {#2} } }
7636 \cs_new_protected:Npn \__regex_replace_all_aux:nnN #1#2#3
7637   {
7638     \group_begin:
7639       \__regex_multi_match:n { \__regex_extract: }
7640       #1
7641       \exp_args:No \__regex_match:n {#3}
7642       \exp_args:No \__regex_query_set:n {#3}
7643       #2
```

```

7644 \int_set:Nn \l__regex_balance_int
7645 {
7646     \c_zero_int
7647     \int_step_function:nnN
7648         \l__regex_min_submatch_int
7649         \l__regex_capturing_group_int
7650         { \l__regex_submatch_int - \c_one_int }
7651         \__regex_replacement_balance_one_match:n
7652     }
7653     \_kernel_tl_set:Nx \l__regex_internal_a_tl
7654     {
7655         \int_step_function:nnN
7656             \l__regex_min_submatch_int
7657             \l__regex_capturing_group_int
7658             { \l__regex_submatch_int - \c_one_int }
7659             \__regex_replacement_do_one_match:n
7660             \__regex_query_range:nn
7661                 \l__regex_start_pos_int \l__regex_max_pos_int
7662             }
7663     \__regex_group_end_replace:N #3
7664 }

```

(End of definition for `\__regex_replace_all:nnN`.)

```
\__regex_group_end_replace:N
    \__regex_group_end_replace_try:
\__regex_group_end_replace_check:w
\__regex_group_end_replace_check:n
```

At this stage `\l__regex_internal_a_tl` (e-expands to the desired result). Guess from `\l__regex_balance_int` the number of braces to add before or after the result then try expanding. The simplest case is when `\l__regex_internal_a_tl` together with the braces we insert via `\prg_replicate:nn` give a balanced result, and the assignment ends at the `\if_false: { \fi: }` construction: then `\__regex_group_end_replace_check:w` sees that there is no material left and we successfully found the result. The harder case is that expanding `\l__regex_internal_a_tl` may produce extra closing braces and end the assignment early. Then we grab the remaining code using; importantly, what follows has not yet been expanded so that `\__regex_group_end_replace_check:n` grabs everything until the last brace in `\__regex_group_end_replace_try:`, letting us try again with an extra surrounding pair of braces.

```

7665 \cs_new_protected:Npn \__regex_group_end_replace:N #1
7666 {
7667     \int_set:Nn \l__regex_added_begin_int

7706  }

```

(End of definition for `\__regex_group_end_replace:N` and others.)

#### 46.7.5 Peeking ahead

`\l__regex_peek_true_tl` True/false code arguments of `\peek_regex:nTF` or similar.

`\l__regex_peek_false_tl`

```

7707 \tl_new:N \l__regex_peek_true_tl
7708 \tl_new:N \l__regex_peek_false_tl

```

(End of definition for `\l__regex_peek_true_tl` and `\l__regex_peek_false_tl`.)

`\l__regex_replacement_tl` When peeking in `\peek_regex_replace_once:nnTF` we need to store the replacement text.

```

7709 \tl_new:N \l__regex_replacement_tl

```

(End of definition for `\l__regex_replacement_tl`.)

`\l__regex_input_tl` Stores each token found as `\__regex_input_item:n {<tokens>}`, where the `<tokens>` expand to the token found, as for `\tl_analysis_map_inline:nn`.

```

7710 \tl_new:N \l__regex_input_tl
7711 \cs_new_eq:NN \__regex_input_item:n ?

```

(End of definition for `\l__regex_input_tl` and `\__regex_input_item:n`.)

`\peek_regex:nTF`

`\peek_regex:NTF`

The T and F functions just call the corresponding TF function. The four TF functions differ along two axes: whether to remove the token or not, distinguished by using `\__regex_peek_end:` or `\__regex_peek_remove_end:n` (the latter case needs an argument, as we will see), and whether the regex has to be compiled or is already in an N-type variable, distinguished by calling `\__regex_build_aux:Nn` or `\__regex_build_aux:NN`. The first argument of these functions is `\c_false_bool` to indicate that there should be no implicit

insertion of a wildcard at the start of the pattern: otherwise the code would keep looking further into the input stream until matching the regex.

```

7712 \cs_new_protected:Npn \peek_regex:nTF #1
7713 {
7714     \__regex_peek:nnTF
7715     { \__regex_build_aux:Nn \c_false_bool {#1} }
7716     { \__regex_peek_end: }
7717 }
7718 \cs_new_protected:Npn \peek_regex:nT #1#2
7719 { \peek_regex:nTF {#1} {#2} { } }
7720 \cs_new_protected:Npn \peek_regex:nF #1 { \peek_regex:nTF {#1} { } }
7721 \cs_new_protected:Npn \peek_regex:NTF #1
7722 {
7723     \__regex_peek:nnTF
7724     { \__regex_build_aux>NN \c_false_bool #1 }
7725     { \__regex_peek_end: }
7726 }
7727 \cs_new_protected:Npn \peek_regex:NT #1#2
7728 { \peek_regex:NTF #1 {#2} { } }
7729 \cs_new_protected:Npn \peek_regex:NF #1 { \peek_regex:NTF {#1} { } }
7730 \cs_new_protected:Npn \peek_regex_remove_once:nTF #1
7731 {
7732     \__regex_peek:nnTF
7733     { \__regex_build_aux:Nn \c_false_bool {#1} }
7734     { \__regex_remove_end:n {##1} }
7735 }
7736 \cs_new_protected:Npn \peek_regex_remove_once:nT #1#2
7737 { \peek_regex_remove_once:nTF {#1} {#2} { } }
7738 \cs_new_protected:Npn \peek_regex_remove_once:nF #1
7739 { \peek_regex_remove_once:nTF {#1} { } }
7740 \cs_new_protected:Npn \peek_regex_remove_once:NTF #1
7741 {
7742     \__regex_peek:nnTF
7743     { \__regex_build_aux>NN \c_false_bool #1 }
7744     { \__regex_remove_end:n {##1} }
7745 }
7746 \cs_new_protected:Npn \peek_regex_remove_once:NT #1#2
7747 { \peek_regex_remove_once:NTF #1 {#2} { } }
7748 \cs_new_protected:Npn \peek_regex_remove_once:NF #1
7749 { \peek_regex_remove_once:NTF #1 { } }

```

(End of definition for `\peek_regex:nTF` and others. These functions are documented on page 207.)

`\__regex_peek:nnTF`  
`\__regex_peek_aux:nnTF`

Store the user's true/false codes (plus `\group_end:`) into two token lists. Then build the automaton with `#1`, without submatch tracking, and aiming for a single match. Then start matching by setting up a few variables like for any regex matching like `\regex_match:nnTF`, with the addition of `\l__regex_input_t1` that keeps track of the tokens seen, to reinsert them at the end. Instead of `\tl_analysis_map_inline:nn` on the input, we call `\peek_analysis_map_inline:n` to go through tokens in the input stream. Since `\__regex_match_one_token:nnN` calls `\__regex_maplike_break:` we need to catch that and break the `\peek_analysis_map_inline:n` loop instead.

```

7750 \cs_new_protected:Npn \__regex_peek:nnTF #1
7751 {

```

```

7752     \_\_regex\_peek\_aux:nnTF
7753     {
7754         \_\_regex\_disable\_submatches:
7755         #1
7756     }
7757 }
7758 \cs_new_protected:Npn \_\_regex\_peek\_aux:nnTF #1#2#3#4
7759 {

`\_\_regex_peek_end:`  
`\_\_regex_peek_remove_end:n`

Once the regex matches (or permanently fails to match) we call `\_\_regex_peek_end:`, or `\_\_regex_peek_remove_end:n` with argument the last token seen. For `\peek_regex:nTF` we reinsert tokens seen by calling `\_\_regex_peek_reinsert:N` regardless of the result of the match. For `\peek_regex_remove_once:nTF` we reinsert the tokens seen only if the match failed; otherwise we just reinsert the tokens `#1`, with one expansion. To be more precise, `#1` consists of tokens that o-expand and e-expand to the last token seen, for example it is `\exp_not:N \cs` for a control sequence. This means that just doing `\exp_after:wN \l__regex_peek_true_tl #1` would be unsafe because the expansion of `\cs` would be suppressed.

```

7778 \cs_new_protected:Npn \_\_regex_peek_end:
7779 {
7780     \bool_if:NTF \g__regex_success_bool
7781     { \_\_regex_peek_reinsert:N \l__regex_peek_true_tl }
7782     { \_\_regex_peek_reinsert:N \l__regex_peek_false_tl }
7783 }
7784 \cs_new_protected:Npn \_\_regex_peek_remove_end:n #1
7785 {
7786     \bool_if:NTF \g__regex_success_bool
7787     { \exp_args:NNo \use:nn \l__regex_peek_true_tl {##1} }
7788     { \_\_regex_peek_reinsert:N \l__regex_peek_false_tl }
7789 }

```

(End of definition for `\_\_regex_peek_end:` and `\_\_regex_peek_remove_end:n`.)

`\__regex_peek_reinsert:N` Insert the true/false code #1, followed by the tokens found, which were stored in `\l__-regex_input_t1`. For this, loop through that token list using `\__regex_reinsert_item:n`, which expands #1 once to get a single token, and jumps over it to expand what follows, with suitable `\exp:w` and `\exp_end:`. We cannot just use `\use:e` on the whole token list because the result may be unbalanced, which would stop the primitive prematurely, or let it continue beyond where we would like.

```

7790 \cs_new_protected:Npn \__regex_peek_reinsert:N #1
7791 {
7792     \tl_build_end:N \l__regex_input_t1
7793     \cs_set_eq:NN \__regex_input_item:n \__regex_reinsert_item:n
7794     \exp_after:wN #1 \exp:w \l__regex_input_t1 \exp_end:
7795 }
7796 \cs_new_protected:Npn \__regex_reinsert_item:n #1
7797 {
7798     \exp_after:wN \exp_after:wN
7799     \exp_after:wN \exp_end:
7800     \exp_after:wN \exp_after:wN
7801     #1
7802     \exp:w
7803 }
```

(End of definition for `\__regex_peek_reinsert:N` and `\__regex_reinsert_item:n`.)

`\peek_regex_replace_once:nn`  
`\peek_regex_replace_once:nnTF`  
`\peek_regex_replace_once:Nn`  
`\peek_regex_replace_once:NnTF`

Similar to `\peek_regex:nTF` above.

```

7804 \cs_new_protected:Npn \peek_regex_replace_once:nnTF #1
7805     { \__regex_peek_replace:nnTF { \__regex_build_aux:Nn \c_false_bool {#1} } }
7806 \cs_new_protected:Npn \peek_regex_replace_once:nnT #1#2#3
7807     { \peek_regex_replace_once:nnTF {#1} {#2} {#3} { } }
7808 \cs_new_protected:Npn \peek_regex_replace_once:nnF #1#2
7809     { \peek_regex_replace_once:nnTF {#1} {#2} { } }
7810 \cs_new_protected:Npn \peek_regex_replace_once:nn #1#2
7811     { \peek_regex_replace_once:nnTF {#1} {#2} { } { } }
7812 \cs_new_protected:Npn \peek_regex_replace_once:NnTF #1
7813     { \__regex_peek_replace:nnTF { \__regex_build_aux>NN \c_false_bool #1 } }
7814 \cs_new_protected:Npn \peek_regex_replace_once:NnT #1#2#3
7815     { \peek_regex_replace_once:NnTF #1 {#2} {#3} { } }
7816 \cs_new_protected:Npn \peek_regex_replace_once:NnF #1#2
7817     { \peek_regex_replace_once:NnTF #1 {#2} { } }
7818 \cs_new_protected:Npn \peek_regex_replace_once:Nn #1#2
7819     { \peek_regex_replace_once:NnTF #1 {#2} { } { } }
```

(End of definition for `\peek_regex_replace_once:nnTF` and `\peek_regex_replace_once:NnTF`. These functions are documented on page 208.)

`\__regex_peek_replace:nnTF`

Same as `\__regex_peek:nnTF` (used for `\peek_regex:nTF` above), but without disabling submatches, and with a different end. The replacement text #2 is stored, to be analyzed later.

```

7820 \cs_new_protected:Npn \__regex_peek_replace:nnTF #1#2
7821     {
7822         \tl_set:Nn \l__regex_replacement_t1 {#2}
7823         \__regex_peek_aux:nnTF {#1} { \__regex_peek_replace_end: }
```

(End of definition for `\__regex_peek_replace:nnTF`.)

\\_\\_regex\\_peek\\_replace\\_end: If the match failed \\_\\_regex\\_reinsert:N reinserts the tokens found. Otherwise, finish storing the submatch information using \\_\\_regex\\_extract:, and store the input into \toks. Redefine a few auxiliaries to change slightly their expansion behaviour as explained below. Analyse the replacement text with \\_\\_regex\\_replacement:n, which as usual defines \\_\\_regex\\_replacement\\_do\\_one\\_match:n to insert the tokens from the start of the match attempt to the beginning of the match, followed by the replacement text. The \use:e expands for instance the trailing \\_\\_regex\\_query\\_range:nn down to a sequence of \\_\\_regex\\_reinsert\\_item:n {*tokens*} where *tokens* o-expand to a single token that we want to insert. After e-expansion, \use:e does \use:n, so we have \exp\\_after:wN \l\\_\\_regex\\_peek\\_true\\_tl \exp:w ... \exp\_end:. This is set up such as to obtain \l\\_\\_regex\\_peek\\_true\\_tl followed by the replaced tokens (possibly unbalanced) in the input stream.

```

7825 \cs_new_protected:Npn \_\_regex_peek_replace_end:
7826 {

7858         \_\_regex_query_set_item:n { }
7859     \l\_\_regex_input_tl
```

```

7860     \_\_regex_query_set_item:n { }
7861     \int_set_eq:NN \l\_regex_max_pos_int \l\_regex_curr_pos_int
7862   }
7863 \cs_new_protected:Npn \_\_regex_query_set_item:n #1
7864   {
7865     \int_incr:N \l\_regex_curr_pos_int
7866     \_\_regex_toks_set:Nn \l\_regex_curr_pos_int { \_\_regex_input_item:n {#1} }
7867   }

```

(End of definition for `\_\_regex_query_set_from_input_tl: and \_\_regex_query_set_item:n`.)

`\_\_regex_peek_replacement_put:n`

While building the replacement function `\_\_regex_replacement_do_one_match:n`, we often want to put simple material, given as #1, whose e-expansion o-expands to a single token. Normally we can just add the token to `\l\_regex_build_tl`, but for `\peek_regex_replace_once:nnTF` we eventually want to do some strange expansion that is basically using `\exp_after:wN` to jump through numerous tokens (we cannot use e-expansion like for `\regex_replace_once:nnTF` because it is ok for the result to be unbalanced since we insert it in the input stream rather than storing it. When within a csname we don't do any such shenanigan because `\cs:w ... \cs_end:` does all the expansion we need.

```

7868 \cs_new_protected:Npn \_\_regex_peek_replacement_put:n #1
7869   {
7870     \if_case:w \l\_regex_replacement_csnames_int
7871       \tl_build_put_right:Nn \l\_regex_build_tl
7872         { \exp_not:N \_\_regex_reinsert_item:n {#1} }
7873     \else:
7874       \tl_build_put_right:Nn \l\_regex_build_tl {#1}
7875     \fi:
7876   }

```

(End of definition for `\_\_regex_peek_replacement_put:n`.)

`\_\_regex_peek_replacement_token:n`

When hit with `\exp:w, \_\_regex_peek_replacement_token:n {<token>}` stops `\exp_end:` and does `\exp_after:wN <token> \exp:w` to continue expansion after it.

```

7877 \cs_new_protected:Npn \_\_regex_peek_replacement_token:n #1
7878   { \exp_after:wN \exp_end: \exp_after:wN #1 \exp:w }

```

(End of definition for `\_\_regex_peek_replacement_token:n`.)

`\_\_regex_peek_replacement_put_submatch_aux:n`

While analyzing the replacement we also have to insert submatches found in the query. Since query items `\_\_regex_input_item:n {<tokens>}` expand correctly only when surrounded by `\exp:w ... \exp_end:`, and since these expansion controls are not there within csnames (because `\cs:w ... \cs_end:` make them unnecessary in most cases), we have to put `\exp:w` and `\exp_end:` by hand here.

```

7879 \cs_new_protected:Npn \_\_regex_peek_replacement_put_submatch_aux:n #1
7880   {
7881     \if_case:w \l\_regex_replacement_csnames_int
7882       \tl_build_put_right:Nn \l\_regex_build_tl
7883         { \_\_regex_query_submatch:n { \_\_regex_int_eval:w #1 + ##1 \scan_stop: } }
7884     \else:
7885       \tl_build_put_right:Nn \l\_regex_build_tl
7886         {
7887           \exp:w
7888             \_\_regex_query_submatch:n { \_\_regex_int_eval:w #1 + ##1 \scan_stop: } }

```

```

7889         \exp_end:
7890     }
7891   \fi:
7892 }

(End of definition for \_\_regex_peek_replacement_put_submatch_aux:n.)
```

\\_\\_regex\_peek\_replacement\_var:N This is used for \u outside csnames. It makes sure to continue expansion with \exp:w before expanding the variable #1 and stopping the \exp:w that precedes.

```

7893 \cs_new_protected:Npn \_\_regex_peek_replacement_var:N #1
7894 {
7895   \exp_after:wN \exp_last_unbraced:NV
7896   \exp_after:wN \exp_end:
7897   \exp_after:wN #1
7898   \exp:w
7899 }
```

(End of definition for \\_\\_regex\_peek\_replacement\_var:N.)

8189 \prop_gput:Nnn \g_msg_module_type_prop { regex } { }

```

\\_\\_regex\\_msg\\_repeated:nnN

This is not technically a message, but seems related enough to go there. The arguments are: #1 is the minimum number of repetitions; #2 is the number of allowed extra repetitions (-1 for infinite number), and #3 tells us about lazyness.

```

8190 \cs_new:Npn \_\_regex_msg_repeated:nnN #1#2#3
8191   {
8192     \str_if_eq:eeF { #1 #2 } { 1 0 }
8193     {
8194       , ~ repeated ~
8195       \int_case:nnF {#2}
8196       {
8197         { -1 } { #1~or~more~times,~\bool_if:NTF #3 { lazy } { greedy } }
8198         { 0 } { #1~times }
8199       }
8200     {
8201       between~#1~and~\int_eval:n {#1+#2}~times,~
8202       \bool_if:NTF #3 { lazy } { greedy }
8203     }
8204   }
8205 }

```

(End of definition for \\_\\_regex\\_msg\\_repeated:nnN.)

## 46.9 Code for tracing

There is a more extensive implementation of tracing in the l3trial package l3trace. Function names are a bit different but could be merged.

\\_\\_regex\\_trace\\_push:nnN  
\\_\\_regex\\_trace\\_pop:nnN  
\\_\\_regex\\_trace:nne

Here #1 is the module name (regex) and #2 is typically 1. If the module's current tracing level is less than #2 show nothing, otherwise write #3 to the terminal.

```

8206 \cs_new_protected:Npn \_\_regex_trace_push:nnN #1#2#3
8207   { \_\_regex_trace:nne {#1} {#2} { entering~ \token_to_str:N #3 } }
8208 \cs_new_protected:Npn \_\_regex_trace_pop:nnN #1#2#3
8209   { \_\_regex_trace:nne {#1} {#2} { leaving~ \token_to_str:N #3 } }
8210 \cs_new_protected:Npn \_\_regex_trace:nne #1#2#3
8211   {
8212     \int_compare:nNf
8213       { \int_use:c { g_\_\_regex_trace_#1_int } } < {#2}
8214       { \iow_term:e { Trace:~#3 } }
8215   }

```

(End of definition for \\_\\_regex\\_trace\\_push:nnN, \\_\\_regex\\_trace\\_pop:nnN, and \\_\\_regex\\_trace:nne.)

\g\_\\_\\_regex\\_trace\\_regex\\_int

No tracing when that is zero.

```
8216 \int_new:N \g_\_\_regex_trace_regex_int
```

(End of definition for `\g__regex_trace_regex_int`.)

`\__regex_trace_states:n` This function lists the contents of all states of the NFA, stored in `\toks` from 0 to `\l__regex_max_state_int` (excluded).

```
8217 \cs_new_protected:Npn \__regex_trace_states:n #1
8218   {
8219     \int_step_inline:nnn
8220       \l__regex_min_state_int
8221       { \l__regex_max_state_int - \c_one_int }
8222       {
8223         \__regex_trace:nne { regex } {#1}
8224         { \iow_char:N \\toks ##1 = { \__regex_toks_use:w ##1 } }
8225       }
8226   }
```

(End of definition for `\__regex_trace_states:n`.)

```
8227 ⟨/package⟩
```

# Chapter 47

## I3prg implementation

The following test files are used for this code: *m3prg001.lvt, m3prg002.lvt, m3prg003.lvt*.

8228 ⟨\*package⟩

### 47.1 Primitive conditionals

**\if\_bool:N** Those two primitive TeX conditionals are synonyms. **\if\_bool:N** is defined in I3basics, as it's needed earlier to define quark test functions.

8229 **\cs\_new\_eq:NN \if\_predicate:w \tex\_ifodd:D**

(End of definition for **\if\_bool:N** and **\if\_predicate:w**. These functions are documented on page 72.)

### 47.2 Defining a set of conditional functions

These are all defined in I3basics, as they are needed “early”. This is just a reminder!

(End of definition for **\prg\_set\_conditional:Npnn** and others. These functions are documented on page 63.)

### 47.3 The boolean data type

8230 ⟨@=bool⟩

Boolean variables have to be initiated when they are created. Other than that there is not much to say here.

8231 **\cs\_new\_protected:Npn \bool\_new:N #1 { \cs\_new\_eq:NN #1 \c\_false\_bool }**  
8232 **\cs\_generate\_variant:Nn \bool\_new:N { c }**

(End of definition for **\bool\_new:N**. This function is documented on page 66.)

**\bool\_const:Nn** A merger between **\tl\_const:Nn** and **\bool\_set:Nn**.

8233 **\cs\_new\_protected:Npn \bool\_const:Nn #1#2**  
8234     {  
8235         **\\_\_kernel\_chk\_if\_free\_cs:N #1**  
8236         **\tex\_global:D \tex\_chardef:D #1 = \bool\_if\_p:n {#2}**  
8237     }  
8238 **\cs\_generate\_variant:Nn \bool\_const:Nn { c }**

(End of definition for `\bool_const:Nn`. This function is documented on page 66.)

`\bool_set_true:N` Setting is already pretty easy. When `check-declarations` is active, the definitions are patched to make sure the boolean exists. This is needed because booleans are not based on token lists nor on T<sub>E</sub>X registers.

```
8239 \cs_new_protected:Npn \bool_set_true:N #1
8240   { \cs_set_eq:NN #1 \c_true_bool }
8241 \cs_new_protected:Npn \bool_set_false:N #1
8242   { \cs_set_eq:NN #1 \c_false_bool }
8243 \cs_new_protected:Npn \bool_gset_true:N #1
8244   { \cs_gset_eq:NN #1 \c_true_bool }
8245 \cs_new_protected:Npn \bool_gset_false:N #1
8246   { \cs_gset_eq:NN #1 \c_false_bool }
8247 \cs_generate_variant:Nn \bool_set_true:N { c }
8248 \cs_generate_variant:Nn \bool_set_false:N { c }
8249 \cs_generate_variant:Nn \bool_gset_true:N { c }
8250 \cs_generate_variant:Nn \bool_gset_false:N { c }
```

(End of definition for `\bool_set_true:N` and others. These functions are documented on page 66.)

`\bool_set_eq:NN` The usual copy code. While it would be cleaner semantically to copy the `\cs_set_eq:NN` family of functions, we copy `\tl_set_eq:NN` because that has the correct checking code.

```
8251 \cs_new_eq:NN \bool_set_eq:NN \tl_set_eq:NN
8252 \cs_new_eq:NN \bool_gset_eq:NN \tl_gset_eq:NN
8253 \cs_generate_variant:Nn \bool_set_eq:NN { Nc, cN, cc }
8254 \cs_generate_variant:Nn \bool_gset_eq:NN { Nc, cN, cc }
```

(End of definition for `\bool_set_eq:NN` and `\bool_gset_eq:NN`. These functions are documented on page 66.)

`\bool_set:Nn` This function evaluates a boolean expression and assigns the first argument the meaning `\c_true_bool` or `\c_false_bool`. Again, we include some checking code. It is important to evaluate the expression before applying the `\chardef` primitive, because that primitive sets the left-hand side to `\scan_stop:` before looking for the right-hand side.

```
8255 \cs_new_protected:Npn \bool_set:Nn #1#2
8256   {
8257     \exp_last_unbraced:NNNF
8258     \tex_chardef:D #1 = { \bool_if_p:n {#2} }
8259   }
8260 \cs_new_protected:Npn \bool_gset:Nn #1#2
8261   {
8262     \exp_last_unbraced:NNNNF
8263     \tex_global:D \tex_chardef:D #1 = { \bool_if_p:n {#2} }
8264   }
8265 \cs_generate_variant:Nn \bool_set:Nn { c }
8266 \cs_generate_variant:Nn \bool_gset:Nn { c }
```

(End of definition for `\bool_set:Nn` and `\bool_gset:Nn`. These functions are documented on page 66.)

`\bool_set_inverse:N` Set to `false` or `true` locally or globally.

```
8267 \cs_new_protected:Npn \bool_set_inverse:N #1
8268   { \bool_if:NTF #1 { \bool_set_false:N } { \bool_set_true:N } #1 }
8269 \cs_generate_variant:Nn \bool_set_inverse:N { c }
8270 \cs_new_protected:Npn \bool_gset_inverse:N #1
8271   { \bool_if:NTF #1 { \bool_gset_false:N } { \bool_gset_true:N } #1 }
8272 \cs_generate_variant:Nn \bool_gset_inverse:N { c }
```

(End of definition for `\bool_set_inverse:N` and `\bool_gset_inverse:N`. These functions are documented on page 66.)

## 47.4 Internal auxiliaries

`\q__bool_recursion_tail` Internal recursion quarks.

```
8273 \quark_new:N \q__bool_recursion_tail  
8274 \quark_new:N \q__bool_recursion_stop
```

(End of definition for `\q__bool_recursion_tail` and `\q__bool_recursion_stop`.)

`\_bool_use_i_delimit_by_q_recursion_stop:nw` Functions to gobble up to a quark.

```
8275 \cs_new:Npn \_bool_use_i_delimit_by_q_recursion_stop:nw  
8276 #1 #2 \q__bool_recursion_stop {#1}
```

(End of definition for `\_bool_use_i_delimit_by_q_recursion_stop:nw`.)

`\_bool_if_recursion_tail_stop_do:nn` Functions to query recursion quarks.

```
8277 \_kernel_quark_new_test:N \_bool_if_recursion_tail_stop_do:nn
```

(End of definition for `\_bool_if_recursion_tail_stop_do:nn`.)

`\bool_if_p:N` Straight forward here. We could optimize here if we wanted to as the boolean can just be input directly.

`\bool_if_p:c` `\bool_if:cTF`

```
8278 \prg_new_conditional:Npnm \bool_if:N #1 { p , T , F , TF }  
8279 {  
8280 \if_bool:N #1  
8281 \prg_return_true:  
8282 \else:  
8283 \prg_return_false:  
8284 \fi:  
8285 }  
8286 \prg_generate_conditional_variant:Nnn \bool_if:N { c } { p , T , F , TF }
```

(End of definition for `\bool_if:NTF`. This function is documented on page 67.)

`\bool_to_str:N` Expands to string literal true or false.

`\bool_to_str:c` `\bool_to_str:n`

```
8287 \cs_new:Npe \bool_to_str:N #1  
8288 {  
8289 \exp_not:N \bool_if:NTF #1  
8290 { \tl_to_str:n { true } } { \tl_to_str:n { false } }  
8291 }  
8292 \cs_generate_variant:Nn \bool_to_str:N { c }  
8293 \cs_new:Npe \bool_to_str:n #1  
8294 {  
8295 \exp_not:N \bool_if:nTF {#1}

8324 \bool_new:N \g_tmpb_bool

```

(End of definition for `\l_tmpa_bool` and others. These variables are documented on page 67.)

`\bool_if_exist_p:N` Copies of the `cs` functions defined in `l3basics`.

```

\bool_if_exist_p:c
\bool_if_exist:NTF
\bool_if_exist:cTF
8325 \prg_new_eq_conditional:NNn \bool_if_exist:N \cs_if_exist:N
8326   { TF , T , F , p }
8327 \prg_new_eq_conditional:NNn \bool_if_exist:c \cs_if_exist:c
8328   { TF , T , F , p }

```

(End of definition for `\bool_if_exist:NTF`. This function is documented on page 67.)

## 47.5 Boolean expressions

\bool\_if\_p:n  
\bool\_if:nTF

Evaluating the truth value of a list of predicates is done using an input syntax somewhat similar to the one found in other programming languages with ( and ) for grouping, ! for logical “Not”, && for logical “And” and || for logical “Or”. However, they perform eager evaluation. We shall use the terms Not, And, Or, Open and Close for these operations.

Any expression is terminated by a Close operation. Evaluation happens from left to right in the following manner using a GetNext function:

- If an Open is seen, start evaluating a new expression using the Eval function and call GetNext again.
- If a Not is seen, remove the ! and call a GetNext function with the logic reversed.
- If none of the above, reinsert the token found (this is supposed to be a predicate function) in front of an Eval function, which evaluates it to the boolean value ⟨true⟩ or ⟨false⟩.

The Eval function then contains a post-processing operation which grabs the instruction following the predicate. This is either And, Or or Close. In each case the truth value is used to determine where to go next. The following situations can arise:

⟨true⟩And Current truth value is true, logical And seen, continue with GetNext to examine truth value of next boolean (sub-)expression.

⟨false⟩And Current truth value is false, logical And seen, stop using the values of predicates within this sub-expression until the next Close. Then return ⟨false⟩.

⟨true⟩Or Current truth value is true, logical Or seen, stop using the values of predicates within this sub-expression until the nearest Close. Then return ⟨true⟩.

⟨false⟩Or Current truth value is false, logical Or seen, continue with GetNext to examine truth value of next boolean (sub-)expression.

⟨true⟩Close Current truth value is true, Close seen, return ⟨true⟩.

⟨false⟩Close Current truth value is false, Close seen, return ⟨false⟩.

```
8329 \prg_new_conditional:Npnn \bool_if:n #1 { T , F , TF }
8330 {
8331     \if_predicate:w \bool_if_p:n {#1}
8332         \prg_return_true:
8333     \else:
8334         \prg_return_false:
8335     \fi:
8336 }
```

(End of definition for \bool\_if:nTF. This function is documented on page 69.)

\bool\_if\_p:n  
\\_bool\_if\_p:n  
\\_bool\_if\_p\_aux:w

To speed up the case of a single predicate, f-expand and check whether the result is one token (possibly surrounded by spaces), which must be \c\_true\_bool or \c\_false\_bool. We use a version of \t1\_if\_single:nTF optimized for speed since we know that an empty #1 is an error. The auxiliary \\_bool\_if\_p\_aux:w removes the trailing parenthesis and gets rid of any space, then returns \c\_true\_bool or \c\_false\_bool as appropriate. This extra work around is because in a \bool\_set:Nn, the underlying \chardef turns

the bool being set temporarily equal to `\relax`, thus assigning a boolean to itself would fail (gh/1055). For the general case, first issue a `\group_align_safe_begin`: as we are using `&&` as syntax shorthand for the And operation and we need to hide it for TeX. This group is closed after `\__bool_get_next:NN` returns `\c_true_bool` or `\c_false_bool`. That function requires the trailing parenthesis to know where the expression ends.

```

8337 \cs_new:Npn \bool_if_p:n { \exp_args:Nf \__bool_if_p:n }
8338 \cs_new:Npn \__bool_if_p:n #1
8339 {
8340     \tl_if_empty:cT { \use_none:nn #1 . } { \__bool_if_p_aux:w }
8341     \group_align_safe_begin:
8342     \exp_after:wN
8343     \group_align_safe_end:
8344     \exp:w \exp_end_continue_f:w % (
8345     \__bool_get_next:NN \use_i:nnnn #1 )
8346 }
8347 \cs_new:Npn \__bool_if_p_aux:w #1 \use_i:nnnn #2#3
8348 { \bool_if:NTF #2 \c_true_bool \c_false_bool }
```

(End of definition for `\bool_if_p:n`, `\__bool_if_p:n`, and `\__bool_if_p_aux:w`. This function is documented on page 69.)

`\__bool_get_next:NN` The GetNext operation. Its first argument is `\use_i:nnnn`, `\use_ii:nnnn`, `\use_iii:nnnn`, or `\use_iv:nnnn` (we call these “states”). In the first state, this function eventually expand to the truth value `\c_true_bool` or `\c_false_bool` of the expression which follows until the next unmatched closing parenthesis. For instance “`\__bool_get_next:NN \use_i:nnnn \c_true_bool && \c_true_bool )`” (including the closing parenthesis) expands to `\c_true_bool`. In the second state (after a `!`) the logic is reversed. We call these two states “normal” and the next two “skipping”. In the third state (after `\c_true_bool||`) it always returns `\c_true_bool`. In the fourth state (after `\c_false_bool&&`) it always returns `\c_false_bool` and also stops when encountering `||`, not only parentheses. This code itself is a switch: if what follows is neither `!` nor `(`, we assume it is a predicate.

```

8349 \cs_new:Npn \__bool_get_next:NN #1#2
8350 {
8351     \use:c
8352     {
8353         __bool_
8354         \if_meaning:w !#2 ! \else: \if_meaning:w (#2 ( \else: p \fi: \fi:
8355         :Nw
8356     }
8357     #1 #2
8358 }
```

(End of definition for `\__bool_get_next:NN`.)

`\__bool_! :Nw` The Not operation reverses the logic: it discards the `!` token and calls the GetNext operation with the appropriate first argument. Namely the first and second states are interchanged, but after `\c_true_bool||` or `\c_false_bool&&` the `!` is ignored.

```

8359 \cs_new:cpn { __bool_!:Nw } #1#2
8360 {
8361     \exp_after:wN \__bool_get_next:NN
8362     #1 \use_ii:nnnn \use_i:nnnn \use_iii:nnnn \use_iv:nnnn
8363 }
```

(End of definition for `\_\_bool\_!:Nw.`)

`\_\_bool\_(:Nw` The Open operation starts a sub-expression after discarding the open parenthesis. This is done by calling GetNext (which eventually discards the corresponding closing parenthesis), with a post-processing step which looks for And, Or or Close after the group.

```
8364 \cs_new:cpn { __bool_(:Nw } #1#2
8365   {
8366     \exp_after:wN __bool_choose:NNN \exp_after:wN #1
8367     \int_value:w __bool_get_next>NN \use_i:nnnn
8368   }
```

(End of definition for `\_\_bool\_(:Nw.`)

`\_\_bool_p:Nw` If what follows GetNext is neither ! nor (, evaluate the predicate using the primitive `\int_value:w`. The canonical `true` and `false` values have numerical values 1 and 0 respectively. Look for And, Or or Close afterwards.

```
8369 \cs_new:cpn { __bool_p:Nw } #1
8370   { \exp_after:wN __bool_choose:NNN \exp_after:wN #1 \int_value:w }
```

(End of definition for `\_\_bool_p:Nw.`)

`\_\_bool_choose:NNN` The arguments are #1: a function such as `\use_i:nnnn`, #2: 0 or 1 encoding the current truth value, #3: the next operation, And, Or or Close. We distinguish three cases according to a combination of #1 and #2. Case 2 is when #1 is `\use_iii:nnnn` (state 3), namely after `\c_true_bool ||`. Case 1 is when #1 is `\use_ii:nnnn` and #2 is `true` or when #1 is `\use_ii:nnnn` and #2 is `false`, for instance for `! \c_false_bool`. Case 0 includes the same with `true/false` interchanged and the case where #1 is `\use_iv:nnnn` namely after `\c_false_bool &&`.

`\_\_bool_|_0:` When seeing ) the current subexpression is done, leave the appropriate boolean. When seeing & in case 0 go into state 4, equivalent to having seen `\c_false_bool &&`.  
`\_\_bool_|_1:` In case 1, namely when the argument is `true` and we are in a normal state continue in the normal state 1. In case 2, namely when skipping alternatives in an Or, continue in the same state. When seeing | in case 0, continue in a normal state; in particular stop skipping for `\c_false_bool &&` because that binds more tightly than |||. In the other two cases start skipping for `\c_true_bool ||`.

```
8371 \cs_new:Npn __bool_choose:NNN #1#2#3
8372   {
8373     \use:c
8374       {
8375         __bool_ \token_to_str:N #3 -
8376         #1 #2 { \if_meaning:w 0 #2 1 \else: 0 \fi: } 2 0 :
8377       }
8378     }
8379 \cs_new:cpn { __bool_|_0: } { \c_false_bool }
8380 \cs_new:cpn { __bool_|_1: } { \c_true_bool }
8381 \cs_new:cpn { __bool_|_2: } { \c_true_bool }
8382 \cs_new:cpn { __bool_&_0: } & { __bool_get_next>NN \use_iv:nnnn }
8383 \cs_new:cpn { __bool_&_1: } & { __bool_get_next>NN \use_i:nnnn }
8384 \cs_new:cpn { __bool_&_2: } & { __bool_get_next>NN \use_iii:nnnn }
8385 \cs_new:cpn { __bool_|_0: } | { __bool_get_next>NN \use_i:nnnn }
8386 \cs_new:cpn { __bool_|_1: } | { __bool_get_next>NN \use_iii:nnnn }
8387 \cs_new:cpn { __bool_|_2: } | { __bool_get_next>NN \use_iii:nnnn }
```

(End of definition for `\_bool_choose:NNN` and others.)

`\bool_lazy_all_p:n` Go through the list of expressions, stopping whenever an expression is `false`. If the end is reached without finding any `false` expression, then the result is `true`.

`\_bool_lazy_all:n`

```
8388 \cs_new:Npn \bool_lazy_all_p:n #1
8389   { \_bool_lazy_all:n #1 \q_bool_recursion_tail \q_bool_recursion_stop }
8390   \prg_new_conditional:Npnn \bool_lazy_all:n #1 { T , F , TF }
8391   {
8392     \if_predicate:w \bool_lazy_all_p:n {#1}
8393       \prg_return_true:
8394     \else:
8395       \prg_return_false:
8396     \fi:
8397   }
8398 \cs_new:Npn \_bool_lazy_all:n #1
8399   {
8400     \_bool_if_recursion_tail_stop_do:nn {#1} { \c_true_bool }
8401     \bool_if:nF {#1}
8402       { \_bool_use_i_delimit_by_q_recursion_stop:nw { \c_false_bool } }
8403     \_bool_lazy_all:n
8404   }
```

(End of definition for `\bool_lazy_all:nTF` and `\_bool_lazy_all:n`. This function is documented on page 69.)

`\bool_lazy_and_p:nn` Only evaluate the second expression if the first is `true`. Note that `#2` must be removed as an argument, not just by skipping to the `\else:` branch of the conditional since `#2` may contain unbalanced T<sub>E</sub>X conditionals.

`\bool_lazy_and:nTF`

```
8405 \prg_new_conditional:Npnn \bool_lazy_and:nn #1#2 { p , T , F , TF }
8406   {
8407     \if_predicate:w
8408       \bool_if:nTF {#1} { \bool_if_p:n {#2} } { \c_false_bool }
8409       \prg_return_true:
8410     \else:
8411       \prg_return_false:
8412     \fi:
8413   }
```

(End of definition for `\bool_lazy_and:nTF`. This function is documented on page 69.)

`\bool_lazy_any_p:n`

`\bool_lazy_any:nTF`

`\_bool_lazy_any:n`

```
8414 \cs_new:Npn \bool_lazy_any_p:n #1
8415   { \_bool_lazy_any:n #1 \q_bool_recursion_tail \q_bool_recursion_stop }
8416   \prg_new_conditional:Npnn \bool_lazy_any:n #1 { T , F , TF }
8417   {
8418     \if_predicate:w \bool_lazy_any_p:n {#1}
8419       \prg_return_true:
8420     \else:
8421       \prg_return_false:
8422     \fi:
8423   }
8424 \cs_new:Npn \_bool_lazy_any:n #1
8425   {
```

```

8426     \_\_bool\_if\_recursion\_tail\_stop\_do:nN { \c_false\_bool }
8427     \bool_if:nT {#1}
8428     { \_\_bool\_use\_i\_delimit\_by\_q\_recursion\_stop:nw { \c_true\_bool } }
8429     \_\_bool\_lazy\_any:n
8430   }

```

(End of definition for `\bool_lazy_any:nTF` and `\_\_bool_lazy_any:n`. This function is documented on page 69.)

`\bool_lazy_or_p:nn` Only evaluate the second expression if the first is `false`.

```

8431   \prg_new_conditional:Npnn \bool_lazy_or:nn #1#2 { p , T , F , TF }
8432   {
8433     \if_predicate:w
8434     \bool_if:nTF {#1} { \c_true_bool } { \bool_if_p:n {#2} }
8435     \prg_return_true:
8436   \else:
8437     \prg_return_false:
8438   \fi:
8439 }

```

(End of definition for `\bool_lazy_or:nnTF`. This function is documented on page 69.)

`\bool_not_p:n` The Not variant just reverses the outcome of `\bool_if_p:n`. Can be optimized but this is nice and simple and according to the implementation plan. Not even particularly useful to have it when the infix notation is easier to use.

```
8440 \cs_new:Npn \bool_not_p:n #1 { \bool_if_p:n { ! ( #1 ) } }
```

(End of definition for `\bool_not_p:n`. This function is documented on page 69.)

`\bool_xor_p:nn` Exclusive or. If the boolean expressions have same truth value, return `false`, otherwise return `true`.

```

8441 \prg_new_conditional:Npnn \bool_xor:nn #1#2 { p , T , F , TF }
8442 {
8443   \bool_if:nT {#1} \reverse_if:N
8444   \if_predicate:w \bool_if_p:n {#2}
8445     \prg_return_true:
8446   \else:
8447     \prg_return_false:
8448   \fi:
8449 }

```

(End of definition for `\bool_xor:nnTF`. This function is documented on page 70.)

## 47.6 Logical loops

`\bool_while_do:Nn` A `while` loop where the boolean is tested before executing the statement. The “while” version executes the code as long as the boolean is true; the “until” version executes the code as long as the boolean is false.

```

8450 \cs_new:Npn \bool_while_do:Nn #1#2
8451   { \bool_if:NT #1 { #2 \bool_while_do:Nn #1 {#2} } }
8452 \cs_new:Npn \bool_until_do:Nn #1#2
8453   { \bool_if:NF #1 { #2 \bool_until_do:Nn #1 {#2} } }
8454 \cs_generate_variant:Nn \bool_while_do:Nn { c }
8455 \cs_generate_variant:Nn \bool_until_do:Nn { c }

```

(End of definition for `\bool_while:Fn` and `\bool_until:Fn`. These functions are documented on page 70.)

`\bool_do_while:Nn` A do-while loop where the body is performed at least once and the boolean is tested after executing the body. Otherwise identical to the above functions.

```
8456 \cs_new:Npn \bool_do_while:Nn #1#2
8457   { #2 \bool_if:NT #1 { \bool_do_while:Nn #1 {#2} } }
8458 \cs_new:Npn \bool_do_until:Nn #1#2
8459   { #2 \bool_if:NF #1 { \bool_do_until:Nn #1 {#2} } }
8460 \cs_generate_variant:Nn \bool_do_while:Nn { c }
8461 \cs_generate_variant:Nn \bool_do_until:Nn { c }
```

(End of definition for `\bool_do_while:Nn` and `\bool_do_until:Nn`. These functions are documented on page 70.)

`\bool_while_do:nn` Loop functions with the test either before or after the first body expansion.

```
8462 \cs_new:Npn \bool_while_do:nn #1#2
8463   {
8464     \bool_if:nT {#1}
8465     {
8466       #2
8467       \bool_while_do:nn {#1} {#2}
8468     }
8469   }
8470 \cs_new:Npn \bool_do_while:nn #1#2
8471   {
8472     #2
8473     \bool_if:nT {#1} { \bool_do_while:nn {#1} {#2} }
8474   }
8475 \cs_new:Npn \bool_until_do:nn #1#2
8476   {
8477     \bool_if:nF {#1}
8478     {
8479       #2
8480       \bool_until_do:nn {#1} {#2}
8481     }
8482   }
8483 \cs_new:Npn \bool_do_until:nn #1#2
8484   {
8485     #2
8486     \bool_if:nF {#1} { \bool_do_until:nn {#1} {#2} }
8487   }
```

(End of definition for `\bool_while_do:nn` and others. These functions are documented on page 71.)

`\s__bool_mark` Internal scan marks.

```
8488 \scan_new:N \s__bool_mark
8489 \scan_new:N \s__bool_stop
```

(End of definition for `\s__bool_mark` and `\s__bool_stop`.)

`\bool_case:n` For boolean cases the overall idea is the same as for `\str_case:nnTF` as described in l3str.

```
8490 \cs_new:Npn \bool_case:nTF
8491   { \exp:w \__bool_case:nTF }
```

a\\_\_bool\_case\_end:nw

```

8492 \cs_new:Npn \bool_case:nT #1#2
8493   { \exp:w \__bool_case:nTF {#1} {#2} { } }
8494 \cs_new:Npn \bool_case:nF #1
8495   { \exp:w \__bool_case:nTF {#1} { } }
8496 \cs_new:Npn \bool_case:n #1
8497   { \exp:w \__bool_case:nTF {#1} { } { } }
8498 \cs_new:Npn \__bool_case:nTF #1#2#3
8499   {
8500     \__bool_case:w
8501     #1 \c_true_bool { } \s__bool_mark {#2} \s__bool_mark {#3} \s__bool_stop
8502   }
8503 \cs_new:Npn \__bool_case:w #1#2
8504   {
8505     \bool_if:nTF {#1}
8506     { \__bool_case_end:nw {#2} }
8507     { \__bool_case:w }
8508   }
8509 \cs_new:Npn \__bool_case_end:nw #1#2#3 \s__bool_mark #4#5 \s__bool_stop
8510   { \exp_end: #1 #4 }

```

(End of definition for `\bool_case:nTF` and others. This function is documented on page 71.)

## 47.7 Producing multiple copies

8511 ⟨@=prg⟩

**\prg\_replicate:nn** This function uses a cascading csname technique by David Kastrup (who else :-)

The idea is to make the input 25 result in first adding five, and then 20 copies of the code to be replicated. The technique uses cascading csnames which means that we start building several csnames so we end up with a list of functions to be called in reverse order. This is important here (and other places) because it means that we can for instance make the function that inserts five copies of something to also hand down ten to the next function in line. This is exactly what happens here: in the example with 25 then the next function is the one that inserts two copies but it sees the ten copies handed down by the previous function. In order to avoid the last function to insert say, 100 copies of the original argument just to gobble them again we define separate functions to be inserted first. These functions also close the expansion of `\exp:w`, which ensures that `\prg_replicate:nn` only requires two steps of expansion.

This function has one flaw though: Since it constantly passes down ten copies of its previous argument it severely affects the main memory once you start demanding hundreds of thousands of copies. Now I don't think this is a real limitation for any ordinary use, and if necessary, it is possible to write `\prg_replicate:nn {1000} { \prg_replicate:nn {1000} {⟨code⟩} }`. An alternative approach is to create a string of m's with `\exp:w` which can be done with just four macros but that method has its own problems since it can exhaust the string pool. Also, it is considerably slower than what we use here so the few extra csnames are well spent I would say.

```

8512 \cs_new:Npn \prg_replicate:nn #1
8513   {
8514     \exp:w
8515     \exp_after:wN \__prg_replicate_first:N
8516     \int_value:w \int_eval:n {#1}
8517     \cs_end:

```

```

8518    }
8519 \cs_new:Npn \__prg_replicate:N #1
8520   { \cs:w __prg_replicate_#1 :n \__prg_replicate:N }
8521 \cs_new:Npn \__prg_replicate_first:N #1
8522   { \cs:w __prg_replicate_first_ #1 :n \__prg_replicate:N }

```

Then comes all the functions that do the hard work of inserting all the copies. The first function takes :n as a parameter.

```

8523 \cs_new:Npn \__prg_replicate_ :n #1 { \cs_end: }
8524 \cs_new:cpn { __prg_replicate_0:n } #1
8525   { \cs_end: {#1#1#1#1#1#1#1#1#1} }
8526 \cs_new:cpn { __prg_replicate_1:n } #1
8527   { \cs_end: {#1#1#1#1#1#1#1#1#1} #1 }
8528 \cs_new:cpn { __prg_replicate_2:n } #1
8529   { \cs_end: {#1#1#1#1#1#1#1#1#1} #1#1 }
8530 \cs_new:cpn { __prg_replicate_3:n } #1
8531   { \cs_end: {#1#1#1#1#1#1#1#1#1} #1#1#1 }
8532 \cs_new:cpn { __prg_replicate_4:n } #1
8533   { \cs_end: {#1#1#1#1#1#1#1#1#1} #1#1#1#1 }
8534 \cs_new:cpn { __prg_replicate_5:n } #1
8535   { \cs_end: {#1#1#1#1#1#1#1#1#1} #1#1#1#1#1 }
8536 \cs_new:cpn { __prg_replicate_6:n } #1
8537   { \cs_end: {#1#1#1#1#1#1#1#1#1} #1#1#1#1#1#1 }
8538 \cs_new:cpn { __prg_replicate_7:n } #1
8539   { \cs_end: {#1#1#1#1#1#1#1#1#1} #1#1#1#1#1#1 }
8540 \cs_new:cpn { __prg_replicate_8:n } #1
8541   { \cs_end: {#1#1#1#1#1#1#1#1#1} #1#1#1#1#1#1#1 }
8542 \cs_new:cpn { __prg_replicate_9:n } #1
8543   { \cs_end: {#1#1#1#1#1#1#1#1#1} #1#1#1#1#1#1#1#1 }

```

Users shouldn't ask for something to be replicated once or even not at all but...

```

8544 \cs_new:cpn { __prg_replicate_first_-:n } #1
8545   {
8546     \exp_end:
8547     \msg_expandable_error:nn { prg } { negative-replication }
8548   }
8549 \cs_new:cpn { __prg_replicate_first_0:n } #1 { \exp_end: }
8550 \cs_new:cpn { __prg_replicate_first_1:n } #1 { \exp_end: #1 }
8551 \cs_new:cpn { __prg_replicate_first_2:n } #1 { \exp_end: #1#1 }
8552 \cs_new:cpn { __prg_replicate_first_3:n } #1 { \exp_end: #1#1#1 }
8553 \cs_new:cpn { __prg_replicate_first_4:n } #1 { \exp_end: #1#1#1#1 }
8554 \cs_new:cpn { __prg_replicate_first_5:n } #1 { \exp_end: #1#1#1#1#1 }
8555 \cs_new:cpn { __prg_replicate_first_6:n } #1 { \exp_end: #1#1#1#1#1#1 }
8556 \cs_new:cpn { __prg_replicate_first_7:n } #1 { \exp_end: #1#1#1#1#1#1 }
8557 \cs_new:cpn { __prg_replicate_first_8:n } #1 { \exp_end: #1#1#1#1#1#1#1 }
8558 \cs_new:cpn { __prg_replicate_first_9:n } #1
8559   { \exp_end: #1#1#1#1#1#1#1#1 }

```

(End of definition for \prg\_replicate:nn and others. This function is documented on page 71.)

## 47.8 Detecting TeX's mode

\mode\_if\_vertical\_p: For testing vertical mode. Strikes me here on the bus with David, that as long as we are just talking about returning true and false states, we can just use the primitive

conditionals for this and gobbling the `\exp_end:` in the input stream. However this requires knowledge of the implementation so we keep things nice and clean and use the return statements.

```
8560 \prg_new_conditional:Npnn \mode_if_vertical: { p , T , F , TF }
8561   { \if_mode_vertical: \prg_return_true: \else: \prg_return_false: \fi: }
```

(End of definition for `\mode_if_vertical:TF`. This function is documented on page 72.)

`\mode_if_horizontal:p`: For testing horizontal mode.

```
8562 \prg_new_conditional:Npnn \mode_if_horizontal: { p , T , F , TF }
8563   { \if_mode_horizontal: \prg_return_true: \else: \prg_return_false: \fi: }
```

(End of definition for `\mode_if_horizontal:TF`. This function is documented on page 71.)

`\mode_if_inner:p`: For testing inner mode.

```
8564 \prg_new_conditional:Npnn \mode_if_inner: { p , T , F , TF }
8565   { \if_mode_inner: \prg_return_true: \else: \prg_return_false: \fi: }
```

(End of definition for `\mode_if_inner:TF`. This function is documented on page 72.)

`\mode_if_math:p`: For testing math mode. At the beginning of an alignment cell, this should be used only inside a non-expandable function.

```
8566 \prg_new_conditional:Npnn \mode_if_math: { p , T , F , TF }
8567   { \if_mode_math: \prg_return_true: \else: \prg_return_false: \fi: }
```

(End of definition for `\mode_if_math:TF`. This function is documented on page 72.)

## 47.9 Internal programming functions

`\group_align_safe_begin:` `\group_align_safe_end:` TeX's alignment structures present many problems. As Knuth says himself in *TeX: The Program*: “It's sort of a miracle whenever `\halign` or `\valign` work, [...]” One problem relates to commands that internally issue a `\cr` but also peek ahead for the next character for use in, say, an optional argument. If the next token happens to be a `&` with category code 4 we get some sort of weird error message because the underlying `\futurelet` stores the token at the end of the alignment template. This could be a `&4` giving a message like `! Misplaced \cr.` or even worse: it could be the `\endtemplate` token causing even more trouble! To solve this we have to open a special group so that TeX still thinks it's on safe ground but at the same time we don't want to introduce any brace group that may find its way to the output. The following functions help with this by using behaviour documented only in Appendix D of *The TeXbook*... In short evaluating ‘`{` and ‘`}` as numbers will not change the counter TeX uses to keep track of its state in an alignment, whereas gobbling a brace using `\if_false:` will affect TeX's state without producing any real group. We place the `\if_false: { \fi:` part at that place so that the successive expansions of `\group_align_safe_begin/end:` are always brace balanced.

```
8568 \group_begin:
8569 \tex_catcode:D '^@ = 2 \exp_stop_f:
8570 \cs_new:Npn \group_align_safe_begin:
8571   { \exp:w \if_false: { \fi: '^@ \exp_stop_f: } }
8572 \tex_catcode:D '^@ = 1 \exp_stop_f:
8573 \cs_new:Npn \group_align_safe_end:
8574   { \exp:w '^@ \if_false: } \fi: \exp_stop_f: }
8575 \group_end:
```

*(End of definition for \group\_align\_safe\_begin: and \group\_align\_safe\_end:. These functions are documented on page 73.)*

\g\_kernel\_prg\_map\_int A nesting counter for mapping.

8576 \int\_new:N \g\_kernel\_prg\_map\_int

*(End of definition for \g\_kernel\_prg\_map\_int.)*

\prg\_break\_point:Nn These are defined in l3basics, as they are needed “early”. This is just a reminder that is the case!

*(End of definition for \prg\_break\_point:Nn and \prg\_map\_break:Nn. These functions are documented on page 72.)*

\prg\_break\_point: Also done in l3basics.

\prg\_break:

\prg\_break:n *(End of definition for \prg\_break\_point:, \prg\_break:, and \prg\_break:n. These functions are documented on page 73.)*

8577 ⟨/package⟩

# Chapter 48

## I3sys implementation

8578 ⟨@@=sys⟩

### 48.1 Kernel code

8579 ⟨\*package⟩  
8580 ⟨\*tex⟩

#### 48.1.1 Detecting the engine

⟨\_\_sys\_const:nn⟩ Set the T, F, TF, p forms of #1 to be constants equal to the result of evaluating the boolean expression #2.

```
8581 \cs_new_protected:Npn __sys_const:nn #1#2
8582 {
8583     \bool_if:nTF {#2}
8584     {
8585         \cs_new_eq:cN {#1 :T} \use:n
8586         \cs_new_eq:cN {#1 :F} \use_none:n
8587         \cs_new_eq:cN {#1 :TF} \use_i:nn
8588         \cs_new_eq:cN {#1 _p:} \c_true_bool
8589     }
8590     {
8591         \cs_new_eq:cN {#1 :T} \use_none:n
8592         \cs_new_eq:cN {#1 :F} \use:n
8593         \cs_new_eq:cN {#1 :TF} \use_i:nn
8594         \cs_new_eq:cN {#1 _p:} \c_false_bool
8595     }
8596 }
```

(End of definition for \_\_sys\_const:nn.)

⟨sys\_if\_engine\_luatex\_p:⟩ Set up the engine tests on the basis exactly one test should be true. Mainly a case of looking for the appropriate marker primitive.

```
8597 \str_const:Ne \c_sys_engine_str
8598 {
8599     \cs_if_exist:NT \tex_luatexversion:D { luatex }
8600     \cs_if_exist:NT \tex_pdftexversion:D { pdftex }
8601     \cs_if_exist:NT \tex_kanjiskip:D
8602 }
```

```

8603     \cs_if_exist:NTF \tex_enablecjktoken:D
8604         { uptex }
8605         { ptex }
8606     }
8607     \cs_if_exist:NT \tex_XeTeXversion:D { xetex }
8608   }
8609 \tl_map_inline:nn { { luatex } { pdftex } { ptex } { uptex } { xetex } }
8610   {
8611     \__sys_const:nn { sys_if_engine_ #1 }
8612     { \str_if_eq_p:Vn \c_sys_engine_str {#1} }
8613   }

```

(End of definition for `\sys_if_engine_luatex:TF` and others. These functions are documented on page 75.)

### `\c_sys_engine_exec_str` `\c_sys_engine_format_str`

Take the functions defined above, and set up the engine and format names. `\c_sys_engine_exec_str` differs from `\c_sys_engine_str` as it is the *actual* engine name, not a “filtered” version. It differs for `ptex` and `uptex`, which have a leading `e`, and for `luatex`, because L<sup>A</sup>T<sub>E</sub>X uses the LuaHBT<sub>E</sub>X engine.

`\c_sys_engine_format_str` is quite similar to `\c_sys_engine_str`, except that it differentiates `pdfflatex` from `latex` (which is pdfT<sub>E</sub>X in DVI mode). This differentiation, however, is reliable only if the user doesn’t change `\tex_pdfoutput:D` before loading this code.

```

8614 \group_begin:
8615   \cs_set_eq:NN \lua_now:e      \tex_directlua:D
8616   \str_const:Ne \c_sys_engine_exec_str
8617   {
8618     \sys_if_engine_pdftex:T { pdf }
8619     \sys_if_engine_xetex:T { xe }
8620     \sys_if_engine_ptex:T { ep }
8621     \sys_if_engine_uptex:T { eup }
8622     \sys_if_engine_luatex:T
8623     {
8624       lua \lua_now:e
8625       {
8626         if (pcall(require, 'luaharfbuzz')) then ~
8627           tex.print("hb") ~
8628         end
8629       }
8630     }
8631   tex
8632 }
8633 \group_end:
8634 \str_const:Ne \c_sys_engine_format_str
8635 {
8636   \cs_if_exist:NTF \fmtname
8637   {
8638     \bool_lazy_or:nnTF
8639       { \str_if_eq_p:Vn \fmtname { plain } }
8640       { \str_if_eq_p:Vn \fmtname { LaTeX2e } }
8641     {
8642       \sys_if_engine_pdftex:T
8643         { \int_compare:nNnT { \tex_pdfoutput:D } = { 1 } { pdf } }
8644       \sys_if_engine_xetex:T { xe }

```

```

8645   \sys_if_engine_ptex:T  { p  }
8646   \sys_if_engine_uptex:T  { up }
8647   \sys_if_engine_luatex:T
8648   {
8649     \int_compare:nNnT { \tex_pdfoutput:D } = { 0 } { dvi }
8650     lua
8651   }
8652   \str_if_eq:VnTF \fmtname { LaTeX2e }
8653   {
8654     {
8655       \bool_lazy_and:nnT
8656         { \sys_if_engine_pdftex_p: }
8657         { \int_compare_p:nNn { \tex_pdfoutput:D } = { 0 } }
8658         { e }
8659       tex
8660     }
8661   }
8662   { \fmtname }
8663 }
8664 { unknown }
8665 }

```

(End of definition for `\c_sys_engine_exec_str` and `\c_sys_engine_format_str`. These variables are documented on page 75.)

`\c_sys_engine_version_str` Various different engines, various different ways to extract the data!

```

8666 \str_const:Nn \c_sys_engine_version_str
8667 {
8668   \str_case:on \c_sys_engine_str
8669   {
8670     { pdftex }

8720   }
8721 }
8722 }
```

(End of definition for `\c_sys_engine_version_str`. This variable is documented on page 75.)

### 48.1.2 Platform

```

\sys_if_platform_unix:p:
\sys_if_platform_unix:TF
\sys_if_platform_windows:p:
\sys_if_platform_windows:TF
\c_sys_platform_str
```

Setting these up requires the file module (file lookup), so is actually implemented there.

(End of definition for `\sys_if_platform_unix:TF`, `\sys_if_platform_windows:TF`, and `\c_sys_platform_str`. These functions are documented on page 76.)

### 48.1.3 Configurations

```

\sys_load_backend:n
\__sys_load_backend_check:N
\c_sys_backend_str
```

Loading the backend code is pretty simply: check that the backend is valid, then load it up.

```

8723   \cs_new_protected:Npn \sys_load_backend:n #1
8724   {
8725     \sys_finalise:
8726     \str_if_exist:NTF \c_sys_backend_str
8727     {
8728       \str_if_eq:VnF \c_sys_backend_str {#1}
8729       { \msg_error:nn { sys } { backend-set } }
8730     }
8731   {
8732     \tl_if_blank:nF {#1}
8733     { \tl_gset:Nn \g__sys_backend_tl {#1} }
```

```

8734     \__sys_load_backend_check:N \g__sys_backend_tl
8735     \str_const:Ne \c_sys_backend_str { \g__sys_backend_tl }
8736     \__kernel_sys_configuration_load:n
8737     { l3backend- \c_sys_backend_str }
8738   }
8739 }
8740 \cs_new_protected:Npn \__sys_load_backend_check:N #1
8741 {
8742   \sys_if_engine_xetex:TF

8792 }
```

(End of definition for `\sys_load_backend:n`, `\__sys_load_backend_check:N`, and `\c_sys_backend_str`. These functions are documented on page 78.)

**\sys\_ensure\_backend:** A simple wrapper.

```

8793 \cs_new_protected:Npn \sys_ensure_backend:
8794 {
8795     \str_if_exist:NF \c_sys_backend_str
8796     { \sys_load_backend:n { } }
8797 }
```

(End of definition for `\sys_ensure_backend:..`. This function is documented on page 78.)

```
\g__sys_debug_bool
8798 \bool_new:N \g__sys_debug_bool
```

(End of definition for `\g__sys_debug_bool`.)

**\sys\_load\_debug:** Simple.

```

8799 \cs_new_protected:Npn \sys_load_debug:
8800 {
8801     \bool_if:NF \g__sys_debug_bool
8802     { \__kernel_sys_configuration_load:n { l3debug } }
8803     \bool_gset_true:N \g__sys_debug_bool
8804 }
```

(End of definition for `\sys_load_debug:..`. This function is documented on page 78.)

#### 48.1.4 Access to the shell

```
\l__sys_internal_tl
8805 \tl_new:N \l__sys_internal_tl
```

(End of definition for `\l__sys_internal_tl`.)

**\c\_\_sys\_marker\_tl** The same idea as the marker for rescanning token lists.

```

8806 \tl_const:Ne \c__sys_marker_tl { : \token_to_str:N : }
```

(End of definition for `\c__sys_marker_tl`.)

**\sys\_get\_shell:nnNTF** Setting using a shell is at this level just a slightly specialised file operation, with an additional check for quotes, as these are not supported.

```

\sys_get:nnN
\__sys_get:nnN
\__sys_get_do:Nw
8807 \cs_new_protected:Npn \sys_get_shell:nnN #1#2#3
8808 {
8809     \sys_get_shell:nnNF {#1} {#2} #3
8810     { \tl_set:Nn #3 { \q_no_value } }
8811 }
8812 \prg_new_protected_conditional:Npnn \sys_get_shell:nnN #1#2#3 { T , F , TF }
8813 {
8814     \sys_if_shell:TF
```

```

8815   { \exp_args:No \__sys_get:nnN { \tl_to_str:n {#1} } {#2} #3 }
8816   { \prg_return_false: }
8817   }
8818 \cs_new_protected:Npn \__sys_get:nnN #1#2#3
8819   {
8820     \tl_if_in:nnTF {#1} { " }
8821     {
8822       \msg_error:nne
8823         { kernel } { quote-in-shell } {#1}
8824       \prg_return_false:
8825     }
8826   {
8827     \group_begin:
8828       \if_false: { \fi:
8829         \int_set_eq:NN \tex_tracingnesting:D \c_zero_int
8830         \exp_args:No \tex_everyeof:D { \c__sys_marker_tl }
8831         #2 \scan_stop:
8832         \exp_after:wN \__sys_get_do:Nw
8833         \exp_after:wN #3
8834         \exp_after:wN \prg_do_nothing:
8835           \tex_input:D | "#1" \scan_stop:
8836         \if_false: } \fi:
8837         \prg_return_true:
8838     }
8839   }
8840 \exp_args:Nno \use:nn
8841   { \cs_new_protected:Npn \__sys_get_do:Nw #1#2 }
8842   { \c__sys_marker_tl }
8843   {
8844     \group_end:
8845     \tl_set:No #1 {#2}
8846   }

```

(End of definition for `\sys_get_shell:nnNTF` and others. These functions are documented on page 77.)

### `\c__sys_shell_stream_int`

This is not needed for LuaTeX: shell escape there isn't done using a TeX interface.

```

8847 \sys_if_engine_luatex:F
8848   { \int_const:Nn \c__sys_shell_stream_int { 18 } }

```

(End of definition for `\c__sys_shell_stream_int`.)

### `\sys_shell_now:n`

`\sys_shell_now:e`

`\sys_shell_now:x`

`\__sys_shell_now:e`

Execute commands through shell escape immediately.

For LuaTeX, we use a pseudo-primitive to do the actual work.

```

8849 </tex>
8850 <*lua>
8851 do
8852   local os_exec = os.execute
8853
8854   local function shellescape(cmd)
8855     local status,msg = os_exec(cmd)
8856     if status == nil then
8857       write_nl("log","runsystem(\" .. cmd .. \")...(\" .. msg .. \")\n")
8858     elseif status == 0 then
8859       write_nl("log","runsystem(\" .. cmd .. \")...executed\n")

```

```

8860     else
8861         write_nl("log", "runsystem(" .. cmd .. ")...failed " .. (msg or "") .. "\n")
8862     end
8863 end
8864 luacmd("__sys_shell_now:e", function()
8865     shellescape(scan_string())
8866 end, "global", "protected")
8867 
```

8876

8877

8878

8879

8880

(End of definition for \sys\_shell\_now:n and \\_\_sys\_shell\_now:e. This function is documented on page 78.)

### \sys\_shell\_shipout:n

### \sys\_shell\_shipout:e

### \sys\_shell\_shipout:x

### \\_\_sys\_shell\_shipout:e

Execute commands through shell escape at shipout.

For LuaTeX, we use the same helper as above but delayed using a `late_lua` whatsit. Creating a `late_lua` whatsit works a bit different if we are running under ConTeXt.

```

8880 
```

8881

8899

8900

8901

8902

8903

8904

8905

```

8906   {
8907     \cs_new_protected:Npn \sys_shell_shipout:n #1
8908       { \iow_shipout:Nn \c_sys_shell_stream_int {#1} }
8909   }
8910 \cs_generate_variant:Nn \sys_shell_shipout:n { e , x }

```

(End of definition for `\sys_shell_shipout:n` and `\_sys_shell_shipout:e`. This function is documented on page 78.)

## 48.2 Dynamic (every job) code

```

\__kernel_sys_everyjob:
\__sys_everyjob:n
\g__sys_everyjob_tl
8911 \cs_new_protected:Npn \__kernel_sys_everyjob:
8912   {
8913     \tl_use:N \g__sys_everyjob_tl
8914     \tl_gclear:N \g__sys_everyjob_tl
8915   }
8916 \cs_new_protected:Npn \__sys_everyjob:n #1
8917   { \tl_gput_right:Nn \g__sys_everyjob_tl {#1} }
8918 \tl_new:N \g__sys_everyjob_tl

```

(End of definition for `\__kernel_sys_everyjob:`, `\__sys_everyjob:n`, and `\g__sys_everyjob_tl`.)

### 48.2.1 The name of the job

`\c_sys_jobname_str` Inherited from the L<sup>A</sup>T<sub>E</sub>X3 name for the primitive. This *has* to be the primitive as it's set in `\everyjob`. If the user does

```
pdflatex \input some-file-name
```

then `\everyjob` is inserted *before* `\jobname` is changed form `\texput`, and thus we would have the wrong result.

```

8919 \__sys_everyjob:n
8920   { \cs_new_eq:NN \c_sys_jobname_str \tex_jobname:D }

```

(End of definition for `\c_sys_jobname_str`. This variable is documented on page 74.)

### 48.2.2 Time and date

```

\c_sys_minute_int
\c_sys_hour_int
\c_sys_day_int
\c_sys_month_int
\c_sys_year_int

```

Copies of the information provided by T<sub>E</sub>X. There is a lot of defensive code in package mode: someone may have moved the primitives, and they can only be recovered if we have `\primitive` and it is working correctly. For IniT<sub>E</sub>X of course that is all redundant but does no harm.

```

8921 \__sys_everyjob:n
8922   {
8923     \group_begin:
8924       \cs_set:Npn \__sys_tmp:w #1
8925         {
8926           \str_if_eq:eeTF { \cs_meaning:N #1 } { \token_to_str:N #1 }
8927             { #1 }
8928             {
8929               \cs_if_exist:NTF \tex_primitive:D
8930                 {

```

```

8931           \bool_lazy_and:nTF
8932             { \sys_if_engine_xetex_p: }
8933             {
8934               \int_compare_p:nNn
8935                 { \exp_after:wN \use_none:n \tex_XeTeXrevision:D }
8936                   < { 99999 }
8937             }
8938             { 0 }
8939               { \tex_primitive:D #1 }
8940             }
8941             { 0 }
8942           }
8943         }
8944         \int_const:Nn \c_sys_minute_int
8945           { \int_mod:nn { \__sys_tmp:w \time } { 60 } }
8946         \int_const:Nn \c_sys_hour_int
8947           { \int_div_truncate:nn { \__sys_tmp:w \time } { 60 } }
8948         \int_const:Nn \c_sys_day_int   { \__sys_tmp:w \day }
8949         \int_const:Nn \c_sys_month_int { \__sys_tmp:w \month }
8950         \int_const:Nn \c_sys_year_int { \__sys_tmp:w \year }
8951       \group_end:
8952     }

```

(End of definition for `\c_sys_minute_int` and others. These variables are documented on page 74.)

- \c\_sys\_timestamp\_str** A simple expansion: LuaTeX chokes if we use `\pdffeedback` here, hence the direct use of Lua. Notice that the function there is in the pdf library but isn't actually tied to PDF.

```

8953   \__sys_everyjob:n
8954   {
8955     \str_const:Ne \c_sys_timestamp_str
8956     {
8957       \cs_if_exist:NTF \tex_directlua:D
8958         { \tex_directlua:D { \text{print}(\pdf.getcreationdate()) } }
8959         { \tex_creationdate:D }
8960     }
8961   }

```

(End of definition for `\c_sys_timestamp_str`. This variable is documented on page 74.)

### 48.2.3 Random numbers

- \sys\_rand\_seed:** Unpack the primitive.

```

8962   \__sys_everyjob:n
8963   {
8964     \cs_new:Npn \sys_rand_seed: { \tex_the:D \tex_randomseed:D }
8965   }

```

(End of definition for `\sys_rand_seed:`. This function is documented on page 76.)

- \sys\_gset\_rand\_seed:n** The primitive always assigns the seed globally.

```

8966   \__sys_everyjob:n
8967   {
8968     \cs_new_protected:Npn \sys_gset_rand_seed:n #1
8969       { \tex_setrandomseed:D \int_eval:n {#1} \exp_stop_f: }
8970   }

```

(End of definition for `\sys_gset_rand_seed:n`. This function is documented on page 77.)

`\sys_timer:` In LuaTeX, create a pseudo-primitive, otherwise try to locate the real primitive. The elapsed time will be available if this succeeds.

```
8971  </tex>
8972  <*lua>
8973      local gettimeofday = os.gettimeofday
8974      local epoch = gettimeofday() - os.clock()
8975      local write = tex.write
8976      local tointeger = math.tointeger
8977      luacmd('`_sys_elapsedtime:', function()
8978          write(tointeger((gettimeofday() - epoch)*65536 // 1))
8979      end, 'global')
8980  </lua>
8981  <*tex>
8982  \sys_if_engine_luatex:TF
8983  {
8984      \cs_new:Npn \sys_timer:
8985          { `_sys_elapsedtime: }
8986  }
8987  {
8988      \cs_if_exist:NTF \tex_elapsedtime:D
8989          {
8990              \cs_new:Npn \sys_timer:
8991                  { \int_value:w \tex_elapsedtime:D }
8992          }
8993          {
8994              \cs_new:Npn \sys_timer:
8995                  {
8996                      \int_value:w
8997                      \msg_expandable_error:n{ kernel } { no-elapsed-time }
8998                      { \sys_timer: }
8999                      \c_zero_int
9000                  }
9001          }
9002      }
9003  `_sys_const:nn { sys_if_timer_exist }
9004      { \cs_if_exist_p:N \tex_elapsedtime:D || \cs_if_exist_p:N `_sys_elapsedtime: }
```

(End of definition for `\sys_timer:`, ``_sys_elapsedtime:`, and `\sys_if_timer_exist:TF`. These functions are documented on page 75.)

#### 48.2.4 Access to the shell

`\c_sys_shell_escape_int` Expose the engine's shell escape status to the user.

```
9005  `_sys_everyjob:n
9006  {
9007      \int_const:Nn \c_sys_shell_escape_int
9008          {
9009              \sys_if_engine_luatex:TF
9010          {
9011              \tex_directlua:D
9012                  { tex.sprint(status.shell_escape~or~os.execute()) }
9013          }
9014      }
```

```

9014           { \tex_shellescape:D }
9015       }
9016   }

```

(End of definition for `\c_sys_shell_escape_int`. This variable is documented on page 77.)

`\sys_if_shell_p:`

`\sys_if_shell:TF`

`\sys_if_shell_unrestricted_p:`

`\sys_if_shell_unrestricted:TF`

`\sys_if_shell_restricted_p:`

`\sys_if_shell_restricted:TF`

```

9017 \__sys_everyjob:n
9018   {
9019     \__sys_const:nn { sys_if_shell }
9020     { \int_compare_p:nNn \c_sys_shell_escape_int > 0 }
9021     \__sys_const:nn { sys_if_shell_unrestricted }
9022     { \int_compare_p:nNn \c_sys_shell_escape_int = 1 }
9023     \__sys_const:nn { sys_if_shell_restricted }
9024     { \int_compare_p:nNn \c_sys_shell_escape_int = 2 }
9025   }

```

(End of definition for `\sys_if_shell:TF`, `\sys_if_shell_unrestricted:TF`, and `\sys_if_shell_restricted:TF`. These functions are documented on page 77.)

#### 48.2.5 Held over from l3file

`\g_file_curr_name_str`

See comments about `\c_sys_jobname_str`: here, as soon as there is file input/output, things get “tided up”.

```

9026 \__sys_everyjob:n
9027   { \cs_gset_eq:NN \g_file_curr_name_str \tex_jobname:D }

```

(End of definition for `\g_file_curr_name_str`. This variable is documented on page 98.)

### 48.3 Last-minute code

`\sys_finalise:`

A simple hook to finalise the system-dependent layer. This is forced by the backend loader, which is forced by the main loader, so we do not need to include that here.

```

9028 \cs_new_protected:Npn \sys_finalise:
9029   {
9030     \__kernel_sys_everyjob:
9031     \tl_use:N \g__sys_finalise_tl
9032     \tl_gclear:N \g__sys_finalise_tl
9033   }
9034 \cs_new_protected:Npn \__sys_finalise:n #1
9035   { \tl_gput_right:Nn \g__sys_finalise_tl {#1} }
9036 \tl_new:N \g__sys_finalise_tl

```

(End of definition for `\sys_finalise:`, `\__sys_finalise:n`, and `\g__sys_finalise_tl`. This function is documented on page 79.)

### 48.3.1 Detecting the output

\sys\_if\_output\_dvi\_p: This is a simple enough concept: the two views here are complementary.

```

9037  \__sys_finalise:n
9038  {
9039  \str_const:Nn \c_sys_output_str
9040  {
9041      \int_compare:nNnTF
9042          { \cs_if_exist_use:N \tex_pdfoutput:D { 0 } } > { 0 }
9043          { pdf }
9044          { dvi }
9045      }
9046  \__sys_const:nn { sys_if_output_dvi }
9047  { \str_if_eq_p:Vn \c_sys_output_str { dvi } }
9048  \__sys_const:nn { sys_if_output_pdf }
9049  { \str_if_eq_p:Vn \c_sys_output_str { pdf } }
9050 }
```

(End of definition for \sys\_if\_output\_dvi:TF, \sys\_if\_output\_pdf:TF, and \c\_sys\_output\_str. These functions are documented on page 76.)

### 48.3.2 Configurations

\g\_\_sys\_backend\_tl: As the backend has to be checked and possibly adjusted, the approach here is to create a variable and use that in a one-shot to set a constant.

```

9051 \tl_new:N \g__sys_backend_tl
9052 \__sys_finalise:n
9053 {
9054     \__kernel_tl_gset:Nx \g__sys_backend_tl
9055     {
9056         \sys_if_engine_xetex:TF
9057         { xetex }
9058         {
9059             \sys_if_output_pdf:TF
9060             {
9061                 \sys_if_engine_pdftex:TF
9062                 { pdftex }
9063                 { luatex }
9064             }
9065             { dvips }
9066         }
9067     }
9068 }
```

If there is a class option set, and recognised, we pick it up: these will over-ride anything set automatically but will themselves be over-written if there is a package option.

```

9069 \__sys_finalise:n
9070 {
9071     \cs_if_exist:NT \@classoptionslist
9072     {
9073         \cs_if_eq:NNF \@classoptionslist \scan_stop:
9074         {
9075             \clist_map_inline:Nn \@classoptionslist
9076             {
```

```

9077 \str_case:nnT {\#1}
9078 {
9079   { dvipdfmx }
9080     { \t1_gset:Nn \g__sys_backend_tl { dvipdfmx } }
9081   { dvips }
9082     { \t1_gset:Nn \g__sys_backend_tl { dvips } }
9083   { dvisvgm }
9084     { \t1_gset:Nn \g__sys_backend_tl { dvisvgm } }
9085   { pdftex }
9086     { \t1_gset:Nn \g__sys_backend_tl { pdfmode } }
9087   { xetex }
9088     { \t1_gset:Nn \g__sys_backend_tl { xdvipdfmx } }
9089   }
9090 { \clist_remove_all:Nn \@unusedoptionlist {\#1} }
9091   }
9092   }
9093   }
9094 }
```

(End of definition for \g\_\_sys\_backend\_tl.)

```

9095 </tex>
9096 </package>
```

# Chapter 49

## I3msg implementation

```
9097  <*package>
9098  <@=msg>
\l__msg_internal_tl A general scratch for the module.
9099  \tl_new:N \l__msg_internal_tl
(End of definition for \l__msg_internal_tl.)
```

```
\l__msg_name_str Used to save module info when creating messages.
\l__msg_text_str 9100 \str_new:N \l__msg_name_str
9101 \str_new:N \l__msg_text_str
(End of definition for \l__msg_name_str and \l__msg_text_str.)
```

### 49.1 Internal auxiliaries

```
\s__msg_mark Internal scan marks.
\s__msg_stop 9102 \scan_new:N \s__msg_mark
9103 \scan_new:N \s__msg_stop
(End of definition for \s__msg_mark and \s__msg_stop.)
```

```
\_msg_use_none_delimit_by_s_stop:w Functions to gobble up to a scan mark.
9104 \cs_new:Npn \_msg_use_none_delimit_by_s_stop:w #1 \s__msg_stop { }
(End of definition for \_msg_use_none_delimit_by_s_stop:w.)
```

### 49.2 Creating messages

Messages are created and used separately, so there two parts to the code here. First, a mechanism for creating message text. This is pretty simple, as there is not actually a lot to do.

```
\c__msg_text_prefix_tl Locations for the text of messages.
\c__msg_more_text_prefix_tl 9105 \tl_const:Nn \c__msg_text_prefix_tl      { msg-text->~ }
9106 \tl_const:Nn \c__msg_more_text_prefix_tl { msg-extra-text->~ }
```

(End of definition for `\c__msg_text_prefix_tl` and `\c__msg_more_text_prefix_tl`.)

`\msg_if_exist_p:nn`

Test whether the control sequence containing the message text exists or not.

`\msg_if_exist:nnTF`

```
9107 \prg_new_conditional:Npnn \msg_if_exist:nn #1#2 { p , T , F , TF }
9108   {
9109     \cs_if_exist:cTF { \c__msg_text_prefix_tl #1 / #2 }
9110     { \prg_return_true: } { \prg_return_false: }
9111   }
```

(End of definition for `\msg_if_exist:nnTF`. This function is documented on page 81.)

`\__msg_chk_if_free:nn`

This auxiliary is similar to `\__kernel_chk_if_free:cs:N`, and is used when defining messages with `\msg_new:nnnn`.

```
9112 \cs_new_protected:Npn \__msg_chk_free:nn #1#2
9113   {
9114     \msg_if_exist:nnT {#1} {#2}
9115     {
9116       \msg_error:nnnn { msg } { already-defined }
9117       {#1} {#2}
9118     }
9119   }
```

(End of definition for `\__msg_chk_if_free:nn`.)

`\msg_new:nnnn`

Setting a message simply means saving the appropriate text into two functions. A sanity check first.

`\msg_new:nnxx`

```
9120 \cs_new_protected:Npn \msg_new:nnnn #1#2
9121   {
9122     \__msg_chk_free:nn {#1} {#2}
9123     \msg_gset:nnnn {#1} {#2}
9124   }
9125 \cs_generate_variant:Nn \msg_new:nnnn { nnee , nnxx }
9126 \cs_new_protected:Npn \msg_new:nnn #1#2#3
9127   { \msg_new:nnnn {#1} {#2} {#3} { } }
9128 \cs_generate_variant:Nn \msg_new:nnn { nne , nnx }
9129 \cs_new_protected:Npn \msg_set:nnnn #1#2#3#4
9130   {
9131     \cs_set:cpn { \c__msg_text_prefix_tl #1 / #2 }
9132     ##1##2##3##4 {#3}
9133     \cs_set:cpn { \c__msg_more_text_prefix_tl #1 / #2 }
9134     ##1##2##3##4 {#4}
9135   }
9136 \cs_new_protected:Npn \msg_set:nnn #1#2#3
9137   { \msg_set:nnnn {#1} {#2} {#3} { } }
9138 \cs_new_protected:Npn \msg_gset:nnnn #1#2#3#4
9139   {
9140     \cs_gset:cpn { \c__msg_text_prefix_tl #1 / #2 }
9141     ##1##2##3##4 {#3}
9142     \cs_gset:cpn { \c__msg_more_text_prefix_tl #1 / #2 }
9143     ##1##2##3##4 {#4}
9144   }
9145 \cs_new_protected:Npn \msg_gset:nnn #1#2#3
9146   { \msg_gset:nnnn {#1} {#2} {#3} { } }
```

(End of definition for `\msg_new:nnnn` and others. These functions are documented on page 81.)

### 49.3 Messages: support functions and text

```
\c__msg_error_text_tl
\c__msg_continue_text_tl
\c__msg_critical_text_tl
\c__msg_fatal_text_tl
\c__msg_help_text_tl
\c__msg_no_info_text_tl
\c__msg_on_line_text_tl
\c__msg_return_text_tl
\c__msg_trouble_text_tl

9147 \tl_const:Nn \c__msg_error_text_tl
9148 {
9149   This-is-a-coding-error.
9150   \\ \\
9151 }
9152 \tl_const:Nn \c__msg_continue_text_tl
9153 { Type-<return>-to-continue }
9154 \tl_const:Nn \c__msg_critical_text_tl
9155 { Reading-the-current-file-'g_file_curr_name_str'-will-stop. }
9156 \tl_const:Nn \c__msg_fatal_text_tl
9157 { This-is-a-fatal-error:-LaTeX-will-abort. }
9158 \tl_const:Nn \c__msg_help_text_tl
9159 { For-immediate-help-type-H-<return> }
9160 \tl_const:Nn \c__msg_no_info_text_tl
9161 {
9162   LaTeX-does-not-know-anything-more-about-this-error,-sorry.
9163   \c__msg_return_text_tl
9164 }
9165 \tl_const:Nn \c__msg_on_line_text_tl { on-line }
9166 \tl_const:Nn \c__msg_return_text_tl
9167 {
9168   \\ \\
9169   Try-typing-<return>-to-proceed.
9170   \\
9171   If-that-doesn't-work,-type-X-<return>-to-quit.
9172 }
9173 \tl_const:Nn \c__msg_trouble_text_tl
9174 {
9175   \\ \\
9176   More-errors-will-almost-certainly-follow: \\
9177   the-LaTeX-run-should-be-aborted.
9178 }
```

(End of definition for `\c__msg_error_text_tl` and others.)

`\msg_line_number:` For writing the line number nicely. `\msg_line_context:` was set up earlier, so this is not new.

```
9179 \cs_new:Npn \msg_line_number: { \int_use:N \tex_inlineno:D }
9180 \cs_gset:Npn \msg_line_context:
9181 {
9182   \c__msg_on_line_text_tl
9183   \c_space_tl
9184   \msg_line_number:
9185 }
```

(End of definition for `\msg_line_number:` and `\msg_line_context:`. These functions are documented on page 82.)

## 49.4 Showing messages: low level mechanism

```
\_\_msg_interrupt:Nnnn
\_\_msg_no_more_text:nnnn
```

The low-level interruption macro is rather opaque, unfortunately. Depending on the availability of more information there is a choice of how to set up the further help. We feed the extra help text and the message itself to a wrapping auxiliary, in this order because we must first setup TeX's `\errhelp` register before issuing an `\errmessage`. To deal with the various cases of critical or fatal errors with and without help text, there is a bit of argument-passing to do.

```
9186 \cs_new_protected:Npn \_\_msg_interrupt:NnnnN #1#2#3#4#5
9187   {
9188     \str_set:Ne \l_\_msg_text_str { #1 {#2} }
9189     \str_set:Ne \l_\_msg_name_str { \msg_module_name:n {#2} }
9190     \cs_if_eq:cNTF
9191       { \c_\_msg_more_text_prefix_tl #2 / #3 }
9192       \_\_msg_no_more_text:nnnn
9193     {
9194       \_\_msg_interrupt_wrap:nnn
9195         { \use:c { \c_\_msg_text_prefix_tl #2 / #3 } #4 }
9196         { \c_\_msg_continue_text_tl }
9197         {
9198           \c_\_msg_no_info_text_tl
9199           \tl_if_empty:NF #5
9200             { \\ \\ #5 }
9201         }
9202     }
9203   {
9204     \_\_msg_interrupt_wrap:nnn
9205       { \use:c { \c_\_msg_text_prefix_tl #2 / #3 } #4 }
9206       { \c_\_msg_help_text_tl }
9207       {
9208         \use:c { \c_\_msg_more_text_prefix_tl #2 / #3 } #4
9209         \tl_if_empty:NF #5
9210           { \\ \\ #5 }
9211       }
9212     }
9213   }
9214 \cs_new:Npn \_\_msg_no_more_text:nnnn #1#2#3#4 { }
```

(End of definition for `\_\_msg_interrupt:Nnnn` and `\_\_msg_no_more_text:nnnn`.)

```
\_\_msg_interrupt_wrap:nnn
\_\_msg_interrupt_text:n
\_\_msg_interrupt_more_text:n
```

First setup TeX's `\errhelp` register with the extra help #1, then build a nice-looking error message with #2. Everything is done using e-type expansion as the new line markers are different for the two type of text and need to be correctly set up. The auxiliary `\_\_msg_interrupt_more_text:n` receives its argument as a line-wrapped string, which is thus unaffected by expansion. We ave to split the main text into two parts as only the "message" itself is wrapped with a leader: the generic help is wrapped at full width. We also have to allow for the two characters used by `\errmessage` itself.

```
9215 \cs_new_protected:Npn \_\_msg_interrupt_wrap:nnn #1#2#3
9216   {
9217     \iow_wrap:nnnN { \\ #3 } { } { } \_\_msg_interrupt_more_text:n
9218     \group_begin:
9219       \int_sub:Nn \l_iow_line_count_int { 2 }
9220       \iow_wrap:nenN { \l_\_msg_text_str : ~ #1 }
```

```

9221   {
9222     ( \l__msg_name_str )
9223     \prg_replicate:nn
9224     {
9225       \str_count:N \l__msg_text_str
9226       - \str_count:N \l__msg_name_str
9227       + 2
9228     }
9229     { ~ }
9230   }
9231   { } \__msg_interrupt_text:n
9232   \iow_wrap:nnnN { \l__msg_internal_tl \\ \\ #2 } { } { }
9233   \__msg_interrupt:n
9234 }
9235 \cs_new_protected:Npn \__msg_interrupt_text:n #1
9236 {
9237   \group_end:
9238   \tl_set:Nn \l__msg_internal_tl {#1}
9239 }
9240 \cs_new_protected:Npn \__msg_interrupt_more_text:n #1
9241 { \exp_args:Ne \tex_errhelp:D { #1 \iow_newline: } }

```

(End of definition for `\__msg_interrupt_wrap:nnn`, `\__msg_interrupt_text:n`, and `\__msg_interrupt_more_text:n`.)

`\__msg_interrupt:n` The business end of the process starts by producing some visual separation of the message from the main part of the log. The error message needs to be printed with everything made “invisible”: TeX’s own information involves the macro in which `\errmessage` is called, and the end of the argument of the `\errmessage`, including the closing brace. We use an active ! to call the `\errmessage` primitive, and end its argument with `\use:none:n {<spaces>}` which fills the output with spaces. Two trailing closing braces are turned into spaces to hide them as well. The group in which we alter the definition of the active ! is closed before producing the message: this ensures that tokens inserted by typing I in the command-line are inserted after the message is entirely cleaned up.

The `\_kernel_iow_with:Nnn` auxiliary, defined in `l3file`, expects an `<integer variable>`, an integer `<value>`, and some `<code>`. It runs the `<code>` after ensuring that the `<integer variable>` takes the given `<value>`, then restores the former value of the `<integer variable>` if needed. We use it to ensure that the `\newlinechar` is 10, as needed for `\iow_newline:` to work, and that `\errorcontextlines` is `-1`, to avoid showing irrelevant context. Note that restoring the former value of these integers requires inserting tokens after the `\errmessage`, which go in the way of tokens which could be inserted by the user. This is unavoidable.

```

9242 \group_begin:
9243   \char_set_lccode:nn { 38 } { 32 } % &
9244   \char_set_lccode:nn { 46 } { 32 } % .
9245   \char_set_lccode:nn { 123 } { 32 } % {
9246   \char_set_lccode:nn { 125 } { 32 } % }
9247   \char_set_catcode_active:N \&
9248 \tex_lowercase:D
9249 {
9250   \group_end:
9251   \cs_new_protected:Npn \__msg_interrupt:n #1
9252   {

```

```

9253     \iow_term:n { }
9254     \_kernel_iow_with:Nnn \tex_newlinechar:D { '\^J }
9255     {
9256         \_kernel_iow_with:Nnn \tex_errorcontextlines:D { -1 }
9257         {
9258             \group_begin:
9259             \cs_set_protected:Npn &
9260             {
9261                 \tex_errmessage:D
9262                 {
9263                     #1
9264                     \use_none:n
9265                     { ..... }
9266                 }
9267             }
9268             \exp_after:wN
9269             \group_end:
9270             &
9271         }
9272     }
9273 }
9274 }
```

(End of definition for `\_msg_interrupt:n`.)

## 49.5 Displaying messages

L<sup>A</sup>T<sub>E</sub>X is handling error messages and so the T<sub>E</sub>X ones are disabled.

```
9275 \int_gset:Nn \tex_errorcontextlines:D { -1 }
```

`\msg_fatal_text:n`  
`\msg_critical_text:n`  
`\msg_error_text:n`  
`\msg_warning_text:n`  
`\msg_info_text:n`

A function for issuing messages: both the text and order could in principle vary. The module name may be empty for kernel messages, hence the slightly contorted code path for a space.

```

9276 \cs_new:Npn \msg_fatal_text:n #1
9277 {
9278     Fatal ~
9279     \msg_error_text:n {#1}
9280 }
9281 \cs_new:Npn \msg_critical_text:n #1
9282 {
9283     Critical ~
9284     \msg_error_text:n {#1}
9285 }
9286 \cs_new:Npn \msg_error_text:n #1
9287 {
9288     \_msg_text:nn {#1} { Error }
9289 }
9290 \cs_new:Npn \msg_warning_text:n #1
9291 {
9292     \_msg_text:nn {#1} { Warning }
9293 }
9294 \cs_new:Npn \msg_info_text:n #1
9295 {
9296     \_msg_text:nn {#1} { Info }
9297 }
9298 \cs_new:Npn \_msg_text:nn #1#2
9299 {
9300     \exp_args:Nf \_msg_text:n { \msg_module_type:n {#1} }
9301     \exp_args:Nf \_msg_text:n { \msg_module_name:n {#1} }
```

```

9296      #2
9297  }
9298 \cs_new:Npn \__msg_text:n #1
9299  {
9300      \tl_if_blank:nF {#1}
9301      { #1 ~ }
9302  }

```

(End of definition for `\msg_fatal_text:n` and others. These functions are documented on page 82.)

`\g_msg_module_name_prop`  
`\g_msg_module_type_prop`

For storing public module information: the kernel data is set up in advance.

```

9303 \prop_new:N \g_msg_module_name_prop
9304 \prop_new:N \g_msg_module_type_prop
9305 \prop_gput:Nnn \g_msg_module_type_prop { LaTeX } { }

```

(End of definition for `\g_msg_module_name_prop` and `\g_msg_module_type_prop`. These variables are documented on page 81.)

`\msg_module_type:n`

Contextual footer information, with the potential to give modules an alternative name.

```

9306 \cs_new:Npn \msg_module_type:n #1
9307  {
9308      \prop_if_in:NnTF \g_msg_module_type_prop {#1}
9309      { \prop_item:Nn \g_msg_module_type_prop {#1} }
9310      { Package }
9311  }

```

(End of definition for `\msg_module_type:n`. This function is documented on page 81.)

`\msg_module_name:n`  
`\msg_see_documentation_text:n`

Contextual footer information, with the potential to give modules an alternative name.

```

9312 \cs_new:Npn \msg_module_name:n #1
9313  {
9314      \prop_if_in:NnTF \g_msg_module_name_prop {#1}
9315      { \prop_item:Nn \g_msg_module_name_prop {#1} }
9316      {#1}
9317  }
9318 \cs_new:Npn \msg_see_documentation_text:n #1
9319  {
9320      See~the~ \msg_module_name:n {#1} ~
9321      documentation~for~further~information.
9322  }

```

(End of definition for `\msg_module_name:n` and `\msg_see_documentation_text:n`. These functions are documented on page 81.)

`\__msg_class_new:nn`

```

9323 \group_begin:
9324     \cs_set_protected:Npn \__msg_class_new:nn #1#2

9432         { } { } \iow_term:n
9433     }
```

(End of definition for `\msg_term:nnnnn` and others. These functions are documented on page 86.)

The none message type is needed so that input can be gobbled.

```
9434     \_msg_class_new:nn { none } { }
```

(End of definition for `\msg_none:nnnnn` and others. These functions are documented on page 86.)

The show message type is used for `\seq_show:N` and similar complicated data structures. Wrap the given text with a trailing dot (important later) then pass it to `\_msg_show:n`. If there is `\>` (or if the whole thing starts with `>`) we split there, print the first part and show the second part using `\showtokens` (the `\exp_after:wN` ensure a nice display). Note that this primitive adds a leading `>` and trailing dot. That is why we included a trailing dot before wrapping and removed it afterwards. If there is no `\>` do the same but with an empty second part which adds a spurious but inevitable `>`.

```
9435     \_msg_class_new:nn { show }
9436     {
9437         \iow_wrap:nnnN

`\__msg_class_chk_exist:nT`

Checking that a message class exists. We build this from `\cs_if_free:cTF` rather than `\cs_if_exist:cTF` because that avoids reading the second argument earlier than necessary.

```

9488 \cs_new:Npn \__msg_class_chk_exist:nT #1
9489     {
9490         \cs_if_free:cTF { __msg_ #1 _code:nnnnnn }
9491         { \msg_error:nnn { msg } { class-unknown } {#1} }
9492     }

```

(End of definition for `\_\_msg\_class\_chk\_exist:nT`.)

`\l\_\_msg\_class\_tl` Support variables needed for the redirection system.

9493 `\tl\_new:N \l\_\_msg\_class\_tl`  
9494 `\tl\_new:N \l\_\_msg\_current\_class\_tl`

(End of definition for `\l\_\_msg\_class\_tl` and `\l\_\_msg\_current\_class\_tl`.)

`\l\_\_msg\_redirect\_prop` For redirection of individually-named messages

9495 `\prop\_new:N \l\_\_msg\_redirect\_prop`

(End of definition for `\l\_\_msg\_redirect\_prop`.)

`\l\_\_msg\_hierarchy\_seq` During redirection, split the message name into a sequence: `{/module/submodule}`, `{/module}`, and `{}`.

9496 `\seq\_new:N \l\_\_msg\_hierarchy\_seq`

(End of definition for `\l\_\_msg\_hierarchy\_seq`.)

`\l\_\_msg\_class\_loop\_seq` Classes encountered when following redirections to check for loops.

9497 `\seq\_new:N \l\_\_msg\_class\_loop\_seq`

(End of definition for `\l\_\_msg\_class\_loop\_seq`.)

`\_\_msg\_use:nnnnnn`  
`\_\_msg\_use\_redirect\_name:n`  
`\_\_msg\_use\_hierarchy:nwnwN`  
`\_\_msg\_use\_redirect\_module:n`  
`\_\_msg\_use\_code:` Actually using a message is a multi-step process. First, some safety checks on the message and class requested. The code and arguments are then stored to avoid passing them around. The assignment to `\_\_msg\_use\_code:` is similar to `\tl\_set:Nn`. The message is eventually produced with whatever `\l\_\_msg\_class\_tl` is when `\_\_msg\_use\_code:` is called. Here is also a good place to suppress tracing output if the trace package is loaded since all (non-expandable) messages go through this auxiliary.

9498 `\cs\_new\_protected:Npn \_\_msg\_use:nnnnnn #1#2#3#4#5#6#7`  
9499 {  
9500     `\cs\_if\_exist\_use:N \conditionally@traceoff`

9502     {  
9503         `\_\_msg\_class\_chk\_exist:nT {#1}`  
9504         {  
9505             `\tl\_set:Nn \l\_\_msg\_current\_class\_tl {#1}`  
9506             `\cs\_set\_protected:Npe \_\_msg\_use\_code:`  
9507             {  
9508                 `\exp\_not:n`  
9509                 {  
9510                     `\use:c { \_\_msg\_ \l\_\_msg\_class\_tl _code:nnnnnn }`  
9511                     `{#2} {#3} {#4} {#5} {#6} {#7}`  
9512                 }  
9513             }  
9514         `\_\_msg\_use\_redirect\_name:n { #2 / #3 }`  
9515     }  
9516 }  
9517 {  
9518     `\msg\_error:nnnn { msg } { unknown } {#2} {#3} }`  
9519     `\cs\_if\_exist\_use:N \conditionally@traceon`  
9520 }  
`\cs\_new\_protected:Npn \_\_msg\_use\_code: { }`

The first check is for a individual message redirection. If this applies then no further redirection is attempted. Otherwise, split the message name into *<module>*, *<submodule>* and *<message>* (with an arbitrary number of slashes), and store *{/module/submodule}*, *{/module}* and *{}* into *\l\_\_msg\_hierarchy\_seq*. We then map through this sequence, applying the most specific redirection.

```

9521 \cs_new_protected:Npn \__msg_use_redirect_name:n #1
9522 {
9523   \prop_get:NnNTF \l__msg_redirect_prop { / #1 } \l__msg_class_tl
9524     { \__msg_use_code: }
9525     {
9526       \seq_clear:N \l__msg_hierarchy_seq
9527       \__msg_use_hierarchy:nwwN { }
9528         #1 \s__msg_mark \__msg_use_hierarchy:nwwN
9529         / \s__msg_mark \__msg_use_none_delimit_by_s_stop:w
9530           \s__msg_stop
9531           \__msg_use_redirect_module:n { }
9532     }
9533   }
9534 \cs_new_protected:Npn \__msg_use_hierarchy:nwwN #1#2 / #3 \s__msg_mark #4
9535   {
9536     \seq_put_left:Nn \l__msg_hierarchy_seq {#1}
9537     #4 { #1 / #2 } #3 \s__msg_mark #4
9538   }

```

At this point, the items of *\l\_\_msg\_hierarchy\_seq* are the various levels at which we should look for a redirection. Redirections which are less specific than the argument of *\\_\_msg\_use\_redirect\_module:n* are not attempted. This argument is empty for a class redirection, */module* for a module redirection, *etc.* Loop through the sequence to find the most specific redirection, with module **#1**. The loop is interrupted after testing for a redirection for **##1** equal to the argument **#1** (least specific redirection allowed). When a redirection is found, break the mapping, then if the redirection targets the same class, output the code with that class, and otherwise set the target as the new current class, and search for further redirections. Those redirections should be at least as specific as **#1**.

```

9539 \cs_new_protected:Npn \__msg_use_redirect_module:n #1
9540   {
9541     \seq_map_inline:Nn \l__msg_hierarchy_seq
9542     {
9543       \prop_get:cnNTF { l__msg_redirect_ \l__msg_current_class_tl _prop }
9544         {##1} \l__msg_class_tl
9545         {
9546           \seq_map_break:n
9547           {

9572     }
9573 }
```

(End of definition for `\msg_redirect_name:nnn`. This function is documented on page 89.)

**\msg\_redirect\_class:nn**  
**\msg\_redirect\_module:nnn**  
`\__msg_redirect:nnn`  
`\__msg_redirect_loop_chk:nnn`  
`\__msg_redirect_loop_list:n`

If the target class is empty, eliminate the corresponding redirection. Otherwise, add the redirection. We must then check for a loop: as an initialization, we start by storing the initial class in `\l__msg_current_class_t1`.

```

9574 \cs_new_protected:Npn \msg_redirect_class:nn
9575 { \__msg_redirect:nnn { } }
9576 \cs_new_protected:Npn \msg_redirect_module:nnn #1
9577 { \__msg_redirect:nnn { / #1 } }
9578 \cs_new_protected:Npn \__msg_redirect:nnn #1#2#3
9579 {
9580     \__msg_class_chk_exist:nT {#2}
9581     {
9582         \tl_if_empty:nTF {#3}
9583         { \prop_remove:cn { l__msg_redirect_ #2 _prop } {#1} }
9584         {
9585             \__msg_class_chk_exist:nT {#3}
9586             {
9587                 \prop_put:cnn { l__msg_redirect_ #2 _prop } {#1} {#3}
9588                 \tl_set:Nn \l__msg_current_class_t1 {#2}
9589                 \seq_clear:N \l__msg_class_loop_seq
9590                 \__msg_redirect_loop_chk:nnn {#2} {#3} {#1}
9591             }
9592         }
9593     }
9594 }
```

Since multiple redirections can only happen with increasing specificity, a loop requires that all steps are of the same specificity. The new redirection can thus only create a loop with other redirections for the exact same module, #1, and not submodules. After some initialization above, follow redirections with `\l__msg_class_t1`, and keep track in `\l__msg_class_loop_seq` of the various classes encountered. A redirection from a class to

itself, or the absence of redirection both mean that there is no loop. A redirection to the initial class marks a loop. To break it, we must decide which redirection to cancel. The user most likely wants the newly added redirection to hold with no further redirection. We thus remove the redirection starting from #2, target of the new redirection. Note that no message is emitted by any of the underlying functions: otherwise we may get an infinite loop because of a message from the message system itself.

```

```

(End of definition for `\msg_redirect_class:nn` and others. These functions are documented on page 89.)

## 49.6 Kernel-specific functions

`\__kernel_msg_show_eval:Nn`  
`\__kernel_msg_log_eval:Nn`  
`\__msg_show_eval:nnN`

A short-hand used for `\int_show:n` and similar functions that passes to `\tl_show:n` the result of applying #1 (a function such as `\int_eval:n`) to the expression #2. The use of f-expansion ensures that #1 is expanded in the scope in which the show command is called, rather than in the group created by `\iow_wrap:nnnN`. This is only important for expressions involving the `\currentgrouplevel` or `\currentgroupstype`. On the other hand we want the expression to be converted to a string with the usual escape character, hence within the wrapping code.

```

9622 \cs_new_protected:Npn \__kernel_msg_show_eval:Nn {#1} {#2}
9623     { \exp_args:Nf \__msg_show_eval:nnN {#1} {#2} {#2} \tl_show:n }
9624 \cs_new_protected:Npn \__kernel_msg_log_eval:Nn {#1} {#2}
9625     { \exp_args:Nf \__msg_show_eval:nnN {#1} {#2} {#2} \tl_log:n }
9626 \cs_new_protected:Npn \__msg_show_eval:nnN {#1} {#2} {#3}
9627     {#3 {#2 = #1} }
```

(End of definition for `\_kernel_msg_show_eval:Nn`, `\_kernel_msg_log_eval:Nn`, and `\_msg_show_eval:nnN`.)

These are all retained purely for older `xparse` support.

```

9974 }

```

## 49.8 Expandable errors

`\_\_msg\_expandable\_error:nn`

In expansion only context, we cannot use the normal means of reporting errors. Instead, we rely on a low-level TeX error caused by expanding a macro `\???` with parameter text “?” (this could be any token) which we used followed by something else (here, a space). This shows the context, which thanks to the odd-looking `\use:n` is

```
<argument> \???
    ! mypkg Error: The error message.
```

In other words, TeX is processing the argument of `\use:n`, which is `\???` *<space>* ! *<error type>* : *<error message>*.

```
9975 \cs_set_protected:Npn \_\_msg\_tmp:w #1
9976 {
9977     \cs_new:Npn #1 ? { }
9978     \cs_new:Npn \_\_msg_expandable_error:nn ##1##2
9979     {
9980         \exp_after:wN \exp_after:wN
9981         \exp_after:wN \_\_msg_use_none_delimit_by_s_stop:w
9982         \use:n { #1 ~ ! ~ ##2 : ~ ##1 } \s_\_msg_stop
9983     }
9984 }
9985 \exp_args:Nc \_\_msg\_tmp:w { ??? }
```

(End of definition for `\_\_msg_expandable_error:nn`.)

The command built from the csname `\c_\_msg_text_prefix_tl #1 / #2` takes four arguments and builds the error text, which is fed to `\_\_msg_expandable_error:n` with appropriate expansion: just as for usual messages the arguments are first turned to strings, then the message is fully expanded. The module name also has to be determined.

```
9986 \exp_args_generate:n { oooo }
9987 \cs_new:Npn \msg_expandable_error:nnnnnn #1#2#3#4#5#6
9988 {
9989     \exp_args:Nee \_\_msg_expandable_error:nn
9990     {
9991         \exp_args:Nc \exp_args:Nooooo
9992         { \c_\_msg_text_prefix_tl #1 / #2 }
9993         { \tl_to_str:n {#3} }
9994         { \tl_to_str:n {#4} }
9995         { \tl_to_str:n {#5} }
9996         { \tl_to_str:n {#6} }
9997     }
9998     { \msg_error_text:n {#1} }
9999 }
```

- 10000 `\cs_new:Npn \msg_expandable_error:nnnnnn #1#2#3#4#5`
- 10001   { `\msg_expandable_error:nnnnnn {#1} {#2} {#3} {#4} {#5} { }` }
- 10002 `\cs_new:Npn \msg_expandable_error:nnnn #1#2#3#4`

# Chapter 50

## I3file implementation

The following test files are used for this code: *m3file001*.

10028 ⟨\*package⟩

### 50.1 Input operations

10029 ⟨@@=ior⟩

#### 50.1.1 Variables and constants

\l\_\_ior\_internal\_tl Used as a short-term scratch variable.

10030 \tl\_new:N \l\_\_ior\_internal\_tl

(End of definition for \l\_\_ior\_internal\_tl.)

\c\_\_ior\_term\_ior Reading from the terminal (with a prompt) is done using a positive but non-existent stream number. Unlike writing, there is no concept of reading from the log.

10031 \int\_const:Nn \c\_\_ior\_term\_ior { 16 }

(End of definition for \c\_\_ior\_term\_ior.)

\g\_\_ior\_streams\_seq A list of the currently-available input streams to be used as a stack.

10032 \seq\_new:N \g\_\_ior\_streams\_seq

(End of definition for \g\_\_ior\_streams\_seq.)

\l\_\_ior\_stream\_tl Used to recover the raw stream number from the stack.

10033 \tl\_new:N \l\_\_ior\_stream\_tl

(End of definition for \l\_\_ior\_stream\_tl.)

\g\_\_ior\_streams\_prop The name of the file attached to each stream is tracked in a property list. To get the correct number of reserved streams in package mode the underlying mechanism needs to be queried. For L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> and plain T<sub>E</sub>X this data is stored in \count16: with the etex package loaded we need to subtract 1 as the register holds the number of the next stream to use. In ConT<sub>E</sub>Xt, we need to look at \count38 but there is no subtraction: like the original plain T<sub>E</sub>X/L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub> mechanism it holds the value of the *last* stream allocated.

10034 \prop\_new:N \g\_\_ior\_streams\_prop

```

10035 \int_step_inline:nnn
10036   { 0 }
10037   {
10038     \cs_if_exist:NTF \contextversion
10039       { \tex_count:D 38 ~ }
10040       {
10041         \tex_count:D 16 ~ %
10042         \cs_if_exist:NT \loccount { - 1 }
10043       }
10044   }
10045   {
10046     \prop_gput:Nnn \g__ior_streams_prop {#1} { Reserved-by~format }
10047   }

```

(End of definition for `\g__ior_streams_prop`.)

### 50.1.2 Stream management

**\ior\_new:N** Reserving a new stream is done by defining the name as equal to using the terminal.  
**\ior\_new:c**

```

10048 \cs_new_protected:Npn \ior_new:N #1 { \cs_new_eq:NN #1 \c__ior_term_ior }
10049 \cs_generate_variant:Nn \ior_new:N { c }

```

(End of definition for `\ior_new:N`. This function is documented on page 91.)

**\g\_tmpa\_ior** The usual scratch space.

**\g\_tmpb\_ior**

```

10050 \ior_new:N \g_tmpa_ior
10051 \ior_new:N \g_tmpb_ior

```

(End of definition for `\g_tmpa_ior` and `\g_tmpb_ior`. These variables are documented on page 98.)

**\ior\_open:Nn** Use the conditional version, with an error if the file is not found.

**\ior\_open:cn**

```

10052 \cs_new_protected:Npn \ior_open:Nn #1#2
10053   { \ior_open:NnF #1 {#2} { \__kernel_file_missing:n {#2} } }
10054 \cs_generate_variant:Nn \ior_open:Nn { c }

```

(End of definition for `\ior_open:Nn`. This function is documented on page 91.)

**\l\_\_ior\_file\_name\_tl** Data storage.

```

10055 \tl_new:N \l__ior_file_name_tl

```

(End of definition for `\l__ior_file_name_tl`.)

**\ior\_open:NnTF** An auxiliary searches for the file in the  $\text{\TeX}$ ,  $\text{\LaTeX}\text{2}_\varepsilon$  and  $\text{\LaTeX}3$  paths. Then pass the  
**\ior\_open:cnTF** file found to the lower-level function which deals with streams. The `full_name` is empty  
when the file is not found.

```

10056 \prg_new_protected_conditional:Npnn \ior_open:Nn #1#2 { T , F , TF }
10057   {
10058     \file_get_full_name:nNTF {#2} \l__ior_file_name_tl
10059     {
10060       \__kernel_ior_open:No #1 \l__ior_file_name_tl
10061       \prg_return_true:
10062     }
10063     { \prg_return_false: }
10064   }
10065 \prg_generate_conditional_variant:Nnn \ior_open:Nn { c } { T , F , TF }

```

(End of definition for `\ior_open:NnTF`. This function is documented on page 91.)

`\__ior_new:N` Streams are reserved using `\newread` before they can be managed by `ior`. To prevent `ior` from being affected by redefinitions of `\newread` (such as done by the third-party package `morewrites`), this macro is saved here under a private name. The complicated code ensures that `\__ior_new:N` is not `\outer` despite plain TeX's `\newread` being `\outer`. For ConTeXt, we have to deal with the fact that `\newread` works like our own: it actually checks before altering definition.

```
10066 \exp_args:NNf \cs_new_protected:Npn \__ior_new:N
10067   { \exp_args:NNc \exp_after:wN \exp_stop_f: { newread } }
10068 \cs_if_exist:NT \contextversion
10069   {
10070     \cs_new_eq:NN \__ior_new_aux:N \__ior_new:N
10071     \cs_gset_protected:Npn \__ior_new:N #1
10072     {
10073       \cs_undefine:N #1
10074       \__ior_new_aux:N #1
10075     }
10076   }
```

(End of definition for `\__ior_new:N`.)

`\__kernel_ior_open:Nn` `\__kernel_ior_open:Nn` `\__ior_open_stream:Nn` The stream allocation itself uses the fact that there is a list of all of those available. Life gets more complex as it's important to keep things in sync. That is done using a two-part approach: any streams that have already been taken up by `ior` but are now free are tracked, so we first try those. If that fails, ask plain TeX or L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  for a new stream and use that number (after a bit of conversion).

```
10077 \cs_new_protected:Npn \__kernel_ior_open:Nn #1#2
10078   {
10079     \ior_close:N #1
10080     \seq_gpop:NNTF \g__ior_streams_seq \l__ior_stream_tl
10081     { \__ior_open_stream:Nn #1 {#2} }
10082     {
10083       \__ior_new:N #1
10084       \__kernel_tl_set:Nx \l__ior_stream_tl { \int_eval:n {#1} }
10085       \__ior_open_stream:Nn #1 {#2}
10086     }
10087   }
10088 \cs_generate_variant:Nn \__kernel_ior_open:Nn { No }
```

Here, we act defensively in case LuaTeX is in use with an extensionless file name.

```
10089 \cs_new_protected:Npe \__ior_open_stream:Nn #1#2
10090   {
10091     \tex_global:D \tex_chardef:D #1 = \exp_not:N \l__ior_stream_tl \scan_stop:
10092     \prop_gput:NVn \exp_not:N \g__ior_streams_prop #1 {#2}
10093     \tex_openin:D #1
10094     \sys_if_engine_luatex:TF
10095     { {#2} }
10096     { \exp_not:N \__kernel_file_name_quote:n {#2} \scan_stop: }
10097   }
```

(End of definition for `\__kernel_ior_open:Nn` and `\__ior_open_stream:Nn`.)

**\ior\_shell\_open:Nn**    Actually much easier than either the standard open or input versions! When calling **\\_\_kernel\_ior\_open:Nn** the file the pipe is added to signal a shell command, but the quotes are not added yet—they are added later by **\\_\_kernel\_file\_name\_quote:n**.

```

10098 \cs_new_protected:Npn \ior_shell_open:Nn #1#2
10099  {
10100      \sys_if_shell:TF
10101          { \__ior_shell_open:oN { \tl_to_str:n {#2} } #1 }
10102          { \msg_error:nn { kernel } { pipe-failed } }
10103      }
10104 \cs_new_protected:Npn \__ior_shell_open:nN #1#2
10105  {
10106      \tl_if_in:nnTF {#1} { " }
10107      {
10108          \msg_error:nne
10109              { kernel } { quote-in-shell } {#1}
10110          }
10111          { \__kernel_ior_open:Nn #2 { |#1 } }
10112      }
10113 \cs_generate_variant:Nn \__ior_shell_open:nN { o }
10114 \msg_new:nnnn { kernel } { pipe-failed }
10115     { Cannot-run-piped-system-commands. }
10116     {
10117         LaTeX-tried-to-call-a-system-process-but-this-was-not-possible.\ \
10118         Try-the--shell-escape-(or--enable-pipes)-option.
10119     }

```

(End of definition for **\ior\_shell\_open:Nn** and **\\_\_ior\_shell\_open:nN**. This function is documented on page 91.)

**\ior\_close:N**    Closing a stream means getting rid of it at the TeX level and removing from the various data structures. Unless the name passed is an invalid stream number (outside the range [0, 15]), it can be closed. On the other hand, it only gets added to the stack if it was not already there, to avoid duplicates building up.

```

10120 \cs_new_protected:Npn \ior_close:N #1
10121  {
10122      \int_compare:nT { -1 < #1 < \c__ior_term_ior }
10123      {
10124          \tex_closein:D #1
10125          \prop_gremove:NV \g__ior_streams_prop #1
10126          \seq_if_in:NVF \g__ior_streams_seq #1
10127              { \seq_gpush:NV \g__ior_streams_seq #1 }
10128          \cs_gset_eq:NN #1 \c__ior_term_ior
10129      }
10130  }
10131 \cs_generate_variant:Nn \ior_close:N { c }

```

(End of definition for **\ior\_close:N**. This function is documented on page 92.)

**\ior\_show:N**    Seek the stream in the **\g\_\_ior\_streams\_prop** list, then show the stream as open or closed accordingly.

```

\__ior_show:NN
10132 \cs_new_protected:Npn \ior_show:N { \__ior_show:NN \tl_show:n }
10133 \cs_generate_variant:Nn \ior_show:N { c }
10134 \cs_new_protected:Npn \ior_log:N { \__ior_show:NN \tl_log:n }
10135 \cs_generate_variant:Nn \ior_log:N { c }

```

```

10136 \cs_new_protected:Npn \__ior_show>NN #1#2
10137 {
10138     \__kernel_chk_defined:NT #2
10139     {
10140         \prop_get:NVNTF \g__ior_streams_prop #2 \l__ior_internal_tl
10141         {
10142             \exp_args:Ne #1
10143             { \token_to_str:N #2 ~ open: ~ \l__ior_internal_tl }
10144         }
10145         { \exp_args:Ne #1 { \token_to_str:N #2 ~ closed } }
10146     }
10147 }

```

(End of definition for `\ior_show:N`, `\ior_log:N`, and `\__ior_show>NN`. These functions are documented on page 92.)

#### `\ior_show_list:`

#### `\ior_log_list:`

#### `\__ior_list:N`

Show the property lists, but with some “pretty printing”. See the `l3msg` module. The first argument of the message is `ior` (as opposed to `iow`) and the second is empty if no read stream is open and non-empty (the list of streams formatted using `\msg_show_item_unbraced:nn`) otherwise. The code of the message `show-streams` takes care of translating `ior/iow` to English.

```

10148 \cs_new_protected:Npn \ior_show_list: { \__ior_list:N \msg_show:nneeee }
10149 \cs_new_protected:Npn \ior_log_list: { \__ior_list:N \msg_log:nneeee }
10150 \cs_new_protected:Npn \__ior_list:N #1
10151 {
10152     #1 { kernel } { show-streams }
10153     { ior }
10154     {
10155         \prop_map_function:NN \g__ior_streams_prop
10156         \msg_show_item_unbraced:nn
10157     }
10158     { } { }
10159 }

```

(End of definition for `\ior_show_list:`, `\ior_log_list:`, and `\__ior_list:N`. These functions are documented on page 92.)

### 50.1.3 Reading input

#### `\if_eof:w`

The primitive conditional

```
10160 \cs_new_eq:NN \if_eof:w \tex_ifeof:D
```

(End of definition for `\if_eof:w`. This function is documented on page 98.)

#### `\ior_if_eof_p:N`

To test if some particular input stream is exhausted the following conditional is provided. The primitive test can only deal with numbers in the range [0, 15] so we catch outliers (they are exhausted).

```

10161 \prg_new_conditional:Npnn \ior_if_eof:N #1 { p , T , F , TF }
10162 {
10163     \if_int_compare:w -1 < #1
10164     \if_int_compare:w #1 < \c__ior_term_ior
10165         \if_eof:w #1
10166             \prg_return_true:
10167         \else:

```

```

10168         \prg_return_false:
10169         \fi:
10170     \else:
10171         \prg_return_true:
10172         \fi:
10173     \else:
10174         \prg_return_true:
10175         \fi:
10176     }

```

(End of definition for `\ior_if_eof:NTF`. This function is documented on page 95.)

`\ior_get:NN` And here we read from files.

```

\__ior_get:NN
10177 \cs_new_protected:Npn \ior_get:NN #1#2
10178   { \ior_get:NNF #1 #2 { \tl_set:Nn #2 { \q_no_value } } }
10179 \cs_new_protected:Npn \__ior_get:NN #1#2
10180   { \tex_read:D #1 to #2 }
10181 \prg_new_protected_conditional:Npnn \ior_get:NN #1#2 { T , F , TF }
10182   {
10183     \ior_if_eof:NTF #1
10184       { \prg_return_false: }
10185       {
10186         \__ior_get:NN #1 #2
10187         \prg_return_true:
10188       }
10189   }

```

(End of definition for `\ior_get:NN`, `\__ior_get:NN`, and `\ior_get:NNF`. These functions are documented on page 93.)

`\ior_str_get:NN` Reading as strings is a more complicated wrapper, as we wish to remove the endline character and restore it afterwards.

```

\__ior_str_get:NN
\ior_str_get:NNF
10190 \cs_new_protected:Npn \ior_str_get:NN #1#2
10191   { \ior_str_get:NNF #1 #2 { \tl_set:Nn #2 { \q_no_value } } }

10272      \fi:
10273      #4
10274      \__ior_map_variable_loop>NNNn #1#2#3 {#4}
10275  }

```

(End of definition for `\ior_map_variable:Nn` and others. These functions are documented on page 94.)

## 50.2 Output operations

```
10274 <@=iow>
```

There is a lot of similarity here to the input operations, at least for many of the basics. Thus quite a bit is copied from the earlier material with minor alterations.

### 50.2.1 Variables and constants

**\l\_\_iow\_internal\_tl** Used as a short-term scratch variable.

```
10275 \tl_new:N \l__iow_internal_tl
```

(End of definition for `\l__iow_internal_tl`.)

**\c\_log\_iow**  
**\c\_term\_iow** Here we allocate two output streams for writing to the transcript file only (`\c_log_iow`) and to both the terminal and transcript file (`\c_term_iow`). Recent LuaTeX provide 128

write streams; we also use `\c_term_iow` as the first non-allowed write stream so its value depends on the engine.

```

10276 \int_const:Nn \c_log_iow { -1 }
10277 \int_const:Nn \c_term_iow
10278 {
10279   \bool_lazy_and:nnTF
10280     { \sys_if_engine_luatex_p: }
10281     { \int_compare_p:nNn \tex_luatexversion:D > { 80 } }
10282     { 128 }
10283     { 16 }
10284 }
```

*(End of definition for `\c_log_iow` and `\c_term_iow`. These variables are documented on page 98.)*

`\g__iow_streams_seq` A list of the currently-available output streams to be used as a stack.

```
10285 \seq_new:N \g__iow_streams_seq
```

*(End of definition for `\g__iow_streams_seq`.)*

`\l__iow_stream_tl` Used to recover the raw stream number from the stack.

```
10286 \tl_new:N \l__iow_stream_tl
```

*(End of definition for `\l__iow_stream_tl`.)*

`\g__iow_streams_prop` As for reads with the appropriate adjustment of the register numbers to check on.

```

10287 \prop_new:N \g__iow_streams_prop
10288 \int_step_inline:nnn
10289   { 0 }
10290   {
10291     \cs_if_exist:NTF \contextversion
10292       { \tex_count:D 39 ~ }
10293       {
10294         \tex_count:D 17 ~
10295         \cs_if_exist:NT \loccount { - 1 }
10296       }
10297   }
10298   {
10299     \prop_gput:Nnn \g__iow_streams_prop {#1} { Reserved-by~format }
10300 }
```

*(End of definition for `\g__iow_streams_prop`.)*

### 50.2.2 Internal auxiliaries

`\s__iow_mark` Internal scan marks.

```

10301 \scan_new:N \s__iow_mark
10302 \scan_new:N \s__iow_stop
```

*(End of definition for `\s__iow_mark` and `\s__iow_stop`.)*

`\_iow_use_i_delimit_by_s_stop:nw` Functions to gobble up to a scan mark.

```
10303 \cs_new:Npn \_iow_use_i_delimit_by_s_stop:nw #1 #2 \s__iow_stop {#1}
```

*(End of definition for `\_iow_use_i_delimit_by_s_stop:nw`.)*

\q\_\_iow\_nil Internal quarks.  
10304 \quark\_new:N \q\_\_iow\_nil  
*(End of definition for \q\_\_iow\_nil.)*

## 50.3 Stream management

\iow\_new:N Reserving a new stream is done by defining the name as equal to writing to the terminal:  
\iow\_new:c odd but at least consistent.

```
10305 \cs_new_protected:Npn \iow_new:N #1 { \cs_new_eq:NN #1 \c_term_iow }  

10306 \cs_generate_variant:Nn \iow_new:N { c }
```

*(End of definition for \iow\_new:N. This function is documented on page 91.)*

\g\_tmpa\_iow The usual scratch space.  
\g\_tmpb\_iow  
10307 \iow\_new:N \g\_tmpa\_iow  
10308 \iow\_new:N \g\_tmpb\_iow

*(End of definition for \g\_tmpa\_iow and \g\_tmpb\_iow. These variables are documented on page 98.)*

\\_\_iow\_new:N As for read streams, copy \newwrite, making sure that it is not \outer. For ConTeXt,  
we have to deal with the fact that \newwrite works like our own: it actually checks  
before altering definition.

```
10309 \exp_args:NNf \cs_new_protected:Npn \__iow_new:N  

10310 { \exp_args:NNc \exp_after:wN \exp_stop_f: { newwrite } }  

10311 \cs_if_exist:NT \contextversion  

10312 {  

10313 \cs_new_eq:NN \__iow_new_aux:N \__iow_new:N  

10314 \cs_gset_protected:Npn \__iow_new:N #1  

10315 {  

10316 \cs_undefine:N #1  

10317 \__iow_new_aux:N #1  

10318 }  

10319 }
```

*(End of definition for \\_\_iow\_new:N.)*

\l\_\_iow\_file\_name\_tl Data storage.  
10320 \tl\_new:N \l\_\_iow\_file\_name\_tl  
*(End of definition for \l\_\_iow\_file\_name\_tl.)*

\iow\_open:Nn \iow\_open:NV \iow\_open:cn \iow\_open:cV The same idea as for reading, but without the path and without the need to allow for a  
conditional version.

```
10321 \cs_new_protected:Npn \iow_open:Nn #1#2  

10322 {  

10323 \__kernel_tl_set:Nx \l__iow_file_name_tl  

10324 { \__kernel_file_name_sanitize:n {#2} }  

10325 \iow_close:N #1  

10326 \seq_gpop:NNTF \g__iow_streams_seq \l__iow_stream_tl  

10327 { \__iow_open_stream:NV #1 \l__iow_file_name_tl }  

10328 {  

10329 \__iow_new:N #1
```

```

10330      \__kernel_tl_set:Nx \l__iow_stream_tl { \int_eval:n {#1} }
10331      \__iow_open_stream:NV #1 \l__iow_file_name_tl
10332  }
10333  }
10334 \cs_generate_variant:Nn \iow_open:Nn { NV , c , cV }
10335 \cs_new_protected:Npn \__iow_open_stream:Nn #1#
10336  {
10337      \tex_global:D \tex_chardef:D #1 = \l__iow_stream_tl \scan_stop:
10338      \prop_gput:NVn \g__iow_streams_prop #1 {#2}
10339      \tex_immediate:D \tex_openout:D
10340          #1 \__kernel_file_name_quote:n {#2} \scan_stop:
10341  }
10342 \cs_generate_variant:Nn \__iow_open_stream:Nn { NV }

(End of definition for \iow_open:Nn and \__iow_open_stream:Nn. This function is documented on page 91.)

```

### \iow\_shell\_open:Nn

Very similar to the ior version

```

10343 \cs_new_protected:Npn \iow_shell_open:Nn #1#
10344  {
10345      \sys_if_shell:TF
10346          { \__iow_shell_open:oN { \tl_to_str:n {#2} } #1 }
10347          { \msg_error:nn { kernel } { pipe-failed } }
10348  }
10349 \cs_new_protected:Npn \__iow_shell_open:nN #1#
10350  {
10351      \tl_if_in:nnTF {#1} { " }
10352  {
10353      \msg_error:nne
10354          { kernel } { quote-in-shell } {#1}
10355  }
10356  { \__kernel_iow_open:Nn #2 { |#1 } }
10357  }
10358 \cs_generate_variant:Nn \__iow_shell_open:nN { o }

(End of definition for \iow_shell_open:Nn and \__iow_shell_open:nN. This function is documented on page 91.)

```

### \iow\_close:N \iow\_close:c

Closing a stream is not quite the reverse of opening one. First, the close operation is easier than the open one, and second as the stream is actually a number we can use it directly to show that the slot has been freed up.

```

10359 \cs_new_protected:Npn \iow_close:N #
10360  {
10361      \int_compare:nT { \c_log_iow < #1 < \c_term_iow }
10362  {
10363      \tex_immediate:D \tex_closeout:D #1
10364      \prop_gremove:NV \g__iow_streams_prop #1
10365      \seq_if_in:NVF \g__iow_streams_seq #1
10366          { \seq_gpush:NV \g__iow_streams_seq #1 }
10367      \cs_gset_eq:NN #1 \c_term_iow
10368  }
10369  }
10370 \cs_generate_variant:Nn \iow_close:N { c }

(End of definition for \iow_close:N. This function is documented on page 92.)

```

```

\iow_show:N Seek the stream in the \g__iow_streams_prop list, then show the stream as open or
\iow_log:N closed accordingly.
\_\_iow_show:NN
 10371 \cs_new_protected:Npn \iow_show:N { \_\_iow_show:NN \tl_show:n }
 10372 \cs_generate_variant:Nn \iow_show:N { c }
 10373 \cs_new_protected:Npn \iow_log:N { \_\_iow_show:NN \tl_log:n }
 10374 \cs_generate_variant:Nn \iow_log:N { c }
 10375 \cs_new_protected:Npn \_\_iow_show:NN #1#2
 10376 {
 10377   \_\_kernel_chk_defined:NT #2
 10378   {
 10379     \prop_get:NVNTF \g__iow_streams_prop #2 \l__iow_internal_tl
 10380     {
 10381       \exp_args:Ne #1
 10382         { \token_to_str:N #2 ~ open: ~ \l__iow_internal_tl }
 10383     }
 10384     { \exp_args:Ne #1 { \token_to_str:N #2 ~ closed } }
 10385   }
 10386 }

```

(End of definition for \iow\_show:N, \iow\_log:N, and \\_\\_iow\_show:NN. These functions are documented on page 92.)

\iow\_show\_list: Done as for input, but with a copy of the auxiliary so the name is correct.

```

\iow_log_list:
\_\_iow_list:N
 10387 \cs_new_protected:Npn \iow_show_list: { \_\_iow_list:N \msg_show:nneeee }
 10388 \cs_new_protected:Npn \iow_log_list: { \_\_iow_list:N \msg_log:nneeee }
 10389 \cs_new_protected:Npn \_\_iow_list:N #1
 10390 {
 10391   #1 { kernel } { show-streams }
 10392   { iow }
 10393   {
 10394     \prop_map_function:NN \g__iow_streams_prop
 10395       \msg_show_item_unbraced:nn
 10396   }
 10397   { } { }
 10398 }

```

(End of definition for \iow\_show\_list:, \iow\_log\_list:, and \\_\\_iow\_list:N. These functions are documented on page 92.)

### 50.3.1 Deferred writing

\iow\_shipout\_e:Nn First the easy part, this is the primitive, which expects its argument to be braced.

```

\iow_shipout_e:Nn
 10399 \cs_new_protected:Npn \iow_shipout_e:Nn #1#2
 10400   { \tex_write:D #1 {#2} }
 10401 \cs_generate_variant:Nn \iow_shipout_e:Nn { Ne , c, ce }

```

(End of definition for \iow\_shipout\_e:Nn. This function is documented on page 96.)

\iow\_shipout:Nn With ε-TEX available deferred writing without expansion is easy.

```

\iow_shipout:Nn
 10402 \cs_new_protected:Npn \iow_shipout:Nn #1#2
 10403   { \tex_write:D #1 { \exp_not:n {#2} } }
 10404 \cs_generate_variant:Nn \iow_shipout:Nn { Ne , c, ce }
 10405 \cs_generate_variant:Nn \iow_shipout:Nn { Nx , cx }

```

(End of definition for \iow\_shipout:Nn. This function is documented on page 96.)

### 50.3.2 Immediate writing

\\_kernel\_iow\_with:Nnn  
\\_\_iow\_with:nNnn  
\\_\_iow\_with:oNnn

If the integer #1 is equal to #2, just leave #3 in the input stream. Otherwise, pass the old value to an auxiliary, which sets the integer to the new value, runs the code, and restores the integer.

```

10406 \cs_new_protected:Npn \_kernel_iow_with:Nnn #1#2
10407  {
10408      \int_compare:nNnTF {#1} = {#2}
10409      { \use:n }
10410      { \__iow_with:oNnn { \int_use:N #1 } #1 {#2} }
10411  }
10412 \cs_new_protected:Npn \__iow_with:nNnn #1#2#3#4
10413  {
10414      \int_set:Nn #2 {#3}
10415      #4
10416      \int_set:Nn #2 {#1}
10417  }
10418 \cs_generate_variant:Nn \__iow_with:nNnn { o }
```

(End of definition for \\_kernel\_iow\_with:Nnn and \\_\_iow\_with:nNnn.)

\iow\_now:Nn  
\iow\_now:NV  
\iow\_now:Ne  
\iow\_now:Nx  
\iow\_now:cn  
\iow\_now:cV  
\iow\_now:ce  
\iow\_now:cx

This routine writes the second argument onto the output stream without expansion. If this stream isn't open, the output goes to the terminal instead. If the first argument is no output stream at all, we get an internal error. We don't use the expansion done by \write to get the Nx variant, because it differs in subtle ways from x-expansion, namely, macro parameter characters would not need to be doubled. We set the \newlinechar to 10 using \\_kernel\_iow\_with:Nnn to support formats such as plain TeX: otherwise, \iow\_newline: would not work. We do not do this for \iow\_shipout:Nn or \iow\_shipout\_x:Nn, as TeX looks at the value of the \newlinechar at shipout time in those cases.

```

10419 \cs_new_protected:Npn \iow_now:Nn #1#2
10420  {
10421      \_kernel_iow_with:Nnn \tex_newlinechar:D { '\^J }
10422      { \tex_immediate:D \tex_write:D #1 { \exp_not:n {#2} } }
10423  }
10424 \cs_generate_variant:Nn \iow_now:Nn { NV , Ne , c , cV , ce }
10425 \cs_generate_variant:Nn \iow_now:Nn { Nx , cx }
```

(End of definition for \iow\_now:Nn. This function is documented on page 95.)

\iow\_log:n  
\iow\_log:e  
\iow\_log:x  
\iow\_term:n  
\iow\_term:e  
\iow\_term:x

Writing to the log and the terminal directly are relatively easy; as we need the two e-type variants for bootstrapping, they are redefinitions here.

```

10426 \cs_new_protected:Npn \iow_log:n { \iow_now:Nn \c_log_iow }
10427 \cs_set_protected:Npn \iow_log:e { \iow_now:Ne \c_log_iow }
10428 \cs_generate_variant:Nn \iow_log:n { x }
10429 \cs_new_protected:Npn \iow_term:n { \iow_now:Nn \c_term_iow }
10430 \cs_set_protected:Npn \iow_term:e { \iow_now:Ne \c_term_iow }
10431 \cs_generate_variant:Nn \iow_term:n { x }
```

(End of definition for \iow\_log:n and \iow\_term:n. These functions are documented on page 95.)

### 50.3.3 Special characters for writing

`\iow_newline:` Global variable holding the character that forces a new line when something is written to an output stream.

```
10432 \cs_new:Npn \iow_newline: { ^J }
```

(End of definition for `\iow_newline:`. This function is documented on page 96.)

`\iow_char:N` Function to write any escaped char to an output stream.

```
10433 \cs_new_eq:NN \iow_char:N \cs_to_str:N
```

(End of definition for `\iow_char:N`. This function is documented on page 96.)

### 50.3.4 Hard-wrapping lines to a character count

The code here implements a generic hard-wrapping function. This is used by the messaging system, but is designed such that it is available for other uses.

`\l_iow_line_count_int` This is the “raw” number of characters in a line which can be written to the terminal. The standard value is the line length typically used by TeX Live and MiKTeX.

```
10434 \int_new:N \l_iow_line_count_int  
10435 \int_set:Nn \l_iow_line_count_int { 78 }
```

(End of definition for `\l_iow_line_count_int`. This variable is documented on page 98.)

`\l__iow_newline_tl` The token list inserted to produce a new line, with the *<run-on text>*.

```
10436 \tl_new:N \l__iow_newline_tl
```

(End of definition for `\l__iow_newline_tl`.)

`\l__iow_line_target_int` This stores the target line count: the full number of characters in a line, minus any part for a leader at the start of each line.

```
10437 \int_new:N \l__iow_line_target_int
```

(End of definition for `\l__iow_line_target_int`.)

`\__iow_set_indent:n` The `one_indent` variables hold one indentation marker and its length. The `\__iow_unindent:w` auxiliary removes one indentation. The function `\__iow_set_indent:n` (that could possibly be public) sets the indentation in a consistent way. We set it to four spaces by default.

```
10438 \tl_new:N \l__iow_one_indent_tl  
10439 \int_new:N \l__iow_one_indent_int  
10440 \cs_new:Npn \__iow_unindent:w { }  
10441 \cs_new_protected:Npn \__iow_set_indent:n #1  
10442 {  
10443     \__kernel_tl_set:Nx \l__iow_one_indent_tl  
10444     { \exp_args:No \__kernel_str_to_other_fast:n { \tl_to_str:n {#1} } }  
10445     \int_set:Nn \l__iow_one_indent_int  
10446     { \str_count:N \l__iow_one_indent_tl }  
10447     \exp_last_unbraced:NNo  
10448     \cs_set:Npn \__iow_unindent:w \l__iow_one_indent_tl { }  
10449 }  
10450 \exp_args:Ne \__iow_set_indent:n { \prg_replicate:nn { 4 } { ~ } }
```

(End of definition for `\__iow_set_indent:n` and others.)

\l\_iow\_indent\_tl      The current indentation (some copies of \l\_iow\_one\_indent\_tl) and its number of characters.

```
10451 \tl_new:N \l_iow_indent_tl
10452 \int_new:N \l_iow_indent_int
```

(End of definition for \l\_iow\_indent\_tl and \l\_iow\_indent\_int.)

\l\_iow\_line\_tl      These hold the current line of text and a partial line to be added to it, respectively.

```
10453 \tl_new:N \l_iow_line_tl
10454 \tl_new:N \l_iow_line_part_tl
```

(End of definition for \l\_iow\_line\_tl and \l\_iow\_line\_part\_tl.)

\l\_iow\_line\_break\_bool      Indicates whether the line was broken precisely at a chunk boundary.

```
10455 \bool_new:N \l_iow_line_break_bool
```

(End of definition for \l\_iow\_line\_break\_bool.)

\l\_iow\_wrap\_tl      Used for the expansion step before detokenizing, and for the output from wrapping text: fully expanded and with lines which are not overly long.

```
10456 \tl_new:N \l_iow_wrap_tl
```

(End of definition for \l\_iow\_wrap\_tl.)

\c\_iow\_wrap\_marker\_tl      Every special action of the wrapping code starts with the same recognizable string, \c\_iow\_wrap\_marker\_tl. Upon seeing that “word”, the wrapping code reads one space-delimited argument to know what operation to perform. The setting of \escapechar here is not very important, but makes \c\_iow\_wrap\_marker\_tl look marginally nicer.

```
10457 \group_begin:
10458   \int_set:Nn \tex_escapechar:D { -1 }
10459   \tl_const:Ne \c_iow_wrap_marker_tl
10460   { \tl_to_str:n { ^^I ^^O ^^W ^^- ^^W ^^R ^^A ^^P } }
10461 \group_end:
10462 \tl_map_inline:nn
10463 { { end } { newline } { allow_break } { indent } { unindent } }
10464 {
10465   \tl_const:ce { c_iow_wrap_#1 _marker_tl }
10466   {
10467     \c_iow_wrap_marker_tl
10468     #1
10469     \c_catcode_other_space_tl
10470   }
10471 }
```

(End of definition for \c\_iow\_wrap\_marker\_tl and others.)

**\iow\_wrap\_allow\_break:** \iow\_wrap\_allow\_break:      We set \iow\_wrap\_allow\_break:n to produce an error when outside messages. Within wrapped message, it is set to \iow\_wrap\_allow\_break: when valid and otherwise to \iow\_wrap\_allow\_break\_error:. The second produces an error expandably.

```
10472 \cs_new_protected:Npn \iow_wrap_allow_break:
10473   {
10474     \msg_error:nnnn { kernel } { iow-indent }
10475     { \iow_wrap:nnnN } { \iow_wrap_allow_break: }
10476   }
```

```

10477 \cs_new:Npe \__iow_wrap_allow_break: { \c__iow_wrap_allow_break_marker_tl }
10478 \cs_new:Npn \__iow_wrap_allow_break_error:
10479 {
10480     \msg_expandable_error:nnnn { kernel } { iow-indent }
10481     { \iow_wrap:nnN } { \iow_wrap_allow_break: }
10482 }

```

(End of definition for `\iow_wrap_allow_break:`, `\__iow_wrap_allow_break:`, and `\__iow_wrap_allow_break_error:`. This function is documented on page 97.)

**\iow\_indent:n**  
`\__iow_indent:n`  
`\__iow_indent_error:n`

We set `\iow_indent:n` to produce an error when outside messages. Within wrapped message, it is set to `\__iow_indent:n` when valid and otherwise to `\__iow_indent_error:n`. The first places the instruction for increasing the indentation before its argument, and the instruction for unindenting afterwards. The second produces an error expandably. Note that there are no forced line-break, so the indentation only changes when the next line is started.

```

10483 \cs_new_protected:Npn \iow_indent:n #1
10484 {
10485     \msg_error:nnnn { kernel } { iow-indent }
10486     { \iow_wrap:nnN } { \iow_indent:n } {#1}
10487     #1
10488 }
10489 \cs_new:Npe \__iow_indent:n #1
10490 {
10491     \c__iow_wrap_indent_marker_tl
10492     #1
10493     \c__iow_wrap_unindent_marker_tl
10494 }
10495 \cs_new:Npn \__iow_indent_error:n #1
10496 {
10497     \msg_expandable_error:nnnn { kernel } { iow-indent }
10498     { \iow_wrap:nnN } { \iow_indent:n } {#1}
10499     #1
10500 }

```

(End of definition for `\iow_indent:n`, `\__iow_indent:n`, and `\__iow_indent_error:n`. This function is documented on page 97.)

**\iow\_wrap:nnnN**  
`\iow_wrap:nenN`

The main wrapping function works as follows. First give `\&`, `\_` and other formatting commands the correct definition for messages and perform the given setup #3. The definition of `\_` uses an “other” space rather than a normal space, because the latter might be absorbed by TeX to end a number or other f-type expansions. Use `\conditionally@traceoff` if defined; it is introduced by the trace package and suppresses uninteresting tracing of the wrapping code.

```

10501 \cs_new_protected:Npn \iow_wrap:nnnN #1#2#3#4
10502 {
10503     \group_begin:
10504     \cs_if_exist_use:N \conditionally@traceoff
10505     \int_set:Nn \tex_escapechar:D { -1 }
10506     \cs_set:Npe \{ { \token_to_str:N \{ }
10507     \cs_set:Npe \# { \token_to_str:N \# }
10508     \cs_set:Npe \} { \token_to_str:N \} }
10509     \cs_set:Npe \% { \token_to_str:N \% }
10510     \cs_set:Npe \~ { \token_to_str:N \~ }

```

```

10511 \int_set:Nn \tex_escapechar:D { 92 }
10512 \cs_set_eq:NN \\ \iow_newline:
10513 \cs_set_eq:NN \c_catcode_other_space_tl
10514 \cs_set_eq:NN \iow_wrap_allow_break: \__iow_wrap_allow_break:
10515 \cs_set_eq:NN \iow_indent:n \__iow_indent:n
10516 #3

```

Then fully-expand the input: in package mode, the expansion uses L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>'s `\protect` mechanism in the same way as `\typeout`. In generic mode this setting is useless but harmless. As soon as the expansion is done, reset `\iow_indent:n` to its error definition: it only works in the first argument of `\iow_wrap:nnN`.

```

10517 \cs_set_eq:NN \protect \token_to_str:N
10518 \__kernel_tl_set:Nx \l__iow_wrap_tl {\#1}
10519 \cs_set_eq:NN \iow_wrap_allow_break: \__iow_wrap_allow_break_error:
10520 \cs_set_eq:NN \iow_indent:n \__iow_indent_error:n

```

Afterwards, set the newline marker (two assignments to fully expand, then convert to a string) and initialize the target count for lines (the first line has target count `\l_iow_line_count_int` instead).

```

10521 \__kernel_tl_set:Nx \l__iow_newline_tl {\iow_newline: #2}
10522 \__kernel_tl_set:Nx \l__iow_newline_tl {\tl_to_str:N \l__iow_newline_tl }
10523 \int_set:Nn \l__iow_line_target_int
10524 {\l_iow_line_count_int - \str_count:N \l__iow_newline_tl + 1 }

```

Sanity check.

```

10525 \int_compare:nNnT {\l__iow_line_target_int} < 0
10526 {
10527 \tl_set:Nn \l__iow_newline_tl {\iow_newline: }
10528 \int_set:Nn \l__iow_line_target_int
10529 {\l_iow_line_count_int + 1 }
10530 }

```

There is then a loop over the input, which stores the wrapped result in `\l__iow_wrap_tl`. After the loop, the resulting text is passed on to the function which has been given as a post-processor. The `\tl_to_str:N` step converts the “other” spaces back to normal spaces. The f-expansion removes a leading space from `\l__iow_wrap_tl`.

```

10531 \__iow_wrap_do:
10532 \exp_args:Nnf \group_end:
10533 #4 {\tl_to_str:N \l__iow_wrap_tl }
10534 }
10535 \cs_generate_variant:Nn \iow_wrap:nnN { ne }

```

(End of definition for `\iow_wrap:nnN`. This function is documented on page 97.)

`\__iow_wrap_do:` Escape spaces and change newlines to `\c_iow_wrap_newline_marker_tl`. Set up a few variables, in particular the initial value of `\l__iow_wrap_tl`: the space stops the f-expansion of the main wrapping function and `\use_none:n` removes a newline marker inserted by later code. The main loop consists of repeatedly calling the chunk auxiliary to wrap chunks delimited by (newline or indentation) markers.

```

10536 \cs_new_protected:Npn \__iow_wrap_do:
10537 {
10538 \__kernel_tl_set:Nx \l__iow_wrap_tl
10539 {

\\_\\_iow\_wrap\_chunk:nw  
\\_\\_iow\_wrap\_next:nw

The **chunk** and **next** auxiliaries are defined indirectly to obtain the expansions of \c\\_catcode\_other\_space\_tl and \c\\_\\_iow\_wrap\_marker\_tl in their definition. The **next** auxiliary calls a function corresponding to the type of marker (its ##2), which can be newline or indent or unindent or end. The first argument of the **chunk** auxiliary is a target number of characters and the second is some string to wrap. If the chunk is empty simply call **next**. Otherwise, set up a call to \\_\\_iow\_wrap\_line:nw, including the indentation if the current line is empty, and including a trailing space (#1) before the \\_\\_iow\_wrap\_end\_chunk:w auxiliary.

```

10569 \cs_set_protected:Npn \_\_iow_tmp:w #1#2
10570 {
10571   \cs_new_protected:Npn \_\_iow_wrap_chunk:nw ##1##2 #2

10592 }
10593 \exp_args:NVV \__iow_tmp:w \c_catcode_other_space_tl \c__iow_wrap_marker_tl

```

(End of definition for `\__iow_wrap_chunk:nw` and `\__iow_wrap_next:nw`.)

```

\__iow_wrap_line:nw
\__iow_wrap_line_loop:w
\__iow_wrap_line_aux:Nw
  \__iow_wrap_line_seven:nmmmmn
  \__iow_wrap_line_end:NmmmmmmN
\__iow_wrap_line_end:nw
\__iow_wrap_end_chunk:w

```

This is followed by `{⟨string⟩} ⟨int expr⟩ ;`. It stores the `⟨string⟩` and up to `⟨int expr⟩` characters from the current chunk into `\l__iow_line_part_tl`. Characters are grabbed 8 at a time and left in `\l__iow_line_part_tl` by the `line_loop` auxiliary. When  $k < 8$  remain to be found, the `line_aux` auxiliary calls the `line_end` auxiliary followed by (the single digit)  $k$ , then  $7 - k$  empty brace groups, then the chunk's remaining characters. The `line_end` auxiliary leaves  $k$  characters from the chunk in the line part, then ends the assignment. Ignore the `\use_none:nnnnn` line for now. If the next character is a space the line can be broken there: store what we found into the result and get the next line. Otherwise some work is needed to find a break-point. So far we have ignored what happens if the chunk is shorter than the requested number of characters: this is dealt with by the `end_chunk` auxiliary, which gets treated like a character by the rest of the code. It ends up being called either as one of the arguments `#2–#9` of the `line_loop` auxiliary or as one of the arguments `#2–#8` of the `line_end` auxiliary. In both cases stop the assignment and work out how many characters are still needed. Notice that when we have exactly seven arguments to clean up, a `\exp_stop_f:` has to be inserted to stop the `\exp:w`. The weird `\use_none:nnnnn` ensures that the required data is in the right place.

```

(End of definition for `\__iow_wrap_line:nw` and others.)

`\__iow_wrap_break:w`, `\__iow_wrap_break_first:w`, `\__iow_wrap_break_none:w`, `\__iow_wrap_break_loop:w`, `\__iow_wrap_break_end:w` Functions here are defined indirectly: `\__iow_tmp:w` is eventually called with an “other” space as its argument. The goal is to remove from `\l__iow_line_part_tl` the part after the last space. In most cases this is done by repeatedly calling the `break_loop` auxiliary, which leaves “words” (delimited by spaces) until it hits the trailing space: then its argument `##3` is ? `\__iow_wrap_break_end:w` instead of a single token, and that `break_end` auxiliary leaves in the assignment the line until the last space, then calls `\__iow_wrap_line_end:nw` to finish up the line and move on to the next. If there is no space in `\l__iow_line_part_tl` then the `break_first` auxiliary calls the `break_none` auxiliary. In that case, if the current line is empty, the complete word (including `##4`, characters beyond what we had grabbed) is added to the line, making it over-long. Otherwise, the word is used for the following line (and the last space of the line so far is removed because it was inserted due to the presence of a marker).

10697   }
10698 }

```

(End of definition for `\__iow_wrap_next_line:w`.)

`\__iow_wrap_allow_break:n` This is called after a chunk has been wrapped. The `\l__iow_line_part_tl` typically ends with a space (except at the beginning of a line?), which we remove since the `allow_-`

**break** marker should not insert a space. Then move on with the next chunk, making sure to adjust the target number of characters for the line in case we did remove a space.

```

10699 \cs_new_protected:Npn \__iow_wrap_allow_break:n #1
10700  {
10701      \__kernel_tl_set:Nx \l__iow_line_tl
10702          { \l__iow_line_tl \__iow_wrap_trim:N \l__iow_line_part_tl }
10703      \bool_set_false:N \l__iow_line_break_bool
10704      \tl_if_empty:NTF \l__iow_line_part_tl
10705          { \__iow_wrap_chunk:nw {#1} }
10706          { \exp_args:Nf \__iow_wrap_chunk:nw { \int_eval:n { #1 + 1 } } }
10707  }

```

(End of definition for `\__iow_wrap_allow_break:n`.)

`\__iow_wrap_indent:n` These functions are called after a chunk has been wrapped, when encountering **indent/unindent** markers. Add the line part (last line part of the previous chunk) to the line so far and reset a boolean denoting the presence of a line-break. Most importantly, add or remove one indent from the current indent (both the integer and the token list). Finally, continue wrapping.

```

10708 \cs_new_protected:Npn \__iow_wrap_indent:n #1
10709  {
10710      \tl_put_right:Ne \l__iow_line_tl { \l__iow_line_part_tl }

10722          { \exp_after:wN \__iow_unindent:w \l__iow_indent_tl }
10723          \__iow_wrap_chunk:nw {#1}
10724  }

```

(End of definition for `\__iow_wrap_indent:n` and `\__iow_wrap_unindent:n`.)

`\__iow_wrap_newline:n` These functions are called after a chunk has been line-wrapped, when encountering a **newline/end** marker. Unless we just took a line-break, store the line part and the line so far into the whole `\l__iow_wrap_tl`, trimming a trailing space. In the **newline** case look for a new line (of length `\l__iow_line_target_int`) in a new chunk.

```

10725 \cs_new_protected:Npn \__iow_wrap_newline:n #1
10726  {
10727      \bool_if:NF \l__iow_line_break_bool
10728          { \__iow_wrap_store_do:n { \__iow_wrap_trim:N } }
10729      \bool_set_false:N \l__iow_line_break_bool
10730      \__iow_wrap_chunk:nw { \l__iow_line_target_int }
10731  }
10732 \cs_new_protected:Npn \__iow_wrap_end:n #1
10733  {
10734      \bool_if:NF \l__iow_line_break_bool
10735          { \__iow_wrap_store_do:n { \__iow_wrap_trim:N } }

```

```
10736     \bool_set_false:N \l__iow_line_break_bool  
10737 }
```

(End of definition for `\_\_iow_wrap_newline:n` and `\_\_iow_wrap_end:n`.)

`\_\_iow_wrap_store_do:n` First add the last line part to the line, then append it to `\l__iow_wrap_tl` with the appropriate new line (with “run-on” text), possibly with its last space removed (#1 is empty or `\_\_iow_wrap_trim:N`).

```
10738 \cs_new_protected:Npn \_\_iow_wrap_store_do:n #1  
10739 {  
10740     \__kernel_tl_set:Nx \l__iow_line_tl  
10741     { \l__iow_line_tl \l__iow_line_part_tl }  
10742     \__kernel_tl_set:Nx \l__iow_wrap_tl  
10743     {  
10744         \l__iow_wrap_tl  
10745         \l__iow_newline_tl  
10746         #1 \l__iow_line_tl  
10747     }  
10748     \tl_clear:N \l__iow_line_tl  
10749 }
```

(End of definition for `\_\_iow_wrap_store_do:n`.)

`\_\_iow_wrap_trim:N` Remove one trailing “other” space from the argument if present.

```
10750 \cs_set_protected:Npn \_\_iow_tmp:w #1  
10751 {  
10752     \cs_new:Npn \_\_iow_wrap_trim:N ##1

## 50.4 File operations

`\l__file_internal_tl` Used as a short-term scratch variable.

```
10760 \tl_new:N \l__file_internal_tl
```

(End of definition for `\l__file_internal_tl`.)

`\g_file_curr_dir_str` `\g_file_curr_ext_str` The name of the current file should be available at all times: the name itself is set dynamically.

`\g_file_curr_name_str`

```
10761 \str_new:N \g_file_curr_dir_str  
10762 \str_new:N \g_file_curr_ext_str  
10763 \str_new:N \g_file_curr_name_str
```

(End of definition for `\g_file_curr_dir_str`, `\g_file_curr_ext_str`, and `\g_file_curr_name_str`. These variables are documented on page 98.)

\g\_\_file\_stack\_seq

The input list of files is stored as a sequence stack. In package mode we can recover the information from the details held by L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  (we must be in the preamble and loaded using \usepackage or \RequirePackage). As L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  doesn't store directory and name separately, we stick to the same convention here. In pre-loading, \currnamestack is empty so is skipped.

```
10764 \seq_new:N \g__file_stack_seq
10765 \group_begin:
10766   \cs_set_protected:Npn \__file_tmp:w #1#2#3

*(End of definition for \\_\\_file\_if\_recursion\_tail\_break:NN and \\_\\_file\_if\_recursion\_tail\_stop\_do:Nn.)*

Expanding the file name uses a \csname-based approach, and relies on active characters (for example from UTF-8 characters) being properly set up to expand to a expansion-safe version using \ifcsname. This is less conservative than the token-by-token approach used before, but it is much faster.

```

10804 \cs_new:Npn \_\_kernel_file_name_sanitze:n #1
10805   {
10806     \exp_args:Ne \_\_file_name_trim_spaces:n
10807     {

10809         { \_\_file_name_expand:n {#1} }
10810     }
10811   }

```

\\_\\_file\_name\_expand\_end:  
\\_\\_file\_name\_expand\_error:Nw  
\\_\\_file\_name\_expand\_error\_aux:Nw  
\\_\\_file\_name\_strip\_quotes:n  
\\_\\_file\_name\_strip\_quotes:nnw  
\\_\\_file\_name\_strip\_quotes:nn  
\\_\\_file\_name\_trim\_spaces:n  
\\_\\_file\_name\_trim\_spaces:nw  
\\_\\_file\_name\_trim\_spaces\_aux:n  
\\_\\_file\_name\_trim\_spaces\_aux:w

We'll use `\cs:w` to start expanding the file name, and to avoid creating csnames equal to `\relax` with "common" names, there's a prefix `__file_name=` to the csname. There's also a guard token at the end so we can check if there was an error during the process and (try to) clean up gracefully.

```
10812 \cs_new:Npn __file_name_expand:n #1
10813 {
10814     \exp_after:wN __file_name_expand_cleanup:Nw
10815     \cs:w __file_name = #1 \cs_end:
10816         __file_name_expand_end:
10817 }
```

With the csname built, we grab it, and grab the remaining tokens delimited by `__file_name_expand_end:`. If there are any remaining tokens, something bad happened, so we'll call the error procedure `\__file_name_expand_error:Nw`. If everything went according to plan, then use `\token_to_str:N` on the csname built, and call `\__file_name_expand_cleanup:w` to remove the prefix we added a while back. `\__file_name_expand_cleanup:w` takes a leading argument so we don't have to bother about the value of `\tex_escapechar:D`.

```
10818 \cs_new:Npn __file_name_expand_cleanup:Nw #1 #2 __file_name_expand_end:
10819 {
10820     \tl_if_empty:nF {#2}
10821     { __file_name_expand_error:Nw #2 __file_name_expand_end: }
10822     \exp_after:wN __file_name_expand_cleanup:w \token_to_str:N #1
10823 }
10824 \exp_last_unbraced:NNNNo
10825 \cs_new:Npn __file_name_expand_cleanup:w #1 \tl_to_str:n { __file_name = } { }
```

In non-error cases `__file_name_expand_end:` should not expand. It will only do so in case there is a `\csname` too much in the file name, so it will throw an error (while expanding), then insert the missing `\cs_end:` and yet another `__file_name_expand_end:` that will be used as a delimiter by `\__file_name_expand_cleanup:Nw` (or that will expand again if yet another `\endcsname` is missing).

```
10826 \cs_new:Npn __file_name_expand_end:
10827 {
10828     \msg_expandable_error:nn
10829     { kernel } { filename-missing-endcsname }
10830     \cs_end: __file_name_expand_end:
10831 }
```

Now to the error case. `\__file_name_expand_error:Nw` adds an extra `\cs_end:` so that in case there was an extra `\csname` in the file name, then `\__file_name_expand_error_aux:Nw` throws the error.

```
10832 \cs_new:Npn __file_name_expand_error:Nw #1 #2 __file_name_expand_end:
10833     { __file_name_expand_error_aux:Nw #1 #2 \cs_end: __file_name_expand_end: }
10834 \cs_new:Npn __file_name_expand_error_aux:Nw #1 #2 \cs_end: #3
10835     __file_name_expand_end:
10836 {
10837     \msg_expandable_error:nnff
10838     { kernel } { filename-chars-lost }
10839     { \token_to_str:N #1 } { \exp_stop_f: #2 }
10840 }
```

Quoting file name uses basically the same approach as for `luaquotejobname`: count the `"` tokens and remove them.

```

10841 \cs_new:Npn \__file_name_strip_quotes:n #1
10842 {
10843     \__file_name_strip_quotes:nw { 0 }

`\c__file_marker_tl` The same idea as the marker for rescanning token lists: this pair of tokens cannot appear in a file that is being input.

10886 `\tl_const:Nn \c__file_marker_tl { : \token_to_str:N : }`

(End of definition for `\c__file_marker_tl`.)

`\file_get:nnNTF`  
`\file_get:VnNTF`  
`\file_get:nnN`  
`\_file_get_aux:nnN`  
`\_file_get_do:Nw` The approach here is similar to that for `\tl_set_rescan:Nnn`. The file contents are grabbed as an argument delimited by `\c__file_marker_tl`. A few subtleties: braces in `\if_false: ... \fi:` to deal with possible alignment tabs, `\tracingnesting` to avoid a warning about a group being closed inside the `\scantokens`, and `\prg_return_true:` is placed after the end-of-file marker.

File searching can be carried out if the `\pdffilesize` primitive or an equivalent is available. That of course means we need to arrange for everything else to here to be done by expansion too. We start off by sanitizing the name and quoting if required: we may need to remove those quotes, so the raw name is passed too.

```
10930 \cs_new:Npn \file_full_name:n #1
10931 {
10932     \exp_args:Ne \__file_full_name:n
10933     { \__kernel_file_name_sanitize:n {#1} }
10934 }
10935 \cs_generate_variant:Nn \file_full_name:n { V }
```

First, we check if the file is just here: no mapping so we do not need the break part of the broader auxiliary. We are using the fact that the primitive here returns nothing if the file is entirely absent. To avoid unnecessary filesystem lookups, the result of `\pdffilesize` is kept available as an argument. For package mode, `\input@path` is a token list not a sequence.

```
10936 \cs_new:Npn \__file_full_name:n #1
10937 {
10938     \tl_if_blank:nF {#1}
10939     { \exp_args:Nne \__file_full_name_auxii:nn {#1} { \__file_full_name_aux:n {#1} } }
10940 }
```

To avoid repeated reading of files we need to cache the loading: this is important as the code here is used by *all* file checks. The same marker is used in the L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  kernel, meaning that we get a double-saving with for example `\IfFileExists`. As this is all about performance, we use the low-level approach for the conditionals. For a file already seen, the size is reported as `-1` so it's distinct from any non-cached ones.

```
10941 \cs_new:Npn \__file_full_name_aux:n #1
10942 {
10943     \if_cs_exist:w \__file_seen_ \tl_to_str:n {#1} : \cs_end:
10944     -1
10945     \else:
10946         \exp_args:Ne \__file_full_name_auxi:nn { \__file_size:n {#1} } {#1}
10947     \fi:
10948 }
```

We will need the size of files later, and we have to avoid the `\scan_stop:` causing issues if we are raising the flag. Thus there is a slightly odd gobble here.

```
10949 \cs_new:Npn \__file_full_name_auxi:nn #1#2
10950 {
10951     \if:w \scan_stop: #1 \scan_stop:
10952     \else:
10953         \exp_after:wN \use_none:n
10954         \cs:w \__file_seen_ \tl_to_str:n {#2} : \cs_end:
10955         #1
10956     \fi:
```

```

10957      }
10958 \cs_new:Npn \__file_full_name_auxii:nn #1 #2
10959  {
10960    \tl_if_blank:nTF {#2}
10961    {
10962      \seq_map_tokens:Nn \l_file_search_path_seq

11186     { T , F , TF }
11187     {
11188         \_kernel_tl_set:Nx #4
11189         { \file_hex_dump:nnn {#1} {#2} {#3} }
11190         \tl_if_empty:NTF #4
```

```

11191      { \prg_return_false: }
11192      { \prg_return_true: }
11193  }
11194 \prg_generate_conditional_variant:Nnn \file_get_hex_dump:nnN
11195  { V } { T , F , TF }

```

(End of definition for `\file_get_hex_dump:nnNTF`. This function is documented on page 99.)

`\__file_str_cmp:nn`

As we are doing a fixed-length “big” integer comparison, it is easiest to use the low-level behavior of string comparisons.

```
11196 \cs_new_eq:NN \__file_str_cmp:nn \tex_strcmp:D
```

(End of definition for `\__file_str_cmp:nn`.)

```

\file_compare_timestamp_p:nn
\file_compare_timestamp_p:nNV
\file_compare_timestamp_p:VNN
\file_compare_timestamp_p:VNV
\file_compare_timestamp_p:VNF
\file_compare_timestamp:nNnTF
\file_compare_timestamp:nNVTNF
\file_compare_timestamp:VNnTF
\file_compare_timestamp:VNVTNF
\__file_compare_timestamp:nnN
\__file_timestamp:n

```

Comparison of file date can be done by using the low-level nature of the string comparison functions.

```

11197 \prg_new_conditional:Npnn \file_compare_timestamp:nNn #1#2#3
11198  { p , T , F , TF }

11329     }
11330   }
11331 \exp_args_generate:n { nne }
```

(End of definition for `\file_input_raw:n` and `\__file_input_raw:nn`. This function is documented on page [102](#).)

**\file\_parse\_full\_name:n** The main parsing macro `\file_parse_full_name_apply:nN` passes the file name #1 through `\__kernel_file_name_sanitize:n` so that we have a single normalised way to treat files internally. `\file_parse_full_name:n` uses the former, with `\prg_do_nothing:` to leave each part of the name within a pair of braces.

```
11332 \cs_new:Npn \file_parse_full_name:n #1
11333   {
11334     \file_parse_full_name_apply:nN {#1}
11335       \prg_do_nothing:
11336   }
11337 \cs_generate_variant:Nn \file_parse_full_name:n { V }
11338 \cs_new:Npn \file_parse_full_name_apply:nN #1
11339   {
11340     \exp_args:Ne \__file_parse_full_name_auxi:nN
11341       { \__kernel_file_name_sanitize:n {#1} }
11342   }
11343 \cs_generate_variant:Nn \file_parse_full_name_apply:nN { V }
```

`\__file_parse_full_name_area:nw` splits the file name into chunks separated by `/`, until the last one is reached. The last chunk is the file name plus the extension, and everything before that is the path. When `\__file_parse_full_name_area:nw` is done, it leaves the path within braces after the scan mark `\s__file_stop` and proceeds parsing the actual file name.

```
11344 \cs_new:Npn \__file_parse_full_name_auxi:nN #1
11345   {
11346     \__file_parse_full_name_area:nw { } #1
11347       / \s__file_stop
11348   }
11349 \cs_new:Npn \__file_parse_full_name_area:nw #1 #2 / #3 \s__file_stop
11350   {
```

```

11351     \tl_if_empty:nTF {#3}
11352         { \__file_parse_full_name_base:nw { } #2 . \s__file_stop {#1} }
11353         { \__file_parse_full_name_area:nw { #1 / #2 } #3 \s__file_stop }
11354     }

```

`\__file_parse_full_name_base:nw` does roughly the same as above, but it separates the chunks at each period. However here there's some extra complications: In case #1 is empty, it is assumed that the extension is actually empty, and the file name is #2. Besides, an extra `.` has to be added to #2 because it is later removed in `\__file_parse_full_name_tidy:nnnN`. In any case, if there's an extension, it is returned with a leading `..`

```

\__file_parse_full_name_base:nw
11355     \cs_new:Npn \__file_parse_full_name_base:nw #1 #2 . #3 \s__file_stop
11356     {
11357         \tl_if_empty:nTF {#3}
11358         {
11359             \tl_if_empty:nTF {#1}
11360             {
11361                 \tl_if_empty:nTF {#2}
11362                     { \__file_parse_full_name_tidy:nnnN { } { } }
11363                     { \__file_parse_full_name_tidy:nnnN { .#2 } { } }
11364             }
11365             { \__file_parse_full_name_tidy:nnnN {#1} { .#2 } }
11366         }
11367         { \__file_parse_full_name_base:nw { #1 . #2 } #3 \s__file_stop }
11368     }

```

Now we just need to tidy some bits left loose before. The loop used in the two macros above start with a leading `/` and `.` in the file path an name, so here we need to remove them, except in the path, if it is a single `/`, in which case it's left as is. After all's done, pass to #4.

```

\__file_parse_full_name_tidy:nnnN
11369     \cs_new:Npn \__file_parse_full_name_tidy:nnnN #1 #2 #3 #4
11370     {
11371         \exp_args:Nee #4
11372         {
11373             \str_if_eq:nnF {#3} { / } { \use_none:n }

11397      {
11398          \exp_args:NNe \seq_set_from_clist:Nn \l__file_tmp_seq
11399          { \tl_to_str:N \@filelist }
11400      }
11401      \seq_concat:NNN \l__file_tmp_seq \l__file_tmp_seq \g__file_record_seq
11402      \seq_remove_duplicates:N \l__file_tmp_seq
11403      #1 { kernel } { file-list }
11404      { \seq_map_function:NN \l__file_tmp_seq \__file_list_aux:n }
11405      { } { } { }
11406  }
11407 \cs_new:Npn \__file_list_aux:n #1 { \iow_newline: #1 }

```

(End of definition for `\file_show_list:` and others. These functions are documented on page 103.)

When used as a package, there is a need to hold onto the standard file list as well as the new one here. File names recorded in `\@filelist` must be turned to strings before being added to `\g__file_record_seq`.

```

11408 \cs_if_exist:NT \@filelist
11409  {
11410      \AtBeginDocument
11411      {
11412          \exp_args:NNe \seq_set_from_clist:Nn \l__file_tmp_seq
11413          { \tl_to_str:N \@filelist }
11414          \seq_gconcat:NNN
11415          \g__file_record_seq
11416          \g__file_record_seq
11417          \l__file_tmp_seq
11418      }
11419  }

```

## 50.5 GetIdInfo

`\GetIdInfo` As documented in `expl3.dtx` this function extracts file name etc from an SVN Id line. This

`\__file_id_info_auxi:w` used to be how we got version number and so on in all modules, so it had to be defined in `\l3bootstrap`. Now it's more convenient to define it after we have set up quite a lot of tools, and `\l3file` seems the least unreasonable place for it.

The idea here is to extract out the information needed from a standard SVN Id line, but to avoid a line that would get changed when the file is checked in. Hence the fact that none of the lines here include both a dollar sign and the `Id` keyword!

```

11420 \cs_new_protected:Npn \GetIdInfo
11421 {
11422     \tl_clear_new:N \ExplFileVersion
11423     \tl_clear_new:N \ExplFileName
11424     \tl_clear_new:N \ExplFileExtension
11425     \tl_clear_new:N \ExplFileDescription
11426     \group_begin:
11427     \char_set_catcode_space:n { 32 }
11428     \exp_after:wN
11429     \group_end:
11430     \__file_id_info_auxi:w
11431 }
11432 }
```

A first check for a completely empty SVN field. If that is not the case, there is a second case when a file created using `svn cp` but has not been checked in. That leaves a special marker `-1` version, which has no further data. Dealing correctly with that is the reason for the space in the line to use `\__file_id_info_auxii:w`.

```

11433 \cs_new_protected:Npn \__file_id_info_auxi:w $ #1 $ #2
11434 {
11435     \tl_set:Nn \ExplFileVersion {#2}
11436     \str_if_eq:nnTF {#1} { Id }
11437     {
11438         \tl_set:Nn \ExplFileDescription { 0000/00/00 }
11439         \tl_set:Nn \ExplFileName { [unknown] }
11440         \tl_set:Nn \ExplFileExtension { [unknown~extension] }
11441         \tl_set:Nn \ExplFileVersion {-1}
11442     }
11443     { \__file_id_info_auxii:w #1 ~ \s_file_stop }
11444 }
```

Here, `#1` is `Id`, `#2` is the file name, `#3` is the extension, `#4` is the version, `#5` is the check in date and `#6` is the check in time and user, plus some trailing spaces. If `#4` is the marker `-1` value then `#5` and `#6` are empty.

```

11445 \cs_new_protected:Npn \__file_id_info_auxii:w
11446     #1 ~ #2.#3 ~ #4 ~ #5 ~ #6 \s_file_stop
11447 {
11448     \tl_set:Nn \ExplFileName {#2}
11449     \tl_set:Nn \ExplFileExtension {#3}
11450     \tl_set:Nn \ExplFileVersion {#4}
11451     \str_if_eq:nnTF {#4} {-1}
11452     { \tl_set:Nn \ExplFileDate { 0000/00/00 } }
11453     { \__file_id_info_auxiii:w #5 - 0 - 0 - \s_file_stop }
11454 }
```

Convert an SVN-style date into a L<sup>A</sup>T<sub>E</sub>X-style one.

```

11455 \cs_new_protected:Npn \__file_id_info_auxiii:w #1 - #2 - #3 - #4 \s_file_stop
11456     { \tl_set:Nn \ExplFileDate { #1/#2/#3 } }
```

(End of definition for `\GetIdInfo` and others. This function is documented on page 10.)

## 50.6 Checking the version of kernel dependencies

This function is responsible for checking if dependencies of the L<sup>A</sup>T<sub>E</sub>X3 kernel match the version preloaded in the L<sup>A</sup>T<sub>E</sub>X 2<sub>C</sub> kernel. If versions don't match, the function attempts to tell why by searching for a possible stray format file.

The function starts by checking that the kernel date is defined, and if not zero is used to force the error route. The kernel date is then compared with the argument requested date (usually the packaging date of the dependency). If the kernel date is less than the required date, it's an error and the loading should abort.

```

11457 \cs_new_protected:Npn \__kernel_dependency_version_check:Nn #1
11458   { \exp_args:NV \__kernel_dependency_version_check:nn #1 }
11459 \cs_new_protected:Npn \__kernel_dependency_version_check:nn #1
11460   {
11461     \cs_if_exist:NTF \c__kernel_expl_date_tl
11462     {
11463       \exp_args:NV \__file_kernel_dependency_compare:nnn
11464         \c__kernel_expl_date_tl {#1}
11465     }
11466     { \__file_kernel_dependency_compare:nnn { 0000-00-00 } {#1} }
11467   }
11468 \cs_new_protected:Npn \__file_kernel_dependency_compare:nnn #1 #2 #3
11469   {
11470     \int_compare:nNnT
11471       { \__file_parse_version:w #1 \s__file_stop } <
11472       { \__file_parse_version:w #2 \s__file_stop }
11473       { \__file_mismatched_dependency_error:nn {#2} {#3} }
11474   }
11475 \cs_new:Npn \__file_parse_version:w #1 - #2 - #3 \s__file_stop {#1#2#3}

```

If the versions differ, then we try to give the user some guidance. This function starts by taking the engine name `\c_sys_engine_str` and replacing `tex` by `latex`, then building a command of the form: `kpsewhich --all --engine=<engine> <format>[-dev].fmt` to query the format files available. A shell is opened and each line is read into a sequence.

```

\__file_mismatched_dependency_error:nn
11476 \cs_new_protected:Npn \__file_mismatched_dependency_error:nn #1 #2
11477   {
11478     \exp_args:NNe \ior_shell_open:Nn \g__file_internal_ior
11479     {
11480       kpsewhich ~ --all ~
11481         --engine = \c_sys_engine_exec_str
11482           \c_space_tl \c_sys_engine_format_str
11483             \bool_lazy_and:nnT
11484               { \tl_if_exist_p:N \development@branch@name }
11485               { ! \tl_if_empty_p:N \development@branch@name }
11486               { -dev } .fmt
11487     }
11488     \seq_clear:N \l__file_tmp_seq
11489     \ior_map_inline:Nn \g__file_internal_ior
11490       { \seq_put_right:Nn \l__file_tmp_seq {##1} }
11491     \ior_close:N \g__file_internal_ior
11492     \msg_error:nnnn { kernel } { mismatched-support-file }
11493       {#1} {#2}

```

And finish by ending the current file.

```

11494     \tex_endinput:D
11495 }

```

Now define the actual error message:

```

11496 \msg_new:nnn { kernel } { mismatched-support-file }
11497 {
11498   Mismatched-LaTeX-support-files-detected. \\
11499   Loading #'2' aborted!

```

\c\_kernel\_expl\_date\_tl may not exist, due to an older format, so only print the dates when the sentinel token list exists:

```

11500 \tl_if_exist:NT \c_kernel_expl_date_tl
11501 {
11502   \\
11503   The-L3-programming-layer-in-the-LaTeX-format \\
11504   is-dated-\c_kernel_expl_date_tl,~but-in-your-TeX-
11505   tree~the~files~require \\ at~least~#1.
11506 }
11507 }
11508 {

```

The sequence containing the format files should have exactly one item: the format file currently being run. If that's the case, the cause of the error is not that, so print a generic help with some possible causes. If more than one format file was found, then print the list to the user, with appropriate indications of what's in the system and what's in the user tree.

```

11509 \int_compare:nNnTF { \seq_count:N \l_file_tmp_seq } > 1
11510 {
11511   The~cause~seems~to~be~an~old~format~file~in~the~user~tree. \\
11512   LaTeX~found~these~files:
11513   \seq_map_tokens:Nn \l_file_tmp_seq { \\~\\use:n } \\
11514   Try~deleting~the~file~in~the~user~tree~then~run~LaTeX~again.
11515 }
11516 {
11517   The~most~likely~causes~are:
11518   \\~\\A~recent~format~generation~failed;
11519   \\~\\A~stray~format~file~in~the~user~tree~which~needs~
11520   to~be~removed~or~rebuilt;
11521   \\~\\You~are~running~a~manually~installed~version~of~#2 \\
11522   \\~\\ which~is~incompatible~with~the~version~in~LaTeX. \\
11523 }
11524 \\
11525 LaTeX~will~abort~loading~the~incompatible~support~files~
11526 but~this~may~lead~to \\ later~errors.~Please~ensure~that~
11527 your~LaTeX~format~is~correctly~regenerated.
11528 }

```

(End of definition for \kernel\_dependency\_version\_check:Nn and others.)

11565   }

```

## 50.8 Functions delayed from earlier modules

<@@@=sys>

**\c\_sys\_platform\_str** Detecting the platform on LuaTeX is easy: for other engines, we use the fact that the two common cases have special null files. It is possible to probe further (see package `platform`), but that requires shell escape and seems unlikely to be useful. This is set up here as it requires file searching.

```

11566 \sys_if_engine_luatex:TF
11567   {
11568     \str_const:Ne \c_sys_platform_str
11569       { \tex_directlua:D { tex.print(os.type) } }
11570   }
11571   {
11572     \file_if_exist:nTF { nul: }
11573       {
11574         \file_if_exist:nF { /dev/null }
11575           { \str_const:Nn \c_sys_platform_str { windows } }
11576       }

```

```

11577     {
11578         \file_if_exist:nT { /dev/null }
11579             { \str_const:Nn \c_sys_platform_str { unix } }
11580     }
11581 }
11582 \cs_if_exist:NF \c_sys_platform_str
11583     { \str_const:Nn \c_sys_platform_str { unknown } }

```

(End of definition for `\c_sys_platform_str`. This variable is documented on page 76.)

`\sys_if_platform_unix:p:`

`\sys_if_platform_unix:TF`

`\sys_if_platform_windows:p:`

`\sys_if_platform_windows:TF`

We can now set up the tests.

```

11584 \clist_map_inline:nn { unix , windows }
11585     {
11586         \__file_const:nn { sys_if_platform_ #1 }
11587             { \str_if_eq_p:Vn \c_sys_platform_str { #1 } }
11588     }

```

(End of definition for `\sys_if_platform_unix:TF` and `\sys_if_platform_windows:TF`. These functions are documented on page 76.)

11589 `</package>`

# Chapter 51

## I3luatex implementation

11590 ⟨\*package⟩

### 51.1 Breaking out to Lua

11591 ⟨\*tex⟩

11592 ⟨@@=lua⟩

\\_\\_lua\\_escape:n Copies of primitives.

11593 \cs\_new\_eq:NN \\_\\_lua\_escape:n \tex\_luascapestring:D  
11594 \cs\_new\_eq:NN \\_\\_lua\_now:n \tex\_directlua:D  
11595 \cs\_new\_eq:NN \\_\\_lua\_shipout:n \tex\_latelua:D

(End of definition for \\_\\_lua\\_escape:n, \\_\\_lua\\_now:n, and \\_\\_lua\\_shipout:n.)

These functions are set up in I3str for bootstrapping: we want to replace them with a “proper” version at this stage, so clean up.

11596 \cs\_undefine:N \lua\_escape:e

11597 \cs\_undefine:N \lua\_now:e

\lua\_now:n Wrappers around the primitives.

11598 \cs\_new:Npn \lua\_now:e #1 { \\_\\_lua\_now:n {#1} }  
11599 \cs\_new:Npn \lua\_now:n #1 { \lua\_now:e { \exp\_not:n {#1} } }  
11600 \cs\_new\_protected:Npn \lua\_shipout\_e:n #1 { \\_\\_lua\_shipout:n {#1} }  
11601 \cs\_new\_protected:Npn \lua\_shipout:n #1  
11602 { \lua\_shipout\_e:n { \exp\_not:n {#1} } }  
11603 \cs\_new:Npn \lua\_escape:e #1 { \\_\\_lua\_escape:n {#1} }  
11604 \cs\_new:Npn \lua\_escape:n #1 { \lua\_escape:e { \exp\_not:n {#1} } }

(End of definition for \lua\_now:n and others. These functions are documented on page 104.)

\lua\_load\_module:n Wrapper around `require'⟨module⟩'`.

11605 \str\_new:N \l\_\\_lua\_err\_msg\_str  
11606 \cs\_new\_protected:Npn \lua\_load\_module:n #1  
11607 {  
11608 \bool\_if:nF { \\_\\_lua\_load\_module\_p:n { #1 } }  
11609 {  
11610 \msg\_error:nnnV  
11611 { luatex } { module-not-found } { #1 } \l\_\\_lua\_err\_msg\_str  
11612 }  
11613 }

(End of definition for \lua\_load\_module:n. This function is documented on page 105.)

As with engines other than LuaTeX these have to be macros, we give them the same status in all cases. When LuaTeX is not in use, simply give an error message/

```
11614 \sys_if_engine_luatex:F
11615 {
11616   \clist_map_inline:nn

## 51.3 Lua functions for internal use

```
11658  {*lua}
```

Most of the emulation of pdfTEX here is based heavily on Heiko Oberdiek's `pdftex-cmbs` package.

**ltx.utils** Create a table for the kernel's own use.

```
11659 ltx = ltx or {utils={}}
11660 ltx.utils = ltx.utils or {}
11661 local ltxutils = ltx.utils
```

(End of definition for `ltx.utils`. This function is documented on page 105.)

Local copies of global tables.

```
11662 local io      = io
11663 local kpse    = kpse
11664 local lfs     = lfs
11665 local math    = math
11666 local md5    = md5
11667 local os      = os
11668 local string  = string
11669 local tex     = tex
11670 local texio   = texio
11671 local tonumber = tonumber
```

Local copies of standard functions.

```
11672 local abs     = math.abs
11673 local byte    = string.byte
11674 local floor   = math.floor
11675 local format  = string.format
11676 local gsub    = string.gsub
11677 local lfs_attr = lfs.attributes
11678 local open    = io.open
11679 local os_date = os.date
11680 local setcatcode = tex.setcatcode
11681 local sprint  = tex.sprint
11682 local cprint  = tex.cprint
11683 local write   = tex.write
11684 local write_nl = texio.write_nl
11685 local utf8_char = utf8.char
11686 local package_loaded = package.loaded
11687 local package_searchers = package.searchers
11688 local table_concat = table.concat
11689
11690 local scan_int  = token.scan_int or token.scan_integer
11691 local scan_string = token.scan_string
11692 local scan_keyword = token.scan_keyword
11693 local put_next   = token.put_next
11694 local token_create = token.create
11695 local token_new   = token.new
11696 local set_macro  = token.set_macro
```

Since `token.create` only returns useful values after the tokens has been added to TeX's hash table, we define a variant which defines it first if necessary.

```
11697 local token_create_safe
11698 do
11699   local is_defined = token.is_defined
11700   local set_char   = token.set_char
```

```

11701 local runtoks      = tex.runtoks
11702 local let_token    = token_create'let'
11703
11704 function token_create_safe(s)
11705     local orig_token = token_create(s)
11706     if is_defined(s, true) then
11707         return orig_token
11708     end
11709     set_char(s, 0)
11710     local new_token = token_create(s)
11711     runtoks(function()
11712         put_next(let_token, new_token, orig_token)
11713     end)
11714     return new_token
11715 end
11716 end
11717
11718 local true_tok     = token_create_safe'prg_return_true:'
11719 local false Tok    = token_create_safe'prg_return_false:'

```

In ConTeXt lmtx token.command\_id does not exist, but it can easily be emulated with ConTeXt's tokens.commands.

```

11720 local command_id   = token.command_id
11721 if not command_id and tokens and tokens.commands then
11722     local id_map = tokens.commands
11723     function command_id(name)
11724         return id_map[name]
11725     end
11726 end

```

Deal with ConTeXt: doesn't use kpse library.

```
11727 local kpse_find = (resolvers and resolvers.findfile) or kpse.find_file
```

`escapehex` An internal auxiliary to convert a string to the matching hex escape. This works on a byte basis: extension to handled UTF-8 input is covered in pdftexcmds but is not currently required here.

```

11728 local function escapehex(str)
11729     return (gsub(str, ".", "
11730         function (ch) return format("%02X", byte(ch)) end))
11731 end

```

(End of definition for `escapehex`.)

`ltx.utils.filereadmp` Similar comments here to the next function: read the file in binary mode to avoid any line-end weirdness.

```

11732 local function filereadmp(name, offset, length)
11733     local file = kpse_find(name, "tex", true)
11734     if not file then return end
11735     local f = open(file, "rb")
11736     if not f then return end
11737     if offset and offset > 0 then
11738         f:seek("set", offset)
11739     end
11740     local data = f:read(length or 'a')
11741     f:close()

```

```

11742     return escapehex(data)
11743 end
11744 ltxutils.filiedump = filiedump

```

(End of definition for `ltx.utils.filiedump`. This function is documented on page 105.)

- `md5.HEX` Hash a string and return the hash in uppercase hexadecimal format. In some engines, this is build-in. For traditional LuaTeX, the conversion to hexadecimal has to be done by us.

```

11745 local md5_HEX = md5.HEX
11746 if not md5_HEX then
11747   local md5_sum = md5.sum
11748   function md5_HEX(data)
11749     return escapehex(md5_sum(data))
11750   end
11751   md5.HEX = md5_HEX
11752 end

```

(End of definition for `md5.HEX`.)

- `ltx.utils.filemd5sum` Read an entire file and hash it: the hash function itself is a built-in. As Lua is byte-based there is no work needed here in terms of UTF-8 (see `pdftexcmds` and how it handles strings that have passed through LuaTeX). The file is read in binary mode so that no line ending normalisation occurs.

```

11753 local function filemd5sum(name)
11754   local file = kpse_find(name, "tex", true) if not file then return end
11755   local f = open(file, "rb") if not f then return end
11756
11757   local data = f:read("*a")
11758   f:close()
11759   return md5_HEX(data)
11760 end
11761 ltxutils.filemd5sum = filemd5sum

```

(End of definition for `ltx.utils.filemd5sum`. This function is documented on page 105.)

- `ltx.utils.filemoddate` There are two cases: If the C standard library is C99 compliant, we can use `%z` to get the timezone in almost the right format. We only have to add primes and replace a zero or missing offset with Z.

Of course this would be boring, so Windows does things differently. There we have to manually calculate the offset. See procedure `makepdftime` in `utils.c` of pdfTeX.

```

11762 local filemoddate
11763 if os_date'%z':match'^[+-]%-d%d%d%' then
11764   local pattern = lpeg.Cs(16 *
11765     (lpeg.Cg(lpeg.S'+-' * '0000' * lpeg.Cc'Z') +
11766      3 * lpeg.Cc'" * 2 * lpeg.Cc'" +
11767      lpeg.Cc'Z') *
11768      -1)
11769   function filemoddate(name)
11770     local file = kpse_find(name, "tex", true)
11771     if not file then return end
11772     local date = lfs_attr(file, "modification")
11773     if not date then return end
11774     return pattern:match(os_date("D:%Y%m%d%H%M%S%z", date))

```

```

11775     end
11776   else
11777     local function filemoddate(name)
11778       local file = kpse_find(name, "tex", true)
11779       if not file then return end
11780       local date = lfs_attr(file, "modification")
11781       if not date then return end
11782       local d = os_date("*t", date)
11783       local u = os_date("!*t", date)
11784       local off = 60 * (d.hour - u.hour) + d.min - u.min
11785       if d.year ~= u.year then
11786         if d.year > u.year then
11787           off = off + 1440
11788         else
11789           off = off - 1440
11790         end
11791       elseif d.yday ~= u.yday then
11792         if d.yday > u.yday then
11793           off = off + 1440
11794         else
11795           off = off - 1440
11796         end
11797       end
11798       local timezone
11799       if off == 0 then
11800         timezone = "Z"
11801       else
11802         if off < 0 then
11803           timezone = "-"
11804           off = -off
11805         else
11806           timezone = "+"
11807         end
11808         timezone = format("%s%02d'%02d'", timezone, hours // 60, hours % 60)
11809       end
11810       return format("D:%04d%02d%02d%02d%02d%s",
11811             d.year, d.month, d.day, d.hour, d.min, d.sec, timezone)
11812     end
11813   end
11814 ltxutils.filemoddate = filemoddate

```

(End of definition for `ltx.utils.filemoddate`. This function is documented on page [105](#).)

**ltx.utils.filesize** A simple disk lookup.

```

11815   local function filesize(name)
11816     local file = kpse_find(name, "tex", true)
11817     if file then
11818       local size = lfs_attr(file, "size")
11819       if size then
11820         return size
11821       end
11822     end
11823   end
11824 ltxutils.filesize = filesize

```

(End of definition for `ltx.utils.filesize`. This function is documented on page 106.)

- `luadef` An internal function for defining control sequences from Lua which behave like primitives. This acts as a wrapper around `token.set_lua` which accepts a function instead of an index into the functions table.

```
11825 local luacmd do
11826   local set_lua = token.set_lua
11827   local undefined_cs = command_id'undefined_cs'
11828
11829   if not context and not luatexbase then require'ltxbase' end
11830   if luatexbase then
11831     local new_luafunction = luatexbase.new_luafunction
11832     local functions = lua.get_functions_table()
11833     function luacmd(name, func, ...)
11834       local id
11835       local tok = token_create(name)
11836       if tok.command == undefined_cs then
11837         id = new_luafunction(name)
11838         set_lua(name, id, ...)
11839       else
11840         id = tok.index or tok.mode
11841       end
11842       functions[id] = func
11843     end
11844   elseif context then
11845     local register = context.functions.register
11846     local functions = context.functions.known
11847     function luacmd(name, func, ...)
11848       local tok = token_create(name)
11849       if tok.command == undefined_cs then
11850         token.set_lua(name, register(func), ...)
11851       else
11852         functions[tok.index or tok.mode] = func
11853       end
11854     end
11855   end
11856 end
```

(End of definition for `luadef`.)

- `try_require` Loads a Lua module. This function loads the module similarly to the standard Lua global function `require`, with a few differences. On success, `try_require` returns `true, module`. If the module cannot be found, it returns `false, err_msg`. If the module is found, but something goes wrong when loading it, the function throws an error.

```
11857 local function try_require(name)
11858   if package_loaded[name] then
11859     return true, package_loaded[name]
11860   end
11861
11862   local failure_details = {}
11863   for _, searcher in ipairs(package_searchers) do
11864     local loader, data = searcher(name)
11865     if type(loader) == 'function' then
11866       package_loaded[name] = loader(name, data) or true
```

```

11867     return true, package_loaded[name]
11868 elseif type(loader) == 'string' then
11869     failure_details[#failure_details + 1] = loader
11870 end
11871 end
11872
11873 return false, table_concat(failure_details, '\n')
11874 end

```

(End of definition for `try_require`.)

`\_lua_load_module_p:n` Check to see if we can load a module using `require`. If we can load the module, then we load it immediately. Otherwise, we save the error message in `\l@@_err_msg_str`.

```

11875 local char_given = command_id'char_given'
11876 local c_true_bool = token_create(1, char_given)
11877 local c_false_bool = token_create(0, char_given)
11878 local c_str_cctab = token_create('c_str_cctab').mode
11879
11880 luacmd('\_lua_load_module_p:n', function()
11881     local success, result = try_require(scan_string())
11882     if success then
11883         set_macro(c_str_cctab, '\l_lua_err_msg_str', '')
11884         put_next(c_true_bool)
11885     else
11886         set_macro(c_str_cctab, '\l_lua_err_msg_str', result)
11887         put_next(c_false_bool)
11888     end
11889 end)

```

(End of definition for `\_lua_load_module_p:n`.)

## 51.4 Preserving iniTeX Lua data for runs

`11890 <@=lua>`

The Lua state is not dumped when a forat is written, therefore any Lua variables filled doing format building need to be restored in order to be accessible during normal runs.

We provide some kernel-internal helpers for this. They will only be available if `luatexbase` is available. This is not a big restriction though, because ConTeXt (which does not use `luatexbase`) does not load `expl3` in the format.

```

11891 local register_luadata, get_luadata
11892
11893 if luatexbase then
11894     local register = token_create'@expl@luadata@bytecode'.index
11895     if status.ini_version then

```

`register_luadata` `register_luadata` is only available during format generation. It accept a string which uniquely identifies the data object and has to be provided to retrieve it later. Additionally it accepts a function which is called in the `pre_dump` callback and which has to return a string that evaluates to a valid Lua object to be preserved.

```

11896     local luadata, luadata_order = {}, {}
11897
11898     function register_luadata(name, func)

```

```

11899     if luadata[name] then
11900         error(format("LaTeX error: data name %q already in use", name))
11901     end
11902     luadata[name] = func
11903     luadata_order[#luadata_order + 1] = func and name
11904 end

```

(End of definition for `register_luadata`.)

The actual work is done in `pre_dump`. The `luadata_order` is used to ensure that the order is consistent over multiple runs.

```

11905     luatexbase.add_to_callback("pre_dump", function()
11906         if next(luadata) then
11907             local str = "return {"
11908             for i=1, #luadata_order do
11909                 local name = luadata_order[i]
11910                 str = format('%s[%q]=%s,', str, name, luadata[name]())
11911             end
11912             lua.bytecode[register] = assert(load(str .. "})")
11913         end
11914     end, "ltx.luadata")
11915 else

```

`get_luadata` `get_luadata` is only available if data should be restored. It accept the identifier which was used when the data object was registered and returns the associated object. Every object can only be retrieved once.

```

11916     local luadata = lua.bytecode[register]
11917     if luadata then
11918         lua.bytecode[register] = nil
11919         luadata = luadata()
11920     end
11921     function get_luadata(name)
11922         if not luadata then return end
11923         local data = luadata[name]
11924         luadata[name] = nil
11925         return data
11926     end
11927 end
11928 end

```

(End of definition for `get_luadata`.)

```

11929 </lua>
11930 </package>

```

# Chapter 52

## I3legacy implementation

```
11931  <*package>
11932  <@=legacy>
```

\legacy\_if\_p:n  
\legacy\_if:nTF

A friendly wrapper. We need to use the \if:w approach here, rather than testing against \iftrue/\iffalse as the latter approach fails for primitive conditionals such as \ifmmode. The \reverse\_if:N here means that we get a slightly more useful error if the name is undefined.

```
11933  \prg_new_conditional:Npnn \legacy_if:n #1 { p , T , F , TF }
11934  {
11935    \exp_after:wN \reverse_if:N
11936    \cs:w if#1 \cs_end:
11937    \prg_return_false:
11938    \else:
11939    \prg_return_true:
11940    \fi:
11941 }
```

(End of definition for \legacy\_if:nTF. This function is documented on page 107.)

\legacy\_if\_set\_true:n

\legacy\_if\_set\_false:n

\legacy\_if\_gset\_true:n

\legacy\_if\_gset\_false:n

A friendly wrapper.

```
11942  \cs_new_protected:Npn \legacy_if_set_true:n #1
11943  { \cs_set_eq:cN { if#1 } \if_true: }
11944  \cs_new_protected:Npn \legacy_if_set_false:n #1
11945  { \cs_set_eq:cN { if#1 } \if_false: }
11946  \cs_new_protected:Npn \legacy_if_gset_true:n #1
11947  { \cs_gset_eq:cN { if#1 } \if_true: }
11948  \cs_new_protected:Npn \legacy_if_gset_false:n #1
11949  { \cs_gset_eq:cN { if#1 } \if_false: }
```

(End of definition for \legacy\_if\_set\_true:n and others. These functions are documented on page 107.)

\legacy\_if\_set:nn

\legacy\_if\_gset:nn

A more elaborate wrapper.

```
11950 \cs_new_protected:Npn \legacy_if_set:nn #1#2
11951 {
11952   \bool_if:nTF {#2} \legacy_if_set_true:n \legacy_if_set_false:n
11953   {#1}
11954 }
```

```
11955 \cs_new_protected:Npn \legacy_if_gset:nn #1#2
11956   {
11957     \bool_if:nTF {#2} \legacy_if_gset_true:n \legacy_if_gset_false:n
11958     {#1}
11959   }
```

(End of definition for `\legacy_if_set:nn` and `\legacy_if_gset:nn`. These functions are documented on page [107](#).)

```
11960 ⟨/package⟩
```

# Chapter 53

## I3tl implementation

```
11961  <*package>
11962  <@@=tl>
```

A token list variable is a T<sub>E</sub>X macro that holds tokens. By using the  $\varepsilon$ -T<sub>E</sub>X primitive `\unexpanded` inside a T<sub>E</sub>X `\edef` it is possible to store any tokens, including `#`, in this way.

### 53.1 Functions

`\__kernel_tl_set:Nx` These two are supplied to get better performance for macros which would otherwise use `\tl_set:Ne` or `\tl_gset:Ne` internally.

```
11963  \cs_new_eq:NN \__kernel_tl_set:Nx \cs_set_nopar:Npe
11964  \cs_new_eq:NN \__kernel_tl_gset:Nx \cs_gset_nopar:Npe
```

(End of definition for `\__kernel_tl_set:Nx` and `\__kernel_tl_gset:Nx`.)

**`\tl_new:N`** Creating new token list variables is a case of checking for an existing definition and doing the definition.

```
11965  \cs_new_protected:Npn \tl_new:N #1
11966  {
11967      \__kernel_chk_if_free_cs:N #1
11968      \cs_gset_eq:NN #1 \c_empty_tl
11969  }
11970  \cs_generate_variant:Nn \tl_new:N { c }
```

(End of definition for `\tl_new:N`. This function is documented on page 109.)

**`\tl_const:Nn`** Constants are also easy to generate. They use `\cs_gset_nopar:Npe` instead of `\__kernel_tl_gset:Nx` so that the correct scope checking for `c`, instead of for `g`, is applied when `\debug_on:n { check-declarations }` is used. Constant assignment functions are patched specially in I3debug to apply such checks.

```
11971  \cs_new_protected:Npn \tl_const:Nn #1#2
11972  {
11973      \__kernel_chk_if_free_cs:N #1
11974      \cs_gset_nopar:Npe #1 { \__kernel_exp_not:w {#2} }
11975  }
11976  \cs_generate_variant:Nn \tl_const:Nn { Ne , c , ce }
11977  \cs_generate_variant:Nn \tl_const:Nn { Nx , cx }
```

(End of definition for `\tl_const:Nn`. This function is documented on page 110.)

`\tl_clear:N` Clearing a token list variable means setting it to an empty value. Error checking is sorted out by the parent function.

```
11978 \cs_new_protected:Npn \tl_clear:N #1
11979   { \tex_let:D #1 = ~ \c_empty_tl }
11980 \cs_new_protected:Npn \tl_gclear:N #1
11981   { \tex_global:D \tex_let:D #1 ~ \c_empty_tl }
11982 \cs_generate_variant:Nn \tl_clear:N { c }
11983 \cs_generate_variant:Nn \tl_gclear:N { c }
```

(End of definition for `\tl_clear:N` and `\tl_gclear:N`. These functions are documented on page 110.)

`\tl_clear_new:N` Clearing a token list variable means setting it to an empty value. Error checking is sorted out by the parent function.

```
11984 \cs_new_protected:Npn \tl_clear_new:N #1
11985   { \tl_if_exist:NTF #1 { \tl_clear:N #1 } { \tl_new:N #1 } }
11986 \cs_new_protected:Npn \tl_gclear_new:N #1
11987   { \tl_if_exist:NTF #1 { \tl_gclear:N #1 } { \tl_new:N #1 } }
11988 \cs_generate_variant:Nn \tl_clear_new:N { c }
11989 \cs_generate_variant:Nn \tl_gclear_new:N { c }
```

(End of definition for `\tl_clear_new:N` and `\tl_gclear_new:N`. These functions are documented on page 110.)

`\tl_set_eq:NN` For setting token list variables equal to each other. To allow for patching, the arguments have to be explicit. In addition this ensures that a braced second argument will not cause problems.

```
11990 \cs_new_protected:Npn \tl_set_eq:NN #1#2
11991   { \tex_let:D #1 = ~ #2 }
11992 \cs_new_protected:Npn \tl_gset_eq:NN #1#2
11993   { \tex_global:D \tex_let:D #1 = ~ #2 }
11994 \cs_generate_variant:Nn \tl_set_eq:NN { cN, Nc, cc }
11995 \cs_generate_variant:Nn \tl_gset_eq:NN { cN, Nc, cc }
```

(End of definition for `\tl_set_eq:NN` and `\tl_gset_eq:NN`. These functions are documented on page 110.)

`\tl_concat:NNN` Concatenating token lists is easy. When checking is turned on, all three arguments must be checked: a token list #2 or #3 equal to `\scan_stop`: would lead to problems later on.

```
11996 \cs_new_protected:Npn \tl_concat:NNN #1#2#3
11997   {
11998     \__kernel_tl_set:Nx #1
11999     {
12000       \__kernel_exp_not:w \exp_after:wN {#2}
12001       \__kernel_exp_not:w \exp_after:wN {#3}
12002     }
12003   }
12004 \cs_new_protected:Npn \tl_gconcat:NNN #1#2#3
12005   {
12006     \__kernel_tl_gset:Nx #1
12007     {
12008       \__kernel_exp_not:w \exp_after:wN {#2}
12009       \__kernel_exp_not:w \exp_after:wN {#3}
```

```

12010         }
12011     }
12012 \cs_generate_variant:Nn \tl_concat:NNN { ccc }
12013 \cs_generate_variant:Nn \tl_gconcat:NNN { ccc }

(End of definition for \tl_concat:NNN and \tl_gconcat:NNN. These functions are documented on page 110.)
```

\tl\_if\_exist\_p:N Copies of the cs functions defined in |3basics.

```

12014 \prg_new_eq_conditional:NNn \tl_if_exist:N \cs_if_exist:N { TF , T , F , p }
12015 \prg_new_eq_conditional:NNn \tl_if_exist:c \cs_if_exist:c { TF , T , F , p }

(End of definition for \tl_if_exist:NTF. This function is documented on page 110.)
```

## 53.2 Constant token lists

\c\_empty\_tl Never full. We need to define that constant before using \tl\_new:N.

```
12016 \tl_const:Nn \c_empty_tl { }
```

(End of definition for \c\_empty\_tl. This variable is documented on page 124.)

\c\_novalue\_tl A special marker: as we don't have \char\_generate:nn yet, has to be created the old-fashioned way.

```

12017 \group_begin:
12018 \tex_catcode:D ` = 11 ~
12019 \tl_const:Ne \c_novalue_tl { - NoValue \token_to_str:N - }
12020 \group_end:
```

(End of definition for \c\_novalue\_tl. This variable is documented on page 125.)

\c\_space\_tl A space as a token list (as opposed to as a character).

```
12021 \tl_const:Nn \c_space_tl { ~ }
```

(End of definition for \c\_space\_tl. This variable is documented on page 125.)

## 53.3 Adding to token list variables

\tl\_set:Nn By using \exp\_not:n token list variables can contain # tokens, which makes the token list registers provided by TeX more or less redundant. The \tl\_set:No version is done by hand as it is used quite a lot.

```

12022 \cs_new_protected:Npn \tl_set:Nn #1#
12023   { \__kernel_tl_set:Nx #1 { \__kernel_exp_not:w {#2} } }
12024 \cs_new_protected:Npn \tl_set:No #1#
12025   { \__kernel_tl_set:Nx #1 { \__kernel_exp_not:w \exp_after:wN {#2} } }
12026 \cs_new_protected:Npn \tl_gset:Nn #1#
12027   { \__kernel_tl_gset:Nx #1 { \__kernel_exp_not:w {#2} } }
12028 \cs_new_protected:Npn \tl_gset:No #1#
12029   { \__kernel_tl_gset:Nx #1 { \__kernel_exp_not:w \exp_after:wN {#2} } }
12030 \cs_generate_variant:Nn \tl_set:Nn { NV , Nv , Ne , Nf }
12031 \cs_generate_variant:Nn \tl_set:Nn { c , cV , cv , ce , cf }
12032 \cs_generate_variant:Nn \tl_set:No { c }
12033 \cs_generate_variant:Nn \tl_set:Nn { Nx , cx }

\q\_\_tl\_recursion\_tail Internal recursion quarks.

```

12183 \quark_new:N \q__tl_recursion_tail
12184 \quark_new:N \q__tl_recursion_stop

```

(End of definition for \q\_\_tl\_recursion\_tail and \q\_\_tl\_recursion\_stop.)

\\_tl\_if\_recursion\_tail\_break:nN Functions to query recursion quarks.

```

12185 \__kernel_quark_new_test:N \_tl_if_recursion_tail_break:nN
12186 \__kernel_quark_new_conditional:Nn \_tl_quark_if_nil:n { TF }

```

(End of definition for \\_tl\_if\_recursion\_tail\_break:nN and \\_tl\_if\_recursion\_tail\_stop:nTF.)

### 53.5 Reassigning token list category codes

\c\_\_tl\_rescan\_marker\_tl

The rescanning code needs a special token list containing the same character (chosen here to be a colon) with two different category codes: it cannot appear in the tokens being rescanned since all colons have the same category code.

```

12187 \tl_const:Ne \c__tl_rescan_marker_tl { : \token_to_str:N : }

```

(End of definition for \c\_\_tl\_rescan\_marker\_tl.)

\tl\_rescan:nV

\\_tl\_rescan\_aux:

\\_\_tl\_set\_rescan>NNn

\\_\_tl\_set\_rescan\_multi:NNN

\\_\_tl\_rescan>NNw

In a group, after some initial setup explained below and the user setup #3 (followed by \scan\_stop: to be safe), there is a call to \\_tl\_set\_rescan:nNN. This shared auxiliary defined later distinguishes single-line and multi-line “files”. In the simplest case of multi-line files, it calls (with the same arguments) \\_tl\_set\_rescan\_multi:nNN, whose code is included here to help understand the approach. This function rescans its argument #1, closes the group, and performs the assignment.

One difficulty when rescanning is that \scantokens treats the argument as a file, and without the correct settings a TeX error occurs:

```

! File ended while scanning definition of ...

```

A related minor issue is a warning due to opening a group before the \scantokens and closing it inside that temporary file; we avoid that by setting \tracingnesting. The standard solution to the “File ended” error is to grab the rescanned tokens as a delimited argument of an auxiliary, here \\_\_tl\_rescan:NNw, that performs the assignment, then let TeX “execute” the end of file marker. As usual in delimited arguments we use \prg\_do\_nothing: to avoid stripping an outer set braces: this is removed by using o-expanding assignments. The delimiter cannot appear within the rescanned token list because it contains twice the same character, with different catcodes.

For \tl\_rescan:nn we cannot simply call \\_tl\_set\_rescan:NNnn \prg\_do\_nothing: \use:n because that would leave the end-of-file marker *after* the result of rescanning. If that rescanned result is code that looks further in the input stream for arguments, it would break.

For multi-line files the only subtlety is that \newlinechar should be equal to \endlinechar because \newlinechar characters become new lines and then become

\endlinechar characters when writing to an abstract file and reading back. This equality is ensured by setting \newlinechar equal to \endlinechar. Prior to this, \endlinechar is set to -1 if it was 32 (in particular true after \ExplSyntaxOn) to avoid unreasonable line-breaks at every space for instance in error messages triggered by the user setup. Another side effect of reading back from the file is that spaces (catcode 10) are ignored at the beginning of lines, and spaces and tabs (character code 32 and 9) are ignored at the end of lines.

The two \if\_false: ... \fi: are there to prevent alignment tabs to cause a change of tabular cell while rescanning. We put the “opening” one after \group\_begin: so that if one accidentally f-expands \tl\_set\_rescan:Nnn braces remain balanced. This is essential in e-type arguments when \expanded is not available.

```

\__tl_set_rescan_single:nnNN
  \_tl_set_rescan_single_aux:nNNN
    \_tl_set_rescan_single_aux:w

```

The function `\__tl_set_rescan:nNN` calls `\__tl_set_rescan_multi:nNN` or `\__tl_set_rescan_single:nnNN` depending on whether its argument is a single-line fragment of code/data or is made of multiple lines by testing for the presence of a `\newlinechar` character. If `\newlinechar` is out of range, the argument is assumed to be a single line.

For a single line, no `\endlinechar` should be added, so it is set to `-1`, and spaces should not be removed. Trailing spaces and tabs are a difficult matter, as TeX removes these at a very low level. The only way to preserve them is to rescan not the argument but the argument followed by a character with a reasonable category code. Here, 11 (letter) and 12 (other) are accepted, as these are convenient, suitable for delimiting an argument, and it is very unlikely that none of the ASCII characters are in one of these categories. To avoid selecting one particular character to put at the end, whose category code may have been modified, there is a loop through characters from `'` (ASCII 39) to `~` (ASCII 127). The choice of starting point was made because this is the start of a very long range of characters whose standard category is letter or other, thus minimizing the number of steps needed by the loop (most often just a single one). If no valid character is found (very rare), fall-back on `\__tl_set_rescan_multi:nNN`.

Otherwise, once a valid character is found (let us use `'` in this explanation) run some code very similar to `\__tl_set_rescan_multi:nNN` but with `'` added at both ends of the input. Of course, we need to define the auxiliary `\__tl_set_rescan_single>NNww` on the fly to remove the additional `'` that is just before `::` (by which we mean `\c_tl_rescan_marker_t1`). Note that the argument must be delimited by `'` with the current catcode; this is done thanks to `\char_generate:nn`. Yet another issue is that the rescaned token list may contain a comment character, in which case the `'` we expected is not there. We fix this as follows: rather than just `::` we set `\everyeof` to `::{\langle code1\rangle}'::{\langle code2\rangle}\s_tl_stop`. The auxiliary `\__tl_set_rescan_single>NNww` runs the `\o-expanding assignment`, expanding either `\langle code1\rangle` or `\langle code2\rangle` before its the main argument #3. In the typical case without comment character, `\langle code1\rangle` is expanded, removing the leading `'`. In the rarer case with comment character, `\langle code2\rangle` is expanded, calling `\__tl_set_rescan_single_aux:w`, which removes the trailing `::{\langle code1\rangle}` and the leading `'`.

## 53.6 Modifying token list variables

`\tl_replace_once:Nnn`  
`\tl_replace_once:NVn`  
`\tl_replace_once:NnV`  
`\tl_replace_once:Nen`  
`\tl_replace_once:Nne`  
`\tl_replace_once:Nnx`  
`\tl_replace_once:Nnx`  
`\tl_replace_once:Nxx`  
`\tl_replace_once:cnn`  
`\tl_replace_once:cVn`  
`\tl_replace_once:cnV`  
`\tl_replace_once:cen`  
`\tl_replace_once:cne`  
`\tl_replace_once:cee`  
`\tl_replace_once:cxn`  
`\tl_replace_once:cnx`  
`\tl_replace_once:cxx`  
`\tl_greplace_once:Nnn`

All of the `replace` functions call `\__tl_replace:NnNNNnn` with appropriate arguments. The first two arguments are explained later. The next controls whether the replacement function calls itself (`\__tl_replace_next:w`) or stops (`\__tl_replace_wrap:w`) after the first replacement. Next comes an e-type assignment function `\tl_set:Ne` or `\tl_gset:Ne` for local or global replacements. Finally, the three arguments  $\langle tl\ var\rangle\ \{\langle pattern\rangle\}\ \{\langle replacement\rangle\}$  provided by the user. When describing the auxiliary functions below, we denote the contents of the  $\langle tl\ var\rangle$  by  $\langle token\ list\rangle$ .

```

12287 \cs_new_protected:Npn \tl_replace_once:Nnn

```

(End of definition for `\tl_replace_once:Nnn` and others. These functions are documented on page 122.)

To implement the actual replacement auxiliary `\__tl_replace_auxii:nNNNnn` we need a `<delimiter>` with the following properties:

- all occurrences of the `<pattern> #6` in “`<token list> <delimiter>`” belong to the `<token list>` and have no overlap with the `<delimiter>`,
- the first occurrence of the `<delimiter>` in “`<token list> <delimiter>`” is the trailing `<delimiter>`.

We first find the building blocks for the `<delimiter>`, namely two tokens `<A>` and `<B>` such that `<A>` does not appear in `#6` and `#6` is not `<B>` (this condition is trivial if `#6` has more than one token). Then we consider the delimiters “`<A>`” and “`<A> <A>n <B> <A>n <B>`”, for  $n \geq 1$ , where `<A>n` denotes  $n$  copies of `<A>`, and we choose as our `<delimiter>` the first one which is not in the `<token list>`.

Every delimiter in the set obeys the first condition: `#6` does not contain `<A>` hence cannot be overlapping with the `<token list>` and the `<delimiter>`, and it cannot be within the `<delimiter>` since it would have to be in one of the two `<B>` hence be equal to this single token (or empty, but this is an error case filtered separately). Given the particular form of these delimiters, for which no prefix is also a suffix, the second condition is actually a consequence of the weaker condition that the `<delimiter>` we choose does not appear in the `<token list>`. Additionally, the set of delimiters is such that a `<token list>` of  $n$  tokens can contain at most  $O(n^{1/2})$  of them, hence we find a `<delimiter>` with at most  $O(n^{1/2})$  tokens in a time at most  $O(n^{3/2})$ . Bear in mind that these upper bounds are reached only in very contrived scenarios: we include the case “`<A>`” in the list of delimiters to try, so that the `<delimiter>` is simply `\q__tl_mark` in the most common situation where neither the `<token list>` nor the `<pattern>` contains `\q__tl_mark`.

Let us now ahead, optimizing for this most common case. First, two special cases: an empty `<pattern>` `#6` is an error, and if `#1` is absent from both the `<token list>` `#5`

and the  $\langle pattern \rangle$  #6 then we can use it as the  $\langle delimiter \rangle$  through  $\_\_tl\_replace\_auxii:nNNNnn$  {#1}. Otherwise, we end up calling  $\_\_tl\_replace:NnNNNnn$  repeatedly with the first two arguments  $\q_tl_mark$  {?},  $\_?$  {??},  $\_?$  {??}, and so on, until #6 does not contain the control sequence #1, which we take as our  $\langle A \rangle$ . The argument #2 only serves to collect ? characters for #1. Note that the order of the tests means that the first two are done every time, which is wasteful (for instance, we repeatedly test for the emptiness of #6). However, this is rare enough not to matter. Finally, choose  $\langle B \rangle$  to be  $\q_tl_nil$  or  $\q_tl_stop$  such that it is not equal to #6.

The  $\_\_tl\_replace\_auxii:NnNNNnn$  auxiliary receives  $\{\langle A \rangle\}$  and  $\{\langle A \rangle^n \langle B \rangle\}$  as its arguments, initially with  $n = 1$ . If “ $\langle A \rangle \langle A \rangle^n \langle B \rangle \langle A \rangle^n \langle B \rangle$ ” is in the  $\langle token\ list \rangle$  then increase  $n$  and try again. Once it is not anymore in the  $\langle token\ list \rangle$  we take it as our  $\langle delimiter \rangle$  and pass this to the auxii auxiliary.

12334   {
12335     \tl_if_in:NnTF #1 { #2 #3 #3 }
12336     { \_\_tl_replace_auxii:NnnNNNnn #1 { #2 #3 } {#2?} }
12337     { \_\_tl_replace_auxii:nNNNnn { #2 #3 #3 } }
12338   }

```

The auxiliary  $\_\_tl\_replace\_auxii:nNNNnn$  receives the following arguments:

```

{⟨delimiter⟩} ⟨function⟩ ⟨assignment⟩
⟨tl var⟩ {⟨pattern⟩} {⟨replacement⟩}

```

All of its work is done between  $\group_align_safe_begin$ : and  $\group_align_safe_end$ : to avoid issues in alignments. It does the actual replacement within #3 #4 {...}, an e-expanding  $\langle assignment \rangle$  #3 to the  $\langle tl\ var \rangle$  #4. The auxiliary  $\_\_tl\_replace\_next:w$  is called, followed by the  $\langle token\ list \rangle$ , some tokens including the  $\langle delimiter \rangle$  #1, followed by the  $\langle pattern \rangle$  #5. This auxiliary finds an argument delimited by #5 (the presence of a trailing #5 avoids runaway arguments) and calls  $\_\_tl\_replace\_wrap:w$  to test whether this #5 is found within the  $\langle token\ list \rangle$  or is the trailing one.

If on the one hand it is found within the *<token list>*, then **##1** cannot contain the *<delimiter>* #1 that we worked so hard to obtain, thus `\_\_tl_replace_wrap:w` gets **##1** as its own argument **##1**, and protects it against the e-expanding assignment. It also finds `\exp_not:n` as **##2** and does nothing to it, thus letting through `\exp_not:n {<replacement>}` into the assignment. Note that `\_\_tl_replace_next:w` and `\_\_tl_replace_wrap:w` are always called followed by two empty brace groups. These are safe because no delimiter can match them. They prevent losing braces when grabbing delimited arguments, but require the use of `\exp_not:o` and `\use_none:nn`, rather than simply `\exp_not:n`. Afterwards, `\_\_tl_replace_next:w` is called to repeat the replacement, or `\_\_tl_replace_wrap:w` if we only want a single replacement. In this second case, **##1** is the *<remaining tokens>* in the *<token list>* and **##2** is some *<ending code>* which ends the assignment and removes the trailing tokens #5 using some `\if_false: { \fi: }` trickery because #5 may contain any delimiter.

If on the other hand the argument **##1** of `\_\_tl_replace_next:w` is delimited by the trailing *<pattern>* #5, then **##1** is “`{ } { } <token list> <delimiter> {<ending code>}`”, hence `\_\_tl_replace_wrap:w` finds “`{ } { } <token list>`” as **##1** and the *<ending code>* as **##2**. It leaves the *<token list>* into the assignment and unbrates the *<ending code>* which removes what remains (essentially the *<delimiter>* and *<replacement>*).

## 53.7 Token list conditionals

These functions check whether the token list in the argument is empty and execute the proper code from their argument(s).

```

12381 \prg_new_conditional:Npnn \tl_if_empty:N #1 { p , T , F , TF }
12382   {
12383     \if_meaning:w #1 \c_empty_tl
12384       \prg_return_true:
12385     \else:
12386       \prg_return_false:
12387     \fi:
12388   }
12389 \prg_generate_conditional_variant:Nnn \tl_if_empty:N
12390   { c } { p , T , F , TF }
```

(End of definition for \tl\_if\_empty:NTF. This function is documented on page 111.)

\tl\_if\_empty\_p:n The \if:w triggers the expansion of \tl\_to\_str:n which converts the argument to a string: this is empty if and only if the argument is. Then \if:w \scan\_stop: ... \scan\_stop: is true if and only if the string ... is empty. It could be tempting to use \if:w \scan\_stop: #1 \scan\_stop: directly. But this fails on a token list expanding to anything starting with \scan\_stop: leaving everything that follows in the input stream.

```

12391 \prg_new_conditional:Npnn \tl_if_empty:n #1 { p , TF , T , F }
12392   {
12393     \if:w \scan_stop: \tl_to_str:n {#1} \scan_stop:
12394       \prg_return_true:
12395     \else:
12396       \prg_return_false:
12397     \fi:
12398   }
12399 \prg_generate_conditional_variant:Nnn \tl_if_empty:n
12400   { V , e } { p , TF , T , F }
```

(End of definition for `\tl_if_empty:nTF`. This function is documented on page [111](#).)

\tl\_if\_empty\_p:o  
\tl\_if\_empty:oTF  
\\_tl\_if\_empty\_if:o

The auxiliary function `\_tl_if_empty_if:o` is for use in various token list conditionals which reduce to testing if a given token list is empty after applying a simple function to it. The test for emptiness is based on `\tl_if_empty:nTF`, but the expansion is hard-coded for efficiency, as this auxiliary function is used in several places. We don't put `\prg_return_true:` and so on in the definition of the auxiliary, because that would prevent an optimization applied to conditionals that end with this code. Also the `\@@_if_empty_if:o` is expanded once in `\tl_if_empty:oTF` for efficiency as well (and to reduce code doubling).

```
12401 \cs_new:Npn \__tl_if_empty_if:o #1
12402 {
12403     \if:w \scan_stop: \__kernel_tl_to_str:w \exp_after:wN {#1} \scan_stop:
12404 }

\tl_if_in:coTF  
12462 \prg_generate_conditional_variant:Nnn \tl_if_in:Nn  
12463   { NV , No , c , cV , co } { T , F , TF }
```

(End of definition for \tl\_if\_in:NnTF. This function is documented on page 112.)

**\tl\_if\_in:nnTF** Once more, the test relies on the emptiness test for robustness. The function `\_tl_-tmp:w` removes tokens until the first occurrence of #2. If this does not appear in #1, then the final #2 is removed, leaving an empty token list. Otherwise some tokens remain, and the test is `false`. See `\tl_if_empty:nTF` for details on the emptiness test.

Treating correctly cases like `\tl_if_in:nnTF {a state}{states}`, where #1#2 contains #2 before the end, requires special care. To cater for this case, we insert `\{}{\}` between the two token lists. This marker may not appear in #2 because of TeX limitations on what can delimit a parameter, hence we are safe. Using two brace groups makes the test work also for empty arguments. The `\if_false:` constructions are a faster way to do `\group_align_safe_begin:` and `\group_align_safe_end::`. The `\scan_stop:` ensures that f-expanding `\tl_if_in:nnTF` does not lead to unbalanced braces.

```

12464 \prg_new_protected_conditional:Npnn \tl_if_in:nn #1#2 { T , F , TF }
12465   {
12466     \scan_stop:
12467     \if_false: { \fi:
12468       \cs_set:Npn \_tl_tmp:w ##1 #2 { }
12469       \tl_if_empty:cTF { \_tl_tmp:w #1 {} {} #2 }
12470         { \prg_return_false: } { \prg_return_true: }
12471       \if_false: } \fi:
12472   }
12473 \prg_generate_conditional_variant:Nnn \tl_if_in:nn
12474   { V , VV , o , oo , nV , no } { T , F , TF }

```

(End of definition for `\tl_if_in:nnTF`. This function is documented on page 112.)

**\tl\_if\_novalue\_p:n** Tests whether ##1 matches `-NoValue-` exactly (with suitable catcodes): this is similar to `\quark_if_nil:nTF`. The first argument of `\_tl_if_novalue:w` is empty if and only if ##1 starts with `-NoValue-`, while the second argument is empty if ##1 is exactly `-NoValue-` or if it has a question mark just following `-NoValue-`. In this second case, however, the material after the first `?!?` remains and makes the emptiness test return `false`.

```

12475 \cs_set_protected:Npn \_tl_tmp:w #1
12476   {
12477     \prg_new_conditional:Npnn \tl_if_novalue:n ##1
12478       { p , T , F , TF }
12479       {
12480         \_tl_if_empty_if:o { \_tl_if_novalue:w {} ##1 {} ? ! #1 ? ? ! }
12481           \prg_return_true:
12482         \else:
12483           \prg_return_false:
12484         \fi:
12485       }
12486     \cs_new:Npn \_tl_if_novalue:w ##1 #1 ##2 ? ##3 ? ! { ##1 ##2 }
12487   }
12488 \exp_args:No \_tl_tmp:w { \c_novalue_tl }

```

(End of definition for `\tl_if_novalue:nTF` and `\_tl_if_novalue:w`. This function is documented on page 112.)

**\tl\_if\_single\_p:N** Expand the token list and feed it to `\tl_if_single:nTF`.

```

12489 \cs_new:Npn \tl_if_single_p:N { \exp_args:No \tl_if_single_p:n }
12490 \cs_new:Npn \tl_if_single:NT { \exp_args:No \tl_if_single:nT }
12491 \cs_new:Npn \tl_if_single:NF { \exp_args:No \tl_if_single:nF }

```

```

12492 \cs_new:Npn \tl_if_single:NTF { \exp_args:No \tl_if_single:nTF }
12493 \prg_generate_conditional_variant:Nnn \tl_if_single:N {c} { p , T , F , TF }

```

(End of definition for `\tl_if_single:NTF`. This function is documented on page 112.)

`\tl_if_single_p:n`  
`\tl_if_single:nTF`  
`\_tl_if_single:nnw`

This test is similar to `\tl_if_empty:nTF`. Expanding `\use_none:nn #1 ??` once yields an empty result if `#1` is blank, a single `?` if `#1` has a single item, and otherwise yields some tokens ending with `??`. Then, `\_kernel_tl_to_str:w` makes sure there are no odd category codes. An earlier version would compare the result to a single `?` using string comparison, but the Lua call is slow in LuaTeX. Instead, `\_tl_if_single:nnw` picks the second token in front of it. If `#1` is empty, this token is the trailing `?` and the `\if:w` test yields `false`. If `#1` has a single item, the token is `\scan_stop:` and the `\if:w` test yields `true`. Otherwise, it is one of the characters resulting from `\tl_to_str:n`, and the `\if:w` test yields `false`. Note that `\if:w` and `\_kernel_tl_to_str:w` are primitives that take care of expansion.

```

12494 \prg_new_conditional:Npnn \tl_if_single:n #1 { p , T , F , TF }
12495 {
12496   \if:w \scan_stop: \exp_after:wN \_tl_if_single:nnw
12497     \_kernel_tl_to_str:w
12498       \exp_after:wN { \use_none:nn #1 ?? } \scan_stop: ? \s__tl_stop
12499     \prg_return_true:
12500   \else:
12501     \prg_return_false:
12502   \fi:
12503 }
12504 \cs_new:Npn \_tl_if_single:nnw #1#2#3 \s__tl_stop {#2}

```

(End of definition for `\tl_if_single:nTF` and `\_tl_if_single:nnw`. This function is documented on page 112.)

`\tl_if_single_token_p:n`  
`\tl_if_single_token:nTF`

There are four cases: empty token list, token list starting with a normal token, with a brace group, or with a space token. If the token list starts with a normal token, remove it and check for emptiness. For the next case, an empty token list is not a single token. Finally, we have a non-empty token list starting with a space or a brace group. Applying f-expansion yields an empty result if and only if the token list is a single space.

```

12505 \prg_new_conditional:Npnn \tl_if_single_token:n #1 { p , T , F , TF }
12506 {
12507   \tl_if_head_is_N_type:nTF {#1}
12508     { \_tl_if_empty_if:o { \use_none:n #1 } }
12509     {
12510       \tl_if_empty:nTF {#1}
12511         { \if_false: }
12512           { \_tl_if_empty_if:o { \exp:w \exp_end_continue_f:w #1 } }
12513     }
12514     \prg_return_true:
12515   \else:
12516     \prg_return_false:
12517   \fi:
12518 }

```

(End of definition for `\tl_if_single_token:nTF`. This function is documented on page 112.)

## 53.8 Mapping over token lists

```
\tl_map_function:nN
\tl_map_function:NN
\tl_map_function:cN
\_tl_map_function:Nnnnnnnnnn
\_tl_map_function_end:w
\_tl_use_none_delimit_by_s_stop:w
```

Expandable loop macro for token lists. We use the internal scan mark `\s__tl_stop` (defined later), which is not allowed to show up in the token list #1 since it is internal to `\_tl`. This allows us a very fast test of whether some `\item` is the end-marker `\s__tl_stop`, namely call `\_tl_use_none_delimit_by_s_stop:w \item \function \s__tl_stop`, which calls `\function` if the `\item` is the end-marker. To speed up the loop even more, only test one out of eight items, and once we hit one of the eight end-markers, go more slowly through the last few items of the list using `\_tl_map_function_end:w`.

```
12519 \cs_new:Npn \tl_map_function:nN #1#2
12520 {
12521     \_tl_map_function:Nnnnnnnnn #2 #1
12522         \s__tl_stop \s__tl_stop \s__tl_stop \s__tl_stop
12523             \s__tl_stop \s__tl_stop \s__tl_stop \s__tl_stop
12524                 \prg_break_point:Nn \tl_map_break: { }
12525             }
12526 \cs_new:Npn \tl_map_function:NN

12582 }

```

(End of definition for `\tl_map_tokens:nn` and others. These functions are documented on page 117.)

`\tl_map_variable:nNn`

`\tl_map_variable:NNn`

`\tl_map_variable:cNn`

`\_tl_map_variable:Nnn`

`\tl_map_variable:nNn` {*<token list>*} *<tl var>* {*<action>*} assigns *<tl var>* to each element and executes *<action>*. The assignment to *<tl var>* is done after the quark test so that this variable does not get set to a quark.

```

12583 \cs_new_protected:Npn \tl_map_variable:nNn #1#2#3
12584   { \tl_map_tokens:nn {#1} { \_tl_map_variable:Nnn #2 {#3} } }
12585 \cs_new_protected:Npn \_tl_map_variable:Nnn #1#2#3
12586   { \tl_set:Nn #1 {#3} #2 }
12587 \cs_new_protected:Npn \tl_map_variable:NNn
12588   { \exp_args:No \tl_map_variable:nNn }
12589 \cs_generate_variant:Nn \tl_map_variable:NNn { c }

```

(End of definition for `\tl_map_variable:nNn`, `\tl_map_variable:NNn`, and `\_tl_map_variable:Nnn`. These functions are documented on page 118.)

`\tl_map_break:`

`\tl_map_break:n`

The break statements use the general `\prg_map_break:Nn`.

```

12590 \cs_new:Npn \tl_map_break:
12591   { \prg_map_break:Nn \tl_map_break: { } }
12592 \cs_new:Npn \tl_map_break:n
12593   { \prg_map_break:Nn \tl_map_break: }

```

(End of definition for `\tl_map_break:` and `\tl_map_break:n`. These functions are documented on page 118.)

## 53.9 Using token lists

\tl\_to\_str: Another name for a primitive: defined in l3basics.

\tl\_to\_str:o 12594 \cs\_generate\_variant:Nn \tl\_to\_str:n { o , v , v , e }

\tl\_to\_str:V  
(End of definition for \tl\_to\_str:n. This function is documented on page 114.)

\tl\_to\_str:v  
(End of definition for \tl\_to\_str:n. This function is documented on page 114.)

\tl\_to\_str:e  
\tl\_to\_str:N These functions return the replacement text of a token list as a string.

\tl\_to\_str:c 12595 \cs\_new:Npn \tl\_to\_str:N #1 { \\_\_kernel\_tl\_to\_str:w \exp\_after:wN {#1} }

12596 \cs\_generate\_variant:Nn \tl\_to\_str:N { c }

(End of definition for \tl\_to\_str:N. This function is documented on page 114.)

\tl\_use:N Token lists which are simply not defined give a clear TeX error here. No such luck for ones equal to \scan\_stop: so instead a test is made and if there is an issue an error is forced.

12597 \cs\_new:Npn \tl\_use:N #1

12598 {

12599 \tl\_if\_exist:NTF #1 {#1}

## 53.10 Working with the contents of token lists

\tl\_count:n Count number of elements within a token list or token list variable. Brace groups within the list are read as a single element. Spaces are ignored. \\_\_tl\_count:n grabs the element and replaces it by +1. The 0 ensures that it works on an empty list.

\tl\_count:v  
\tl\_count:v

\tl\_count:e  
\tl\_count:o

\tl\_count:N  
\tl\_count:c

\\_\_tl\_count:n

12606 \cs\_new:Npn \tl\_count:n #1

12607 {

12608 \int\_eval:n

12609 { 0 \tl\_map\_function:nN {#1} \\_\_tl\_count:n }

12610 }

12611 \cs\_new:Npn \tl\_count:N #1

12612 {

12613 \int\_eval:n

12614 { 0 \tl\_map\_function:NN #1 \\_\_tl\_count:n }

12615 }

12616 \cs\_new:Npn \\_\_tl\_count:n #1 { + 1 }

12617 \cs\_generate\_variant:Nn \tl\_count:n { V , v , e , o }

12618 \cs\_generate\_variant:Nn \tl\_count:N { c }

(End of definition for \tl\_count:n, \tl\_count:N, and \\_\_tl\_count:n. These functions are documented on page 115.)

```
\tl_count_tokens:n
\__tl_act_count_normal:nn
\__tl_act_count_group:nn
\__tl_act_count_space:n
```

The token count is computed through an `\int_eval:n` construction. Each `1+` is output to the *left*, into the integer expression, and the sum is ended by the `\exp_end:` inserted by `\__tl_act_end:wn` (which is technically implemented as `\c_zero_int`). Somewhat a hack!

```
12619 \cs_new:Npn \tl_count_tokens:n #1
12620   {
12621     \int_eval:n
12622     {
12623       \__tl_act:NNNn
12624       \__tl_act_count_normal:N
12625       \__tl_act_count_group:n
12626       \__tl_act_count_space:
12627       {#1}
12628     }
12629   }
12630 \cs_new:Npn \__tl_act_count_normal:N #1 { 1 + }
12631 \cs_new:Npn \__tl_act_count_space: { 1 + }
12632 \cs_new:Npn \__tl_act_count_group:n #1 { 2 + \tl_count_tokens:n {#1} + }
```

(End of definition for `\tl_count_tokens:n` and others. This function is documented on page 115.)

```
\tl_reverse_items:n
\__tl_reverse_items:nwNwn
\__tl_reverse_items:wn
```

Reversal of a token list is done by taking one item at a time and putting it after `\s__-tl_stop`.

```
12633 \cs_new:Npn \tl_reverse_items:n #1
12634   {
12635     \__tl_reverse_items:nwNwn #1 ?
12636     \s__tl_mark \__tl_reverse_items:nwNwn
12637     \s__tl_mark \__tl_reverse_items:wn
12638     \s__tl_stop { }
12639   }
12640 \cs_new:Npn \__tl_reverse_items:nwNwn #1 #2 \s__tl_mark #3 #4 \s__tl_stop #5
12641   {
12642     #3 #2
12643     \s__tl_mark \__tl_reverse_items:nwNwn
12644     \s__tl_mark \__tl_reverse_items:wn
12645     \s__tl_stop { {#1} #5 }
12646   }
12647 \cs_new:Npn \__tl_reverse_items:wn #1 \s__tl_stop #2
12648   { \__kernel_exp_not:w \exp_after:wN { \use_none:nn #2 } }
```

(End of definition for `\tl_reverse_items:n`, `\__tl_reverse_items:nwNwn`, and `\__tl_reverse_items:wn`. This function is documented on page 115.)

```
\tl_trim_spaces:n
\tl_trim_spaces:v
\tl_trim_spaces:v
\tl_trim_spaces:e
\tl_trim_spaces:o
\tl_trim_spaces_apply:nN
\tl_trim_spaces_apply:oN
```

Trimming spaces from around the input is deferred to an internal function whose first argument is the token list to trim, augmented by an initial `\__tl_trim_mark:`, and whose second argument is a *(continuation)*, which receives as a braced argument `\__tl_trim_mark: <trimmed token list>`. The control sequence `\__tl_trim_mark:` expands to nothing in a single expansion. In the case at hand, we take `\__kernel_exp_not:w \exp_after:wN` as our continuation, so that space trimming behaves correctly within an e-type or x-type expansion.

```
12649 \cs_new:Npn \tl_trim_spaces:n #1
12650   {
12651     \__tl_trim_spaces:nn
12652     { \__tl_trim_mark: #1 }
```

```

12653      { \_\_kernel\_exp\_not:w \exp\_after:wN }
12654    }
12655  \cs_generate_variant:Nn \tl_trim_spaces:n { V , v , e , o }
12656  \cs_new:Npn \tl_trim_spaces_apply:nN #1#2
12657    { \_\_tl_trim_spaces:nn { \_\_tl_trim_mark: #1 } { \exp_args:No #2 } }
12658  \cs_generate_variant:Nn \tl_trim_spaces_apply:nN { o }
12659  \cs_new_protected:Npn \tl_trim_spaces:N #1
12660    { \_\_kernel_tl_set:Nx #1 { \exp_args:No \tl_trim_spaces:n {#1} } }
12661  \cs_new_protected:Npn \tl_gtrim_spaces:N #1

12663  \cs_generate_variant:Nn \tl_trim_spaces:N { c }
12664  \cs_generate_variant:Nn \tl_gtrim_spaces:N { c }

```

Trimming spaces from around the input is done using delimited arguments and quarks, and to get spaces at odd places in the definitions, we nest those in `\_\_tl_tmp:w`, which then receives a single space as its argument: #1 is `\s__tl_nil`. Removing leading spaces is done with `\_\_tl_trim_spaces_auxi:w`, which loops until `\_\_tl_trim_mark:\s__tl_nil` matches the end of the token list: then #1 is the token list and #3 is `\_\_tl_trim_spaces_auxii:w`. This hands the relevant tokens to the loop `\_\_tl_trim_spaces_auxiii:w`, responsible for trimming trailing spaces. The end is reached when `\s__tl_stop` matches the one present in the definition of `\tl_trim_spaces:n`. Then `\_\_tl_trim_spaces_auxiv:w` puts the token list into a group, with a lingering `\_\_tl_trim_mark:` at the start (which will expand to nothing in one step of expansion), and feeds this to the *(continuation)*.

`\tl_sort:nN`

### 53.11 The first token from a token list

`\tl_head:N` Finding the head of a token list expandably always strips braces, which is fine as this is  
`\tl_head:n` consistent with for example mapping over a list. The empty brace groups in `\tl_head:n`  
`\tl_head:V` ensure that a blank argument gives an empty result. The result is returned within the  
`\tl_head:v` `\unexpanded` primitive. The approach here is to use `\if_false:` to allow us to use } as  
`\tl_head:f` the closing delimiter: this is the only safe choice, as any other token would not be able  
`\_\_tl_head_auxi:nw` to parse it's own code. More detail in <http://tex.stackexchange.com/a/70168>.

```

12705 \cs_new:Npn \tl_head:n #1
12706  {
12707      \_\_kernel_exp_not:w \tex_expanded:D
12708      { { \if_false: { \fi: \_\_tl_head_auxi:nw #1 { } } } }
12709  }
12710 \cs_new:Npn \_\_tl_head_auxi:nw #1
12711  {
12712      \_\_kernel_exp_not:w {#1}
12713      \exp_after:wN \use_none:n \exp_after:wN { \if_false: } \fi:
12714  }
12715 \cs_generate_variant:Nn \tl_head:n { V , v , f }
12716 \cs_new:Npn \tl_head:w #1#2 \q_stop {#1}
12717 \cs_new:Npn \_\_tl_tl_head:w #1#2 \s__tl_stop {#1}
12718 \cs_new:Npn \tl_head:N { \exp_args:No \tl_head:n }
```

To correctly leave the tail of a token list, it's important *not* to absorb any of the tail part as an argument. For example, the simple definition

```

\cs_new:Npn \tl_tail:n #1 { \tl_tail:w #1 \q_stop }
\cs_new:Npn \tl_tail:w #1#2 \q_stop
```

would give the wrong result for `\tl_tail:n { a { bc } }` (the braces would be stripped). Thus the only safe way to proceed is to first check that there is an item to grab (*i.e.* that the argument is not blank) and assuming there is to dispose of the first item. As with `\tl_head:n`, the result is protected from further expansion by `\unexpanded`. While we could optimise the test here, this would leave some tokens “banned” in the input, which we do not have with this definition.

```

12719 \exp_args:Nno \use:n { \cs_new:Npn \tl_tail:n #1 }
12720   {
12721     \exp_after:wN \_kernel_exp_not:w
12722     \tl_if_blank:nTF {#1}
12723     { { } }
12724     { \exp_after:wN { \use_none:n #1 } }
12725   }
12726 \cs_generate_variant:Nn \tl_tail:n { V , v , f }
12727 \cs_new:Npn \tl_tail:N { \exp_args:No \tl_tail:n }

```

12739 }
12740 \prg_generate_conditional_variant:Nnn \tl_if_head_eq_charcode:nN
12741   { V , e , f } { p , TF , T , F }

```

For `\tl_if_head_eq_catcode:nN`, again we detect special cases with a `\tl_if_head_is_N_type:n`. Then we need to test if the first token is a begin-group token or an explicit space token, and produce the relevant token, either `\c_group_begin_token` or `\c_space_token`. Again, for an empty argument, a hack is used, removing the token given by the user and leaving two tokens in the input stream which will make the `\if_catcode:w` test return false.

```

12742 \prg_new_conditional:Npnn \tl_if_head_eq_catcode:nN #1 #2 { p , T , F , TF }
12743   {
12744     \if_catcode:w
12745       \tl_if_head_is_N_type:nTF { #1 ? }

```

```

12746 { \__tl_head_exp_not:w #1 { ^ \__tl_if_head_eq_empty_arg:w } \s__tl_stop }
12747 {
12748     \tl_if_head_is_group:nTF {#1}
12749         \c_group_begin_token
12750         \c_space_token
12751     }
12752     \exp_not:N #2
12753     \prg_return_true:
12754     \else:
12755     \prg_return_false:
12756     \fi:
12757 }
12758 \prg_generate_conditional_variant:Nnn \tl_if_head_eq_catcode:nN
12759 { V , e , o } { p , TF , T , F }

```

For `\tl_if_head_eq_meaning:nN`, again, detect special cases. In the normal case, use `\tl_head:w`, with no `\exp_not:N` this time, since `\if_meaning:w` causes no expansion. With an empty argument, the test is `true`, and `\use_none:nN` removes #2 and `\prg_return_true:` and `\else:` (it is safe this way here as in this case `\prg_new_conditional:Npnn` didn't optimize these two away). In the special cases, we know that the first token is a character, hence `\if_charcode:w` and `\if_catcode:w` together are enough. We combine them in some order, hopefully faster than the reverse. Tests are not nested because the arguments may contain unmatched primitive conditionals.

```

12760 \prg_new_conditional:Npnn \tl_if_head_eq_meaning:nN #1#2 { p , T , F , TF }

12794     \fi:
12795 }
12796 }
```

Both `\tl_if_head_eq_charcode:nN` and `\tl_if_head_eq_catcode:nN` will need to get the first token of their argument and apply `\exp_not:N` to it. `\_tl_head_exp_not:w` does exactly that.

```

12797 \cs_new:Npn \_tl_head_exp_not:w #1 #2 \s__tl_stop
12798 { \exp_not:N #1 }
```

If the argument of `\tl_if_head_eq_charcode:nN` and `\tl_if_head_eq_catcode:nN` was empty `\_tl_if_head_eq_empty_arg:w` will be left in the input stream. This macro has to remove `\exp_not:N` and the following token from the input stream to make sure no unbalanced if-construct is created and leave tokens there which make the two tests return `false`.

```

12799 \cs_new:Npn \_tl_if_head_eq_empty_arg:w \exp_not:N #1
12800 { ? }
```

(End of definition for `\tl_if_head_eq_meaning:nNTF` and others. These functions are documented on page 113.)

A token list can be empty, can start with an explicit space character (catcode 10 and charcode 32), can start with a begin-group token (catcode 1), or start with an N-type argument. In the first two cases, and when #1~ starts with {}~, `\_tl_if_head_is_N_type_auxi:w` receives an empty argument hence produces f and removes everything before the first `\scan_stop:`. In the third case (except when #1~ starts with {}~), the second auxiliary removes the first copy of #1 that was used for the space test, then expands `\token_to_str:N` which hits the leading begin-group token, leaving a single closing brace to be compared with `\scan_stop:`. In the last case, `\token_to_str:N` does not change the brace balance so that only `\scan_stop: \scan_stop:` remain, making the character code test true. One cannot optimize by moving one of the `\scan_stop:` to the beginning: if #1 contains primitive conditionals, all of its occurrences must be dealt with before the `\if:w` tries to skip the `true` branch of the conditional.

```

12801 \prg_new_conditional:Npnn \tl_if_head_is_N_type:n #1 { p , T , F , TF }
12802 {

```

(End of definition for `\tl_if_head_is_group:nTF` and `\__tl_if_head_is_group_fi_false:w`. This function is documented on page 113.)

- `\tl_if_head_is_space_p:n` The auxiliary's argument is all that is before the first explicit space in `\prg_do_nothing:#1?~`.  
`\tl_if_head_is_space:nTF` If that is a single `\prg_do_nothing`: the test yields `true`. Otherwise, that is more than one token, and the test yields `false`. The work is done within braces (with an `\if_false: { \fi: ... }` construction) both to hide potential alignment tab characters from TeX in a table, and to allow for removing what remains of the token list after its first space. The use of `\if:w` ensures that the result of a single step of expansion directly yields a balanced token list (no trailing closing brace).  
`\__tl_if_head_is_space:w`

```

12836 \prg_new_conditional:Npnn \tl_if_head_is_space:n #1 { p , T , F , TF }

12850   }

```

(End of definition for `\tl_if_head_is_space:nTF` and `\__tl_if_head_is_space:w`. This function is documented on page 114.)

## 53.12 Token by token changes

\s\_\_tl\_act\_stop

The `\__tl_act_...` functions may be applied to any token list. Hence, we use a private quark, to allow any token, even quarks, in the token list. Only `\s__tl_act_stop` may not appear in the token lists manipulated by `\__tl_act:NNNn` functions.

12851 `\scan_new:N \s__tl_act_stop`

(End of definition for `\s__tl_act_stop`.)

`\__tl_act:NNNn`

`\__tl_act_output:n`

`\__tl_act_reverse_output:n`

`\__tl_act_loop:w`

`\__tl_act_normal:NwNNN`

`\__tl_act_group:nwNNN`

`\__tl_act_space:wwNNN`

`\__tl_act_end:wn`

`\__tl_act_if_head_is_space:nTF`

`\__tl_act_if_head_is_space:w`

`\__tl_act_if_head_is_space_true:w`

`\__tl_use_none_delimit_by_q_act_stop:w`

To help control the expansion, `\__tl_act:NNNn` should always be preceded by `\exp:w` and ends by producing `\exp_end:` once the result has been obtained. This way no internal token of it can be accidentally end up in the input stream. Because `\s__tl_act_stop` can't appear without braces around it in the argument #1 of `\__tl_act_loop:w`, we can use this marker to set up a fast test for leading spaces.

12852 `\cs_set_protected:Npn \__tl_tmp:w #1`

12853    {

12854      `\cs_new:Npn \__tl_act_if_head_is_space:nTF ##1`

12855       {

12856        `\__tl_act_if_head_is_space:w`

12857        `\s__tl_act_stop ##1 \s__tl_act_stop \__tl_act_if_head_is_space_true:w`

12858        `\s__tl_act_stop #1 \s__tl_act_stop \use_ii:nn`

12859       }

12860      `\cs_new:Npn \__tl_act_if_head_is_space:w`

12861       `#1 \s__tl_act_stop #1 ##2 \s__tl_act_stop`

12862       {}

12863      `\cs_new:Npn \__tl_act_if_head_is_space_true:w`

12864       `\s__tl_act_stop #1 \s__tl_act_stop \use_ii:nn ##1 ##2`

12865       {##1}

12866      }

12867     `\__tl_tmp:w { ~ }`

(We expand the definition `\__tl_act_if_head_is_space:nTF` when setting up `\__tl_act_loop:w`, so we can then undefine the auxiliary.) In the loop, we check how the token list begins and act accordingly. In the “group” case, we may have reached `\s__tl_act_stop`, the end of the list. Then leave `\exp_end:` and the result in the input stream, to terminate the expansion of `\exp:w`. Otherwise, apply the relevant function to the “arguments”, #3 and to the head of the token list. Then repeat the loop. The scheme is the same if the token list starts with an N-type or with a space, making sure that `\__tl_act_space:wwNNN` gobbles the space.

12868 `\exp_args:Nne \use:n { \cs_new:Npn \__tl_act_loop:w #1 \s__tl_act_stop }`

12869    {

12870      `\exp_not:o { \__tl_act_if_head_is_space:nTF {#1} }`

12872      {

12873       `\exp_not:o { \tl_if_head_is_group:nTF {#1} }`

12874       `\exp_not:N \__tl_act_group:nwNNN`

12875       `\exp_not:N \__tl_act_normal:NwNNN`

12876      }

12877      `\exp_not:n {#1} \s__tl_act_stop`

12878     }

12879 `\cs_undefine:N \__tl_act_if_head_is_space:nTF`

12880 `\cs_new:Npn \__tl_act_normal:NwNNN #1 #2 \s__tl_act_stop #3`

12881    {

```

12882      #3 #1
12883      \_tl_act_loop:w #2 \s__tl_act_stop
12884      #3
12885  }
12886 \cs_new:Npn \_tl_use_none_delimit_by_s_act_stop:w #1 \s__tl_act_stop { }
12887 \cs_new:Npn \_tl_act_end:wn #1 \_tl_act_result:n #2
12888   { \group_align_safe_end: \exp_end: #2 }
12889 \cs_new:Npn \_tl_act_group:nwNNN #1 #2 \s__tl_act_stop #3#4#5
12890  {
12891    \_tl_use_none_delimit_by_s_act_stop:w #1 \_tl_act_end:wn \s__tl_act_stop
12892    #5 {#1}
12893    \_tl_act_loop:w #2 \s__tl_act_stop
12894    #3 #4 #5
12895  }
12896 \exp_last_unbraced:NNo
12897   \cs_new:Npn \_tl_act_space:wwNNN \c_space_tl #1 \s__tl_act_stop #2#3
12898  {
12899    #3
12900    \_tl_act_loop:w #1 \s__tl_act_stop
12901    #2 #3
12902  }

```

\\_tl\_act:NNNn loops over tokens, groups, and spaces in #4. {\s\_@@\_act\_stop} serves as the end of token list marker, the ? after it avoids losing outer braces. The result is stored as an argument for the dummy function \\_tl\_act\_result:n.

```

12903 \cs_new:Npn \_tl_act:NNNn #1#2#3#4
12904  {
12905    \group_align_safe_begin:
12906    \_tl_act_loop:w #4 { \s__tl_act_stop } ? \s__tl_act_stop
12907    #1 #3 #2
12908    \_tl_act_result:n { }
12909  }

```

Typically, the output is done to the right of what was already output, using \\_tl\_act\_output:n, but for the \\_tl\_act\_reverse functions, it should be done to the left.

```

12910 \cs_new:Npn \_tl_act_output:n #1 #2 \_tl_act_result:n #3
12911   { #2 \_tl_act_result:n { #3 #1 } }
12912 \cs_new:Npn \_tl_act_reverse_output:n #1 #2 \_tl_act_result:n #3
12913   { #2 \_tl_act_result:n { #1 #3 } }

```

(End of definition for \\_tl\_act:NNNn and others.)

**\tl\_reverse:n** The goal here is to reverse without losing spaces nor braces. This is done using the general internal function \\_tl\_act:NNNn. Spaces and “normal” tokens are output on the left of the current output. Grouped tokens are output to the left but without any reversal within the group.

**\tl\_reverse:o**

**\tl\_reverse:v**

**\tl\_reverse:f**

**\tl\_reverse:e**

```

12914 \cs_new:Npn \tl_reverse:n #1
12915  {
12916    \_kernel_exp_not:w \exp_after:wn
12917    {
12918      \exp:w
12919      \_tl_act:NNNn
12920      \_tl_reverse_normal:N
12921      \_tl_reverse_group_preserve:n
12922      \_tl_reverse_space:

```

```

12923           {#1}
12924       }
12925   }
12926 \cs_generate_variant:Nn \tl_reverse:n { o , V , f , e }
12927 \cs_new:Npn \__tl_reverse_normal:N
12928   { \__tl_act_reverse_output:n }
12929 \cs_new:Npn \__tl_reverse_group_preserve:n #1
12930   { \__tl_act_reverse_output:n { #1 } }
12931 \cs_new:Npn \__tl_reverse_space:
12932   { \__tl_act_reverse_output:n { ~ } }

```

(End of definition for `\tl_reverse:n` and others. This function is documented on page 115.)

**\tl\_reverse:N** This reverses the list, leaving `\exp_stop_f:` in front, which stops the f-expansion.  
**\tl\_reverse:c** 12933 `\cs_new_protected:Npn \tl_reverse:N #1`  
**\tl\_greverse:N** 12934 { `\__kernel_tl_set:Nx #1 { \exp_args:No \tl_reverse:n { #1 } }` }  
**\tl\_greverse:c** 12935 `\cs_new_protected:Npn \tl_greverse:N #1`  
12936 { `\__kernel_tl_gset:Nx #1 { \exp_args:No \tl_reverse:n { #1 } }` }  
12937 `\cs_generate_variant:Nn \tl_reverse:N { c }`  
12938 `\cs_generate_variant:Nn \tl_greverse:N { c }`

(End of definition for `\tl_reverse:N` and `\tl_greverse:N`. These functions are documented on page 115.)

### 53.13 Using a single item

**\tl\_item:nn** The idea here is to find the offset of the item from the left, then use a loop to grab  
**\tl\_item:Nn** the correct item. If the resulting offset is too large, then `\__tl_if_recursion_tail_-`  
**\tl\_item:cn** `\break:nN` terminates the loop, and returns nothing at all.

```

\__tl_item_aux:nn
\__tl_item:nn
12939 \cs_new:Npn \tl_item:nn #1#2
12940   {
12941     \exp_args:Nf \__tl_item:nn
12942     { \exp_args:Nf \__tl_item_aux:nn { \int_eval:n {#2} } {#1} }
12943     #1

*(End of definition for `\__tl_range_normalize:nn`.)*

### 53.14 Viewing token lists

```

\tl_show:N Showing token list variables is done after checking that the variable is defined (see
\tl_show:c \__kernel_register_show:N).
\tl_log:N 13067 \cs_new_protected:Npn \tl_show:N { \__tl_show>NN \tl_show:n }
\tl_log:c 13068 \cs_generate_variant:Nn \tl_show:N { c }
\__tl_show>NN 13069 \cs_new_protected:Npn \tl_log:N { \__tl_show>NN \tl_log:n }
13070 \cs_generate_variant:Nn \tl_log:N { c }
13071 \cs_new_protected:Npn \__tl_show>NN #1#2
13072 {
13073     \__kernel_chk_defined:NT #2
13074     {
13075         \exp_args:Nf \tl_if_empty:nTF
13076             { \cs_prefix_spec:N #2 \cs_parameter_spec:N #2 }
13077             {
13078                 \exp_args:Ne #1
13079                     { \token_to_str:N #2 = \__kernel_exp_not:w \exp_after:wN {#2} }
13080             }
13081             {
13082                 \msg_error:nneee { kernel } { bad-type }
13083                     { \token_to_str:N #2 } { \token_to_meaning:N #2 } { tl }
13084             }
13085     }
13086 }
```

*(End of definition for `\tl_show:N`, `\tl_log:N`, and `\__tl_show>NN`. These functions are documented on page 116.)*

\tl\_show:n Many show functions are based on \tl\_show:n. The argument of \tl\_show:n is line-wrapped using \iow\_wrap:nnN but with a leading >~ and trailing period, both removed before passing the wrapped text to the \showtokens primitive. This primitive shows the result with a leading >~ and trailing period.

\tl\_show:e \tl\_show:x \\_\_tl\_show:n \\_\_tl\_show:w The token list \l\_\_tl\_internal\_a\_t1 containing the result of all these manipulations is displayed to the terminal using \tex\_showtokens:D and an odd \exp\_after:wN which expand the closing brace to improve the output slightly. The calls to \kernel\_iow\_with:Nnn ensure that the \newlinechar is set to 10 so that the \iow\_newline: inserted by the line-wrapping code are correctly recognized by TeX, and that \errorcontextlines is -1 to avoid printing irrelevant context.

```

13087 \cs_new_protected:Npn \tl_show:n #1
13088   { \iow_wrap:nnN { >~ \tl_to_str:n {#1} . } { } { } \__tl_show:n }
13089 \cs_generate_variant:Nn \tl_show:n { e , x }
13090 \cs_new_protected:Npn \__tl_show:n #1
13091   {
13092     \tl_set:Nf \l__tl_internal_a_t1 { \__tl_show:w #1 \s__tl_stop }
13093     \__kernel_iow_with:Nnn \tex_newlinechar:D { 10 }
13094     {
13095       \__kernel_iow_with:Nnn \tex_errorcontextlines:D { -1 }
13096       {
13097         \tex_showtokens:D \exp_after:wN \exp_after:wN \exp_after:wN
13098           { \exp_after:wN \l__tl_internal_a_t1 }
13099       }
13100     }
13101   }
13102 \cs_new:Npn \__tl_show:w #1 > #2 . \s__tl_stop {#2}

```

(End of definition for \tl\_show:n, \\_\_tl\_show:n, and \\_\_tl\_show:w. This function is documented on page 116.)

\tl\_log:n Logging is much easier, simply line-wrap. The >~ and trailing period is there to match the output of \tl\_show:n.

\tl\_log:e \tl\_log:x

```

13103 \cs_new_protected:Npn \tl_log:n #1
13104   { \iow_wrap:nnN { >~ \tl_to_str:n {#1} . } { } { } \iow_log:n }
13105 \cs_generate_variant:Nn \tl_log:n { e , x }

```

(End of definition for \tl\_log:n. This function is documented on page 116.)

\\_\_kernel\_chk\_tl\_type:Nnn Helper for checking that #1 has the correct internal structure to be of a certain type. Make sure that it is defined and that it is a token list, namely a macro with no \long nor \protected prefix. Then compare #1 to an attempt at reconstructing a valid structure of the given type using #2 (see implementation of \seq\_show:N for instance). If that is successful run the requested code #4.

```

13106 \cs_new_protected:Npn \__kernel_chk_tl_type:NnnT #1#2#3#4
13107   {
13108     \__kernel_chk_defined:NT #1
13109     {
13110       \exp_args:Nf \tl_if_empty:nTF
13111         { \cs_prefix_spec:N #1 \cs_parameter_spec:N #1 }
13112       {
13113         \tl_set:Ne \l__tl_internal_a_t1 {#3}
13114         \tl_if_eq:NNTF #1 \l__tl_internal_a_t1
13115           {#4}

```

```

13116    {
13117        \msg_error:nneeee { kernel } { bad-type }
13118            { \token_to_str:N #1 } { \tl_to_str:N #1 }
13119            {#2} { \tl_to_str:N \l__tl_internal_a_tl }
13120    }
13121 }
13122 {
13123     \msg_error:nneeee { kernel } { bad-type }
13124         { \token_to_str:N #1 } { \token_to_meaning:N #1 } {#2}
13125     }
13126 }
13127 }
```

(End of definition for `\_kernel_chk_tl_type:NnnT.`)

### 53.15 Internal scan marks

`\s__tl_nil` Internal scan marks. These are defined here at the end because the code for `\scan_new:N` depends on some l3tl functions.  
`\s__tl_mark`  
`\s__tl_stop`

```

13128 \scan_new:N \s__tl_nil
13129 \scan_new:N \s__tl_mark
13130 \scan_new:N \s__tl_stop
```

(End of definition for `\s__tl_nil`, `\s__tl_mark`, and `\s__tl_stop`.)

### 53.16 Scratch token lists

`\g_tmpa_tl` Global temporary token list variables. They are supposed to be set and used immediately, with no delay between the definition and the use because you can't count on other macros not to redefine them from under you.  
`\g_tmpb_tl`

```

13131 \tl_new:N \g_tmpa_tl
13132 \tl_new:N \g_tmpb_tl
```

(End of definition for `\g_tmpa_tl` and `\g_tmpb_tl`. These variables are documented on page 125.)

`\l_tmpa_tl` These are local temporary token list variables. Be sure not to assume that the value you put into them will survive for long—see discussion above.  
`\l_tmpb_tl`

```

13133 \tl_new:N \l_tmpa_tl
13134 \tl_new:N \l_tmpb_tl
```

(End of definition for `\l_tmpa_tl` and `\l_tmpb_tl`. These variables are documented on page 125.)

We finally clean up a temporary control sequence that we have used at various points to set up some definitions.

```

13135 \cs_undefine:N \_tl_tmp:w
13136 </package>
```

# Chapter 54

## I3tl-build implementation

```
13137  {*package}
13138  @@@=tl}

Between \tl_build_begin:N  $\langle tl\ var\rangle$  and \tl_build_end:N  $\langle tl\ var\rangle$ , the  $\langle tl\ var\rangle$  has the structure
\exp_end: ... \exp_end: \_tl_build_last:NNn  $\langle assignment\rangle$   $\langle next\ tl\rangle$ 
 $\langle left\rangle\}$   $\langle right\rangle$ 
```

where  $\langle right\rangle$  is not braced. The “data” it represents is  $\langle left\rangle$  followed by the “data” of  $\langle next\ tl\rangle$  followed by  $\langle right\rangle$ . The  $\langle next\ tl\rangle$  is a token list variable whose name is that of  $\langle tl\ var\rangle$  followed by ‘’. There are between 0 and 4 \exp\_end: to keep track of when  $\langle left\rangle$  and  $\langle right\rangle$  should be put into the  $\langle next\ tl\rangle$ . The  $\langle assignment\rangle$  is \cs\_set\_nopar:Npe if the variable is local, and \cs\_gset\_nopar:Npe if it is global.

\tl\_build\_begin:N  
\tl\_build\_gbegin:N  
\\_tl\_build\_begin:NN  
\\_tl\_build\_begin:NNN

First construct the  $\langle next\ tl\rangle$ : using a prime here conflicts with the usual expl3 convention but we need a name that can be derived from #1 without any external data such as a counter. Empty that  $\langle next\ tl\rangle$  and setup the structure. The local and global versions only differ by a single function \cs\_(g)set\_nopar:Npe used for all assignments: this is important because only that function is stored in the  $\langle tl\ var\rangle$  and  $\langle next\ tl\rangle$  for subsequent assignments. In principle \\_tl\_build\_begin:NNN could use \tl\_(g)clear\_new:N to empty #1 and make sure it is defined, but logging the definition does not seem useful so we just do #3 #1 {} to clear it locally or globally as appropriate.

```
13139 \cs_new_protected:Npn \tl_build_begin:N #1
13140   { \_tl_build_begin:NN \cs_set_nopar:Npe #1 }
13141 \cs_new_protected:Npn \tl_build_gbegin:N #1
13142   { \_tl_build_begin:NN \cs_gset_nopar:Npe #1 }
13143 \cs_new_protected:Npn \_tl_build_begin:NN #1#2
13144   { \exp_args:Nc \_tl_build_begin:NNN { \cs_to_str:N #2 } #2 #1 }
13145 \cs_new_protected:Npn \_tl_build_begin:NNN #1#2#3
13146   {
13147     #3 #1 {}
13148     #3 #2
13149     {
13150       \exp_not:n { \exp_end: \exp_end: \exp_end: \exp_end: }
13151       \exp_not:n { \_tl_build_last:NNn #3 #1 {} }
13152     }
13153 }
```

(End of definition for `\tl_build_begin:N` and others. These functions are documented on page 126.)

```
\tl_build_put_right:Nn
\tl_build_put_right:Ne
\tl_build_put_right:Nx
\tl_build_gput_right:Nn
\tl_build_gput_right:Ne
\tl_build_gput_right:Nx
  \__tl_build_last:NNn
  \__tl_build_put:nn
  \__tl_build_put:nw
```

Similar to `\tl_put_right:Nn`, but apply `\exp:w` to #1. Most of the time this just removes one `\exp_end:`. When there are none left, `\__tl_build_last:NNn` is expanded instead. It resets the definition of the `\tl var` by ending the `\exp_not:n` and the definition early. Then it makes sure the `\next tl` (its argument #1) is set-up and starts a new definition. Then `\__tl_build_put:nn` and `\__tl_build_put:nw` place the `\left` part of the original `\tl var` as appropriate for the definition of the `\next tl` (the `\right` part is left in the right place without ever becoming a macro argument). We use `\exp_after:wN` rather than some `\exp_args:No` to avoid reading arguments that are likely very long token lists. We use `\cs_(g)set_nopar:Npe` rather than `\tl_(g)set:Ne` partly for the same reason and partly because the assignments are interrupted by brace tricks, which implies that the assignment does not simply set the token list to an e-expansion of the second argument.

```
13154 \cs_new_protected:Npn \tl_build_put_right:Nn #1#2
13155   {
13156     \cs_set_nopar:Npe #1
13157     { \__kernel_exp_not:w \exp_after:wN { \exp:w #1 #2 } }
13158   }
13159 \cs_generate_variant:Nn \tl_build_put_right:Nn { Ne , Nx }
13160 \cs_new_protected:Npn \tl_build_gput_right:Nn #1#2
13161   {
13162     \cs_gset_nopar:Npe #1
13163     { \__kernel_exp_not:w \exp_after:wN { \exp:w #1 #2 } }
13164   }
13165 \cs_generate_variant:Nn \tl_build_gput_right:Nn { Ne , Nx }
13166 \cs_new_protected:Npn \__tl_build_last:NNn #1#2
13167   {
13168     \if_false: { { \fi:
13169       \exp_end: \exp_end: \exp_end: \exp_end: \exp_end:
13170       \__tl_build_last:NNn #1 #2 { }
13171     }
13172   }
13173   \if_meaning:w \c_empty_tl #2
13174     \__tl_build_begin:NN #1 #2
13175   \fi:
13176   #1 #2
13177   {
13178     \__kernel_exp_not:w \exp_after:wN
13179     {
13180       \exp:w \if_false: } } \fi:
13181       \exp_after:wN \__tl_build_put:nn \exp_after:wN {#2}
13182   }
13183 \cs_new_protected:Npn \__tl_build_put:nn #1#2 { \__tl_build_put:nw {#2} #1 }
13184 \cs_new_protected:Npn \__tl_build_put:nw #1#2 \__tl_build_last:NNn #3#4#5
13185   { #2 \__tl_build_last:NNn #3 #4 { #1 #5 } }
```

(End of definition for `\tl_build_put_right:Nn` and others. These functions are documented on page 126.)

See `\tl_build_put_right:Nn` for all the machinery. We could easily provide `\tl-build_put_left_right:Nnn`, by just adding the `\right` material after the `\{ \left \}` in the e-expanding assignment.

```
13186 \cs_new_protected:Npn \tl_build_put_left:Nn #1
```

```
\tl_build_gput_left:Nn

13199       \exp_after:wN {#2} {#3}
13200     }
13201   }
13202 }
```

(End of definition for `\tl_build_put_left:Nn`, `\tl_build_gput_left:Nn`, and `\__tl_build_put_left:NNn`. These functions are documented on page 126.)

`\tl_build_end:N`  
`\tl_build_gend:N`  
`\__tl_build_end_loop>NN`

```

Get the data then clear the  $\langle next\ tl \rangle$  recursively until finding an empty one. It is perhaps wasteful to repeatedly use \cs_to_str:N. The local/global scope is checked by \tl_set:Ne or \tl_gset:Ne.
13203 \cs_new_protected:Npn \tl_build_end:N #1
13204   {
13205     \__tl_build_get:NNN \__kernel_tl_set:Nx #1 #1
13206     \exp_args:Nc \__tl_build_end_loop>NN { \cs_to_str:N #1 ' } \tl_clear:N
13207   }
13208 \cs_new_protected:Npn \tl_build_gend:N #1
13209   {
13210     \__tl_build_get:NNN \__kernel_tl_gset:Nx #1 #1
13211     \exp_args:Nc \__tl_build_end_loop>NN { \cs_to_str:N #1 ' } \tl_gclear:N
13212   }
13213 \cs_new_protected:Npn \__tl_build_end_loop>NN #1#2
13214   {
13215     \if_meaning:w \c_empty_tl #1
13216       \exp_after:wN \use_none:nnnnnn
13217     \fi:
13218     #2 #1
13219     \exp_args:Nc \__tl_build_end_loop>NN { \cs_to_str:N #1 ' } #2
13220   }
```

(End of definition for `\tl_build_end:N`, `\tl_build_gend:N`, and `\__tl_build_end_loop>NN`. These functions are documented on page 127.)

`\tl_build_get_intermediate>NN`

```

13221 \cs_new_protected:Npn \tl_build_get_intermediate>NN
13222   { \__tl_build_get:NNN \__kernel_tl_set:Nx }
```

(End of definition for `\tl_build_get_intermediate>NN`. This function is documented on page 127.)

`\__tl_build_get>NNN`  
`\__tl_build_get:w`  
`\__tl_build_get_end:w`

The idea is to expand the  $\langle tl\ var \rangle$  then the  $\langle next\ tl \rangle$  and so on, all within an e-expanding assignment, and wrap as appropriate in `\exp_not:n`. The various  $\langle left \rangle$  parts are left in the assignment as we go, which enables us to expand the  $\langle next\ tl \rangle$  at the right place. The

various  $\langle right \rangle$  parts are eventually picked up in one last  $\exp_{not:n}$ , with a brace trick to wrap all the  $\langle right \rangle$  parts together.

```
13223 \cs_new_protected:Npn \__tl_build_get:NNN #1#2#3
13224   { #1 #3 { \if_false: { \fi: \exp_after:wN \__tl_build_get:w #2 } } }

(End of definition for \str_new:N and others. These functions are documented on page 129.)

```

**\str\_set:Nn** Similar to corresponding l3tl base functions, except that `\__kernel_exp_not:w` is replaced with `\__kernel_tl_to_str:w`. Just like token list, string constants use `\cs_gset_nopar:Npe` instead of `\__kernel_tl_gset:Nx` so that the scope checking for `c` is applied when `l3debug` is used. To maintain backward compatibility, in `\str_(g)put_left:Nn` and `\str_(g)put_right:Nn`, contents of string variables are wrapped in `\__kernel_exp_not:w` to prevent further expansion.

```

### 55.3 Modifying string variables

Start by applying \tl\_to\_str:n to convert the old and new token lists to strings, and also apply \tl\_to\_str:N to avoid any issues if we are fed a token list variable. Then the code is a much simplified version of the token list code because neither the delimiter nor the replacement can contain macro parameters or braces. The delimiter \s\_\_str\_mark cannot appear in the string to edit so it is used in all cases. Some e-expansion is unnecessary. There is no need to avoid losing braces nor to protect against expansion. The ending code is much simplified and does not need to hide in braces.

```

13309 \cs_new_protected:Npn \str_replace_once:Nnn
13310 { \__str_replace>NNNnn \prg_do_nothing: \__kernel_tl_set:Nx }
13311 \cs_new_protected:Npn \str_greplace_once:Nnn

13359 \cs_generate_variant:Nn \str_remove_all:Nn { c }
13360 \cs_generate_variant:Nn \str_gremove_all:Nn { c }

```

(End of definition for `\str_remove_all:Nn` and `\str_gremove_all:Nn`. These functions are documented on page 137.)

## 55.4 String comparisons

**\str\_if\_empty\_p:N** More copy-paste!

```

13361 \prg_new_eq_conditional:NNn \str_if_exist:N \tl_if_exist:N
13362 { p , T , F , TF }
13363 \prg_new_eq_conditional:NNn \str_if_exist:c \tl_if_exist:c
13364 { p , T , F , TF }
13365 \prg_new_eq_conditional:NNn \str_if_empty:N \tl_if_empty:N
\str_if_exist_p:N
\str_if_exist_p:c
\str_if_exist:NTF
\str_if_exist:cTF

```

```

13366   { p , T , F , TF }
13367 \prg_new_eq_conditional:NNn \str_if_empty:c \tl_if_empty:c
13368   { p , T , F , TF }
13369 \prg_new_eq_conditional:NNn \str_if_empty:n \tl_if_empty:n
13370   { p , T , F , TF }

```

(End of definition for `\str_if_empty:NTF`, `\str_if_empty:nTF`, and `\str_if_exist:NTF`. These functions are documented on page 130.)

`\__str_if_eq:nn` String comparisons rely on the primitive `\(pdf)strcmp`, so we define a new name for it.  
13371 `\cs_new_eq:NN \__str_if_eq:nn \tex_strcmp:D`  
(End of definition for `\__str_if_eq:nn`.)

`\str_compare_p:nNn` Simply rely on `\__str_if_eq:nn`, which expands to -1, 0 or 1. The `ee` version is created directly because it is more efficient.

`\str_compare:nNnTF`  
`\str_compare:eNeTF`  
13372 `\prg_new_conditional:Npnn \str_compare:nNn #1#2#3 { p , T , F , TF }`  
13373 {  
13374 `\if_int_compare:w`  
13375 `\__str_if_eq:nn { \exp_not:n {#1} } { \exp_not:n {#3} }`  
13376 #2 `\c_zero_int`  
13377 `\prg_return_true: \else: \prg_return_false: \fi:`  
13378 }  
13379 `\prg_new_conditional:Npnn \str_compare:eNe #1#2#3 { p , T , F , TF }`  
13380 {  
13381 `\if_int_compare:w \__str_if_eq:nn {#1} {#3} #2 \c_zero_int`  
13382 `\prg_return_true: \else: \prg_return_false: \fi:`  
13383 }

(End of definition for `\str_compare:nNnTF`. This function is documented on page 132.)

`\str_if_eq_p:nn` Modern engines provide a direct way of comparing two token lists, but returning a number. This set of conditionals therefore makes life a bit clearer. The `nn` and `ee` versions are created directly as this is most efficient. Since `\__str_if_eq:nn` will expand to 0 as an explicit character with category 12 if the two lists match (and either -1 or 1 if they don't) we can use `\if:w` here which is faster than using `\if_int_compare:w`.

`\str_if_eq_p:Vn`  
`\str_if_eq_p:on`  
`\str_if_eq_p:nV`  
`\str_if_eq_p:no`  
`\str_if_eq_p:VV`  
`\str_if_eq_p:ee`  
`\str_if_eq:nnTF`  
`\str_if_eq:VnTF`  
`\str_if_eq:onTF`  
`\str_if_eq:nVTF`  
`\str_if_eq:notTF`  
`\str_if_eq:VVT`  
`\str_if_eq:eeTF`  
13384 `\prg_new_conditional:Npnn \str_if_eq:nn #1#2 { p , T , F , TF }`  
13385 {  
13386 `\if:w 0 \__str_if_eq:nn { \exp_not:n {#1} } { \exp_not:n {#2} }`  
13387 `\prg_return_true: \else: \prg_return_false: \fi:`  
13388 }  
13389 `\prg_generate_conditional_variant:Nnn \str_if_eq:nn`  
13390 { V , v , o , nV , no , VV , nv } { p , T , F , TF }  
13391 `\prg_new_conditional:Npnn \str_if_eq:ee #1#2 { p , T , F , TF }`  
13392 {  
13393 `\if:w 0 \__str_if_eq:nn {#1} {#2}`  
13394 `\prg_return_true: \else: \prg_return_false: \fi:`  
13395 }

(End of definition for `\str_if_eq:nnTF`. This function is documented on page 131.)

`\str_if_eq_p:NN` Note that `\str_if_eq:NNTF` is different from `\tl_if_eq:NNTF` because it needs to ignore category codes.

`\str_if_eq_p:Nc`  
`\str_if_eq_p:cN`  
`\str_if_eq_p:cc`  
`\str_if_eq:NNTF`  
`\str_if_eq:NcTF`  
`\str_if_eq:cNTF`  
`\str_if_eq:ccTF`  
13396 `\prg_new_conditional:Npnn \str_if_eq:NN #1#2 { p , TF , T , F }`  
13397 {

```

13398     \if:w 0 \__str_if_eq:nn { \tl_to_str:N #1 } { \tl_to_str:N #2 }
13399         \prg_return_true: \else: \prg_return_false: \fi:
13400     }
13401 \prg_generate_conditional_variant:Nnn \str_if_eq:NN
13402     { c , Nc , cc } { T , F , TF , p }

```

(End of definition for `\str_if_eq:NNTF`. This function is documented on page 130.)

**\str\_if\_in:NnTF** Everything here needs to be detokenized but beyond that it is a simple token list test.  
**\str\_if\_in:cNTF** It would be faster to fine-tune the T, F, TF variants by calling the appropriate variant of  
**\str\_if\_in:nNTF** `\tl_if_in:nNTF` directly but that takes more code.

```

13403 \prg_new_protected_conditional:Npnn \str_if_in:Nn #1#2 { T , F , TF }
13404     {
13405         \use:e
13406         { \tl_if_in:nNTF { \tl_to_str:N #1 } { \tl_to_str:n {#2} } }
13407         { \prg_return_true: } { \prg_return_false: }
13408     }
13409 \prg_generate_conditional_variant:Nnm \str_if_in:Nn
13410     { c } { T , F , TF }
13411 \prg_new_protected_conditional:Npnn \str_if_in:nn #1#2 { T , F , TF }
13412     {
13413         \use:e
13414         { \tl_if_in:nNTF { \tl_to_str:n {#1} } { \tl_to_str:n {#2} } }
13415         { \prg_return_true: } { \prg_return_false: }
13416     }

```

(End of definition for `\str_if_in:NnTF` and `\str_if_in:nNTF`. These functions are documented on page 131.)

**\str\_case:nn** The aim here is to allow the case statement to be evaluated using a known number of expansion steps (two), and without needing to use an explicit “end of recursion” marker.  
**\str\_case:Vn** That is achieved by using the test input as the final case, as this is always true. The trick is then to tidy up the output such that the appropriate case code plus either the  
**\str\_case:on** true or false branch code is inserted.  
**\str\_case:en**

```

To tidy up the recursion, there are two outcomes. If there was a hit to one of the cases searched for, then #1 is the code to insert, #2 is the *next* case to check on and #3 is all of the rest of the cases code. That means that #4 is the **true** branch code, and #5 tidies up the spare **\s\_\_str\_mark** and the **false** branch. On the other hand, if none of the cases matched then we arrive here using the “termination” case of comparing the search with itself. That means that #1 is empty, #2 is the first **\s\_\_str\_mark** and so #4 is the **false** code (the **true** code is mopped up by #3).

```
13482 \cs_new:Npn \__str_case_end:nw #1#2#3 \s__str_mark #4#5 \s__str_stop
```

```
13483 { \exp_end: #1 #4 }
```

## 55.5 Mapping over strings

```
\str_map_function:NN  
\str_map_function:cN  
\str_map_function:nN  
 \str_map_inline:Nn  
 \str_map_inline:cn  
 \str_map_inline:nn  
\str_map_variable:NNn  
\str_map_variable:cNn  
\str_map_variable:nNn  
 \str_map_break:  
 \str_map_break:n  
\_str_map_function:w  
\_str_map_function:nn  
 \_str_map_inline>NN  
\_str_map_variable:NnN
```

The inline and variable mappings are similar to the usual token list mappings but start out by turning the argument to an “other string”. Doing the same for the expandable function mapping would require `\_kernel_str_to_other:n`, quadratic in the string length. To deal with spaces in that case, `\_str_map_function:w` replaces the following space by a braced space and a further call to itself. These are received by `\_str_map_function:nn`, which passes the space to `#1` and calls `\_str_map_function:w` to deal with the next space. The space before the braced space allows to optimize the `\q\_str_recursion_tail` test. Of course we need to include a trailing space (the question mark is needed to avoid losing the space when TeX tokenizes the line). At the cost of about three more auxiliaries this code could get a 9 times speed up by testing only every 9-th character for whether it is `\q\_str_recursion_tail` (also by converting 9 spaces at a time in the `\str_map_function:nN` case).

For the `map_variable` functions we use a string assignment to store each character because spaces are made catcode 12 before the loop.

## 55.6 Accessing specific characters in a string

```
\__kernel_str_to_other:n
\__str_to_other_loop:w
\__str_to_other_end:w
```

First apply `\tl_to_str:n`, then replace all spaces by “other” spaces, 8 at a time, storing the converted part of the string between the `\s__str_mark` and `\s__str_stop` markers. The end is detected when `\__str_to_other_loop:w` finds one of the trailing A, distinguished from any contents of the initial token list by their category. Then `\__str_to_other_end:w` is called, and finds the result between `\s__str_mark` and the first A (well, there is also the need to remove a space).

```
13562 \cs_new:Npn \__kernel_str_to_other:n #1
13563 {
13564     \exp_after:wN \__str_to_other_loop:w
13565         \tl_to_str:n {#1} ~ A ~ A ~ A ~ A ~ A ~ A ~ A ~ \s__str_mark \s__str_stop
13566     }
13567 \group_begin:
13568 \tex_lccode:D `* = '\ %
13569 \tex_lccode:D `A = '\A %
13570 \tex_lowercase:D
13571 {
13572     \group_end:
13573     \cs_new:Npn \__str_to_other_loop:w
13574         #1 ~ #2 ~ #3 ~ #4 ~ #5 ~ #6 ~ #7 ~ #8 ~ #9 \s__str_stop
13575     {
13576         \if_meaning:w A #8
13577             \__str_to_other_end:w
13578         \fi:
13579         \__str_to_other_loop:w
13580             #9 #1 * #2 * #3 * #4 * #5 * #6 * #7 * #8 * \s__str_stop
13581     }
13582     \cs_new:Npn \__str_to_other_end:w \fi: #1 \s__str_mark #2 * A #3 \s__str_stop
13583     { \fi: #2 }
13584 }
```

(End of definition for `\__kernel_str_to_other:n`, `\__str_to_other_loop:w`, and `\__str_to_other_end:w`.)

The difference with `\__kernel_str_to_other:n` is that the converted part is left in the input stream, making these commands only restricted-expandable.

```
\__kernel_str_to_other_fast:n
\__kernel_str_to_other_fast_loop:w
\__str_to_other_fast_end:w
```

```
13585 \cs_new:Npn \__kernel_str_to_other_fast:n #1

13595     \group_end:
13596     \cs_new:Npn \__str_to_other_fast_loop:w
13597         #1 ~ #2 ~ #3 ~ #4 ~ #5 ~ #6 ~ #7 ~ #8 ~ #9 ~
13598     {
13599         \if_meaning:w A #9
13600             \__str_to_other_fast_end:w
13601         \fi:
```

```

13602     #1 * #2 * #3 * #4 * #5 * #6 * #7 * #8 * #9
13603     \__str_to_other_fast_loop:w *
13604 }
13605 \cs_new:Npn \__str_to_other_fast_end:w #1 * A #2 \s__str_stop {#1}
13606 }

```

(End of definition for `\__kernel_str_to_other_fast:n`, `\__kernel_str_to_other_fast_loop:w`, and `\__str_to_other_fast_end:w`.)

`\str_item:Nn`

`\str_item:cn`

`\str_item:nn`

`\str_item_ignore_spaces:nn`

`\__str_item:nn`

`\__str_item:w`

The `\str_item:nn` hands its argument with spaces escaped to `\__str_item:nn`, and makes sure to turn the result back into a proper string (with category code 10 spaces) eventually. The `\str_item_ignore_spaces:nn` function does not escape spaces, which are thus ignored by `\__str_item:nn` since everything else is done with undelimited arguments. Evaluate the `<index>` argument `#2` and count characters in the string, passing those two numbers to `\__str_item:w` for further analysis. If the `<index>` is negative, shift it by the `<count>` to know the how many character to discard, and if that is still negative give an empty result. If the `<index>` is larger than the `<count>`, give an empty result, and otherwise discard `<index>` – 1 characters before returning the following one. The shift by –1 is obtained by inserting an empty brace group before the string in that case: that brace group also covers the case where the `<index>` is zero.

```

\__str_skip_exp_end:w
\__str_skip_loop:wNNNNNNNN
    \__str_skip_end:w
\__str_skip_end:NNNNNNNN
```

Removes `max(#1,0)` characters from the input stream, and then leaves `\exp_end:`. This should be expanded using `\exp:w`. We remove characters 8 at a time until there are at most 8 to remove. Then we do a dirty trick: the `\if_case:w` construction leaves between 0 and 8 times the `\or:` control sequence, and those `\or:` become arguments of `\__str_skip_end:NNNNNNNN`. If the number of characters to remove is 6, say, then there are two `\or:` left, and the 8 arguments of `\__str_skip_end:NNNNNNNN` are the two `\or:`, and 6 characters from the input stream, exactly what we wanted to remove. Then close the `\if_case:w` conditional with `\fi:`, and stop the initial expansion with `\exp_end:` (see places where `\__str_skip_exp_end:w` is called).

\__str_range:nnw
```

Sanitize the string. Then evaluate the arguments. At this stage we also decrement the `<start index>`, since our goal is to know how many characters should be removed. Then limit the range to be non-negative and at most the length of the string (this avoids needing to check for the end of the string when grabbing characters), shifting negative numbers by the appropriate amount. Afterwards, skip characters, then keep some more, and finally drop the end of the string.

```

```

(End of definition for `\str_range:Nnn` and others. These functions are documented on page 136.)

`\__str_range_normalize:nn` This function converts an  $\langle index \rangle$  argument into an explicit position in the string (a result of 0 denoting “out of bounds”). Expects two explicit integer arguments: the  $\langle index \rangle$  `#1` and the string count `#2`. If `#1` is negative, replace it by  $\#1 + \#2 + 1$ , then limit to the range  $[0, \#2]$ .

```

13700 \cs_new:Npn \__str_range_normalize:nn #1#2
13701   {
13702     \int_eval:n
13703       {

13715           \fi:
13716         \fi:
13717       }
13718   }

```

(End of definition for `\__str_range_normalize:nn`.)

```

\_\_str\_collect\_delimit\_by\_q\_stop:w
\_\_str\_collect\_loop:wn
  \_\_str\_collect\_loop:wnNNNNNNN
    \_\_str\_collect\_end:wn
\_\_str\_collect\_end:nnnnnnnnw

```

Collects `max(#1,0)` characters, and removes everything else until `\s__str_stop`. This is somewhat similar to `\_\_str_skip_exp_end:w`, but accepts integer expression arguments. This time we can only grab 7 characters at a time. At the end, we use an `\if_case:w` trick again, so that the 8 first arguments of `\_\_str_collect_end:nnnnnnnnw` are some `\or:`, followed by an `\fi:`, followed by #1 characters from the input stream. Simply leaving this in the input stream closes the conditional properly and the `\or:` disappear.

```

## 55.7 Counting characters

```

\str_count_spaces:N
\str_count_spaces:c
\str_count_spaces:n
\_\_str_count_spaces_loop:w

```

To speed up this function, we grab and discard 9 space-delimited arguments in each iteration of the loop. The loop stops when the last argument is one of the trailing `X<number>`, and that `<number>` is added to the sum of 9 that precedes, to adjust the result.

```

13745 \cs_new:Npn \str_count_spaces:N
13746   { \exp_args:No \str_count_spaces:n }
13747 \cs_generate_variant:Nn \str_count_spaces:N { c }
13748 \cs_new:Npn \str_count_spaces:n #1
13749   {
13750     \int_eval:n
13751     {
13752       \exp_after:wN \_\_str_count_spaces_loop:w
13753       \tl_to_str:n {#1} ~
13754       X 7 ~ X 6 ~ X 5 ~ X 4 ~ X 3 ~ X 2 ~ X 1 ~ X 0 ~ X -1 ~
13755       \s__str_stop

```

```

13756      }
13757  }
13758 \cs_new:Npn \__str_count_spaces_loop:w #1~#2~#3~#4~#5~#6~#7~#8~#9~
13759  {
13760      \if_meaning:w X #9
13761          \__str_use_i_delimit_by_s_stop:nw
13762      \fi:
13763      9 + \__str_count_spaces_loop:w
13764  }

```

(End of definition for `\str_count_spaces:N`, `\str_count_spaces:n`, and `\__str_count_spaces_loop:w`. These functions are documented on page 134.)

`\str_count:N` To count characters in a string we could first escape all spaces using `\_kernel_str_-to_other:n`, then pass the result to `\tl_count:n`. However, the escaping step would be quadratic in the number of characters in the string, and we can do better. Namely, sum the number of spaces (`\str_count_spaces:n`) and the result of `\tl_count:n`, which ignores spaces. Since strings tend to be longer than token lists, we use specialized functions to count characters ignoring spaces. Namely, loop, grabbing 9 non-space characters at each step, and end as soon as we reach one of the 9 trailing items. The internal function `\__str_count:n`, used in `\str_item:nn` and `\str_range:nnn`, is similar to `\str_count_ignore_spaces:n` but expects its argument to already be a string or a string with spaces escaped.

```

13765 \cs_new:Npn \str_count:N { \exp_args:No \str_count:n }

## 55.8 The first character in a string

**\str\_head:N** The `_ignore_spaces` variant applies `\tl_to_str:n` then grabs the first item, thus skipping spaces. As usual, `\str_head:N` expands its argument and hands it to `\str_head:n`. To circumvent the fact that TeX skips spaces when grabbing undelimited macro parameters, `\__str_head:w` takes an argument delimited by a space. If #1 starts with a non-space character, `\__str_use_i_delimit_by_s_stop:nw` leaves that in the input stream. On the other hand, if #1 starts with a space, the `\__str_head:w` takes an empty argument, and the single (initially braced) space in the definition of `\__str_head:w` makes its way to the output. Finally, for an empty argument, the (braced) empty brace group in the definition of `\str_head:n` gives an empty result after passing through `\__str_use_i_delimit_by_s_stop:nw`.

```

13803 \cs_new:Npn \str_head:N { \exp_args:No \str_head:n }
13804 \cs_generate_variant:Nn \str_head:N { c }
13805 \cs_new:Npn \str_head:n #1
13806  {
13807      \exp_after:wN \__str_head:w
13808      \tl_to_str:n {#1}
13809      { { } } ~ \s__str_stop
13810  }
13811 \cs_new:Npn \__str_head:w #1 ~ %
13812  { \__str_use_i_delimit_by_s_stop:nw #1 { ~ } }
13813 \cs_new:Npn \str_head_ignore_spaces:n #1
13814  {
13815      \exp_after:wN \__str_use_i_delimit_by_s_stop:nw
13816      \tl_to_str:n {#1} { } \s__str_stop
13817  }

```

(End of definition for `\str_head:N` and others. These functions are documented on page 135.)

**\str\_tail:N** Getting the tail is a little bit more convoluted than the head of a string. We hit the front of the string with `\reverse_if:N \if_charcode:w \scan_stop:`. This removes the first character, and necessarily makes the test true, since the character cannot match `\scan_stop:`. The auxiliary function then inserts the required `\fi:` to close the conditional, and leaves the tail of the string in the input stream. The details are such that an empty string has an empty tail (this requires in particular that the end-marker X be unexpandable and not a control sequence). The `_ignore_spaces` is rather simpler: after converting the input to a string, `\__str_tail_auxii:w` removes one undelimited argument and leaves everything else until an end-marker `\s__str_mark`. One can check that an empty (or blank) string yields an empty tail.

```

13818 \cs_new:Npn \str_tail:N { \exp_args:No \str_tail:n }
13819 \cs_generate_variant:Nn \str_tail:N { c }

```

```

13980 \str_const:Ne \c_zero_str { 0 }
```

(End of definition for `\c_ampersand_str` and others. These variables are documented on page 140.)

`\c_empty_str` An empty string is simply an empty token list.

```
13981 \cs_new_eq:NN \c_empty_str \c_empty_tl
```

(End of definition for `\c_empty_str`. This variable is documented on page 140.)

`\l_tmpa_str` Scratch strings.

```
13982 \str_new:N \l_tmpa_str
13983 \str_new:N \l_tmpb_str
13984 \str_new:N \g_tmpa_str
13985 \str_new:N \g_tmpb_str
```

(End of definition for `\l_tmpa_str` and others. These variables are documented on page 140.)

## 55.10 Viewing strings

`\str_show:n` Displays a string on the terminal.

```
13986 \cs_new_eq:NN \str_show:n \tl_show:n
13987 \cs_new_protected:Npn \str_show:N #1
\str_log:n {
13988   {
13989     \__kernel_chk_tl_type:NnnT #1 { str } { \tl_to_str:N #1 }
13990     { \tl_show:N #1 }
13991   }
13992   \cs_generate_variant:Nn \str_show:N { c }
13993   \cs_new_eq:NN \str_log:n \tl_log:n
13994   \cs_new_protected:Npn \str_log:N #1
13995   {
13996     \__kernel_chk_tl_type:NnnT #1 { str } { \tl_to_str:N #1 }
13997     { \tl_log:N #1 }
13998   }
13999 \cs_generate_variant:Nn \str_log:N { c }
```

(End of definition for `\str_show:n` and others. These functions are documented on page 139.)

```
14000 </package>
```

# Chapter 56

## I3str-convert implementation

```
14001 <*package>
14002 <@@=str>
```

### 56.1 Helpers

#### 56.1.1 Variables and constants

<code>\__str_tmp:w</code>	Internal scratch space for some functions.
<code>\l__str_internal_tl</code>	<pre>14003 \cs_new_protected:Npn \__str_tmp:w { } 14004 \tl_new:N \l__str_internal_tl</pre> <p>(End of definition for <code>\__str_tmp:w</code> and <code>\l__str_internal_tl</code>.)</p>
<code>\g__str_result_tl</code>	The <code>\g__str_result_tl</code> variable is used to hold the result of various internal string operations (mostly conversions) which are typically performed in a group. The variable is global so that it remains defined outside the group, to be assigned to a user-provided variable. <pre>14005 \tl_new:N \g__str_result_tl</pre> <p>(End of definition for <code>\g__str_result_tl</code>.)</p>
<code>\c__str_replacement_char_int</code>	When converting, invalid bytes are replaced by the Unicode replacement character "FFFD. <pre>14006 \int_const:Nn \c__str_replacement_char_int { "FFFD }</pre> <p>(End of definition for <code>\c__str_replacement_char_int</code>.)</p>
<code>\c__str_max_byte_int</code>	The maximal byte number. <pre>14007 \int_const:Nn \c__str_max_byte_int { 255 }</pre> <p>(End of definition for <code>\c__str_max_byte_int</code>.)</p>
<code>\s__str</code>	Internal scan marks. <pre>14008 \scan_new:N \s__str</pre> <p>(End of definition for <code>\s__str</code>.)</p>

\q\_\_str\_nil Internal quarks.

14009 \quark\_new:N \q\_\_str\_nil

(End of definition for \q\_\_str\_nil.)

\g\_\_str\_alias\_prop To avoid needing one file per encoding/escaping alias, we keep track of those in a property list.

```
14010 \prop_new:N \g__str_alias_prop
14011 \prop_gput:Nnn \g__str_alias_prop { latin1 } { iso88591 }
14012 \prop_gput:Nnn \g__str_alias_prop { latin2 } { iso88592 }
14013 \prop_gput:Nnn \g__str_alias_prop { latin3 } { iso88593 }
14014 \prop_gput:Nnn \g__str_alias_prop { latin4 } { iso88594 }
14015 \prop_gput:Nnn \g__str_alias_prop { latin5 } { iso88599 }
14016 \prop_gput:Nnn \g__str_alias_prop { latin6 } { iso885910 }
14017 \prop_gput:Nnn \g__str_alias_prop { latin7 } { iso885913 }
14018 \prop_gput:Nnn \g__str_alias_prop { latin8 } { iso885914 }
14019 \prop_gput:Nnn \g__str_alias_prop { latin9 } { iso885915 }
14020 \prop_gput:Nnn \g__str_alias_prop { latin10 } { iso885916 }
14021 \prop_gput:Nnn \g__str_alias_prop { utf16le } { utf16 }
14022 \prop_gput:Nnn \g__str_alias_prop { utf16be } { utf16 }
14023 \prop_gput:Nnn \g__str_alias_prop { utf32le } { utf32 }
14024 \prop_gput:Nnn \g__str_alias_prop { utf32be } { utf32 }
14025 \prop_gput:Nnn \g__str_alias_prop { hexadecimal } { hex }
14026 \bool_lazy_any:nTF
14027 {
14028   \sys_if_engine_luatex_p:
14029   \sys_if_engine_xetex_p:
14030 }
14031 {
14032   \prop_gput:Nnn \g__str_alias_prop { default } { }
14033 }
14034 {
14035   \prop_gput:Nnn \g__str_alias_prop { default } { utf8 }
14036 }
```

(End of definition for \g\_\_str\_alias\_prop.)

\g\_\_str\_error\_bool In conversion functions with a built-in conditional, errors are not reported directly to the user, but the information is collected in this boolean, used at the end to decide on which branch of the conditional to take.

14037 \bool\_new:N \g\_\_str\_error\_bool

(End of definition for \g\_\_str\_error\_bool.)

\l\_\_str\_byte\_flag \l\_\_str\_error\_flag Conversions from one *encoding*/*escaping* pair to another are done within e-expanding assignments. Errors are signalled by raising the relevant flag.

14038 \flag\_new:N \l\_\_str\_byte\_flag

14039 \flag\_new:N \l\_\_str\_error\_flag

(End of definition for \l\_\_str\_byte\_flag and \l\_\_str\_error\_flag.)

## 56.2 String conditionals

```
\_\_str_if_contains_char:NnT
\_\_str_if_contains_char:NnTF
\_\_str_if_contains_char:nntF
    \_\_str_if_contains_char_aux:nN
\_\_str_if_contains_char_auxi:nN
\_\_str_if_contains_char_true:
```

`\_\_str_if_contains_char:nnTF {<token list>} <char>`  
 Expects the *<token list>* to be an *<other string>*: the caller is responsible for ensuring that no (too-)special catcodes remain. Loop over the characters of the string, comparing character codes. The loop is broken if character codes match. Otherwise we return “false”.

```
14040 \prg_new_conditional:Npnn \_\_str_if_contains_char:Nn #1#2 { T , TF }
14041   {
14042     \exp_after:wN \_\_str_if_contains_char_aux:nn \exp_after:wN {#1} {#2}
14043     { \prg_break:n { ? \fi: } }
14044     \prg_break_point:
14045     \prg_return_false:
14046   }
14047 \cs_new:Npn \_\_str_if_contains_char_auxi:nn #1#2
14048   { \_\_str_if_contains_char_auxi:nN {#2} #1 }
14049 \prg_new_conditional:Npnn \_\_str_if_contains_char:nn #1#2 { TF }
14050   {
14051     \_\_str_if_contains_char_auxi:nN {#2} #1 { \prg_break:n { ? \fi: } }
14052     \prg_break_point:
14053     \prg_return_false:
14054   }
14055 \cs_new:Npn \_\_str_if_contains_char_auxi:nN #1#2
14056   {
14057     \if_charcode:w #1 #2
14058       \exp_after:wN \_\_str_if_contains_char_true:
14059       \fi:
14060       \_\_str_if_contains_char_auxi:nN {#1}
14061   }
14062 \cs_new:Npn \_\_str_if_contains_char_true:
14063   { \prg_break:n { \prg_return_true: \use_none:n } }
```

(End of definition for `\_\_str_if_contains_char:NnT` and others.)

```
\_\_str_octal_use:NTF
```

`\_\_str_octal_use:NTF <token> {<true code>} {<false code>}`

If the *<token>* is an octal digit, it is left in the input stream, *followed* by the *<true code>*. Otherwise, the *<false code>* is left in the input stream.

**TeXhackers note:** This function will fail if the escape character is an octal digit. We are thus careful to set the escape character to a known value before using it. TeX dutifully detects octal digits for us: if #1 is an octal digit, then the right-hand side of the comparison is ’1#1, greater than 1. Otherwise, the right-hand side stops as ’1, and the conditional takes the `false` branch.

```
14064 \prg_new_conditional:Npnn \_\_str_octal_use:N #1 { TF }
14065   {
14066     \if_int_compare:w 1 < '1 \token_to_str:N #1 \exp_stop_f:
14067       #1 \prg_return_true:
14068     \else:
14069       \prg_return_false:
14070     \fi:
14071   }
```

(End of definition for `\_\_str_octal_use:NTF`.)

`\__str_hexadecimal_use:NTF` T<sub>E</sub>X detects uppercase hexadecimal digits for us (see `\__str_octal_use:NTF`), but not the lowercase letters, which we need to detect and replace by their uppercase counterpart.

```

14072 \prg_new_conditional:Npnn \__str_hexadecimal_use:N #1 { TF }
14073   {
14074     \if_int_compare:w 1 < "1 \token_to_str:N #1 \exp_stop_f:
14075       #1 \prg_return_true:
14076     \else:
14077       \if_case:w \int_eval:n { \exp_after:wN ` \token_to_str:N #1 - 'a }
14078         A
14079         \or: B
14080         \or: C
14081         \or: D
14082         \or: E
14083         \or: F
14084       \else:
14085         \prg_return_false:
14086         \exp_after:wN \use_none:n
14087       \fi:
14088       \prg_return_true:
14089     \fi:
14090   }

```

(End of definition for `\__str_hexadecimal_use:NTF`.)

## 56.3 Conversions

### 56.3.1 Producing one byte or character

For each integer  $N$  in the range  $[0, 255]$ , we create a constant token list which holds three character tokens with category code other: the character with character code  $N$ , followed by the representation of  $N$  as two hexadecimal digits. The value  $-1$  is given a default token list which ensures that later functions give an empty result for the input  $-1$ .

```

14091 \group_begin:
14092   \__kernel_tl_set:Nx \l__str_internal_tl { \tl_to_str:n { 0123456789ABCDEF } }
14093   \tl_map_inline:Nn \l__str_internal_tl
14094   {
14095     \tl_map_inline:Nn \l__str_internal_tl
14096     {
14097       \tl_const:ce { c__str_byte_ \int_eval:n {"#1##1} _tl }
14098       { \char_generate:nn { "#1##1" } { 12 } #1 ##1 }
14099     }
14100   }
14101 \group_end:
14102 \tl_const:cn { c__str_byte_-1_tl } { { } \use_none:n { } }

```

(End of definition for `\c__str_byte_0_tl` and others.)

`\__str_output_byte:n` `\__str_output_byte:w` `\__str_output_hexadecimal:n` `\__str_output_end:` Those functions must be used carefully: feeding them a value outside the range  $[-1, 255]$  will attempt to use the undefined token list variable `\c__str_byte_{number}_tl`. Assuming that the argument is in the right range, we expand the corresponding token list, and pick either the byte (first token) or the hexadecimal representations (second and third tokens). The value  $-1$  produces an empty result in both cases.

```

14103 \cs_new:Npn \__str_output_byte:n #1
14104   { \__str_output_byte:w #1 \__str_output_end: }
14105 \cs_new:Npn \__str_output_byte:w
14106   {
14107     \exp_after:wN \exp_after:wN
14108     \exp_after:wN \use_i:nnn
14109     \cs:w c__str_byte_ \int_eval:w
14110   }
14111 \cs_new:Npn \__str_output_hexadecimal:n #1
14112   {
14113     \exp_after:wN \exp_after:wN
14114     \exp_after:wN \use_none:n
14115     \cs:w c__str_byte_ \int_eval:n {#1} _tl \cs_end:
14116   }
14117 \cs_new:Npn \__str_output_end:
14118   { \scan_stop: _tl \cs_end: }

```

(End of definition for `\__str_output_byte:n` and others.)

`\__str_output_byte_pair_be:n`  
`\__str_output_byte_pair_le:n`  
`\__str_output_byte_pair:nnN`

Convert a number in the range [0, 65535] to a pair of bytes, either big-endian or little-endian.

```

14119 \cs_new:Npn \__str_output_byte_pair_be:n #1
14120   {
14121     \exp_args:Nf \__str_output_byte_pair:nnN
14122       { \int_div_truncate:nn { #1 } { "100" } {#1} \use:nn
14123     }
14124 \cs_new:Npn \__str_output_byte_pair_le:n #1
14125   {
14126     \exp_args:Nf \__str_output_byte_pair:nnN
14127       { \int_div_truncate:nn { #1 } { "100" } {#1} \use_i:i:nn
14128     }
14129 \cs_new:Npn \__str_output_byte_pair:nnN #1#2#3
14130   {
14131     #3
14132       { \__str_output_byte:n { #1 } }
14133       { \__str_output_byte:n { #2 - #1 * "100" } }
14134   }

```

(End of definition for `\__str_output_byte_pair_be:n`, `\__str_output_byte_pair_le:n`, and `\__str_output_byte_pair:nnN`.)

### 56.3.2 Mapping functions for conversions

`\__str_convert_gmap:N`  
`\__str_convert_gmap_loop>NN`

This maps the function `#1` over all characters in `\g__str_result_tl`, which should be a byte string in most cases, sometimes a native string.

```

14135 \cs_new_protected:Npn \__str_convert_gmap:N #1
14136   {
14137     \__kernel_tl_gset:Nx \g__str_result_tl
14138     {
14139       \exp_after:wN \__str_convert_gmap_loop>NN
14140       \exp_after:wN #1
14141         \g__str_result_tl { ? \prg_break: }
14142         \prg_break_point:
14143     }

```

```

14144      }
14145  \cs_new:Npn \__str_convert_gmap_loop:NN #1#2
14146  {
14147      \use_none:n #2
14148      #1#2
14149      \__str_convert_gmap_loop:NN #1
14150  }

```

(End of definition for `\__str_convert_gmap:N` and `\__str_convert_gmap:NN`.)

`\__str_convert_gmap_internal:N`  
`\__str_convert_gmap internal loop:Nw`

This maps the function #1 over all character codes in `\g__str_result_tl`, which must be in the internal representation.

```

14151 \cs_new_protected:Npn \__str_convert_gmap_internal:N #1
14152  {
14153      \__kernel_tl_gset:Nx \g__str_result_tl
14154      {
14155          \exp_after:wN \__str_convert_gmap_internal_loop:Nww
14156          \exp_after:wN #1
14157          \g__str_result_tl \s__str \s__str_stop \prg_break: \s__str
14158          \prg_break_point:
14159      }
14160  }
14161 \cs_new:Npn \__str_convert_gmap_internal_loop:Nww #1 #2 \s__str #3 \s__str
14162  {
14163      \__str_use_none_delimit_by_s_stop:w #3 \s__str_stop
14164      #1 {#3}
14165      \__str_convert_gmap_internal_loop:Nww #1
14166  }

```

(End of definition for `\__str_convert_gmap_internal:N` and `\__str_convert_gmap_internal_loop:Nw`.)

### 56.3.3 Error-reporting during conversion

When converting using the function `\str_set_convert:Nnnn`, errors should be reported to the user after each step in the conversion. Errors are signalled by raising some flag (typically `\@@_error`), so here we test that flag: if it is raised, give the user an error, otherwise remove the arguments. On the other hand, in the conditional functions `\str_set_convert:NnnnTF`, errors should be suppressed. This is done by changing `\__str_if_flag_error:Nne` into `\__str_if_flag_no_error:Nne` locally.

```

14167 \cs_new_protected:Npn \__str_if_flag_error:Nne #1
14168  {
14169      \flag_if_raised:NTF #1
14170      { \msg_error:nne { str } }
14171      { \use_none:nn }
14172  }
14173 \cs_new_protected:Npn \__str_if_flag_no_error:Nne #1#2#3
14174  { \flag_if_raised:NT #1 { \bool_gset_true:N \g__str_error_bool } }

```

(End of definition for `\__str_if_flag_error:Nne` and `\__str_if_flag_no_error:Nne`.)

`\__str_if_flag_times:NT`

At the end of each conversion step, we raise all relevant errors as one error message, built on the fly. The height of each flag indicates how many times a given error was encountered. This function prints #2 followed by the number of occurrences of an error if it occurred, nothing otherwise.

```

14175 \cs_new:Npn \__str_if_flag_times:NT #1#2
14176   { \flag_if_raised:NT #1 { #2~(x \flag_height:N #1 ) } }

```

(End of definition for `\__str_if_flag_times:NT`.)

### 56.3.4 Framework for conversions

Most functions in this module expect to be working with “native” strings. Strings can also be stored as bytes, in one of many encodings, for instance UTF8. The bytes themselves can be expressed in various ways in terms of TEX tokens, for instance as pairs of hexadecimal digits. The questions of going from arbitrary Unicode code points to bytes, and from bytes to tokens are mostly independent.

Conversions are done in four steps:

- “unescape” produces a string of bytes;
- “decode” takes in a string of bytes, and converts it to a list of Unicode characters in an internal representation, with items of the form

`<bytes> \s__str <Unicode code point> \s__str`

where we have collected the `<bytes>` which combined to form this particular Unicode character, and the `<Unicode code point>` is in the range [0, "10FFFF].

- “encode” encodes the internal list of code points as a byte string in the new encoding;
- “escape” escapes bytes as requested.

The process is modified in case one of the encoding is empty (or the conversion function has been set equal to the empty encoding because it was not found): then the unescape or escape step is ignored, and the decode or encode steps work on tokens instead of bytes. Otherwise, each step must ensure that it passes a correct byte string or internal string to the next step.

`\str_set_convert:Nnnn`  
`\str_gset_convert:Nnnn`  
`\str_set_convert:NnnnTF`  
`\str_gset_convert:NnnnTF`  
`\__str_convert:nNNnnn`

```

14177 \cs_new_protected:Npn \str_set_convert:Nnnn
14178   { \__str_convert:nNNnnn { } \tl_set_eq:NN }
14179 \cs_new_protected:Npn \str_gset_convert:Nnnn
14180   { \__str_convert:nNNnnn { } \tl_gset_eq:NN }
14181 \prg_new_protected_conditional:Npnn
14182   \str_set_convert:Nnnn #1#2#3#4 { T , F , TF }
14183   {
14184     \bool_gset_false:N \g__str_error_bool
14185     \__str_convert:nNNnnn
14186     { \cs_set_eq:NN \__str_if_flag_error:Nne \__str_if_flag_no_error:Nne }
14187     \tl_set_eq:NN #1 {#2} {#3} {#4}
14188     \bool_if:NTF \g__str_error_bool \prg_return_false: \prg_return_true:
14189   }
14190 \prg_new_protected_conditional:Npnn
14191   \str_gset_convert:Nnnn #1#2#3#4 { T , F , TF }

```

```

14192  {
14193    \bool_gset_false:N \g__str_error_bool
14194    \__str_convert:nNNnnn
14195      { \cs_set_eq:NN \__str_if_flag_error:Nne \__str_if_flag_no_error:Nne }
14196      \tl_gset_eq:NN #1 {#2} {#3} {#4}
14197    \bool_if:NTF \g__str_error_bool \prg_return_false: \prg_return_true:
14198  }
14199 \cs_new_protected:Npn \__str_convert:nNNnnn #1#2#3#4#5#6
14200  {
14201    \group_begin:

```

(End of definition for `\str_set_convert:Nnnn` and others. These functions are documented on page [143](#).)

`\__str_convert:wwnn`  
`\__str_convert:NNnnn`

The task of `\__str_convert:wwnn` is to split `<encoding>/<escaping>` pairs into their components, #1 and #2. Calls to `\__str_convert:nnn` ensure that the corresponding conversion functions are defined. The third auxiliary does the main work.

- #1 is the encoding conversion function;
- #2 is the escaping function;
- #3 is the escaping name for use in an error message;
- #4 is `\prg_do_nothing:` for unescaping/decoding, and `\use_i:i:nn` for encoding/escaping;
- #5 is the default encoding function (either “decode” or “encode”), for which there should be no escaping.

Let us ignore the native encoding for a second. In the unescaping/decoding phase, we want to do #2#1 in this order, and in the encoding/escaping phase, the order should be reversed: #4#2#1 does exactly that. If one of the encodings is the default (native), then the escaping should be ignored, with an error if any was given, and only the encoding, #1, should be performed.

```

14219 \cs_new_protected:Npn \__str_convert:wwnn
14220   #1 / #2 // #3 \s__str_stop #4#5
14221  {

```

```

14222     \__str_convert:nmn {enc} {#4} {#1}
14223     \__str_convert:nnn {esc} {#5} {#2}
14224     \exp_args:Ncc \__str_convert:NNnNN
14225         { __str_convert_#4_#1: } { __str_convert_#5_#2: } {#2}
14226     }
14227 \cs_new_protected:Npn \__str_convert:NNnNN #1#2#3#4#5
14228     {
14229         \if_meaning:w #1 #5
14230             \tl_if_empty:nF {#3}
14231                 { \msg_error:nne { str } { native-escaping } {#3} }
14232             #1
14233         \else:
14234             #4 #2 #1
14235         \fi:
14236     }

```

(End of definition for `\__str_convert:wwwnn` and `\__str_convert:NNnNN`.)

```
\__str_convert:nnn
\__str_convert:nnnn
```

The arguments of `\__str_convert:nnn` are: `enc` or `esc`, used to build filenames, the type of the conversion (unescape, decode, encode, escape), and the encoding or escaping name. If the function is already defined, no need to do anything. Otherwise, filter out all non-alphanumerics in the name, and lowercase it. Feed that, and the same three arguments, to `\__str_convert:nnnn`. The task is then to make sure that the conversion function `#3_#1` corresponding to the type `#3` and filtered name `#1` is defined, then set our initial conversion function `#3_#4` equal to that.

How do we get the `#3_#1` conversion to be defined if it isn't? Two main cases.

First, if `#1` is a key in `\g__str_alias_prop`, then the value `\l__str_internal_tl` tells us what file to load. Loading is skipped if the file was already read, *i.e.*, if the conversion command based on `\l__str_internal_tl` already exists. Otherwise, try to load the file; if that fails, there is an error, use the default empty name instead.

Second, `#1` may be absent from the property list. The `\cs_if_exist:cF` test is automatically false, and we search for a file defining the encoding or escaping `#1` (this should allow third-party `.def` files). If the file is not found, there is an error, use the default empty name instead.

In all cases, the conversion based on `\l__str_internal_tl` is defined, so we can set the `#3_#1` function equal to that. In some cases (*e.g.*, `utf16be`), the `#3_#1` function is actually defined within the file we just loaded, and it is different from the `\l__str_internal_tl`-based function: we mustn't clobber that different definition.

```

(End of definition for `\__str_convert_lowercase_alphanum:n` and `\__str_convert_lowercase_alphanum-loop:N`.)

### 56.3.5 Byte unescape and escape

Strings of bytes may need to be stored in auxiliary files in safe “escaping” formats. Each such escaping is only loaded as needed. By default, on input any non-byte is filtered out, while the output simply consists in letting bytes through.

`\__str_filter_bytes:n` In the case of 8-bit engines, every character is a byte. For Unicode-aware engines, test  
`\__str_filter_bytes_aux:N` the character code; non-bytes cause us to raise the flag `\l__str_byte_flag`. Spaces have already been given the correct category code when this function is called.

```
14300 \bool_lazy_any:nTF
14301 {
14302   \sys_if_engine_luatex_p:
14303   \sys_if_engine_xetex_p:
14304 }
14305 {
14306   \cs_new:Npn \__str_filter_bytes:n #1
14307   {
14308     \__str_filter_bytes_aux:N #1
14309     { ? \prg_break: }
14310     \prg_break_point:
14311   }
14312   \cs_new:Npn \__str_filter_bytes_aux:N #1
14313   {
14314     \use_none:n #1
14315     \if_int_compare:w '#1 < 256 \exp_stop_f:
14316       #1
14317     \else:
14318       \flag_raise:N \l__str_byte_flag
14319     \fi:
14320     \__str_filter_bytes_aux:N
14321   }
14322 }
14323 { \cs_new_eq:NN \__str_filter_bytes:n \use:n }
```

(End of definition for `\__str_filter_bytes:n` and `\__str_filter_bytes_aux:N`.)

`\__str_convert_unescape_:` The simplest unescaping method removes non-bytes from `\g__str_result_tl`.

```
14324 \bool_lazy_any:nTF
14325 {
14326   \sys_if_engine_luatex_p:
14327   \sys_if_engine_xetex_p:
14328 }
14329 {
14330   \cs_new_protected:Npn \__str_convert_unescape_:
14331   {
14332     \flag_clear:N \l__str_byte_flag
14333     \__kernel_tl_gset:Nx \g__str_result_tl
14334     { \exp_args:No \__str_filter_bytes:n \g__str_result_tl }
14335     \__str_if_flag_error:Nne \l__str_byte_flag { non-byte } { bytes }
14336   }
14337 }
```

```

14338 { \cs_new_protected:Npn \__str_convert_unescape_:
14339 \cs_new_eq:NN \__str_convert_unescape_bytes: \__str_convert_unescape_:

```

(End of definition for `\__str_convert_unescape_:` and `\__str_convert_unescape_bytes::`)

`\__str_convert_escape_:` The simplest form of escape leaves the bytes from the previous step of the conversion unchanged.

```

14340 \cs_new_protected:Npn \__str_convert_escape_:
14341 \cs_new_eq:NN \__str_convert_escape_bytes: \__str_convert_escape_:

```

(End of definition for `\__str_convert_escape_:` and `\__str_convert_escape_bytes::`)

### 56.3.6 Native strings

`\__str_convert_decode_:` Convert each character to its character code, one at a time.

```

14342 \cs_new_protected:Npn \__str_convert_decode_:
14343 { \__str_convert_gmap:N \__str_decode_native_char:N }
14344 \cs_new:Npn \__str_decode_native_char:N #1
14345 { #1 \s__str \int_value:w '#1 \s__str }

```

(End of definition for `\__str_convert_decode_:` and `\__str_decode_native_char:N`.)

`\__str_convert_encode_:` The conversion from an internal string to native character tokens basically maps `\char_generate:nn` through the code-points, but in non-Unicode-aware engines we use a fallback character ? rather than nothing when given a character code outside [0, 255]. We detect the presence of bad characters using a flag and only produce a single error after the e-expanding assignment.

```

14346 \bool_lazy_any:nTF
14347 {
14348   \sys_if_engine_luatex_p:
14349   \sys_if_engine_xetex_p:
14350 }
14351 {
14352   \cs_new_protected:Npn \__str_convert_encode_:

14361     \__str_convert_gmap_internal:N \__str_encode_native_char:n
14362     \__str_if_flag_error:Nne \l__str_error_flag
14363     { native-overflow } { }
14364   }
14365   \cs_new:Npn \__str_encode_native_char:n #1
14366   {
14367     \if_int_compare:w #1 > \c__str_max_byte_int
14368       \flag_raise:N \l__str_error_flag
14369       ?
14370     \else:
14371       \char_generate:nn {#1} {12}
14372     \fi:

```

```

14373     }
14374     \msg_new:nnnn { str } { native-overflow }
14375     { Character-code-too-large-for-this-engine. }
14376     {
14377         This-engine-only-support-8-bit-characters:-
14378         valid-character-codes-are-in-the-range-[0,255].-
14379         To-manipulate-arbitrary-Unicode,-use-LuaTeX-or-XeTeX.
14380     }
14381 }
```

(End of definition for `\__str_convert_encode_`: and `\__str_encode_native_char:n`.)

### 56.3.7 `clist`

`\__str_convert_decode_clist:` Convert each integer to the internal form. We first turn `\g__str_result_tl` into a `clist` variable, as this avoids problems with leading or trailing commas.

```

14382 \cs_new_protected:Npn \__str_convert_decode_clist:
14383 {
14384     \clist_gset:No \g__str_result_tl \g__str_result_tl
14385     \__kernel_tl_gset:Nx \g__str_result_tl
14386     {
14387         \exp_args:No \clist_map_function:nN
14388         \g__str_result_tl \__str_decode_clist_char:n
14389     }
14390 }
14391 \cs_new:Npn \__str_decode_clist_char:n #1
14392 { #1 \s__str \int_eval:n {#1} \s__str }
```

(End of definition for `\__str_convert_decode_clist`: and `\__str_decode_clist_char:n`.)

`\__str_convert_encode_clist:` Convert the internal list of character codes to a comma-list of character codes. The first line produces a comma-list with a leading comma, removed in the next step (this also works in the empty case, since `\tl_tail:N` does not trigger an error in this case).

```

14393 \cs_new_protected:Npn \__str_convert_encode_clist:
14394 {
14395     \__str_convert_gmap_internal:N \__str_encode_clist_char:n
14396     \__kernel_tl_gset:Nx \g__str_result_tl { \tl_tail:N \g__str_result_tl }
14397 }
14398 \cs_new:Npn \__str_encode_clist_char:n #1 { , #1 }
```

(End of definition for `\__str_convert_encode_clist`: and `\__str_encode_clist_char:n`.)

### 56.3.8 8-bit encodings

It is not clear in what situations 8-bit encodings are used, hence it is not clear what should be optimized. The current approach is reasonably efficient to convert long strings, and it scales well when using many different encodings.

The data needed to support a given 8-bit encoding is stored in a file that consists of a single function call

```
\__str_declare_eight_bit_encoding:nnnn {{name}} {{modulo}} {{mapping}}
{{missing}}
```

This declares the encoding  $\langle name \rangle$  to map bytes to Unicode characters according to the  $\langle mapping \rangle$ , and map those bytes which are not mentioned in the  $\langle mapping \rangle$  either to the replacement character (if they appear in  $\langle missing \rangle$ ), or to themselves. The  $\langle mapping \rangle$  argument is a token list of pairs  $\{\langle byte \rangle\} \{\langle Unicode \rangle\}$  expressed in uppercase hexadecimal notation. The  $\langle missing \rangle$  argument is a token list of  $\{\langle byte \rangle\}$ . Every  $\langle byte \rangle$  which does not appear in the  $\langle mapping \rangle$  nor the  $\langle missing \rangle$  lists maps to itself in Unicode, so for instance the `latin1` encoding has empty  $\langle mapping \rangle$  and  $\langle missing \rangle$  lists. The  $\langle modulo \rangle$  is a (decimal) integer between 256 and 558 inclusive, modulo which all Unicode code points supported by the encodings must be different.

We use two integer arrays per encoding. When decoding we only use the `decode` integer array, with entry  $n + 1$  (offset needed because integer array indices start at 1) equal to the Unicode code point that corresponds to the  $n$ -th byte in the encoding under consideration, or  $-1$  if the given byte is invalid in this encoding. When encoding we use both arrays: upon seeing a code point  $n$ , we look up the entry (1 plus)  $n$  modulo some number  $M$  in the `encode` array, which tells us the byte that might encode the given Unicode code point, then we check in the `decode` array that indeed this byte encodes the Unicode code point we want. Here,  $M$  is an encoding-dependent integer between 256 and 558 (it turns out), chosen so that among the Unicode code points that can be validly represented in the given encoding, no pair of code points have the same value modulo  $M$ .

Loop through both lists of bytes to fill in the `decode` integer array, then fill the `encode` array accordingly. For bytes that are invalid in the given encoding, store  $-1$  in the `decode` array.

```

```
\__str_convert_decode_eight_bit:n
\__str_decode_eight_bit_aux:n
\__str_decode_eight_bit_aux:Nn
```

The map from bytes to Unicode code points is in the `decode` array corresponding to the given encoding. Define `\__str_tmp:w` and pass it successively all bytes in the string. It produces an internal representation with suitable `\s__str` inserted, and the corresponding code point is obtained by looking it up in the integer array. If the entry is `-1` then issue a replacement character and raise the flag indicating that there was an error.

```

```
\_str_convert_encode_eight_bit:n
\str_encode_eight_bit_aux:nnN
\str_encode_eight_bit_aux:NNn
```

It is not practical to make an integer array with indices in the full Unicode range, so we work modulo some number, which is simply the size of the `encode` integer array for the given encoding. This gives us a candidate byte for representing a given Unicode code point. Of course taking the modulo leads to collisions so we check in the `decode` array that the byte we got is indeed correct. Otherwise the Unicode code point we started from is simply not representable in the given encoding.

## 56.4 Messages

General messages, and messages for the encodings and escapings loaded by default (“native”, and “bytes”).

```
14503 \msg_new:nnn { str } { unknown-esc }
14504     { Escaping-scheme~'#1'~(filtered:~'#2')~unknown. }
14505 \msg_new:nnn { str } { unknown-enc }
14506     { Encoding-scheme~'#1'~(filtered:~'#2')~unknown. }
14507 \msg_new:nnnn { str } { native-escaping }
14508     { The~'native'~encoding-scheme~does~not~support~any~escaping. }
14509 }
```

```

14510      Since~native~strings~do~not~consist~in~bytes,~
14511      none~of~the~escaping~methods~make~sense.~
14512      The~specified~escaping,~'#1',~will~be~ignored.
14513  }
14514 \msg_new:n { str } { file-not-found }
14515   { File~'l3str-#1.def'~not~found. }

```

Message used when the “bytes” unescaping fails because the string given to `\str_set_convert:Nnnn` contains a non-byte. This cannot happen for the -8-bit engines. Messages used for other escapings and encodings are defined in each definition file.

```

14516 \bool_lazy_any:nT
14517  {
14518    \sys_if_engine_luatex_p:
14519    \sys_if_engine_xetex_p:
14520  }
14521  {

14547     string~contains~a~character~that~'#1'~does~not~support.
14548 }

```

## 56.5 Escaping definitions

Several of those encodings are defined by the pdf file format. The following byte storage methods are defined:

- **bytes** (default), non-bytes are filtered out, and bytes are left untouched (this is defined by default);

- `hex` or `hexadecimal`, as per the pdfTeX primitive `\pdfescapehex`
- `name`, as per the pdfTeX primitive `\pdfescapename`
- `string`, as per the pdfTeX primitive `\pdfescapestring`
- `url`, as per the percent encoding of urls.

### 56.5.1 Unescape methods

```
\__str_convert_unescape_hex:
  \__str_unescape_hex_auxi:N
  \__str_unescape_hex_auxii:N
```

Take chars two by two, and interpret each pair as the hexadecimal code for a byte. Anything else than hexadecimal digits is ignored, raising the flag. A string which contains an odd number of hexadecimal digits gets 0 appended to it: this is equivalent to appending a 0 in all cases, and dropping it if it is alone.

```
14549 \cs_new_protected:Npn \__str_convert_unescape_hex:

14594   }

(End of definition for \__str_convert_unescape_hex:, \__str_unescape_hex_auxi:N, and \__str-unescape_hex_auxii:N.)

```

```
\__str_convert_unescape_name:
\__str_unescape_name loop:wNN
\__str_convert_unescape_url:
\__str_unescape_url_loop:wNN
```

The `\__str_convert_unescape_name:` function replaces each occurrence of # followed by two hexadecimal digits in `\g__str_result_tl` by the corresponding byte. The `url` function is identical, with escape character % instead of #. Thus we define the two together. The arguments of `\__str_tmp:w` are the character code of # or % in hexadecimal, the name of the main function to define, and the name of the auxiliary which performs the loop.

The looping auxiliary #3 finds the next escape character, reads the following two characters, and tests them. The test `\__str_hexadecimal_use:NTF` leaves the upper-case digit in the input stream, hence we surround the test with `\__str_output_byte:w` and `\__str_output_end:`. If both characters are hexadecimal digits, they should be removed before looping: this is done by `\use_i:nnn`. If one of the characters is not a hexadecimal digit, then feed "#1 to `\__str_output_byte:w` to produce the escape character, raise the flag, and call the looping function followed by the two characters (remove `\use_i:nnn`).

\__str_convert_unescape_string:
\__str_unescape_string_newlines:wN
  \__str_unescape_string_loop:wNNN
\__str_unescape_string_repeat:NNNNNN

```

The `string` escaping is somewhat similar to the `name` and `url` escapings, with escape character `\`. The first step is to convert all three line endings, `^J`, `^M`, and `^M^J` to the common `^J`, as per the PDF specification. This step cannot raise the flag.

Then the following escape sequences are decoded.

- `\n` Line feed (10)
- `\r` Carriage return (13)
- `\t` Horizontal tab (9)
- `\b` Backspace (8)
- `\f` Form feed (12)
- `\(` Left parenthesis
- `\)` Right parenthesis
- `\\\` Backslash

`\ddd` (backslash followed by 1 to 3 octal digits) Byte `ddd` (octal), subtracting 256 in case of overflow.

If followed by an end-of-line character, the backslash and the end-of-line are ignored. If followed by anything else, the backslash is ignored, raising the error flag.

### 56.5.2 Escape methods

Currently, none of the escape methods can lead to errors, assuming that their input is made out of bytes.

`\__str_convert_escape_hex:`

`\__str_escape_hex_char:N`

```

14733 \cs_new_protected:Npn \__str_convert_escape_hex:
14734     { \__str_convert_gmap:N \__str_escape_hex_char:N }
14735 \cs_new:Npn \__str_escape_hex_char:N #1
14736     { \__str_output_hexadecimal:n { '#1' } }

```

(End of definition for `\__str_convert_escape_hex:` and `\__str_escape_hex_char:N`.)

`\__str_convert_escape_name:`

`\__str_escape_name_char:n`

`\__str_if_escape_name:nTF`

`\c__str_escape_name_str`

`\c__str_escape_name_not_str`

For each byte, test whether it should be output as is, or be “hash-encoded”. Roughly, bytes outside the range [“2A”, “7E”] are hash-encoded. We keep two lists of exceptions: characters in `\c__str_escape_name_not_str` are not hash-encoded, and characters in the `\c__str_escape_name_str` are encoded.

```

14737 \str_const:Nn \c__str_escape_name_not_str { ! " $ & ' } %$%
14738 \str_const:Nn \c__str_escape_name_str { {} / > [ ] }
14739 \cs_new_protected:Npn \__str_convert_escape_name:
14740     { \__str_convert_gmap:N \__str_escape_name_char:n }

## 56.6 Encoding definitions

The `native` encoding is automatically defined. Other encodings are loaded as needed. The following encodings are supported:

- UTF-8;
- UTF-16, big-, little-endian, or with byte order mark;
- UTF-32, big-, little-endian, or with byte order mark;
- the ISO 8859 code pages, numbered from 1 to 16, skipping the nonexistent ISO 8859-12.

### 56.6.1 utf-8 support

```
\__str_convert_encode_utf8:  
  \__str_encode_utf_viii_char:n  
  \__str_encode_utf_viii_loop:wwnw  
Loop through the internal string, and convert each character to its UTF-8 representation. The representation is built from the right-most (least significant) byte to the left-most (most significant) byte. Continuation bytes are in the range [128, 191], taking 64 different values, hence we roughly want to express the character code in base 64, shifting the first digit in the representation by some number depending on how many continuation bytes there are. In the range [0, 127], output the corresponding byte directly. In the range [128, 2047], output the remainder modulo 64, plus 128 as a continuation byte, then output the quotient (which is in the range [0, 31]), shifted by 192. In the next range, [2048, 65535], split the character code into residue and quotient modulo 64, output the
```

residue as a first continuation byte, then repeat; this leaves us with a quotient in the range [0, 15], which we output shifted by 224. The last range, [65536, 1114111], follows the same pattern: once we realize that dividing twice by 64 leaves us with a number larger than 15, we repeat, producing a last continuation byte, and offset the quotient by 240 for the leading byte.

How is that implemented? `\__str_encode_utf_vii_loop:wwnnw` takes successive quotients as its first argument, the quotient from the previous step as its second argument (except in step 1), the bound for quotients that trigger one more step or not, and finally the offset used if this step should produce the leading byte. Leading bytes can be in the ranges [0, 127], [192, 223], [224, 239], and [240, 247] (really, that last limit should be 244 because Unicode stops at the code point 1114111). At each step, if the quotient #1 is less than the limit #3 for that range, output the leading byte (#1 shifted by #4) and stop. Otherwise, we need one more step: use the quotient of #1 by 64, and #1 as arguments for the looping auxiliary, and output the continuation byte corresponding to the remainder #2 – 64#1 + 128. The bizarre construction `- 1 + 0 *` removes the spurious initial continuation byte (better methods welcome).

```

14813 \cs_new_protected:cpn { __str_convert_encode_utf8: }
14814   { __str_convert_gmap_internal:N __str_encode_utf_viii_char:n }
14815 \cs_new:Npn __str_encode_utf_viii_char:n #1

14834   }

```

(End of definition for `\__str_convert_encode_utf8:`, `\__str_encode_utf_viii_char:n`, and `\__str_encode_utf_viii_loop:wwnnw`.)

`--str_missing`  
`--str_extra`  
`--str_overlong`  
`--str_overflow`

When decoding a string that is purportedly in the UTF-8 encoding, four different errors can occur, signalled by a specific flag for each (we define those flags using `\flag_clear_new:N` rather than `\flag_new:N`, because they are shared with other encoding definition files).

- “Missing continuation byte”: a leading byte is not followed by the right number of continuation bytes.
- “Extra continuation byte”: a continuation byte appears where it was not expected, *i.e.*, not after an appropriate leading byte.

- “Overlong”: a Unicode character is expressed using more bytes than necessary, for instance, "C0"80 for the code point 0, instead of a single null byte.
- “Overflow”: this occurs when decoding produces Unicode code points greater than 1114111.

We only raise one L<sup>A</sup>T<sub>E</sub>X3 error message, combining all the errors which occurred. In the short message, the leading comma must be removed to get a grammatically correct sentence. In the long text, first remind the user what a correct UTF-8 string should look like, then add error-specific information.

\__str_decode_utf_viii_end:

```

Decoding is significantly harder than encoding. As before, lower some flags, which are tested at the end (in bulk, to trigger at most one L<sup>A</sup>T<sub>E</sub>X3 error, as explained above). We expect successive multi-byte sequences of the form  $\langle start\ byte \rangle \langle continuation\ bytes \rangle$ . The `_start` auxiliary tests the first byte:

- [0, "7F]: the byte stands alone, and is converted to its own character code;
- ["80, "BF]: unexpected continuation byte, raise the appropriate flag, and convert that byte to the replacement character "FFFD";
- ["C0, "FF]: this byte should be followed by some continuation byte(s).

In the first two cases, `\use_none_delimit_by_q_stop:w` removes data that only the third case requires, namely the limits of ranges of Unicode characters which can be expressed with 1, 2, 3, or 4 bytes.

We can now concentrate on the multi-byte case and the `_continuation` auxiliary. We expect #3 to be in the range ["80, "BF]. The test for this goes as follows: if the character code is less than "80, we compare it to ="C0, yielding `false`; otherwise to "C0, yielding `true` in the range ["80, "BF] and `false` otherwise. If we find that the byte is not a continuation range, stop the current slew of bytes, output the replacement character, and continue parsing with the `_start` auxiliary, starting at the byte we just tested. Once we know that the byte is a continuation byte, leave it behind us in the input stream, compute what code point the bytes read so far would produce, and feed that number to the `_aux` function.

The `_aux` function tests whether we should look for more continuation bytes or not. If the number it receives as #1 is less than the maximum #4 for the current range, then we are done: check for an overlong representation by comparing #1 with the maximum #3 for the previous range. Otherwise, we call the `_continuation` auxiliary again, after shifting the “current code point” by #4 (maximum from the range we just checked).

Two additional tests are needed: if we reach the end of the list of range maxima and we are still not done, then we are faced with an overflow. Clean up, and again insert the code point "FFFD for the replacement character. Also, every time we read a byte, we need to check whether we reached the end of the string. In a correct UTF-8 string, this happens automatically when the `_start` auxiliary leaves its first argument in the input stream: the end-marker begins with `\prg_break:`, which ends the loop. On the other hand, if the end is reached when looking for a continuation byte, the `\use_none:n` #3 construction removes the first token from the end-marker, and leaves the `_end` auxiliary, which raises the appropriate error flag before ending the mapping.

### 56.6.2 utf-16 support

The definitions are done in a category code regime where the bytes 254 and 255 used by the byte order mark have catcode 12.

```

14981 \group_begin:
14982     \char_set_catcode_other:N \^fe
14983     \char_set_catcode_other:N \^ff

```

`\__str_convert_encode_utf16:`  
`\__str_convert_encode_utf16be:`  
`\__str_convert_encode_utf16le:`

When the endianness is not specified, it is big-endian by default, and we add a byte-order mark. Convert characters one by one in a loop, with different behaviours depending on the character code.

- [0, "D7FF]: converted to two bytes;

- ["D800, "DFFF] are used as surrogates: they cannot be converted and are replaced by the replacement character;
- ["E000, "FFFF]: converted to two bytes;
- ["10000, "10FFFF]: converted to a pair of surrogates, each two bytes. The magic "D7C0 is "D800 - "10000/"400.

For the duration of this operation, `\__str_tmp:w` is defined as a function to convert a number in the range [0, "FFFF] to a pair of bytes (either big endian or little endian), by feeding the quotient of the division of #1 by "100, followed by #1 to `\__str_encode_utf_xvi_be:nn` or its `le` analog; those compute the remainder, and output two bytes for the quotient and remainder.

`--str_missing`  
`--str_extra`  
`--str_end`

When encoding a Unicode string to UTF-16, only one error can occur: code points in the range ["D800, "DFFF], corresponding to surrogates, cannot be encoded. We use the all-purpose flag `@@_error` to signal that error.

When decoding a Unicode string which is purportedly in UTF-16, three errors can occur: a missing trail surrogate, an unexpected trail surrogate, and a string containing an odd number of bytes.

\__str_decode_utf_xvi_bom:NN
  \__str_decode_utf_xvi:Nw
```

As for UTF-8, decoding UTF-16 is harder than encoding it. If the endianness is unknown, check the first two bytes: if those are "FE and "FF in either order, remove them and use the corresponding endianness, otherwise assume big-endianness. The three endianness cases are based on a common auxiliary whose first argument is 1 for big-endian and 2 for little-endian, and whose second argument, delimited by the scan mark `\s__str_stop`, is expanded once (the string may be long; passing `\g__str_result_tl` as an argument before expansion is cheaper).

The `\__str_decode_utf_xvi:Nw` function defines `\__str_tmp:w` to take two arguments and return the character code of the first one if the string is big-endian, and the second one if the string is little-endian, then loops over the string using `\__str_decode_utf_xvi_pair:NN` described below.

\__str_decode_utf_xvi_error:nNN
\__str_decode_utf_xvi_extra:NNw
```

Bytes are read two at a time. At this stage, `\@_tmp:w #1#2` expands to the character code of the most significant byte, and we distinguish cases depending on which range it lies in:

- ["D8, "DB] signals a lead surrogate, and the integer expression yields 1 ( $\varepsilon$ -TEX rounds ties away from zero);
- ["DC, "DF] signals a trail surrogate, unexpected here, and the integer expression yields 2;
- any other value signals a code point in the Basic Multilingual Plane, which stands for itself, and the \if\_case:w construction expands to nothing (cases other than 1 or 2), leaving the relevant material in the input stream, followed by another call to the \_pair auxiliary.

The case of a lead surrogate is treated by the \_quad auxiliary, whose arguments #1, #2, #4 and #5 are the four bytes. We expect the most significant byte of #4#5 to be in the range ["DC, "DF] (trail surrogate). The test is similar to the test used for continuation bytes in the UTF-8 decoding functions. In the case where #4#5 is indeed a trail surrogate, leave #1#2#4#5 \s\_\_str <code point> \s\_\_str, and remove the pair #4#5 before looping with \\_\_str\_decode\_utf\_xvi\_pair:NN. Otherwise, of course, complain about the missing surrogate.

The magic number "D7F7 is such that "D7F7\*"400 = "D800\*"400+"DC00-"10000.

Every time we read a pair of bytes, we test for the end-marker \q\_\_str\_nil. When reaching the end, we additionally check that the string had an even length. Also, if the end is reached when expecting a trail surrogate, we treat that as a missing surrogate.

`--str_overflow` There can be no error when encoding in UTF-32. When decoding, the string may not have length  $4n$ , or it may contain code points larger than "10FFFF". The latter case often happens if the encoding was in fact not UTF-32, because most arbitrary strings are not valid in UTF-32.

\__str_decode_utf_xxxii:Nw
  \__str_decode_utf_xxxii_loop:NNNN
    \__str_decode_utf_xxxii_end:w
```

The structure is similar to UTF-16 decoding functions. If the endianness is not given, test the first 4 bytes of the string (possibly `\s__str_stop` if the string is too short) for the presence of a byte-order mark. If there is a byte-order mark, use that endianness, and remove the 4 bytes, otherwise default to big-endian, and leave the 4 bytes in place. The `\__str_decode_utf_xxxii:Nw` auxiliary receives 1 or 2 as its first argument indicating endianness, and the string to convert as its second argument (expanded or not). It sets `\__str_tmp:w` to expand to the character code of either of its two arguments depending on endianness, then triggers the `_loop` auxiliary inside an e-expanding assignment to `\g__str_result_tl`.

The `_loop` auxiliary first checks for the end-of-string marker `\s__str_stop`, calling the `_end` auxiliary if appropriate. Otherwise, leave the *<4 bytes>* `\s__str` behind, then check that the code point is not overflowing: the leading byte must be 0, and the following byte at most 16.

In the ending code, we check that there remains no byte: there should be nothing left until the first `\s__str_stop`. Break the map.

## 56.7 PDF names and strings by expansion

To convert to PDF names by expansion, we work purely on UTF-8 input. The first step is to make a string with “other” spaces, after which we use a simple token-by-token approach. In Unicode engines, we break down everything before one-byte codepoints, but for 8-bit engines there is no need to worry. Actual escaping is covered by the same code as used in the non-expandable route.

```

### 56.7.1 iso 8859 support

The ISO-8859-1 encoding exactly matches with the 256 first Unicode characters. For other 8-bit encodings of the ISO-8859 family, we keep track only of differences, and of unassigned bytes.

```

15333 <*iso88591>

# Chapter 57

## l3quark implementation

The following test files are used for this code: *m3quark001.lvt*.

16178 ⟨\*package⟩

### 57.1 Quarks

16179 ⟨@=quark⟩

＼quark\_new:N Allocate a new quark.

```
16180 \cs_new_protected:Npn \quark_new:N #1
16181 {
16182     \__kernel_chk_if_free_cs:N #1
16183     \cs_gset_nopar:Npn #1 {#1}
16184 }
```

(End of definition for \quark\_new:N. This function is documented on page 146.)

＼q\_nil Some “public” quarks. \q\_stop is an “end of argument” marker, \q\_nil is a empty value and \q\_no\_value marks an empty argument.

```
16185 \quark_new:N \q_nil
16186 \quark_new:N \q_mark
16187 \quark_new:N \q_no_value
16188 \quark_new:N \q_stop
```

(End of definition for \q\_nil and others. These variables are documented on page 146.)

＼q\_recursion\_tail Quarks for ending recursions. Only ever used there! \q\_recursion\_tail is appended to whatever list structure we are doing recursion on, meaning it is added as a proper list item with whatever list separator is in use. \q\_recursion\_stop is placed directly after the list.

```
16189 \quark_new:N \q_recursion_tail
16190 \quark_new:N \q_recursion_stop
```

(End of definition for \q\_recursion\_tail and \q\_recursion\_stop. These variables are documented on page 147.)

＼s\_\_quark Private scan mark used in l3quark. We don’t have l3scan yet, so we declare the scan mark here and add it to the scan mark pool later.

```
16191 \cs_new_eq:NN \s__quark \scan_stop:
```

(End of definition for `\s_quark`.)

`\q_quark_nil` Private quark use for some tests.

16192   `\quark_new:N \q_quark_nil`

(End of definition for `\q_quark_nil`.)

`\quark_if_recursion_tail_stop:N`  
`\quark_if_recursion_tail_stop_do:Nn`

When doing recursions, it is easy to spend a lot of time testing if the end marker has been found. To avoid this, a dedicated end marker is used each time a recursion is set up. Thus if the marker is found everything can be wrapped up and finished off. The simple case is when the test can guarantee that only a single token is being tested. In this case, there is just a dedicated copy of the standard quark test. Both a gobbling version and one inserting end code are provided.

```
16193  \cs_new:Npn \quark_if_recursion_tail_stop:N #1
16194   {
16195     \if_meaning:w \q_recursion_tail #1
16196       \exp_after:wN \use_none_delimit_by_q_recursion_stop:w
16197     \fi:
16198 }
16199 \cs_new:Npn \quark_if_recursion_tail_stop_do:Nn #1
16200 {
16201   \if_meaning:w \q_recursion_tail #1
16202     \exp_after:wN \use_i_delimit_by_q_recursion_stop:nw
16203   \else:
16204     \exp_after:wN \use_none:n
16205   \fi:
16206 }
```

(End of definition for `\quark_if_recursion_tail_stop:N` and `\quark_if_recursion_tail_stop_do:Nn`. These functions are documented on page [147](#).)

`\quark_if_recursion_tail_stop:`  
`\quark_if_recursion_tail_stop:o`  
`\quark_if_recursion_tail_stop:nn`  
`\quark_if_recursion_tail_stop:on`  
`\__quark_if_recursion_tail:w`

See `\quark_if_nil:nTF` for the details. Expanding `\__quark_if_recursion_tail:w` once in front of the tokens chosen here gives an empty result if and only if `#1` is exactly `\q_recursion_tail`.

```
16207 \cs_new:Npn \quark_if_recursion_tail_stop:n #1
16208 {
16209   \tl_if_empty:oTF
16210   { \__quark_if_recursion_tail:w {} #1 {} ?! \q_recursion_tail ??! }
16211   { \use_none_delimit_by_q_recursion_stop:w }
16212   { }
16213 }
16214 \cs_new:Npn \quark_if_recursion_tail_stop_do:nn #1
16215 {
16216   \tl_if_empty:oTF
16217   { \__quark_if_recursion_tail:w {} #1 {} ?! \q_recursion_tail ??! }
16218   { \use_i_delimit_by_q_recursion_stop:nw }
16219   { \use_none:n }
16220 }
16221 \cs_new:Npn \__quark_if_recursion_tail:w
16222   #1 \q_recursion_tail #2 ? #3 ?! { #1 #2 }
16223 \cs_generate_variant:Nn \quark_if_recursion_tail_stop:n { o }
16224 \cs_generate_variant:Nn \quark_if_recursion_tail_stop_do:nn { o }
```

(End of definition for `\quark_if_recursion_tail_stop:n`, `\quark_if_recursion_tail_stop_do:nn`, and `\__quark_if_recursion_tail:w`. These functions are documented on page [147](#).)

`\quark_if_recursion_tail_break:NN` Analogues of the `\quark_if_recursion_tail_stop...` functions. Break the mapping using #2.

```

16225 \cs_new:Npn \quark_if_recursion_tail_break:NN #1#2
16226 {
16227     \if_meaning:w \q_recursion_tail #1
16228     \exp_after:wN #2
16229     \fi:
16230 }
16231 \cs_new:Npn \quark_if_recursion_tail_break:nN #1#2
16232 {
16233     \tl_if_empty:oT
16234     { \__quark_if_recursion_tail:w {} #1 {} ?! \q_recursion_tail ??! }
16235     {#2}
16236 }
```

(End of definition for `\quark_if_recursion_tail_break:NN` and `\quark_if_recursion_tail_break:nN`. These functions are documented on page 148.)

`\quark_if_nil_p:N` Here we test if we found a special quark as the first argument. We better start with `\q_no_value` as the first argument since the whole thing may otherwise loop if #1 is wrongly given a string like `aabc` instead of a single token.<sup>8</sup>

```

\quark_if_nil:p:N
\quark_if_nil:NTF
\quark_if_no_value_p:N
\quark_if_no_value_p:c
\quark_if_no_value:NTF
\quark_if_no_value:cTF
16237 \prg_new_conditional:Npnn \quark_if_nil:N #1 { p, T , F , TF }
16238 {
16239     \if_meaning:w \q_nil #1
16240     \prg_return_true:
16241     \else:
16242     \prg_return_false:
16243     \fi:
16244 }
16245 \prg_new_conditional:Npnn \quark_if_no_value:N #1 { p, T , F , TF }
16246 {
16247     \if_meaning:w \q_no_value #1
16248     \prg_return_true:
16249     \else:
16250     \prg_return_false:
16251     \fi:
16252 }
16253 \prg_generate_conditional_variant:Nnn \quark_if_no_value:N
16254 { c } { p , T , F , TF }
```

(End of definition for `\quark_if_nil:NTF` and `\quark_if_no_value:NTF`. These functions are documented on page 146.)

`\quark_if_nil_p:n` Let us explain `\quark_if_nil:nTF`. Expanding `\__quark_if_nil:w` once is safe thanks to the trailing `\q_nil ??!`. The result of expanding once is empty if and only if both delimited arguments #1 and #2 are empty and #3 is delimited by the last tokens `?!`. Thanks to the leading `{}`, the argument #1 is empty if and only if the argument of `\quark_if_nil:n` starts with `\q_nil`. The argument #2 is empty if and only if this `\q_nil` is followed immediately by `?` or by `{?}`, coming either from the trailing tokens in the definition of `\quark_if_nil:n`, or from its argument. In the first case, `\__quark_if_nil:w` is followed by `{?}\q_nil {?} ?!\q_nil ??!`, hence #3 is delimited by the final `?!`, and the test returns `true` as wanted. In the second case, the result is not empty since

---

<sup>8</sup>It may still loop in special circumstances however!

the first `?!` in the definition of `\quark_if_nil:n` stop #3. The auxiliary here is the same as `\__tl_if_empty_if:o`, with the same comments applying.

```

16255 \prg_new_conditional:Npnn \quark_if_nil:n #1 { p, T , F , TF }
16256   {
16257     \__quark_if_empty_if:o
16258     { \__quark_if_nil:w {} #1 {} ? ! \q_nil ? ? ! }
16259     \prg_return_true:
16260   \else:
16261     \prg_return_false:
16262   \fi:
16263   }
16264 \cs_new:Npn \__quark_if_nil:w #1 \q_nil #2 ? #3 ? ! { #1 #2 }
16265 \prg_new_conditional:Npnn \quark_if_no_value:n #1 { p, T , F , TF }
16266   {
16267     \__quark_if_empty_if:o
16268     { \__quark_if_no_value:w {} #1 {} ? ! \q_no_value ? ? ! }
16269     \prg_return_true:
16270   \else:
16271     \prg_return_false:
16272   \fi:
16273   }
16274 \cs_new:Npn \__quark_if_no_value:w #1 \q_no_value #2 ? #3 ? ! { #1 #2 }
16275 \prg_generate_conditional_variant:Nnn \quark_if_nil:n
16276   { V , o } { p , TF , T , F }
16277 \cs_new:Npn \__quark_if_empty_if:o #1
16278   {

16280     \__kernel_tl_to_str:w \exp_after:wN {#1} \q_nil
16281   }

```

(End of definition for `\quark_if_nil:nTF` and others. These functions are documented on page 146.)

`\__kernel_quark_new_test:N` The function `\__kernel_quark_new_test:N` defines #1 in a similar way as `\quark_if_recursion_tail_...` functions (as described below), using `\q_{namespace}_recursion_tail` as the test quark and `\q_{namespace}_recursion_stop` as the delimiter quark, where the `<namespace>` is determined as the first \_-delimited part in #1.

There are six possible function types which this function can define, and which is defined depends on the signature of the function being defined:

- `:n` gives an analogue of `\quark_if_recursion_tail_stop:n`
- `:nn` gives an analogue of `\quark_if_recursion_tail_stop_do:nn`
- `:nN` gives an analogue of `\quark_if_recursion_tail_break:nN`
- `:N` gives an analogue of `\quark_if_recursion_tail_stop:N`
- `:Nn` gives an analogue of `\quark_if_recursion_tail_stop_do:Nn`
- `:NN` gives an analogue of `\quark_if_recursion_tail_break:NN`

Any other signature causes an error, as does a function without signature.

```
\_\_kernel_quark_new_conditional:Nn
```

Similar to `\_\_kernel_quark_new_test:N`, but defines quark branching conditionals like `\quark_if_nil:nTF` that test for the quark `\q\_\<namespace>\_\<name>`. The `<namespace>` and `<name>` are determined from the conditional #1, which must take the rather rigid form `\_\<namespace>\quark_if_<name>:(arg spec)`. There are only two cases for the `(arg spec)` here:

`:n` gives an analogue of `\quark_if_nil:nTF`

`:N` gives an analogue of `\quark_if_nil:NTF`

Any other signature causes an error, as does a function without signature. We use low-level emptiness tests as `l3tl` is not available yet when these functions are used; thankfully we only care about whether strings are empty so a simple `\if_meaning:w \q_nil <string> \q_nil` suffices.

16353      \__quark_new_test_define_ifx:nNnNNn #1 { }
16354  }
16355 \cs_new_protected:Npn \__quark_new_test_Nn:Nnnn #1 #2 #3 #4
16356  {
16357      \__quark_new_test_aux_do:nNNnnnnNNn {#4} #2 #3 { i } { n } {##1} {##2}
16358      \__quark_new_test_define_ifx:nNnNNn #1
16359      { \else: \exp_after:wN \use_none:n }
16360  }
16361 \cs_new_protected:Npn \__quark_new_test_NN:Nnnn #1 #2 #3 #4
16362  {
16363      \__quark_new_test_aux_do:nNNnnnnNNn {#4} #2 #3 { i } { n } {##1} {##2}
16364      \__quark_new_test_define_break_ifx:nNNNNn #1 { }
16365  }

```

(End of definition for `\__quark_new_test_n:Nnnn` and others.)

```
\_\_quark_new_test_aux_do:nNNnnnnNNn
\_\_quark_test_define_aux:NNNNnnNNn
```

`\_\_quark_new_test_aux_do:nNNnnnnNNn` makes the control sequence names which will be used by `\_\_quark_test_define_aux:NNNNnnNNn`, and then later by `\_\_quark_new_-test_define_t1:nNnNNn` or `\_\_quark_new_test_define_ifx:nNnNNn`. The control sequences defined here are analogous to `\_\_quark_if_recursion_tail:w` and to `\use_-(none|i)_delimit_by_q_recursion_stop:(|n)w`.

The name is composed by the name-space and the name of the quarks. Suppose `\_\_kernel_quark_new_test:N` was used with:

```
\_\_kernel_quark_new_test:N \_\_test_quark_tail:n
```

then the first auxiliary will be `\_\_test_quark_recursion_tail:w`, and the second one will be `\_\_test_use_none_delimit_by_q_recursion_stop:w`.

Note that the actual quarks are *not* defined here. They should be defined separately using `\quark_new:N`.

```
16366 \cs_new_protected:Npn \_\_quark_new_test_aux_do:nNNnnnnNNn #1 #2 #3 #4 #5
16367   {
16368     \exp_args:Ncc \_\_quark_test_define_aux:NNNNnnNNn
16369       { #1 _quark_recursion_tail:w }
16370       { #1 _use_ #4 _delimit_by_q_recursion_stop: #5 w }
16371       #2 #3
16372   }
16373 \cs_new_protected:Npn \_\_quark_test_define_aux:NNNNnnNNn #1 #2 #3 #4 #5 #6 #7
16374   {
16375     \cs_gset:Npn #1 ##1 #3 ##2 ? ##3 ?! { ##1 ##2 }
16376     \cs_gset:Npn #2 ##1 #6 #4 {##5}
16377     #7 {##1} #1 #2 #3
16378 }
```

(End of definition for `\_\_quark_new_test_aux_do:nNNnnnnNNn` and `\_\_quark_test_define_aux:NNNNnnNNn`.)

Finally, these two macros define the main conditional function using what's been set up before.

```
\_\_quark_new_test_define_t1:nNnNNn
\_\_quark_new_test_define_ifx:nNnNNn
```

```
16379 \cs_new_protected:Npn \_\_quark_new_test_define_t1:nNnNNn #1 #2 #3 #4 #5 #6
16380   {
16381     \cs_new:Npn #5 #1
16382       {
16383         \tl_if_empty:oTF
16384           { #2 {} ##1 {} ?! #4 ??! }
16385           {##3} {##6}
16386       }
16387   }
16388 \cs_new_protected:Npn \_\_quark_new_test_define_ifx:nNnNNn #1 #2 #3 #4 #5 #6
16389   {
16390     \cs_new:Npn #5 #1
16391       {
16392         \if_meaning:w #4 ##1
16393           \exp_after:wN #3
16394           #6
16395           \fi:
16396       }
16397   }
16398 \cs_new_protected:Npn \_\_quark_new_test_define_break_t1:nNNNNn #1 #2 #3
16399   { \_\_quark_new_test_define_t1:nNnNNn {##1##2} #2 {##2} }
16400 \cs_new_protected:Npn \_\_quark_new_test_define_break_ifx:nNNNNn #1 #2 #3
```

```
16401 { \__quark_new_test_define_ifx:nNnNNn {##1##2} #2 {##2} }
```

(End of definition for `\__quark_new_test_define_t1:nNnNNn` and others.)

```
\__quark_new_conditional_n:Nnnn  
\__quark_new_conditional_N:Nnnn
```

These macros implement the two possibilities for branching quark conditionals, passing the right arguments to `\__quark_new_conditional_aux_do:NNnnn`, which defines some auxiliaries and defines the main conditionals.

```
16402 \cs_new_protected:Npn \__quark_new_conditional_n:Nnnn  
16403 { \__quark_new_conditional_aux_do:NNnnn \use_i:nn }  
16404 \cs_new_protected:Npn \__quark_new_conditional_N:Nnnn  
16405 { \__quark_new_conditional_aux_do:NNnnn \use_ii:nn }
```

(End of definition for `\__quark_new_conditional_n:Nnnn` and `\__quark_new_conditional_N:Nnnn`.)

```
\__quark_new_conditional_aux_do:NNnnn  
\__quark_new_conditional_define:NNNNn
```

Similar to the previous macros, but branching conditionals only require one auxiliary, so we take a shortcut. In `\__quark_new_conditional_define:NNNNn`, #4 is `\use_i:nn` to define the n-type function (which needs an auxiliary) and is `\use_ii:nn` to define the N-type function.

```
16406 \cs_new_protected:Npn \__quark_new_conditional_aux_do:NNnnn #1 #2 #3 #4  
16407 {  
16408     \exp_args:Ncc \__quark_new_conditional_define:NNNNn  
16409     { __ #4 _if_quark_ #3 :w } { q__ #4 _ #3 } #2 #1  
16410 }  
16411 \cs_new_protected:Npn \__quark_new_conditional_define:NNNNn #1 #2 #3 #4 #5  
16412 {  
16413     #4 { \cs_gset:Npn #1 ##1 #2 ##2 ? ##3 ?! { ##1 ##2 } } { }  
16414     \exp_args:Nno \use:n { \prg_new_conditional:Npnn #3 ##1 {#5} }  
16415     {  
16416         #4 { \__quark_if_empty_if:o { #1 {} ##1 {} ?! #2 ??! } }  
16417         { \if_meaning:w #2 ##1 }  
16418         \prg_return_true: \else: \prg_return_false: \fi:  
16419     }  
16420 }
```

(End of definition for `\__quark_new_conditional_aux_do:NNnnn` and `\__quark_new_conditional_define:NNNNn`.)

```
\__quark_module_name:N  
\__quark_module_name:w  
\__quark_module_name_loop:w  
\__quark_module_name_end:w
```

`\__quark_module_name:N` takes a control sequence and returns its *<module>* name, determined as the first non-empty non-single-character word, separated by `_` or `:`. These rules give the correct result for public functions `\<module>_...`, private functions `\__-<module>_...`, and variables such as `\l_<module>_...`. If no valid module is found the result is an empty string. The approach is to first cut off everything after the (first) `:` if any is present, then repeatedly grab `_`-delimited words until finding one of length at least 2 (we use low-level tests as `|3tl` is not fully available when `\__kernel_quark_new-test:N` is first used. If no *<module>* is found (such as in `\:::n`) we get the trailing marker `\use_none:n {}`, which expands to nothing.

```
16421 \cs_set:Npn \__quark_tmp:w #1#2  
16422 {  
16423     \cs_new:Npn \__quark_module_name:N ##1  
16424     {  
16425         \exp_last_unbraced:Nf \__quark_module_name:w  
16426         { \cs_to_str:N ##1 } #1 \s__quark  
16427     }  
16428     \cs_new:Npn \__quark_module_name:w ##1 #1 ##2 \s__quark
```

```

16429 { \__quark_module_name_loop:w ##1 #2 \use_none:n { } #2 \s__quark }
16430 \cs_new:Npn \__quark_module_name_loop:w ##1 #2
16431 {
16432     \use_i_i:nnn \if_meaning:w \prg_do_nothing:
16433         ##1 \prg_do_nothing: \prg_do_nothing:
16434             \exp_after:wN \__quark_module_name_loop:w
16435     \else:
16436         \__quark_module_name_end:w ##1
16437     \fi:
16438 }
16439 \cs_new:Npn \__quark_module_name_end:w
16440     ##1 \fi: ##2 \s__quark { \fi: ##1 }
16441 }
16442 \exp_after:wN \__quark_tmp:w \tl_to_str:n { : _ }
```

(End of definition for `\__quark_module_name:N` and others.)

`\__quark_quark_conditional_name:N` and `\__quark_quark_conditional_name:w` determine the quark name that the quark conditional function `##1` queries, as the part of the function name between `_quark_if_` and the trailing `:`. Again we define it through `\__quark_tmp:w`, which receives `:` as `#1` and `_quark_if_` as `#2`. The auxiliary `\__quark_quark_conditional_name:w` returns the part between the first `_quark_if_` and the next `:`, and we apply this auxiliary to the function name followed by `:` (in case the function name is lacking a signature), and `_quark_if_:` so that `\__quark_quark_conditional_name:N` returns an empty string if `_quark_if_` is not present.

```

16443 \cs_set:Npn \__quark_tmp:w #1 #2 \s__quark
16444 {
16445     \cs_new:Npn \__quark_quark_conditional_name:N ##1
16446     {
16447         \exp_last_unbraced:Nf \__quark_quark_conditional_name:w
16448             { \cs_to_str:N ##1 } #1 #2 #1 \s__quark
16449     }
16450     \cs_new:Npn \__quark_quark_conditional_name:w
16451         ##1 #2 ##2 #1 ##3 \s__quark {##2}
16452 }
16453 \exp_after:wN \__quark_tmp:w \tl_to_str:n { : _quark_if_ } \s__quark
```

(End of definition for `\__quark_quark_conditional_name:N` and `\__quark_quark_conditional_name:w`.)

## 57.2 Scan marks

16454 `<@@=scan>`

`\scans_new:N` Check whether the variable is already a scan mark, then declare it to be equal to `\scans_stop:` globally.

```

16455 \cs_new_protected:Npn \scans_new:N #1
16456 {
16457     \tl_if_in:NnTF \g__scan_marks_tl { #1 }
16458     {
16459         \msg_error:nne { scanmark } { already-defined }
16460             { \token_to_str:N #1 }
16461     }
16462 }
```

```

16463          \tl_gput_right:Nn \g__scan_marks_tl {#1}
16464          \cs_new_eq:NN #1 \scan_stop:
16465      }
16466  }

```

(End of definition for `\scan_new:N`. This function is documented on page 149.)

**\s\_stop** We only declare one scan mark here, more can be defined by specific modules. Can't use `\scan_new:N` yet because l3tl isn't loaded, so define `\s_stop` by hand and add it to `\g__scan_marks_tl`. We also add the scan marks declared earlier to the pool here. Since they live in a different namespace, a little DocStrip cheating is necessary.

```

16467  \cs_new_eq:NN \s_stop \scan_stop:
16468  \cs_gset_nopar:Npn \g__scan_marks_tl
16469  {
16470      \s_stop
16471      ⟨@=quark⟩
16472      \s__quark
16473      ⟨@=cs⟩
16474      \s__cs_mark
16475      \s__cs_stop
16476      ⟨@=scan⟩
16477  }

```

(End of definition for `\s_stop` and `\g__scan_marks_tl`. This variable is documented on page 149.)

**\use\_none\_delimit\_by\_s\_stop:w** Similar to `\use_none_delimit_by_q_stop:w`.

```
16478  \cs_new:Npn \use_none_delimit_by_s_stop:w #1 \s_stop { }
```

(End of definition for `\use_none_delimit_by_s_stop:w`. This function is documented on page 149.)

```
16479  ⟨/package⟩
```

# Chapter 58

## I3seq implementation

The following test files are used for this code: *m3seq002*, *m3seq003*.

```
16480  <*package>
16481  <@@=seq>
```

A sequence is a control sequence whose top-level expansion is of the form “`\s__-seq \__seq_item:n {\langle item_1 \rangle} ... \__seq_item:n {\langle item_n \rangle}`”, with a leading scan mark followed by *n* items of the same form. An earlier implementation used the structure “`\seq_elt:w \langle item_1 \rangle \seq_elt_end: ... \seq_elt:w \langle item_n \rangle \seq_elt_end:`”. This allowed rapid searching using a delimited function, but was not suitable for items containing {, } and # tokens, and also lead to the loss of surrounding braces around items

---

```
\__seq_item:n * \__seq_item:n {\langle item \rangle}
```

The internal token used to begin each sequence entry. If expanded outside of a mapping or manipulation function, an error is raised. The definition should always be set globally.

---

```
\__seq_push_item_def:n \__seq_push_item_def:n {\langle code \rangle}
```

---

```
\__seq_push_item_def:e
```

Saves the definition of `\__seq_item:n` and redefines it to accept one parameter and expand to `\langle code \rangle`. This function should always be balanced by use of `\__seq_pop_item_def:..`.

---

```
\__seq_pop_item_def: \__seq_pop_item_def:
```

Restores the definition of `\__seq_item:n` most recently saved by `\__seq_push_item_def:n`. This function should always be used in a balanced pair with `\__seq_push_item_def:n`.

`\s__seq` This private scan mark.

```
16482  \scan_new:N \s__seq
```

(End of definition for `\s__seq`.)

`\s__seq_mark` Private scan marks.

```
16483  \scan_new:N \s__seq_mark
16484  \scan_new:N \s__seq_stop
```

(End of definition for `\s__seq_mark` and `\s__seq_stop`.)

`\_\_seq\_item:n` The delimiter is always defined, but when used incorrectly simply removes its argument and hits an undefined control sequence to raise an error.

```
16485 \cs_new:Npn \_\_seq\_item:n
16486 {
16487     \msg_expandable_error:nn { seq } { misused }
16488     \use_none:n
16489 }
```

(End of definition for `\_\_seq\_item:n`.)

`\l\_seq_internal_a_tl` Scratch space for various internal uses.

```
16490 \tl_new:N \l\_seq_internal_a_tl
16491 \tl_new:N \l\_seq_internal_b_tl
```

(End of definition for `\l\_seq_internal_a_tl` and `\l\_seq_internal_b_tl`.)

`\_\_seq_tmp:w` Scratch function for internal use.

```
16492 \cs_new_eq:NN \_\_seq_tmp:w ?
```

(End of definition for `\_\_seq_tmp:w`.)

`\c_empty_seq` A sequence with no item, following the structure mentioned above.

```
16493 \tl_const:Nn \c_empty_seq { \s_seq }
```

(End of definition for `\c_empty_seq`. This variable is documented on page 162.)

## 58.1 Allocation and initialisation

`\seq_new:N` Sequences are initialized to `\c_empty_seq`.

```
16494 \cs_new_protected:Npn \seq_new:N #1
16495 {
16496     \__kernel_chk_if_free_cs:N #1
16497     \cs_gset_eq:NN #1 \c_empty_seq
16498 }
16499 \cs_generate_variant:Nn \seq_new:N { c }
```

(End of definition for `\seq_new:N`. This function is documented on page 150.)

`\seq_clear:N` Clearing a sequence is similar to setting it equal to the empty one.

```
16500 \cs_new_protected:Npn \seq_clear:N #1
16501 { \seq_set_eq:NN #1 \c_empty_seq }
16502 \cs_generate_variant:Nn \seq_clear:N { c }
16503 \cs_new_protected:Npn \seq_gclear:N #1
16504 { \seq_gset_eq:NN #1 \c_empty_seq }
16505 \cs_generate_variant:Nn \seq_gclear:N { c }
```

(End of definition for `\seq_clear:N` and `\seq_gclear:N`. These functions are documented on page 150.)

`\seq_clear_new:N` Once again we copy code from the token list functions.

```
16506 \cs_new_protected:Npn \seq_clear_new:N #1
16507 { \seq_if_exist:NTF #1 { \seq_clear:N #1 } { \seq_new:N #1 } }
16508 \cs_generate_variant:Nn \seq_clear_new:N { c }
16509 \cs_new_protected:Npn \seq_gclear_new:N #1
16510 { \seq_if_exist:NTF #1 { \seq_gclear:N #1 } { \seq_new:N #1 } }
16511 \cs_generate_variant:Nn \seq_gclear_new:N { c }
```

(End of definition for `\seq_clear_new:N` and `\seq_gclear_new:N`. These functions are documented on page 150.)

```
\seq_set_eq:NN Copying a sequence is the same as copying the underlying token list.
\seq_set_eq:cN 16512 \cs_new_eq:NN \seq_set_eq:NN \tl_set_eq:NN
\seq_set_eq:Nc 16513 \cs_new_eq:NN \seq_set_eq:Nc \tl_set_eq:Nc
\seq_set_eq:cc 16514 \cs_new_eq:NN \seq_set_eq:cN \tl_set_eq:cN
\seq_gset_eq:NN 16515 \cs_new_eq:NN \seq_set_eq:cc \tl_set_eq:cc
\seq_gset_eq:cN 16516 \cs_new_eq:NN \seq_gset_eq:NN \tl_gset_eq:NN
\seq_gset_eq:Nc 16517 \cs_new_eq:NN \seq_gset_eq:Nc \tl_gset_eq:Nc
\seq_gset_eq:cc 16518 \cs_new_eq:NN \seq_gset_eq:cN \tl_gset_eq:cN
16519 \cs_new_eq:NN \seq_gset_eq:cc \tl_gset_eq:cc
```

(End of definition for `\seq_set_eq:NN` and `\seq_gset_eq:NN`. These functions are documented on page 150.)

`\seq_set_from_clist:NN` Setting a sequence from a comma-separated list is done using a simple mapping.

```
\seq_set_from_clist:cN 16520 \cs_new_protected:Npn \seq_set_from_clist:NN #1#2
\seq_set_from_clist:Nc 16521 {
\seq_set_from_clist:cc 16522   \__kernel_tl_set:Nx #1
\seq_set_from_clist:Nn 16523     { \s__seq \clist_map_function:NN #2 \__seq_wrap_item:n }
\seq_set_from_clist:cn 16524   }
\seq_gset_from_clist:NN 16525 \cs_new_protected:Npn \seq_set_from_clist:Nn #1#2
\seq_gset_from_clist:cN 16526   {
\seq_gset_from_clist:Nc 16527     \__kernel_tl_set:Nx #1
\seq_gset_from_clist:cc 16528       { \s__seq \clist_map_function:nN {#2} \__seq_wrap_item:n }
\seq_gset_from_clist:Nn 16529   }
\seq_gset_from_clist:NN 16530 \cs_new_protected:Npn \seq_gset_from_clist:NN #1#2
\seq_gset_from_clist:cN 16531   {
\seq_gset_from_clist:Nc 16532     \__kernel_tl_gset:Nx #1
\seq_gset_from_clist:cc 16533       { \s__seq \clist_map_function:NN #2 \__seq_wrap_item:n }
\seq_gset_from_clist:Nn 16534   }
\seq_gset_from_clist:NN 16535 \cs_new_protected:Npn \seq_gset_from_clist:Nn #1#2
\seq_gset_from_clist:cN 16536   {
\seq_gset_from_clist:Nc 16537     \__kernel_tl_gset:Nx #1
\seq_gset_from_clist:cc 16538       { \s__seq \clist_map_function:nN {#2} \__seq_wrap_item:n }
\seq_gset_from_clist:Nn 16539   }
\cs_generate_variant:Nn \seq_set_from_clist:NN { Nc }
\cs_generate_variant:Nn \seq_set_from_clist:NN { c , cc }
\cs_generate_variant:Nn \seq_set_from_clist:Nn { c }
\cs_generate_variant:Nn \seq_gset_from_clist:NN { Nc }
\cs_generate_variant:Nn \seq_gset_from_clist:NN { c , cc }
\cs_generate_variant:Nn \seq_gset_from_clist:Nn { c }
```

(End of definition for `\seq_set_from_clist:NN` and others. These functions are documented on page 151.)

`\seq_const_from_clist:NN` Almost identical to `\seq_set_from_clist:Nn`.

```
\seq_const_from_clist:cN 16546 \cs_new_protected:Npn \seq_const_from_clist:Nn #1#2
16547   {
16548     \tl_const:Ne #1
16549       { \s__seq \clist_map_function:nN {#2} \__seq_wrap_item:n }
16550   }
16551 \cs_generate_variant:Nn \seq_const_from_clist:Nn { c }
```

(End of definition for `\seq_const_from_clist:Nn`. This function is documented on page 151.)

`\seq_set_split:Nnn`  
`\seq_set_split:NnV`  
`\seq_set_split:NnV`  
`\seq_set_split:NVV`  
`\seq_set_split:Nne`  
`\seq_set_split:Nee`  
`\seq_set_split:Nnx`  
`\seq_set_split:Nxx`  
`\seq_gset_split:Nnn`  
`\seq_gset_split:NnV`  
`\seq_gset_split:NnV`  
`\seq_gset_split:NVV`  
`\seq_gset_split:Nne`  
`\seq_gset_split:Nee`  
`\seq_gset_split:Nnx`  
`\seq_gset_split:Nxx`  
`\seq_gset_split_keep_spaces:Nnn`  
`\seq_set_split_keep_spaces:NnV`  
`\seq_gset_split_keep_spaces:Nnn`  
`\seq_gset_split_keep_spaces:NnV`  
`\seq_gset_split:Nnn`  
`\_seq_set_split:Nw`  
`\_seq_set_split:w`  
`\_seq_set_split_end:`

When the separator is empty, everything is very simple, just map `\_seq_wrap_item:n` through the items of the last argument. For non-trivial separators, the goal is to split a given token list at the marker, strip spaces from each item, and remove one set of outer braces if after removing leading and trailing spaces the item is enclosed within braces. After `\tl_replace_all:Nnn`, the token list `\l__seq_internal_a_tl` is a repetition of the pattern `\_seq_set_split:Nw \prg_do_nothing: <item with spaces> \_seq_set_split_end:`. Then, e-expansion causes `\_seq_set_split:Nw` to trim spaces, and leaves its result as `\_seq_set_split:w <trimmed item> \_seq_set_split_end:`. This is then converted to the l3seq internal structure by another e-expansion. In the first step, we insert `\prg_do_nothing:` to avoid losing braces too early: that would cause space trimming to act within those lost braces. The second step is solely there to strip braces which are outermost after space trimming.

```

16552 \cs_new_protected:Npn \seq_set_split:Nnn
16553   { \_seq_set_split:NNNnn \_kernel_tl_set:Nx \tl_trim_spaces:n }
16554 \cs_new_protected:Npn \seq_gset_split:Nnn
16555   { \_seq_set_split:NNNnn \_kernel_tl_gset:Nx \tl_trim_spaces:n }
16556 \cs_new_protected:Npn \seq_set_split_keep_spaces:Nnn

16588   }
16589 \cs_new:Npn \_seq_set_split:w #1 \_seq_set_split_end:
16590   { \_seq_wrap_item:n {#1} }
```

```

16591 \cs_generate_variant:Nn \seq_set_split:Nnn { NV , NnV , NVV , Nne , Nee }
16592 \cs_generate_variant:Nn \seq_set_split:Nnn { Nnx , Nxx }
16593 \cs_generate_variant:Nn \seq_gset_split:Nnn { NV , NnV , NVV , Nne , Nee }
16594 \cs_generate_variant:Nn \seq_gset_split:Nnn { Nnx , Nxx }
16595 \cs_generate_variant:Nn \seq_set_split_keep_spaces:Nnn { NnV }
16596 \cs_generate_variant:Nn \seq_gset_split_keep_spaces:Nnn { NnV }

```

(End of definition for `\seq_set_split:Nnn` and others. These functions are documented on page 151.)

`\seq_set_filter:NNn`  
`\seq_gset_filter:NNn`  
`\_seq_set_filter:NNNn`

Similar to `\seq_map_inline:Nn`, without a `\prg_break_point`: because the user's code is performed within the evaluation of a boolean expression, and skipping out of that would break horribly. The `\_seq_wrap_item:n` function inserts the relevant `\_seq_item:n` without expansion in the input stream, hence in the e-expanding assignment.

```

16597 \cs_new_protected:Npn \seq_set_filter:NNn
16598   { \_seq_set_filter:NNNn \_kernel_tl_set:Nx }
16599 \cs_new_protected:Npn \seq_gset_filter:NNn
16600   { \_seq_set_filter:NNNn \_kernel_tl_gset:Nx }
16601 \cs_new_protected:Npn \_seq_set_filter:NNNn #1#2#3#4
16602   {
16603     \_seq_push_item_def:n { \bool_if:nT {#4} { \_seq_wrap_item:n {##1} } }
16604     #1 #2 { #3 }
16605     \_seq_pop_item_def:
16606   }

```

(End of definition for `\seq_set_filter:NNn`, `\seq_gset_filter:NNn`, and `\_seq_set_filter:NNNn`. These functions are documented on page 152.)

`\seq_concat:NNN`  
`\seq_concat:ccc`  
`\seq_gconcat:NNN`

When concatenating sequences, one must remove the leading `\s__seq` of the second sequence. The result starts with `\s__seq` (of the first sequence), which stops f-expansion.

```

16607 \cs_new_protected:Npn \seq_concat:NNN #1#2#3
16608   { \tl_set:Nf #1 { \exp_after:wN \use_i:nn \exp_after:wN #2 #3 } }
16609 \cs_new_protected:Npn \seq_gconcat:NNN #1#2#3
16610   { \tl_gset:Nf #1 { \exp_after:wN \use_i:nn \exp_after:wN #2 #3 } }
16611 \cs_generate_variant:Nn \seq_concat:NNN { ccc }
16612 \cs_generate_variant:Nn \seq_gconcat:NNN { ccc }

```

(End of definition for `\seq_concat:NNN` and `\seq_gconcat:NNN`. These functions are documented on page 152.)

`\seq_if_exist_p:N`

Copies of the `cs` functions defined in `l3basics`.

```

16613 \prg_new_eq_conditional:NNn \seq_if_exist:N \cs_if_exist:N
16614   { TF , T , F , p }
16615 \prg_new_eq_conditional:NNn \seq_if_exist:c \cs_if_exist:c
16616   { TF , T , F , p }

```

(End of definition for `\seq_if_exist:NTF`. This function is documented on page 152.)

## 58.2 Appending data to either end

`\seq_put_left:Nn`  
`\seq_put_left:NV`

When adding to the left of a sequence, remove `\s__seq`. This is done by `\_seq_put_left_aux:w`, which also stops f-expansion.

```

16617 \cs_new_protected:Npn \seq_put_left:Nn #1#2
16618   {
16619     \_kernel_tl_set:Nx #1

```

`\seq_gput_left:Nn`  
`\seq_gput_left:NV`  
`\seq_gput_left:Nv`

```

16620      {
16621          \exp_not:n { \s__seq \__seq_item:n {#2} }
16622          \exp_not:f { \exp_after:wN \__seq_put_left_aux:w #1 }
16623      }
16624  }
16625 \cs_new_protected:Npn \seq_gput_left:Nn #1#2
16626  {
16627      \__kernel_tl_gset:Nx #1
16628  {
16629      \exp_not:n { \s__seq \__seq_item:n {#2} }
16630      \exp_not:f { \exp_after:wN \__seq_put_left_aux:w #1 }
16631  }
16632  }
16633 \cs_new:Npn \__seq_put_left_aux:w \s__seq { \exp_stop_f: }
16634 \cs_generate_variant:Nn \seq_put_left:Nn { NV , Nv , Ne , No , Nx }
16635 \cs_generate_variant:Nn \seq_put_left:Nn { c , cV , cv , ce , co , cx }
16636 \cs_generate_variant:Nn \seq_gput_left:Nn { NV , Nv , Ne , No , Nx }
16637 \cs_generate_variant:Nn \seq_gput_left:Nn { c , cV , cv , ce , co , cx }

```

(End of definition for `\seq_put_left:Nn`, `\seq_gput_left:Nn`, and `\__seq_put_left_aux:w`. These functions are documented on page 152.)

**\seq\_put\_right:Nn**  
**\seq\_put\_right:NV**  
**\seq\_put\_right:Nv**  
**\seq\_put\_right:Ne**  
**\seq\_put\_right:No**  
**\seq\_put\_right:Nx**  
**\seq\_put\_right:cn**  
**\seq\_put\_right:cV**  
**\seq\_put\_right:cV**  
**\seq\_put\_right:cX**  
**\seq\_put\_right:cX**  
**\seq\_put\_right:co**  
**\seq\_put\_right:cX**

**\seq\_gput\_right:Nn**

**\seq\_gput\_right:NV**

**\seq\_gput\_right:Nv**

**\seq\_gput\_right:Ne**

**\\_\_seq\_wrap\_item:n**

**\seq\_gput\_right:No**

**\seq\_gput\_right:Nx**

**\seq\_gput\_right:cn**

**\seq\_gput\_right:cV**

**\seq\_gput\_right:cV**

**\seq\_gput\_right:cX**

**\seq\_gput\_right:cX**

**\seq\_gput\_right:cX**

Since there is no trailing marker, adding an item to the right of a sequence simply means wrapping it in `\__seq_item:n`.

```

16638 \cs_new_protected:Npn \seq_put_right:Nn #1#2
16639  { \tl_put_right:Nn #1 { \__seq_item:n {#2} } }
16640 \cs_new_protected:Npn \seq_gput_right:Nn #1#2
16641  { \tl_gput_right:Nn #1 { \__seq_item:n {#2} } }
16642 \cs_generate_variant:Nn \seq_put_right:Nn { NV , Nv , Ne , No , Nx }
16643 \cs_generate_variant:Nn \seq_put_right:Nn { c , cV , cv , ce , co , cx }
16644 \cs_generate_variant:Nn \seq_gput_right:Nn { NV , Nv , Ne , No , Nx }
16645 \cs_generate_variant:Nn \seq_gput_right:Nn { c , cV , cv , ce , co , cx }

```

(End of definition for `\seq_put_right:Nn` and `\seq_gput_right:Nn`. These functions are documented on page 152.)

## 58.3 Modifying sequences

This function converts its argument to a proper sequence item in an e-expansion context.

```
16646 \cs_new:Npn \__seq_wrap_item:n #1 { \exp_not:n { \__seq_item:n {#1} } }
```

(End of definition for `\__seq_wrap_item:n`.)

An internal sequence for the removal routines.

```
16647 \seq_new:N \l__seq_remove_seq
```

(End of definition for `\l__seq_remove_seq`.)

**\seq\_remove\_duplicates:N**

**\seq\_remove\_duplicates:c**

**\seq\_gremove\_duplicates:N**

**\seq\_gremove\_duplicates:c**

**\\_\_seq\_remove\_duplicates>NN**

Removing duplicates means making a new list then copying it.

```

16648 \cs_new_protected:Npn \seq_remove_duplicates:N
16649  { \__seq_remove_duplicates>NN \seq_set_eq:NN }
16650 \cs_new_protected:Npn \seq_gremove_duplicates:N
16651  { \__seq_remove_duplicates>NN \seq_gset_eq:NN }
16652 \cs_new_protected:Npn \__seq_remove_duplicates>NN #1#2

```

```

16653  {

**\seq\_remove\_all:cx**  
**\seq\_gremove\_all:Nn**

The idea of the code here is to avoid a relatively expensive addition of items one at a time to an intermediate sequence. The approach taken is therefore similar to that in `\__seq_pop_right:NNN`, using a “flexible” e-type expansion to do most of the work. As `\tl_if_eq:nnT` is not expandable, a two-part strategy is needed. First, the e-type expansion uses `\str_if_eq:nnT` to find potential matches. If one is found, the expansion is halted and the necessary set up takes place to use the `\tl_if_eq:NNT` test. The e-type is started again, including all of the items copied already. This happens repeatedly until the entire sequence has been scanned. The code is set up to avoid needing an intermediate scratch list: the lead-off e-type expansion (#1 #2 {#2}) ensures that nothing is lost.

16732 }
```

If the position is ok, `\__seq_set_item:nNnnNNNN` makes the assignment and returns `true` (in the case of conditionnals). Here #1 is an integer expression (position minus one), it needs to be evaluated. The sequence #5 starts with `\s__seq` (even if empty), which stops the integer expression and is absorbed by it. The `\if_meaning:w` test is slightly faster than an integer test (but only works when testing against zero, hence the offset we chose in the position). When we are done skipping items, insert the saved item `\l__seq_internal_a_t1`. For put functions the last argument of `\__seq_set_item_end:w` is `\use_none:nn` and it absorbs the item #2 that we are removing: this is only useful for the pop functions.

16756     #5 #2
16757 }
```

(End of definition for `\seq_set_item:NnnTF` and others. These functions are documented on page 155.)

**\seq\_reverse:N** Previously, `\seq_reverse:N` was coded by collecting the items in reverse order after an `\exp_stop_f:` marker.

```

\seq_reverse:c
\seq_greverse:N
\seq_greverse:c
\__seq_reverse:NN
\__seq_reverse_item:nwn
```

```

\cs_new_protected:Npn \seq_reverse:N #1
{
    \cs_set_eq:NN \@@_item:n \@@_reverse_item:nw
    \tl_set:Nf #2 { #2 \exp_stop_f: }
}
\cs_new:Npn \@@_reverse_item:nw #1 #2 \exp_stop_f:
{
    #2 \exp_stop_f:
    \@@_item:n {#1}
}
```

At first, this seems optimal, since we can forget about each item as soon as it is placed after `\exp_stop_f:`. Unfortunately, TeX's usual tail recursion does not take place in

this case: since the following `\__seq_reverse_item:nw` only reads tokens until `\exp_stop_f:`, and never reads the `\@@_item:n {#1}` left by the previous call, TeX cannot remove that previous call from the stack, and in particular must retain the various macro parameters in memory, until the end of the replacement text is reached. The stack is thus only flushed after all the `\__seq_reverse_item:nw` are expanded. Keeping track of the arguments of all those calls uses up a memory quadratic in the length of the sequence. TeX can then not cope with more than a few thousand items.

Instead, we collect the items in the argument of `\exp_not:n`. The previous calls are cleanly removed from the stack, and the memory consumption becomes linear.

```

## 58.4 Sequence conditionals

`\seq_if_empty_p:N` Similar to token lists, we compare with the empty sequence.

```

16776 \prg_new_conditional:Npnn \seq_if_empty:N #1 { p , T , F , TF }
16777   {
16778     \if_meaning:w #1 \c_empty_seq
16779       \prg_return_true:
1680     \else:
1681       \prg_return_false:
1682     \fi:
1683   }
16784 \prg_generate_conditional_variant:Nnn \seq_if_empty:N
16785   { c } { p , T , F , TF }

```

(End of definition for `\seq_if_empty:NTF`. This function is documented on page 156.)

`\seq_shuffle:N`

`\seq_shuffle:c`

`\seq_gshuffle:N`

`\seq_gshuffle:c`

`\__seq_shuffle>NN`

`\__seq_shuffle_item:n`

`\g__seq_internal_seq`

We apply the Fisher–Yates shuffle, storing items in `\toks` registers. We use the primitive `\tex_uniformdeviate:D` for speed reasons. Its non-uniformity is of order its argument divided by  $2^{28}$ , not too bad for small lists. For sequences with more than 13 elements

there are more possible permutations than possible seeds ( $13! > 2^{28}$ ) so the question of uniformity is somewhat moot. The integer variables are declared in `\l3int`: load-order issues.

```

16786 \seq_new:N \g__seq_internal_seq

```

(End of definition for `\seq_shuffle:N` and others. These functions are documented on page 156.)

`\seq_if_in:NnTF` The approach here is to define `\__seq_item:n` to compare its argument with the test sequence. If the two items are equal, the mapping is terminated and `\group_end: \prg_return_true:` is inserted after skipping over the rest of the recursion. On the other hand, if there is no match then the loop breaks, returning `\prg_return_false:`. Everything is inside a group so that `\__seq_item:n` is preserved in nested situations.

```

```

(End of definition for `\seq_if_in:NnTF` and `\__seq_if_in:`. This function is documented on page 156.)

## 58.5 Recovering data from sequences

`\__seq_pop:NNNN` The two pop functions share their emptiness tests. We also use a common emptiness test for all branching `get` and `pop` functions.

```

16846 \cs_new_protected:Npn \__seq_pop:NNNN #1#2#3#4
16847   {
16848     \if_meaning:w #3 \c_empty_seq
16849       \tl_set:Nn #4 { \q_no_value }
16850     \else:
16851       #1#2#3#4
16852     \fi:
16853   }
16854 \cs_new_protected:Npn \__seq_pop_TF:NNNN #1#2#3#4
16855   {
16856     \if_meaning:w #3 \c_empty_seq
16857       % \tl_set:Nn #4 { \q_no_value }
16858       \prg_return_false:
16859     \else:
16860       #1#2#3#4
16861       \prg_return_true:
16862     \fi:
16863   }

```

(End of definition for `\__seq_pop:NNNN` and `\__seq_pop_TF:NNNN`.)

`\seq_get_left:NN` Getting an item from the left of a sequence is pretty easy: just trim off the first item after `\__seq_item:n` at the start. We append a `\q_no_value` item to cover the case of an empty sequence

```

16864 \cs_new_protected:Npn \seq_get_left:NN #1#2
16865   {
16866     \__kernel_tl_set:Nx #2
16867     {
16868       \exp_after:wN \__seq_get_left:wnw

```

```

16869      #1 \__seq_item:n { \q_no_value } \s__seq_stop
16870    }
16871  }
16872 \cs_new:Npn \__seq_get_left:wnw #1 \__seq_item:n #2#3 \s__seq_stop
16873  { \exp_not:n {#2} }
16874 \cs_generate_variant:Nn \seq_get_left:NN { c }

```

(End of definition for `\seq_get_left:NN` and `\__seq_get_left:wnw`. This function is documented on page 152.)

`\seq_pop_left:NN`  
`\seq_pop_left:cN`  
`\seq_gpop_left:NN`

`\seq_gpop_left:cN`  
`\__seq_pop_left:NNN`  
`\__seq_pop_left:wnwNNN`

The approach to popping an item is pretty similar to that to get an item, with the only difference being that the sequence itself has to be redefined. This makes it more sensible to use an auxiliary function for the local and global cases.

```

16875 \cs_new_protected:Npn \seq_pop_left:NN

\seq_gpop_right:NN
\seq_gpop_right:cN
\_\_seq_pop_right:NNN
\_\_seq_pop_right_loop:nn

```

The approach to popping from the right is a bit more involved, but does use some of the same ideas as getting from the right. What is needed is a “flexible length” way to set a token list variable. This is supplied by the `{ \if_false: } \fi: ... \if_false: { \fi: }` construct. Using an e-type expansion and a “non-expanding” definition for `\_\_seq_item:n`, the left-most  $n - 1$  entries in a sequence of  $n$  items are stored back in the sequence. That needs a loop of unknown length, hence using the strange `\if_false:` way of including braces. When the last item of the sequence is reached, the closing brace for the assignment is inserted, and `\tl_set:Nn #3` is inserted in front of the final entry. This therefore does the pop assignment. One more iteration is performed, with an empty argument and `\use_none:nn`, which finally stops the loop.

```

```

(End of definition for `\seq_pop_left:NNTF` and others. These functions are documented on page 154.)

`\seq_item:Nn` The idea here is to find the offset of the item from the left, then use a loop to grab the correct item. If the resulting offset is too large, then the argument delimited by `\__seq_item:n` is `\prg_break:` instead of being empty, terminating the loop and returning nothing at all.

```

\seq_item:NV
\seq_item:NV
\seq_item:Ne

16985 \cs_generate_variant:Nn \seq_item:Nn { NV , Ne , c , cV , ce }

```

(End of definition for `\seq_item:Nn` and others. This function is documented on page 153.)

**\seq\_rand\_item:N** Importantly, `\seq_item:Nn` only evaluates its argument once.

```

16986 \cs_new:Npn \seq_rand_item:N #1
16987 {
16988     \seq_if_empty:NF #1
16989     { \seq_item:Nn #1 { \int_rand:nn { 1 } { \seq_count:N #1 } } }
16990 }
16991 \cs_generate_variant:Nn \seq_rand_item:N { c }

```

(End of definition for `\seq_rand_item:N`. This function is documented on page 153.)

## 58.6 Mapping over sequences

**\seq\_map\_break:** To break a function, the special token `\prg_break_point:Nn` is used to find the end of the code. Any ending code is then inserted before the return value of `\seq_map_break:n` is inserted.

```

16992 \cs_new:Npn \seq_map_break:
16993     { \prg_map_break:Nn \seq_map_break: { } }
16994 \cs_new:Npn \seq_map_break:n
16995     { \prg_map_break:Nn \seq_map_break: }

```

(End of definition for `\seq_map_break:` and `\seq_map_break:n`. These functions are documented on page 158.)

**\seq\_map\_function>NN** The idea here is to apply the code of #2 to each item in the sequence without altering the definition of `\_seq_item:n`. The even-numbered arguments of `\_seq_map_function:Nw` delimited by `\_seq_item:n` are almost always empty, except at the end of the loop where it is `\prg_break:`. This allows to break the loop without needing to do a (relatively-expensive) quark test.

```

16996 \cs_new:Npn \seq_map_function>NN #1#2
16997 {
16998     \exp_after:wN \use_i_i:nnn
16999     \exp_after:wN \_seq_map_function:Nw
17000     \exp_after:wN #2
17001     #1
17002     \prg_break:
17003     \_seq_item:n { } \_seq_item:n { } \_seq_item:n { } \_seq_item:n { }
17004     \prg_break_point:
17005     \prg_break_point:Nn \seq_map_break: { }
17006 }
17007 \cs_new:Npn \_seq_map_function:Nw #1
17008     #2 \_seq_item:n #3
17009     #4 \_seq_item:n #5
17010     #6 \_seq_item:n #7
17011     #8 \_seq_item:n #9
17012 {
17013     #2 #1 {#3}
17014     #4 #1 {#5}
17015     #6 #1 {#7}
17016     #8 #1 {#9}
17017     \_seq_map_function:Nw #1
17018 }
17019 \cs_generate_variant:Nn \seq_map_function>NN { c }

```

(End of definition for `\seq_map_function:NN` and `\_seq_map_function:Nw`. This function is documented on page 156.)

`\_seq_push_item_def:n` The definition of `\_seq_item:n` needs to be saved and restored at various points within the mapping and manipulation code. That is handled here: as always, this approach uses global assignments.

```

17020 \cs_new_protected:Npn \_seq_push_item_def:n
17021 {
17022     \_seq_push_item_def:
17023     \cs_gset:Npn \_seq_item:n ##1
17024 }
17025 \cs_new_protected:Npn \_seq_push_item_def:e
17026 {
17027     \_seq_push_item_def:
17028     \cs_gset:Npe \_seq_item:n ##1
17029 }
17030 \cs_new_protected:Npn \_seq_push_item_def:
17031 {
17032     \int_gincr:N \g_kernel_prg_map_int
17033     \cs_gset_eq:cN { _seq_map_ \int_use:N \g_kernel_prg_map_int :w }
17034     \_seq_item:n
17035 }
17036 \cs_new_protected:Npn \_seq_pop_item_def:
17037 {
17038     \cs_gset_eq:Nc \_seq_item:n
17039     { _seq_map_ \int_use:N \g_kernel_prg_map_int :w }
17040     \int_gdecr:N \g_kernel_prg_map_int
17041 }
```

(End of definition for `\_seq_push_item_def:n`, `\_seq_push_item_def:`, and `\_seq_pop_item_def:..`)

`\seq_map_inline:Nn` The idea here is that `\_seq_item:n` is already “applied” to each item in a sequence, and so an in-line mapping is just a case of redefining `\_seq_item:n`.

```

17042 \cs_new_protected:Npn \seq_map_inline:Nn #1#2
17043 {
17044     \_seq_push_item_def:n {#2}
17045     #1
17046     \prg_break_point:Nn \seq_map_break: { \_seq_pop_item_def: }
17047 }
17048 \cs_generate_variant:Nn \seq_map_inline:Nn { c }
```

(End of definition for `\seq_map_inline:Nn`. This function is documented on page 156.)

`\seq_map_tokens:Nn` This is based on the function mapping but using the same tricks as described for `\prop_map_tokens:Nn`. The idea is to remove the leading `\s_seq` and apply the tokens such that they are safe with the break points, hence the `\use:n`.

```

17049 \cs_new:Npn \seq_map_tokens:Nn #1#2
17050 {
17051     \exp_last_unbraced:Nno
17052     \use_i:nn { \_seq_map_tokens:nw {#2} } #1
17053     \prg_break:
17054     \_seq_item:n { } \_seq_item:n { } \_seq_item:n { } \_seq_item:n { }
17055     \prg_break_point:
17056     \prg_break_point:Nn \seq_map_break: { }
```

```

17057      }
17058  \cs_generate_variant:Nn \seq_map_tokens:Nn { c }
17059  \cs_new:Npn \__seq_map_tokens:nw #1
17060      #2 \__seq_item:n #3
17061      #4 \__seq_item:n #5
17062      #6 \__seq_item:n #7
17063      #8 \__seq_item:n #9
17064  {
17065      #2 \use:n {#1} {#3}
17066      #4 \use:n {#1} {#5}
17067      #6 \use:n {#1} {#7}
17068      #8 \use:n {#1} {#9}
17069      \__seq_map_tokens:nw {#1}
17070  }

```

(End of definition for `\seq_map_tokens:Nn` and `\__seq_map_tokens:nw`. This function is documented on page 157.)

`\seq_map_variable>NNn`  
`\seq_map_variable:Ncn`  
`\seq_map_variable:cNn`  
`\seq_map_variable:ccn`

This is just a specialised version of the in-line mapping function, using an e-type expansion for the code set up so that the number of # tokens required is as expected.

```

17071 \cs_new_protected:Npn \seq_map_variable>NNn #1#2#3
17072  {
17073      \__seq_push_item_def:

17115  }

```

(End of definition for `\seq_map_indexed_function:NN` and others. These functions are documented on page 157.)

#### `\seq_map_pairwise_function:NNN`

```

\seq_map_pairwise_function:NcN
\seq_map_pairwise_function:cNN
\seq_map_pairwise_function:ccN
\_seq_map_pairwise_function:wNN
\_seq_map_pairwise_function:wNw
\_seq_map_pairwise_function:Nnnwnn

```

The idea is to first expand both sequences, adding the usual `{ ? \prg_break: }` to the end of each one. This is most conveniently done in two steps using an auxiliary function. The mapping then throws away the first tokens of #2 and #5, which for items in both sequences are `\s__seq \_seq_item:n`. The function to be mapped are then be applied to the two entries. When the code hits the end of one of the sequences, the break material stops the entire loop and tidy up. This avoids needing to find the count of the two sequences, or worrying about which is longer.

```

17123  }
17124 \cs_new:Npn \_seq_map_pairwise_function:wNw \s__seq #1 \s__seq_stop #2
17125  {
17126      \_seq_map_pairwise_function:Nnnwnn #2
17127      #1 { ? \prg_break: } { }
17128      \s__seq_stop
17129  }
17130 \cs_new:Npn \_seq_map_pairwise_function:Nnnwnn #1#2#3#4 \s__seq_stop #5#6
17131  {
17132      \use_none:n #2
17133      \use_none:n #5
17134      #1 {#3} {#6}
17135      \_seq_map_pairwise_function:Nnnwnn #1 #4 \s__seq_stop
17136  }
17137 \cs_generate_variant:Nn \seq_map_pairwise_function:NNN { Nc , c , cc }

```

(End of definition for `\seq_map_pairwise_function:NNN` and others. This function is documented on page 157.)

#### `\seq_set_map_e:NNn`

```
\seq_gset_map_e:NNn
```

```
\_seq_set_map_e:NNNn
```

Very similar to `\seq_set_filter:NNn`. We could actually merge the two within a single function, but it would have weird semantics.

```

17138 \cs_new_protected:Npn \seq_set_map_e:NNn
17139   { \__seq_set_map_e:NNNn \__kernel_tl_set:Nx }
17140 \cs_new_protected:Npn \seq_gset_map_e:NNn
17141   { \__seq_set_map_e:NNNn \__kernel_tl_gset:Nx }
17142 \cs_new_protected:Npn \__seq_set_map_e:NNNn #1#2#3#4
17143   {
17144     \__seq_push_item_def:n { \exp_not:N \__seq_item:n {#4} }
17145     #1 #2 { #3 }
17146     \__seq_pop_item_def:
17147   }

```

(End of definition for `\seq_set_map_e:NNn`, `\seq_gset_map_e:NNn`, and `\__seq_set_map_e:NNNn`. These functions are documented on page 159.)

`\seq_set_map:NNn` Similar to `\seq_set_map_e:NNn`, but prevents expansion of the <inline function>.

`\seq_gset_map:NNn`

`\__seq_set_map:NNNn`

```

17148 \cs_new_protected:Npn \seq_set_map:NNn
17149   { \__seq_set_map:NNNn \__kernel_tl_set:Nx }
17150 \cs_new_protected:Npn \seq_gset_map:NNn
17151   { \__seq_set_map:NNNn \__kernel_tl_gset:Nx }
17152 \cs_new_protected:Npn \__seq_set_map:NNNn #1#2#3#4
17153   {
17154     \__seq_push_item_def:n { \exp_not:n { \__seq_item:n {#4} } }
17155     #1 #2 { #3 }
17156     \__seq_pop_item_def:
17157   }

```

(End of definition for `\seq_set_map:NNn`, `\seq_gset_map:NNn`, and `\__seq_set_map:NNNn`. These functions are documented on page 158.)

`\seq_count:N` Since counting the items in a sequence is quite common, we optimize it by grabbing 8 items at a time and correspondingly adding 8 to an integer expression. At the end of the loop, #9 is `\__seq_count_end:w` instead of being empty. It removes `8+` and instead places the number of `\__seq_item:n` that `\__seq_count:w` grabbed before reaching the end of the sequence.

`\seq_count:c`

`\__seq_count:w`

`\__seq_count_end:w`

```

17158 \cs_new:Npn \seq_count:N #1
17159   {
17160     \int_eval:n
17161     {
17162       \exp_after:wN \use_i:nn
17163       \exp_after:wN \__seq_count:w
17164       #1
17165       \__seq_count_end:w \__seq_item:n 7
17166       \__seq_count_end:w \__seq_item:n 6
17167       \__seq_count_end:w \__seq_item:n 5
17168       \__seq_count_end:w \__seq_item:n 4
17169       \__seq_count_end:w \__seq_item:n 3
17170       \__seq_count_end:w \__seq_item:n 2
17171       \__seq_count_end:w \__seq_item:n 1
17172       \__seq_count_end:w \__seq_item:n 0
17173       \prg_break_point:
17174     }
17175   }
17176 \cs_new:Npn \__seq_count:w
17177   #1 \__seq_item:n #2 \__seq_item:n #3 \__seq_item:n #4 \__seq_item:n

```

```

17178      #5 \_seq_item:n #6 \_seq_item:n #7 \_seq_item:n #8 #9 \_seq_item:n
17179      { #9 8 + \_seq_count:w }
17180  \cs_new:Npn \_seq_count_end:w 8 + \_seq_count:w #1#2 \prg_break_point: {#1}
17181  \cs_generate_variant:Nn \seq_count:N { c }

```

(End of definition for `\seq_count:N`, `\_seq_count:w`, and `\_seq_count_end:w`. This function is documented on page 159.)

## 58.7 Using sequences

```

\seq_use:Nnnn
\seq_use:cnnn
\_seq_use:NNnNnn
\_seq_use_setup:w
\_seq_use:nwwwnwnw
\_seq_use:nwwn
\seq_use:Nn
\seq_use:cn

```

See `\clist_use:Nnnn` for a general explanation. The main difference is that we use `\_seq_item:n` as a delimiter rather than commas. We also need to add `\_seq_item:n` at various places, and `\s__seq`.

```

17182  \cs_new:Npn \seq_use:Nnnn #1#2#3#4
17183  {
17184  \seq_if_exist:NTF #1
17185  {
17186  \int_case:nnF { \seq_count:N #1 }
17187  {
17188  { 0 } { }
17189  { 1 } { \exp_after:wN \_seq_use:NNnNnn #1 ? { } { } }
17190  { 2 } { \exp_after:wN \_seq_use:NNnNnn #1 {#2} }
17191  }
17192  {
17193  \exp_after:wN \_seq_use_setup:w #1 \_seq_item:n
17194  \s__seq_mark { \_seq_use:nwwwnwn {#3} }
17195  \s__seq_mark { \_seq_use:nwwn {#4} }
17196  \s__seq_stop { }
17197  }
17198  }
17199  {
17200  \msg_expandable_error:nnn
17201  { kernel } { bad-variable } {#1}
17202  }
17203  }
17204  \cs_generate_variant:Nn \seq_use:Nnnn { c }
17205  \cs_new:Npn \_seq_use:NNnNnn #1#2#3#4#5#6 { \exp_not:n { #3 #6 #5 } }
17206  \cs_new:Npn \_seq_use_setup:w \s__seq { \_seq_use:nwwwnwn { } }
17207  \cs_new:Npn \_seq_use:nwwwnwn
17208  #1 \_seq_item:n #2 \_seq_item:n #3 \_seq_item:n #4#5
17209  \s__seq_mark #6#7 \s__seq_stop #8
17210  {
17211  #6 \_seq_item:n {#3} \_seq_item:n {#4} #5
17212  \s__seq_mark {#6} #7 \s__seq_stop { #8 #1 #2 }
17213  }
17214  \cs_new:Npn \_seq_use:nwwn #1 \_seq_item:n #2 #3 \s__seq_stop #4
17215  { \exp_not:n { #4 #1 #2 } }
17216  \cs_new:Npn \seq_use:Nn #1#2
17217  { \seq_use:Nnnn #1 {#2} {#2} {#2} }
17218  \cs_generate_variant:Nn \seq_use:Nn { c }

```

(End of definition for `\seq_use:Nnnn` and others. These functions are documented on page 159.)

## 58.8 Sequence stacks

The same functions as for sequences, but with the correct naming.

```
\seq_push:Nn
\seq_push:NV
\seq_push:Nv
\seq_push:Ne
\seq_push:No
\seq_push:Nx
\seq_push:cn
\seq_push:cV
\seq_push:cV
\seqpush:NN
\seqpush:cN
17219 \cs_new_eq:NN \seq_push:Nn \seq_put_left:Nn
17220 \cs_generate_variant:Nn \seq_push:Nn { NV , Nv , Ne , c , cv , ce }
17221 \cs_generate_variant:Nn \seq_push:Nn { No , Nx , co , cx }
17222 \cs_new_eq:NN \seq_gpush:Nn \seq_gput_left:Nn
17223 \cs_generate_variant:Nn \seq_gpush:Nn { NV , Nv , Ne , c , cv , ce }
17224 \cs_generate_variant:Nn \seq_gpush:Nn { No , Nx , co , cx }
(End of definition for \seq_push:Nn and \seq_gpush:Nn. These functions are documented on page 161.)
```

In most cases, getting items from the stack does not need to specify that this is from the left. So alias are provided.

```
\seqpush:NN
\seqpop:CN
\seqgpush:NN
\seqggpush:NN
\seq_gpush:Ne
\seq_gpush:No
\seq_gpush:Nx
\seq_gpush:cn
\seq_gpush:cV
\seq_get:NNTF
\seq_get:cV
17225 \cs_new_eq:NN \seq_get:NN \seq_get_left:NN
17226 \cs_new_eq:NN \seq_get:cN \seq_get_left:cN
17227 \cs_new_eq:NN \seq_pop:NN \seq_pop_left:NN
17228 \cs_new_eq:NN \seq_pop:cN \seq_pop_left:cN
17229 \cs_new_eq:NN \seq_gpop:NN \seq_gpop_left:NN
17230 \cs_new_eq:NN \seq_gpop:cN \seq_gpop_left:cN
(End of definition for \seq_get:NN, \seq_pop:NN, and \seq_gpop:NN. These functions are documented on page 160.)
```

More copies.

```
\seq_get:NNTF
\seq_pop:NNTF
\seq_gpop:NNTF
\seq_gpop:cNTF
17231 \prg_new_eq_conditional:NNn \seq_get:NN \seq_get_left:NN { T , F , TF }
17232 \prg_new_eq_conditional:NNn \seq_get:cN \seq_get_left:cN { T , F , TF }
17233 \prg_new_eq_conditional:NNn \seq_pop:NN \seq_pop_left:NN { T , F , TF }
17234 \prg_new_eq_conditional:NNn \seq_pop:cN \seq_pop_left:cN { T , F , TF }
17235 \prg_new_eq_conditional:NNn \seq_gpop:NN \seq_gpop_left:NN { T , F , TF }
17236 \prg_new_eq_conditional:NNn \seq_gpop:cN \seq_gpop_left:cN { T , F , TF }
(End of definition for \seq_get:NNTF, \seq_pop:NNTF, and \seq_gpop:NNTF. These functions are documented on page 160.)
```

## 58.9 Viewing sequences

```
\seq_show:N
\seq_show:c
\seq_log:N
\seq_log:c
\seq_show:NN
\seq_validate:nn
17237 \cs_new_protected:Npn \seq_show:N { \__seq_show:NN \msg_show:nneeee }
17238 \cs_generate_variant:Nn \seq_show:N { c }
17239 \cs_new_protected:Npn \seq_log:N { \__seq_show:NN \msg_log:nneeee }
17240 \cs_generate_variant:Nn \seq_log:N { c }
17241 \cs_new_protected:Npn \__seq_show:NN #1#2
17242 {
17243     \__kernel_chk_tl_type:NnnT #2 { seq }
17244     {
17245         \s_seq
17246         \exp_after:wN \use_i:nn \exp_after:wN \__seq_show_validate:nn #2
17247         \q_recursion_tail \q_recursion_tail \q_recursion_stop
17248     }
17249     {
17250         #1 { seq } { show }
```

```

17251      { \token_to_str:N #2 }
17252      { \seq_map_function:NN #2 \msg_show_item:n }
17253      { } { }
17254      }
17255  }
17256 \cs_new:Npn \__seq_show_validate:nn #1#2
17257  {
17258      \quark_if_recursion_tail_stop:n {#2}
17259      \__seq_wrap_item:n {#2}
17260      \__seq_show_validate:nn
17261  }

```

(End of definition for `\seq_show:N` and others. These functions are documented on page 163.)

## 58.10 Scratch sequences

`\l_tmpa_seq` Temporary comma list variables.

```

\l_tmpb_seq 17262 \seq_new:N \l_tmpa_seq
\g_tmpa_seq 17263 \seq_new:N \l_tmpb_seq
\g_tmpb_seq 17264 \seq_new:N \g_tmpa_seq
17265 \seq_new:N \g_tmpb_seq

```

(End of definition for `\l_tmpa_seq` and others. These variables are documented on page 163.)

17266 ⟨/package⟩

# Chapter 59

## I3int implementation

```
17267  <*package>
17268  <@@=int>
```

*The following test files are used for this code: m3int001,m3int002,m3int03.*

**\c\_max\_register\_int** Done in I3basics.

(End of definition for \c\_max\_register\_int. This variable is documented on page 177.)

**\\_\_int\_to\_roman:w** Done in I3basics.

**\if\_int\_compare:w**

(End of definition for \\_\_int\_to\_roman:w and \if\_int\_compare:w. This function is documented on page 178.)

**\or:** Done in I3basics.

(End of definition for \or:. This function is documented on page 178.)

**\int\_value:w** Here are the remaining primitives for number comparisons and expressions.

```
17269  \cs_new_eq:NN \int_value:w      \tex_number:D
17270  \cs_new_eq:NN \__int_eval:w     \tex_numexpr:D
17271  \cs_new_eq:NN \__int_eval_end:   \tex_relax:D
17272  \cs_new_eq:NN \if_int_odd:w    \tex_ifodd:D
17273  \cs_new_eq:NN \if_case:w       \tex_ifcase:D
```

(End of definition for \int\_value:w and others. These functions are documented on page 178.)

**\s\_\_int\_mark** Scan marks used throughout the module.

```
17274  \scan_new:N \s__int_mark
17275  \scan_new:N \s__int_stop
```

(End of definition for \s\_\_int\_mark and \s\_\_int\_stop.)

**\\_\_int\_use\_none\_delimit\_by\_s\_stop:w** Function to gobble until a scan mark.

```
17276  \cs_new:Npn \__int_use_none_delimit_by_s_stop:w #1 \s__int_stop { }
```

(End of definition for \\_\_int\_use\_none\_delimit\_by\_s\_stop:w.)

**\q\_\_int\_recursion\_tail** Quarks for recursion.

```
17277  \quark_new:N \q__int_recursion_tail
17278  \quark_new:N \q__int_recursion_stop
```

(End of definition for `\q_int_recursion_tail` and `\q_int_recursion_stop`.)

`\_int_if_recursion_tail_stop_do:Nn`  
`\_int_if_recursion_tail_stop:N`

```
17279 \__kernel_quark_new_test:N \_int_if_recursion_tail_stop_do:Nn
17280 \__kernel_quark_new_test:N \_int_if_recursion_tail_stop:N
```

(End of definition for `\_int_if_recursion_tail_stop_do:Nn` and `\_int_if_recursion_tail_stop:N`.)

## 59.1 Integer expressions

`\int_eval:n`  
`\int_eval:w`

Wrapper for `\_int_eval:w`: can be used in an integer expression or directly in the input stream. It is very slightly faster to use `\the` rather than `\number` to turn the expression to a number. When debugging, we introduce parentheses to catch early termination (see `\l3debug`).

```
17281 \cs_new:Npn \int_eval:n #1
17282   { \tex_the:D \_int_eval:w #1 \_int_eval_end: }
17283 \cs_new:Npn \int_eval:w { \tex_the:D \_int_eval:w }
```

(End of definition for `\int_eval:n` and `\int_eval:w`. These functions are documented on page 166.)

`\int_sign:n`  
`\_int_sign:Nw`

See `\int_abs:n`. Evaluate the expression once (and when debugging is enabled, check that the expression is well-formed), then test the first character to determine the sign. This is wrapped in `\int_value:w ... \exp_stop_f:` to ensure a fixed number of expansions and to avoid dealing with closing the conditionals.

```
17284 \cs_new:Npn \int_sign:n #1
17285   {
17286     \int_value:w \exp_after:wN \_int_sign:Nw
17287     \int_value:w \_int_eval:w #1 \_int_eval_end: ;
17288     \exp_stop_f:
17289   }
17290 \cs_new:Npn \_int_sign:Nw #1#2 ;
17291   {
17292     \if_meaning:w 0 #1
17293       0
17294     \else:
17295       \if_meaning:w - #1 - \fi: 1
17296     \fi:
17297   }
```

(End of definition for `\int_sign:n` and `\_int_sign:Nw`. This function is documented on page 167.)

`\int_abs:n`  
`\_int_abs:N`  
`\int_max:nn`  
`\int_min:nn`

`\_int_maxmin:wwN`

```
17298 \cs_new:Npn \int_abs:n #1
17299   {
17300     \int_value:w \exp_after:wN \_int_abs:N
17301     \int_value:w \_int_eval:w #1 \_int_eval_end:
17302     \exp_stop_f:
17303   }
17304 \cs_new:Npn \_int_abs:N #1
17305   { \if_meaning:w - #1 \else: \exp_after:wN #1 \fi: }
17306 \cs_set:Npn \int_max:nn #1#2
17307   {
```

```

17308     \int_value:w \exp_after:wN \__int_maxmin:wwN
17309     \int_value:w \__int_eval:w #1 \exp_after:wN ;
17310     \int_value:w \__int_eval:w #2 ;
17311     >
17312     \exp_stop_f:
17313   }
17314 \cs_set:Npn \int_min:nn #1#2
17315   {
17316     \int_value:w \exp_after:wN \__int_maxmin:wwN
17317     \int_value:w \__int_eval:w #1 \exp_after:wN ;
17318     \int_value:w \__int_eval:w #2 ;
17319     <
17320     \exp_stop_f:
17321   }
17322 \cs_new:Npn \__int_maxmin:wwN #1 ; #2 ; #3
17323   {
17324     \if_int_compare:w #1 #3 #2 ~
17325       #1
17326     \else:
17327       #2
17328     \fi:
17329   }

```

(End of definition for `\int_abs:n` and others. These functions are documented on page 167.)

`\int_div_truncate:nn`  
`\int_div_round:nn`  
`\int_mod:nn`

`\__int_div_truncate:NwNw`  
`\__int_mod:ww`

As `\__int_eval:w` rounds the result of a division we also provide a version that truncates the result. We use an auxiliary to make sure numerator and denominator are only evaluated once: this comes in handy when those are more expensive to evaluate (e.g., `\tl_count:n`). If the numerator `#1#2` is 0, then we divide 0 by the denominator (this ensures that 0/0 is correctly reported as an error). Otherwise, shift the numerator `#1#2` towards 0 by  $(|#3#4|-1)/2$ , which we round away from zero. It turns out that this quantity exactly compensates the difference between  $\varepsilon$ -TEX's rounding and the truncating behaviour that we want. The details are thanks to Heiko Oberdiek: getting things right in all cases is not so easy.

```

17330 \cs_new:Npn \int_div_truncate:nn #1#2
17331   {
17332     \int_value:w \__int_eval:w
17333     \exp_after:wN \__int_div_truncate:NwNw
17334     \int_value:w \__int_eval:w #1 \exp_after:wN ;
17335     \int_value:w \__int_eval:w #2 ;
17336     \__int_eval_end:
17337   }
17338 \cs_new:Npn \__int_div_truncate:NwNw #1#2; #3#4;
17339   {
17340     \if_meaning:w 0 #1
17341       0
17342     \else:
17343       (
17344         #1#2
17345         \if_meaning:w - #1 + \else: - \fi:
17346         ( \if_meaning:w - #3 - \fi: #3#4 - 1 ) / 2
17347       )
17348     \fi:
17349     / #3#4

```

```
17350 }
```

For the sake of completeness:

```
17351 \cs_new:Npn \int_div_round:nn #1#2
17352 { \int_value:w \__int_eval:w (#1) / (#2) \__int_eval_end: }
```

Finally there's the modulus operation.

```
17353 \cs_new:Npn \int_mod:nn #1#2
17354 {
17355     \int_value:w \__int_eval:w \exp_after:wN \__int_mod:ww
17356     \int_value:w \__int_eval:w #1 \exp_after:wN ;
17357     \int_value:w \__int_eval:w #2 ;
17358     \__int_eval_end:
17359 }
17360 \cs_new:Npn \__int_mod:ww #1; #2;
17361 { #1 - ( \__int_div_truncate:NwNw #1 ; #2 ; ) * #2 }
```

(End of definition for `\int_div_truncate:nn` and others. These functions are documented on page 167.)

`\__kernel_int_add:nnn` Equivalent to `\int_eval:n {#1+#2+#3}` except that overflow only occurs if the final result overflows  $[-2^{31} + 1, 2^{31} - 1]$ . The idea is to choose the order in which the three numbers are added together. If #1 and #2 have opposite signs (one is in  $[-2^{31} + 1, -1]$  and the other in  $[0, 2^{31} - 1]$ ) then #1+#2 cannot overflow so we compute the result as #1+#2+#3. If they have the same sign, then either #3 has the same sign and the order does not matter, or #3 has the opposite sign and any order in which #3 is not last will work. We use #1+#3+#2.

```
17362 \cs_new:Npn \__kernel_int_add:nnn #1#2#3
17363 {
17364     \int_value:w \__int_eval:w #1
17365     \if_int_compare:w #2 < \c_zero_int \exp_after:wN \reverse_if:N \fi:
17366     \if_int_compare:w #1 < \c_zero_int + #2 + #3 \else: + #3 + #2 \fi:
17367     \__int_eval_end:
17368 }
```

(End of definition for `\__kernel_int_add:nnn`.)

## 59.2 Creating and initialising integers

`\int_new:N` Two ways to do this: one for the format and one for the L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  package. In plain T<sub>E</sub>X, `\newcount` (and other allocators) are `\outer`: to allow the code here to work in “generic” mode this is therefore accessed by name. (The same applies to `\newbox`, `\newdimen` and so on.)

```
17369 \cs_new_protected:Npn \int_new:N #1
17370 {
17371     \__kernel_chk_if_free_cs:N #1
17372     \cs:w newcount \cs_end: #1
17373 }
17374 \cs_generate_variant:Nn \int_new:N { c }
```

(End of definition for `\int_new:N`. This function is documented on page 167.)

```
\int_const:Nn
\int_const:cn
\__int_const:nN
\__int_const:eN
\__int_constdef:Nw
```

As stated, most constants can be defined as `\chardef` or `\mathchardef` but that's engine dependent. As a result, there is some set up code to determine what can be done. No full engine testing just yet so everything is a little awkward. We cannot use `\int_gset:Nn` because (when `check-declarations` is enabled) this runs some checks that constants would fail.

```
17375 \cs_new_protected:Npn \int_const:Nn #1#2
17376   { \__int_const:eN { \int_eval:n {#2} } #1 }
17377 \cs_generate_variant:Nn \int_const:Nn { c }
17378 \cs_new_protected:Npn \__int_const:nN #1#2
17379   {
17380     \int_compare:nNnTF {#1} < \c_zero_int
17381     {
17382       \int_new:N #2
17383       \tex_global:D
17384     }
17385   {
17386     \int_compare:nNnTF {#1} > \c__int_max_constdef_int
17387     {
17388       \int_new:N #2
17389       \tex_global:D
17390     }
17391   {
17392     \__kernel_chk_if_free_cs:N #2
17393     \tex_global:D \__int_constdef:Nw
17394   }
17395 }
17396 #2 = \__int_eval:w #1 \__int_eval_end:
17397 }
17398 \cs_generate_variant:Nn \__int_const:nN { e }
17399 \if_int_odd:w 0
17400   \cs_if_exist:NT \tex_luatexversion:D { 1 }
17401   \cs_if_exist:NT \tex_omathchardef:D { 1 }
17402   \cs_if_exist:NT \tex_XeTeXversion:D { 1 } ~
17403   \cs_if_exist:NTF \tex_omathchardef:D
17404     { \cs_new_eq:NN \__int_constdef:Nw \tex_omathchardef:D }
17405     { \cs_new_eq:NN \__int_constdef:Nw \tex_chardef:D }
17406   \__int_constdef:Nw \c__int_max_constdef_int 1114111 ~
17407 \else:
17408   \cs_new_eq:NN \__int_constdef:Nw \tex_mathchardef:D
17409   \tex_mathchardef:D \c__int_max_constdef_int 32767 ~
17410 \fi:
```

(End of definition for `\int_const:Nn` and others. This function is documented on page 167.)

`\int_zero:N`

Functions that reset an `<integer>` register to zero.

`\int_zero:c`

```
17411 \cs_new_protected:Npn \int_zero:N #1 { #1 = \c_zero_int }
```

`\int_gzero:N`

```
17412 \cs_new_protected:Npn \int_gzero:N #1 { \tex_global:D #1 = \c_zero_int }
```

`\int_gzero:c`

```
17413 \cs_generate_variant:Nn \int_zero:N { c }
```

```
17414 \cs_generate_variant:Nn \int_gzero:N { c }
```

(End of definition for `\int_zero:N` and `\int_gzero:N`. These functions are documented on page 168.)

`\int_zero_new:N`

Create a register if needed, otherwise clear it.

`\int_zero_new:c`

```
17415 \cs_new_protected:Npn \int_zero_new:N #1
```

`\int_gzero_new:N`

```

17416   { \int_if_exist:NTF #1 { \int_zero:N #1 } { \int_new:N #1 } }
17417   \cs_new_protected:Npn \int_gzero_new:N #1
17418   { \int_if_exist:NTF #1 { \int_gzero:N #1 } { \int_new:N #1 } }
17419   \cs_generate_variant:Nn \int_zero_new:N { c }
17420   \cs_generate_variant:Nn \int_gzero_new:N { c }

```

(End of definition for `\int_zero_new:N` and `\int_gzero_new:N`. These functions are documented on page 168.)

`\int_set_eq:NN` Setting equal means using one integer inside the set function of another. Check that assigned integer is local/global. No need to check that the other one is defined as TeX does it for us.

```

17421 \cs_new_protected:Npn \int_set_eq:NN #1#2 { #1 = #2 }
17422 \cs_generate_variant:Nn \int_set_eq:NN { c , Nc , cc }
17423 \cs_new_protected:Npn \int_gset_eq:NN #1#2 { \tex_global:D #1 = #2 }
17424 \cs_generate_variant:Nn \int_gset_eq:NN { c , Nc , cc }

```

(End of definition for `\int_set_eq:NN` and `\int_gset_eq:NN`. These functions are documented on page 168.)

`\int_if_exist_p:N` Copies of the `cs` functions defined in `l3basics`.

```

17425 \prg_new_eq_conditional:NNN \int_if_exist:N \cs_if_exist:N
17426 { TF , T , F , p }
17427 \prg_new_eq_conditional:NNN \int_if_exist:c \cs_if_exist:c
17428 { TF , T , F , p }

```

(End of definition for `\int_if_exist:NTF`. This function is documented on page 168.)

### 59.3 Setting and incrementing integers

`\int_add:Nn` Adding and subtracting to and from a counter. Including here the optional `by` would slow down these operations by a few percent.

```

17429 \cs_new_protected:Npn \int_add:Nn #1#2
17430 { \tex_advance:D #1 \__int_eval:w #2 \__int_eval_end: }
17431 \cs_new_protected:Npn \int_sub:Nn #1#2
17432 { \tex_advance:D #1 - \__int_eval:w #2 \__int_eval_end: }
17433 \cs_new_protected:Npn \int_gadd:Nn #1#2
17434 { \tex_global:D \tex_advance:D #1 \__int_eval:w #2 \__int_eval_end: }
17435 \cs_new_protected:Npn \int_gsub:Nn #1#2
17436 { \tex_global:D \tex_advance:D #1 - \__int_eval:w #2 \__int_eval_end: }
17437 \cs_generate_variant:Nn \int_add:Nn { c }
17438 \cs_generate_variant:Nn \int_gadd:Nn { c }
17439 \cs_generate_variant:Nn \int_sub:Nn { c }
17440 \cs_generate_variant:Nn \int_gsub:Nn { c }

```

(End of definition for `\int_add:Nn` and others. These functions are documented on page 168.)

`\int_incr:N` Incrementing and decrementing of integer registers is done with the following functions.

```

17441 \cs_new_protected:Npn \int_incr:N #1
17442 { \tex_advance:D #1 \c_one_int }
17443 \cs_new_protected:Npn \int_decr:N #1
17444 { \tex_advance:D #1 - \c_one_int }
17445 \cs_new_protected:Npn \int_gincr:N #1
17446 { \tex_global:D \tex_advance:D #1 \c_one_int }

```

`\int_gdecr:N`

`\int_gdecr:c`

```

17447 \cs_new_protected:Npn \int_gdecr:N #1
17448   { \tex_global:D \tex_advance:D #1 - \c_one_int }
17449 \cs_generate_variant:Nn \int_incr:N { c }
17450 \cs_generate_variant:Nn \int_decr:N { c }
17451 \cs_generate_variant:Nn \int_gincr:N { c }
17452 \cs_generate_variant:Nn \int_gdecr:N { c }

```

(End of definition for `\int_incr:N` and others. These functions are documented on page 168.)

`\int_set:Nn` As integers are register-based TeX issues an error if they are not defined. While the = sign is optional, this version with = is slightly quicker than without, while adding the optional space after = slows things down minutely.  
`\int_set:cn`

```

17453 \cs_new_protected:Npn \int_set:Nn #1#2
17454   { #1 = \__int_eval:w #2 \__int_eval_end: }
17455 \cs_new_protected:Npn \int_gset:Nn #1#2
17456   { \tex_global:D #1 = \__int_eval:w #2 \__int_eval_end: }
17457 \cs_generate_variant:Nn \int_set:Nn { c }
17458 \cs_generate_variant:Nn \int_gset:Nn { c }

```

(End of definition for `\int_set:Nn` and `\int_gset:Nn`. These functions are documented on page 168.)

## 59.4 Using integers

`\int_use:N` Here is how counters are accessed. We hand-code the c variant for some speed gain.

`\int_use:c`

```

17459 \cs_new_eq:NN \int_use:N \tex_the:D
17460 \cs_new:Npn \int_use:c #1 { \tex_the:D \cs:w #1 \cs_end: }

```

(End of definition for `\int_use:N`. This function is documented on page 169.)

## 59.5 Integer expression conditionals

`\__int_compare_error:` Those functions are used for comparison tests which use a simple syntax where only one set of braces is required and additional operators such as != and >= are supported. The tests first evaluate their left-hand side, with a trailing `\__int_compare_error:`. This marker is normally not expanded, but if the relation symbol is missing from the test's argument, then the marker inserts = (and itself) after triggering the relevant TeX error. If the first token which appears after evaluating and removing the left-hand side is not a known relation symbol, then a judiciously placed `\__int_compare_error:Nw` gets expanded, cleaning up the end of the test and telling the user what the problem was.

```

17461 \cs_new_protected:Npn \__int_compare_error:
17462   {
17463     \if_int_compare:w \c_zero_int \c_zero_int \fi:
17464     =
17465     \__int_compare_error:
17466   }
17467 \cs_new:Npn \__int_compare_error:Nw
17468   #1#2 \s__int_stop
17469   {
17470     { }
17471     \c_zero_int \fi:
17472     \msg_expandable_error:nnn
17473       { kernel } { unknown-comparison } {#1}

```

```

17474     \prg_return_false:
17475 }

```

(End of definition for `\_int_compare_error:` and `\_int_compare_error:Nw.`)

```

\int_compare_p:n
\int_compare:nTF
\int_compare:w
\int_compare:Nw
\int_compare>NNw
\int_compare:nnN
\_int_compare_end_=:NNw
\int_compare_=:NNw
\int_compare_<:NNw
\int_compare_>:NNw
\int_compare_==:NNw
\int_compare_!=:NNw
\int_compare_<=:NNw
\int_compare_>=:NNw

```

Comparison tests using a simple syntax where only one set of braces is required, additional operators such as `!=` and `>=` are supported, and multiple comparisons can be performed at once, for instance `0 < 5 <= 1`. The idea is to loop through the argument, finding one operand at a time, and comparing it to the previous one. The looping auxiliary `\_int_compare:Nw` reads one `<operand>` and one `<comparison>` symbol, and leaves roughly

```

<operand> \prg_return_false: \fi:
\reverse_if:N \if_int_compare:w <operand> <comparison>
\int_compare:Nw

```

in the input stream. Each call to this auxiliary provides the second operand of the last call's `\if_int_compare:w`. If one of the `<comparisons>` is `false`, the `true` branch of the TeX conditional is taken (because of `\reverse_if:N`), immediately returning `false` as the result of the test. There is no TeX conditional waiting the first operand, so we add an `\if_false:` and expand by hand with `\int_value:w`, thus skipping `\prg_return_false:` on the first iteration.

Before starting the loop, the first step is to make sure that there is at least one relation symbol. We first let TeX evaluate this left hand side of the (in)equality using `\_int_eval:w`. Since the relation symbols `<`, `>`, `=` and `!` are not allowed in integer expressions, they would terminate the expression. If the argument contains no relation symbol, `\_int_compare_error:` is expanded, inserting `=` and itself after an error. In all cases, `\_int_compare:w` receives as its argument an integer, a relation symbol, and some more tokens. We then setup the loop, which is ended by the two odd-looking items `e` and `{=nd_}`, with a trailing `\s__int_stop` used to grab the entire argument when necessary.

```

17476 \prg_new_conditional:Npnn \int_compare:n #1 { p , T , F , TF }
17477 {
17478   \exp_after:wN \int_compare:w
17479   \int_value:w \int_eval:w #1 \int_compare_error:
17480 }
17481 \cs_new:Npn \int_compare:w #1 \int_compare_error:
17482 {
17483   \exp_after:wN \if_false: \int_value:w
17484   \int_compare:Nw #1 e { = nd_ } \s__int_stop
17485 }

```

The goal here is to find an `<operand>` and a `<comparison>`. The `<operand>` is already evaluated, but we cannot yet grab it as an argument. To access the following relation symbol, we remove the number by applying `\_int_to_roman:w`, after making sure that the argument becomes non-positive: its roman numeral representation is then empty. Then probe the first two tokens with `\_int_compare>NNw` to determine the relation symbol, building a control sequence from it (`\token_to_str:N` gives better errors if `#1` is not a character). All the extended forms have an extra `=` hence the test for that as a second token. If the relation symbol is unknown, then the control sequence is turned by TeX into `\scan_stop:`, ignored thanks to `\unexpanded`, and `\_int_compare_error:Nw` raises an error.

```

17486 \cs_new:Npn \int_compare:Nw #1#2 \s__int_stop
17487 {

```

```

17488     \exp_after:wN \__int_compare>NNw
17489         \__int_to_roman:w - 0 #2 \s__int_mark
17490     #1#2 \s__int_stop
17491 }
17492 \cs_new:Npn \__int_compare>NNw #1#2#3 \s__int_mark
17493 {
17494     \__kernel_exp_not:w
17495     \use:c
17496     {
17497         \__int_compare_ \token_to_str:N #1
17498         \if_meaning:w = #2 = \fi:
17499         :NNw
17500     }
17501     \__int_compare_error:Nw #1
17502 }

```

When the last  $\langle operand \rangle$  is seen, `\__int_compare>NNw` receives `e` and `=nd_` as arguments, hence calling `\__int_compare_end_=NNw` to end the loop: return the result of the last comparison (involving the operand that we just found). When a normal relation is found, the appropriate auxiliary calls `\__int_compare:nnN` where `#1` is `\if_int_compare:w` or `\reverse_if:N \if_int_compare:w`, `#2` is the  $\langle operand \rangle$ , and `#3` is one of `<`, `=`, or `>`. As announced earlier, we leave the  $\langle operand \rangle$  for the previous conditional. If this conditional is true the result of the test is known, so we remove all tokens and return `false`. Otherwise, we apply the conditional `#1` to the  $\langle operand \rangle$  `#2` and the comparison `#3`, and call `\__int_compare:Nw` to look for additional operands, after evaluating the following expression.

```

17503 \cs_new:cpn { __int_compare_end_=NNw } #1#2#3 e #4 \s__int_stop
17504 {
17505     {#3} \exp_stop_f:
17506     \prg_return_false: \else: \prg_return_true: \fi:
17507 }
17508 \cs_new:Npn \__int_compare:nnN #1#2#3
17509 {
17510     {#2} \exp_stop_f:
17511     \prg_return_false: \exp_after:wN \__int_use_none_delimit_by_s_stop:w
17512     \fi:
17513     #1 #2 #3 \exp_after:wN \__int_compare:Nw \int_value:w \__int_eval:w
17514 }

```

The actual comparisons are then simple function calls, using the relation as delimiter for a delimited argument and discarding `\__int_compare_error:Nw` ( $\langle token \rangle$ ) responsible for error detection.

```

17515 \cs_new:cpn { __int_compare_=NNw } #1#2#3 =
17516     { \__int_compare:nnN { \reverse_if:N \if_int_compare:w } {#3} = }
17517 \cs_new:cpn { __int_compare_<:NNw } #1#2#3 <
17518     { \__int_compare:nnN { \reverse_if:N \if_int_compare:w } {#3} < }
17519 \cs_new:cpn { __int_compare_>:NNw } #1#2#3 >
17520     { \__int_compare:nnN { \reverse_if:N \if_int_compare:w } {#3} > }
17521 \cs_new:cpn { __int_compare_==:NNw } #1#2#3 ==
17522     { \__int_compare:nnN { \reverse_if:N \if_int_compare:w } {#3} = }
17523 \cs_new:cpn { __int_compare_!=:NNw } #1#2#3 !=
17524     { \__int_compare:nnN { \if_int_compare:w } {#3} = }
17525 \cs_new:cpn { __int_compare_<=:NNw } #1#2#3 <=
17526     { \__int_compare:nnN { \if_int_compare:w } {#3} > }

```

```

17527 \cs_new:cpn { __int_compare_>=:NNw } #1#2#3 >=
17528   { __int_compare:nnN { \if_int_compare:w } {#3} < }

```

(End of definition for `\int_compare:nTF` and others. This function is documented on page 170.)

`\int_compare_p:nNn` More efficient but less natural in typing.

```

17529 \prg_new_conditional:Npnn \int_compare:nNn #1#2#3 { p , T , F , TF }
17530   {
17531     \if_int_compare:w __int_eval:w #1 #2 __int_eval:w #3 __int_eval_end:
17532       \prg_return_true:
17533     \else:
17534       \prg_return_false:
17535     \fi:
17536   }

```

(End of definition for `\int_compare:nNnTF`. This function is documented on page 169.)

`\int_if_zero_p:n`

`\int_if_zero:nTF`

```

17537 \prg_new_conditional:Npnn \int_if_zero:n #1 { p , T , F , TF }
17538   {
17539     \if_int_compare:w __int_eval:w #1 = \c_zero_int
17540       \prg_return_true:
17541     \else:
17542       \prg_return_false:
17543     \fi:
17544   }

```

(End of definition for `\int_if_zero:nTF`. This function is documented on page 171.)

`\int_case:nn`

`\int_case:nnTF`

`\__int_case:nnTF`

`\__int_case:nw`

`\__int_case_end:nw`

For integer cases, the first task to fully expand the check condition. The over all idea is then much the same as for `\str_case:nnTF` as described in l3str.

```

17545 \cs_new:Npn \int_case:nnTF #1
17546   {
17547     \exp:w
17548     \exp_args:Nf \__int_case:nnTF { \int_eval:n {#1} }
17549   }
17550 \cs_new:Npn \int_case:nnT #1#2#3
17551   {
17552     \exp:w
17553     \exp_args:Nf \__int_case:nnTF { \int_eval:n {#1} } {#2} {#3} { }
17554   }
17555 \cs_new:Npn \int_case:nnF #1#2
17556   {
17557     \exp:w
17558     \exp_args:Nf \__int_case:nnTF { \int_eval:n {#1} } {#2} { }
17559   }
17560 \cs_new:Npn \int_case:nn #1#2
17561   {
17562     \exp:w
17563     \exp_args:Nf \__int_case:nnTF { \int_eval:n {#1} } {#2} { } { }
17564   }
17565 \cs_new:Npn \__int_case:nnTF #1#2#3#4
17566   { \__int_case:nw {#1} #2 {#1} { } \s__int_mark {#3} \s__int_mark {#4} \s__int_stop }
17567 \cs_new:Npn \__int_case:nw #1#2#3
17568   {

```

```

17569     \int_compare:nNnTF {#1} = {#2}

17574   { \exp_end: #1 #4 }

```

(End of definition for `\int_case:nnTF` and others. This function is documented on page 171.)

`\int_if_odd_p:n` A predicate function.

```

17575 \prg_new_conditional:Npnn \int_if_odd:n #1 { p , T , F , TF}
17576   {
17577     \if_int_odd:w \__int_eval:w #1 \__int_eval_end:
17578       \prg_return_true:
17579     \else:
17580       \prg_return_false:
17581     \fi:
17582   }
17583 \prg_new_conditional:Npnn \int_if_even:n #1 { p , T , F , TF}
17584   {
17585     \reverse_if:N \if_int_odd:w \__int_eval:w #1 \__int_eval_end:
17586       \prg_return_true:
17587     \else:
17588       \prg_return_false:
17589     \fi:
17590   }

```

(End of definition for `\int_if_odd:nTF` and `\int_if_even:nTF`. These functions are documented on page 171.)

## 59.6 Integer expression loops

`\int_while_do:nn` These are quite easy given the above functions. The `while` versions test first and then execute the body. The `do_while` does it the other way round.

```

17591 \cs_new:Npn \int_while_do:nn #1#2
17592   {
17593     \int_compare:nT {#1}
17594     {
17595       #2
17596       \int_while_do:nn {#1} {#2}
17597     }
17598   }
17599 \cs_new:Npn \int_until_do:nn #1#2
17600   {
17601     \int_compare:nF {#1}
17602     {
17603       #2
17604       \int_until_do:nn {#1} {#2}
17605     }
17606   }
17607 \cs_new:Npn \int_do_while:nn #1#2
17608   {
17609     #2

```

```

17610      \int_compare:nT {#1}
17611          { \int_do_while:nn {#1} {#2} }
17612      }
17613 \cs_new:Npn \int_do_until:nn #1#2
17614 {
17615     #2
17616     \int_compare:nF {#1}
17617         { \int_do_until:nn {#1} {#2} }
17618 }

```

(End of definition for `\int_while_do:nn` and others. These functions are documented on page 172.)

`\int_while_do:nNnn`  
`\int_until_do:nNnn`  
`\int_do_while:nNnn`  
`\int_do_until:nNnn`

```

17619 \cs_new:Npn \int_while_do:nNnn #1#2#3#4
17620 {
17621     \int_compare:nNnT {#1} #2 {#3}
17622     {
17623         #4
17624         \int_while_do:nNnn {#1} #2 {#3} {#4}
17625     }
17626 }
17627 \cs_new:Npn \int_until_do:nNnn #1#2#3#4
17628 {
17629     \int_compare:nNnF {#1} #2 {#3}
17630     {
17631         #4

17646 }

```

(End of definition for `\int_while_do:nNnn` and others. These functions are documented on page 172.)

## 59.7 Integer step functions

`\int_step_function:nnN`  
`\_int_step:wwwN`  
`\_int_step:NwnnN`  
`\int_step_function:nN`  
`\int_step_function:nnN`

Before all else, evaluate the initial value, step, and final value. Repeating a function by steps first needs a check on the direction of the steps. After that, do the function for the start value then step and loop around. It would be more symmetrical to test for a step size of zero before checking the sign, but we optimize for the most frequent case (positive step).

```

17647 \cs_new:Npn \int_step_function:nnnN #1#2#3
17648 {

```

```

17649      \exp_after:wN \__int_step:wwwN
17650      \int_value:w \__int_eval:w #1 \exp_after:wN ;
17651      \int_value:w \__int_eval:w #2 \exp_after:wN ;
17652      \int_value:w \__int_eval:w #3 ;
17653    }
17654 \cs_new:Npn \__int_step:wwwN #1; #2; #3; #4
17655  {
17656    \int_compare:nNnTF {#2} > \c_zero_int
17657    { \__int_step:NwnnN > }
17658    {
17659      \int_compare:nNnTF {#2} = \c_zero_int
17660      {
17661        \msg_expandable_error:nnn
17662          { kernel } { zero-step } {#4}
17663        \prg_break:
17664      }
17665      { \__int_step:NwnnN < }
17666    }
17667    #1 ; {#2} {#3} #4
17668    \prg_break_point:
17669  }
17670 \cs_new:Npn \__int_step:NwnnN #1#2 ; #3#4#5
17671  {
17672    \if_int_compare:w #2 #1 #4 \exp_stop_f:
17673      \prg_break:n
17674    \fi:
17675    #5 {#2}
17676    \exp_after:wN \__int_step:NwnnN
17677    \exp_after:wN #1
17678    \int_value:w \__int_eval:w #2 + #3 ; {#3} {#4} #5
17679  }
17680 \cs_new:Npn \int_step_function:nN
17681  { \int_step_function:nnnN { 1 } { 1 } }
17682 \cs_new:Npn \int_step_function:nnN #1
17683  { \int_step_function:nnnN {#1} { 1 } }

```

(End of definition for `\int_step_function:nnnN` and others. These functions are documented on page 173.)

`\int_step_inline:nn`  
`\int_step_inline:nnn`  
`\int_step_inline:nnnn`  
`\int_step_variable:nnN`  
`\int_step_variable:nnNn`  
`\int_step_variable:nnnN`

The approach here is to build a function, with a global integer required to make the nesting safe (as seen in other in line functions), and map that function using `\int_step_function:nnnN`. We put a `\prg_break_point:Nn` so that `map_break` functions from other modules correctly decrement `\g_kernel_prg_map_int` before looking for their own break point. The first argument is `\scan_stop:`, so that no breaking function recognizes this break point as its own.

```

17684 \cs_new_protected:Npn \int_step_inline:nn
17685  { \int_step_inline:nnnn { 1 } { 1 } }
17686 \cs_new_protected:Npn \int_step_inline:nnn #1
17687  { \int_step_inline:nnnn {#1} { 1 } }
17688 \cs_new_protected:Npn \int_step_inline:nnnn
17689  {
17690    \int_gincr:N \g_kernel_prg_map_int
17691    \exp_args:NNc \__int_step:NNnnnn
17692      \cs_gset_protected:Npn

```

```

17693      { __int_map_ \int_use:N \g__kernel_prg_map_int :w }
17694    }
17695  \cs_new_protected:Npn \int_step_variable:nNn
17696    { \int_step_variable:nNn { 1 } { 1 } }
17697  \cs_new_protected:Npn \int_step_variable:nnNn #1
17698    { \int_step_variable:nnNn {#1} { 1 } }
17699  \cs_new_protected:Npn \int_step_variable:nnnNn #1#2#3#4#5
1770    {
1771      \int_gincr:N \g__kernel_prg_map_int
1772      \exp_args:NNc \__int_step:NNnnnn
1773        \cs_gset_protected:Npe
1774        { __int_map_ \int_use:N \g__kernel_prg_map_int :w }
1775        {#1}{#2}{#3}
1776        {
1777          \tl_set:Nn \exp_not:N #4 {##1}
1778          \exp_not:n {#5}
1779        }
1780    }
1781  \cs_new_protected:Npn \__int_step:NNnnnn #1#2#3#4#5#6
1782    {
1783      #1 #2 ##1 {#6}
1784      \int_step_function:nnnN {#3} {#4} {#5} #2
1785      \prg_break_point:Nn \scan_stop: { \int_gdecr:N \g__kernel_prg_map_int }
1786    }

```

(End of definition for `\int_step_inline:nn` and others. These functions are documented on page 173.)

## 59.8 Formatting integers

`\int_to_arabic:n` Nothing exciting here.

```

\int_to_arabic:v
17717 \cs_new_eq:NN \int_to_arabic:n \int_eval:n
17718 \cs_generate_variant:Nn \int_to_arabic:n { v }

```

(End of definition for `\int_to_arabic:n`. This function is documented on page 174.)

`\int_to_symbols:nnn`  
`\__int_to_symbols:nnnn`  
`\__int_to_symbols:ennn`

For conversion of integers to arbitrary symbols the method is in general as follows. The input number (#1) is compared to the total number of symbols available at each place (#2). If the input is larger than the total number of symbols available then the modulus is needed, with one added so that the positions don't have to number from zero. Using an f-type expansion, this is done so that the system is recursive. The actual conversion function therefore gets a ‘nice’ number at each stage. Of course, if the initial input was small enough then there is no problem and everything is easy.

```

17719 \cs_new:Npn \int_to_symbols:nnn #1#2#3
17720  {
17721    \int_compare:nNnTF {#1} > {#2}
17722    {
17723      \__int_to_symbols:ennn
17724      {
17725        \int_case:nn
17726        { 1 + \int_mod:nn { #1 - 1 } {#2} }
17727        {#3}
17728      }
17729      {#1} {#2} {#3}

```

```

17730      }
17731      { \int_case:nn {#1} {#3} }
17732    }
17733 \cs_new:Npn \__int_to_symbols:nnnn #1#2#3#4
17734  {
17735    \exp_args:Nf \int_to_symbols:nnn
17736    { \int_div_truncate:nn {#2 - 1} {#3} } {#3} {#4}
17737    #1
17738  }
17739 \cs_generate_variant:Nn \__int_to_symbols:nnnn { e }

```

(End of definition for `\int_to_symbols:nnn` and `\__int_to_symbols:nnnn`. This function is documented on page [174](#).)

**\int\_to\_alpha:n** These both use the above function with input functions that make sense for the alphabet in English.

```

17740 \cs_new:Npn \int_to_alpha:n #1
17741  {
17742    \int_to_symbols:nnn {#1} { 26 }
17743    {
17744      { 1 } { a }
17745      { 2 } { b }
17746      { 3 } { c }
17747      { 4 } { d }
17748      { 5 } { e }
17749      { 6 } { f }
17750      { 7 } { g }
17751      { 8 } { h }
17752      { 9 } { i }
17753      { 10 } { j }
17754      { 11 } { k }
17755      { 12 } { l }
17756      { 13 } { m }
17757      { 14 } { n }
17758      { 15 } { o }
17759      { 16 } { p }
17760      { 17 } { q }
17761      { 18 } { r }
17762      { 19 } { s }
17763      { 20 } { t }
17764      { 21 } { u }
17765      { 22 } { v }
17766      { 23 } { w }
17767      { 24 } { x }
17768      { 25 } { y }
17769      { 26 } { z }
17770    }
17771  }
17772 \cs_new:Npn \int_to_Alph:n #1
17773  {
17774    \int_to_symbols:nnn {#1} { 26 }
17775    {
17776      { 1 } { A }
17777      { 2 } { B }

```

```

17791      { 16 } { P }
17792      { 17 } { Q }
17793      { 18 } { R }
17794      { 19 } { S }
17795      { 20 } { T }
17796      { 21 } { U }
17797      { 22 } { V }
17798      { 23 } { W }
17799      { 24 } { X }
17800      { 25 } { Y }
17801      { 26 } { Z }
17802    }
17803  }

```

(End of definition for `\int_to_alpha:n` and `\int_to_Alpha:n`. These functions are documented on page 174.)

`\int_to_base:nn`  
`\int_to_Base:nn` Converting from base ten (#1) to a second base (#2) starts with computing #1: if it is a complicated calculation, we shouldn't perform it twice. Then check the sign, store it, either - or `\c_empty_t1`, and feed the absolute value to the next auxiliary function.

```

17804 \cs_new:Npn \int_to_base:nn #1
17805   { \exp_args:Nf \__int_to_base:nn { \int_eval:n {#1} } }
17806 \cs_new:Npn \int_to_Base:nn #1
17807   { \exp_args:Nf \__int_to_Base:nn { \int_eval:n {#1} } }
17808 \cs_new:Npn \__int_to_base:nn #1#2
17809  {
17810    \int_compare:nNnTF {#1} < 0
17811    { \exp_args:No \__int_to_base:nnN { \use_none:n #1 } {#2} - }
17812    { \__int_to_base:nnN {#1} {#2} \c_empty_t1 }
17813  }
17814 \cs_new:Npn \__int_to_Base:nn #1#2
17815  {
17816    \int_compare:nNnTF {#1} < 0
17817    { \exp_args:No \__int_to_Base:nnN { \use_none:n #1 } {#2} - }
17818    { \__int_to_Base:nnN {#1} {#2} \c_empty_t1 }
17819  }

```

Here, the idea is to provide a recursive system to deal with the input. The output is built up after the end of the function. At each pass, the value in #1 is checked to see if it is less than the new base (#2). If it is, then it is converted directly, putting the sign back in front. On the other hand, if the value to convert is greater than or equal to the new

base then the modulus and remainder values are found. The modulus is converted to a symbol and put on the right, and the remainder is carried forward to the next round.

```

17820 \cs_new:Npn \__int_to_base:nnN #1#2#3
17821 {
17822     \int_compare:nNnTF {#1} < {#2}
17823     { \exp_last_unbraced:Nf #3 { \__int_to_letter:n {#1} } }
17824     {
17825         \exp_args:Nf \__int_to_base:nnnN
17826         { \__int_to_letter:n { \int_mod:nn {#1} {#2} } }
17827         {#1}
17828         {#2}
17829         #3
17830     }
17831 }
17832 \cs_new:Npn \__int_to_base:nnnN #1#2#3#4
17833 {
17834     \exp_args:Nf \__int_to_base:nn
17835     { \int_div_truncate:nn {#2} {#3} }
17836     {#3}
17837     #4
17838     #1
17839 }
17840 \cs_new:Npn \__int_to_Base:nnN #1#2#3
17841 {

17856     {#3}
17857     #4
17858     #1
17859 }
```

Convert to a letter only if necessary, otherwise simply return the value unchanged. It would be cleaner to use `\int_case:nn`, but in our case, the cases are contiguous, so it is forty times faster to use the `\if_case:w` primitive. The first `\exp_after:wN` expands the conditional, jumping to the correct case, the second one expands after the resulting character to close the conditional. Since `#1` might be an expression, and not directly a single digit, we need to evaluate it properly, and expand the trailing `\fi:`.

```

17860 \cs_new:Npn \__int_to_letter:n #1
17861 {
17862     \exp_after:wN \exp_after:wN
17863     \if_case:w \__int_eval:w #1 - 10 \__int_eval_end:
17864     a
```

```

17865      \or: b
17866      \or: c

17933 { `\int_to_base:nn {#1} { 8 }` }

(End of definition for `\int_to_bin:n` and others. These functions are documented on page 175.)

`\int_to_roman:n` The `\__int_to_roman:w` primitive creates tokens of category code 12 (other). Usually, what is actually wanted is letters. The approach here is to convert the output of the primitive into letters using appropriate control sequence names. That keeps everything expandable. The loop is terminated by the conversion of the Q.

(End of definition for `\int_to_roman:n` and others. These functions are documented on page 175.)

## 59.9 Converting from other formats to integers

`\__int_pass_signs:wn`  
`\__int_pass_signs_end:wn`

Called as `\__int_pass_signs:wn <signs and digits> \s__int_stop {<code>}`, this function leaves in the input stream any sign it finds, then inserts the `<code>` before the first non-sign token (and removes `\s__int_stop`). More precisely, it deletes any `+` and passes any `-` to the input stream, hence should be called in an integer expression.

```

17970 \cs_new:Npn \__int_pass_signs:wn #1
17971 {
17972     \if:w + \if:w - \exp_not:N #1 + \fi: \exp_not:N #1
17973         \exp_after:wN \__int_pass_signs:wn
17974     \else:
17975         \exp_after:wN \__int_pass_signs_end:wn
17976         \exp_after:wN #1
17977     \fi:
17978 }
17979 \cs_new:Npn \__int_pass_signs_end:wn #1 \s__int_stop #2 { #2 #1 }

```

(End of definition for `\__int_pass_signs:wn` and `\__int_pass_signs_end:wn`.)

`\int_from_alpha:n`  
`\__int_from_alpha:nN`  
`\__int_from_alpha:N`

First take care of signs then loop through the input using the `recursion quarks`. The `\__int_from_alpha:nN` auxiliary collects in its first argument the value obtained so far, and the auxiliary `\__int_from_alpha:N` converts one letter to an expression which evaluates to the correct number.

```

17980 \cs_new:Npn \int_from_alpha:n #1
17981 {
17982     \int_eval:n
17983     {
17984         \exp_after:wN \__int_pass_signs:wn \tl_to_str:n {#1}
17985             \s__int_stop { \__int_from_alpha:nN { 0 } }
17986             \q__int_recursion_tail \q__int_recursion_stop
17987     }
17988 }
17989 \cs_new:Npn \__int_from_alpha:nN #1#2
17990 {
17991     \__int_if_recursion_tail_stop_do:Nn #2 {#1}
17992     \exp_args:Nf \__int_from_alpha:nN
17993         { \int_eval:n { #1 * 26 + \__int_from_alpha:N #2 } }
17994 }
17995 \cs_new:Npn \__int_from_alpha:N #1
17996     { '#1 - \int_compare:nNnTF { '#1 } < { 91 } { 64 } { 96 } } }

```

(End of definition for `\int_from_alpha:n`, `\__int_from_alpha:nN`, and `\__int_from_alpha:N`. This function is documented on page 175.)

`\int_from_base:nn` Leave the signs into the integer expression, then loop through characters, collecting the value found so far in the first argument of `\_int_from_base:nnN`. To convert a single character, `\_int_from_base:N` checks first for digits, then distinguishes lower from upper case letters, turning them into the appropriate number. Note that this auxiliary does not use `\int_eval:n`, hence is not safe for general use.

```

17997 \cs_new:Npn \int_from_base:nn #1#2
17998 {
17999     \int_eval:n
18000     {
18001         \exp_after:wN \_int_pass_signs:wn \tl_to_str:n {#1}
18002         \s_int_stop { \_int_from_base:nnN { 0 } {#2} }
18003         \q_int_recursion_tail \q_int_recursion_stop
18004     }
18005 }
18006 \cs_new:Npn \_int_from_base:nnN #1#2#3
18007 {
18008     \_int_if_recursion_tail_stop_do:Nn #3 {#1}
18009     \exp_args:Nf \_int_from_base:nnN
18010     { \int_eval:n { #1 * #2 + \_int_from_base:N #3 } }
18011     {#2}
18012 }
18013 \cs_new:Npn \_int_from_base:N #1
18014 {
18015     \int_compare:nNnTF { '#1 } < { 58 }
18016     { '#1 }
18017     { '#1 - \int_compare:nNnTF { '#1 } < { 91 } { 55 } { 87 } }
18018 }
```

(End of definition for `\int_from_base:nn`, `\_int_from_base:nnN`, and `\_int_from_base:N`. This function is documented on page 176.)

`\int_from_bin:n` Wrappers around the generic function.

```

18019 \cs_new:Npn \int_from_bin:n #1
18020     { \int_from_base:nn {#1} { 2 } }
18021 \cs_new:Npn \int_from_hex:n #1
18022     { \int_from_base:nn {#1} { 16 } }
18023 \cs_new:Npn \int_from_oct:n #1
18024     { \int_from_base:nn {#1} { 8 } }
```

(End of definition for `\int_from_bin:n`, `\int_from_hex:n`, and `\int_from_oct:n`. These functions are documented on page 175.)

`\c_int_from_roman_i_int` Constants used to convert from Roman numerals to integers.

```

18025 \int_const:cn { c_int_from_roman_i_int } { 1 }
18026 \int_const:cn { c_int_from_roman_v_int } { 5 }
18027 \int_const:cn { c_int_from_roman_x_int } { 10 }
18028 \int_const:cn { c_int_from_roman_l_int } { 50 }
18029 \int_const:cn { c_int_from_roman_c_int } { 100 }
18030 \int_const:cn { c_int_from_roman_d_int } { 500 }
18031 \int_const:cn { c_int_from_roman_m_int } { 1000 }
18032 \int_const:cn { c_int_from_roman_I_int } { 1 }
18033 \int_const:cn { c_int_from_roman_V_int } { 5 }
18034 \int_const:cn { c_int_from_roman_X_int } { 10 }
18035 \int_const:cn { c_int_from_roman_L_int } { 50 }
```

```

18036 \int_const:cn { c__int_from_roman_C_int } { 100 }
18037 \int_const:cn { c__int_from_roman_D_int } { 500 }
18038 \int_const:cn { c__int_from_roman_M_int } { 1000 }

```

(End of definition for `\c__int_from_roman_i_int` and others.)

**\int\_from\_roman:n**  
`\_\_int_from_roman:NN`  
`\_\_int_from_roman_error:w`

The method here is to iterate through the input, finding the appropriate value for each letter and building up a sum. This is then evaluated by TeX. If any unknown letter is found, skip to the closing parenthesis and insert \*0-1 afterwards, to replace the value by -1.

```

18039 \cs_new:Npn \int_from_roman:n #1
18040   {
18041     \int_eval:n
18042       {
18043         (
18044           0
18045           \exp_after:wN \_\_int_from_roman:NN \tl_to_str:n {#1}
18046           \q__int_recursion_tail \q__int_recursion_tail \q__int_recursion_stop
18047         )
18048       }
18049     }
18050 \cs_new:Npn \_\_int_from_roman:NN #1#2
18051   {
18052     \_\_int_if_recursion_tail_stop:N #1
18053     \int_if_exist:cF { c__int_from_roman_ #1 _int }
18054       { \_\_int_from_roman_error:w }
18055     \_\_int_if_recursion_tail_stop_do:Nn #2
18056       { + \use:c { c__int_from_roman_ #1 _int } }
18057     \int_if_exist:cF { c__int_from_roman_ #2 _int }
18058       { \_\_int_from_roman_error:w }
18059     \int_compare:nNnTF
18060       { \use:c { c__int_from_roman_ #1 _int } }
18061       <
18062       { \use:c { c__int_from_roman_ #2 _int } }
18063       {
18064         + \use:c { c__int_from_roman_ #2 _int }
18065         - \use:c { c__int_from_roman_ #1 _int }
18066         \_\_int_from_roman:NN
18067       }
18068     {
18069       + \use:c { c__int_from_roman_ #1 _int }
18070       \_\_int_from_roman:NN #2
18071     }
18072   }
18073 \cs_new:Npn \_\_int_from_roman_error:w #1 \q__int_recursion_stop #2
18074   { #2 * 0 - 1 }

```

(End of definition for `\int_from_roman:n`, `\_\_int_from_roman:NN`, and `\_\_int_from_roman_error:w`. This function is documented on page 176.)

## 59.10 Viewing integer

**\int\_show:N** Diagnostics.  
**\int\_show:c**  
`\_\_int_show:nn`

```
18075 \cs_new_eq:NN \int_show:N \_kernel_register_show:N  
18076 \cs_generate_variant:Nn \int_show:N { c }
```

(End of definition for `\int_show:N` and `\_int_show:nN`. This function is documented on page 176.)

**\int\_show:n** We don't use the TeX primitive `\showthe` to show integer expressions: this gives a more unified output.

```
18077 \cs_new_protected:Npn \int_show:n  
18078 { \_kernel_msg_show_eval:Nn \int_eval:n }
```

(End of definition for `\int_show:n`. This function is documented on page 177.)

**\int\_log:N** Diagnostics.

```
18079 \cs_new_eq:NN \int_log:N \_kernel_register_log:N  
18080 \cs_generate_variant:Nn \int_log:N { c }
```

(End of definition for `\int_log:N`. This function is documented on page 177.)

**\int\_log:n** Similar to `\int_show:n`.

```
18081 \cs_new_protected:Npn \int_log:n  
18082 { \_kernel_msg_log_eval:Nn \int_eval:n }
```

(End of definition for `\int_log:n`. This function is documented on page 177.)

## 59.11 Random integers

**\int\_rand:nn** Defined in `l3fp-random`.

(End of definition for `\int_rand:nn`. This function is documented on page 176.)

## 59.12 Constant integers

**\c\_zero\_int** The zero is defined in `l3basics`.

```
18083 \int_const:Nn \c_zero_int { 1 }
```

(End of definition for `\c_zero_int` and `\c_one_int`. These variables are documented on page 177.)

**\c\_max\_int** The largest number allowed is  $2^{31} - 1$

```
18084 \int_const:Nn \c_max_int { 2 147 483 647 }
```

(End of definition for `\c_max_int`. This variable is documented on page 177.)

**\c\_max\_char\_int** The largest character code is 1114111 (hexadecimal 10FFFF) in XeTeX and LuaTeX and 255 in other engines. In many places pTeX and upTeX support larger character codes but for instance the values of `\lccode` are restricted to [0, 255].

```
18085 \int_const:Nn \c_max_char_int  
18086 {  
18087   \if_int_odd:w 0  
18088     \cs_if_exist:NT \tex_luatexversion:D { 1 }  
18089     \cs_if_exist:NT \tex_XeTeXversion:D { 1 } ~  
18090     "10FFFF  
18091   \else:  
18092     "FF  
18093   \fi:  
18094 }
```

(End of definition for `\c_max_char_int`. This variable is documented on page 177.)

## 59.13 Scratch integers

```
\l_tmpa_int  
\l_tmpb_int  
\g_tmpa_int  
\g_tmpb_int  
18095 \int_new:N \l_tmpa_int  
18096 \int_new:N \l_tmpb_int  
18097 \int_new:N \g_tmpa_int  
18098 \int_new:N \g_tmpb_int
```

(End of definition for `\l_tmpa_int` and others. These variables are documented on page 177.)

## 59.14 Integers for earlier modules

<@@=seq>

```
\l__int_internal_a_int  
\l__int_internal_b_int  
18099 \int_new:N \l__int_internal_a_int  
18100 \int_new:N \l__int_internal_b_int
```

(End of definition for `\l__int_internal_a_int` and `\l__int_internal_b_int`.)

18101 </package>

# Chapter 60

## I3flag implementation

```
18102  <*package>
18103  <@=flag>
```

The following test files are used for this code: *m3flag001*.

### 60.1 Protected flag commands

The height  $h$  of a flag (which is initially zero) is stored by setting control sequences of the form  $\langle\text{flag name}\rangle\langle\text{integer}\rangle$  to  $\text{\relax}$  for  $0 \leq \langle\text{integer}\rangle < h$ . These control sequences are produced by  $\text{\cs:w } \langle\text{flag var}\rangle \langle\text{integer}\rangle \text{\cs_end:}$ , namely the  $\langle\text{flag var}\rangle$  is actually a (protected) macro expanding to its own csname.

**\flag\_new:N** Evaluate the csname of #1 for use in constructing the various indexed macros.

```
18104  \cs_new_protected:Npn \flag_new:N #1
18105    { \cs_new_protected:Npe #1 { \cs_to_str:N #1 } }
18106  \cs_generate_variant:Nn \flag_new:N { c }
```

(End of definition for *\flag\_new:N*. This function is documented on page 180.)

**\l\_tmpa\_flag** Two flag variables for scratch use.

```
18107  \flag_new:N \l_tmpa_flag
18108  \flag_new:N \l_tmpb_flag
```

(End of definition for *\l\_tmpa\_flag* and *\l\_tmpb\_flag*. These variables are documented on page 182.)

**\flag\_clear:N** Undefine control sequences, starting from the 0 flag, upwards, until reaching an undefined control sequence. We don't use  $\text{\cs_undefine:c}$  because that would act globally.

```
18109  \cs_new_protected:Npn \flag_clear:N #1
18110    {
18111      \__flag_clear:wN 0 ; #1
18112      \prg_break_point:
18113    }
18114  \cs_generate_variant:Nn \flag_clear:N { c }
18115  \cs_new_protected:Npn \__flag_clear:wN #1 ; #2
18116  {
18117    \if_cs_exist:w #2 #1 \cs_end: \else:
18118      \prg_break:n
18119    \fi:
```

```

18120      \cs_set_eq:cN { #2 #1 } \tex_undefined:D
18121      \exp_after:wN \__flag_clear:wN
18122      \int_value:w \int_eval:w \c_one_int + #1 ; #2
18123  }

```

(End of definition for `\flag_clear:N` and `\__flag_clear:wN`. This function is documented on page 181.)

`\flag_clear_new:N` As for other datatypes, clear the  $\langle\text{flag var}\rangle$  or create a new one, as appropriate.

```

18124  \cs_new_protected:Npn \flag_clear_new:N #1
18125  { \flag_if_exist:NTF #1 { \flag_clear:N } { \flag_new:N } #1 }
18126  \cs_generate_variant:Nn \flag_clear_new:N { c }

```

(End of definition for `\flag_clear_new:N`. This function is documented on page 181.)

`\flag_show:N` Show the height (terminal or log file) using appropriate l3msg auxiliaries.

```

\flag_show:c
\flag_log:N
\flag_log:c
\__flag_show>NN
18127  \cs_new_protected:Npn \flag_show:N { \__flag_show>NN \tl_show:n }
18128  \cs_generate_variant:Nn \flag_show:N { c }
18129  \cs_new_protected:Npn \flag_log:N { \__flag_show>NN \tl_log:n }
18130  \cs_generate_variant:Nn \flag_log:N { c }
18131  \cs_new_protected:Npn \__flag_show>NN #1#2
18132  {
18133  \__kernel_chk_defined:NT #2
18134  { \exp_args:Ne #1 { \tl_to_str:n { #2 height } = \flag_height:N #2 } }
18135  }

```

(End of definition for `\flag_show:N`, `\flag_log:N`, and `\__flag_show>NN`. These functions are documented on page 181.)

## 60.2 Expandable flag commands

`\flag_if_exist_p:N` Copies of the cs functions defined in l3basics.

```

\flag_if_exist_p:c
18136  \prg_new_eq_conditional:NNn \flag_if_exist:N \cs_if_exist:N
18137  { TF , T , F , p }
\flag_if_exist:cTF
18138  \prg_new_eq_conditional:NNn \flag_if_exist:c \cs_if_exist:c
18139  { TF , T , F , p }

```

(End of definition for `\flag_if_exist:NTF`. This function is documented on page 181.)

`\flag_if_raised_p:N` Test if the flag has a non-zero height, by checking the 0 control sequence.

```

\flag_if_raised_p:c
18140  \prg_new_conditional:Npnn \flag_if_raised:N #1 { p , T , F , TF }
18141  {
18142  \if_cs_exist:w #1 0 \cs_end:
18143  \prg_return_true:
18144  \else:
18145  \prg_return_false:
18146  \fi:
18147  }
18148  \prg_generate_conditional_variant:Nnn \flag_if_raised:N
18149  { c } { p , T , F , TF }

```

(End of definition for `\flag_if_raised:NTF`. This function is documented on page 181.)

**\flag\_height:N** Extract the value of the flag by going through all of the control sequences starting from 0.

```

\__flag_height_loop:wN
\__flag_height_end:wN
18150 \cs_new:Npn \flag_height:N #1 { \__flag_height_loop:wN 0; #1 }
18151 \cs_new:Npn \__flag_height_loop:wN #1 ; #2
18152 {
18153     \if_cs_exist:w #2 #1 \cs_end: \else:
18154         \exp_after:wN \__flag_height_end:wN
18155     \fi:
18156     \exp_after:wN \__flag_height_loop:wN
18157     \int_value:w \int_eval:w \c_one_int + #1 ; #2
18158 }
18159 \cs_new:Npn \__flag_height_end:wN #1 + #2 ; #3 {#2}
18160 \cs_generate_variant:Nn \flag_height:N { c }

```

(End of definition for `\flag_height:N`, `\__flag_height_loop:wN`, and `\__flag_height_end:wN`. This function is documented on page 181.)

**\flag\_raise:N** Change the appropriate control sequence to `\relax` by expanding a `\cs:w ... \cs_end:` construction, then pass it to `\use_none:n` to avoid leaving anything in the input stream.

```

18161 \cs_new:Npn \flag_raise:N #1
18162     { \exp_after:wN \use_none:n \cs:w #1 \flag_height:N #1 \cs_end: }
18163 \cs_generate_variant:Nn \flag_raise:N { c }

```

(End of definition for `\flag_raise:N`. This function is documented on page 181.)

**\flag.ensure\_raised:N** Pass the control sequence with name `\flag_name`0 to `\use_none:n`. Constructing the control sequence ensures that it changes from being undefined (if it was so) to being `\relax`.

```

18164 \cs_new:Npn \flag.ensure_raised:N #1
18165     { \exp_after:wN \use_none:n \cs:w #1 0 \cs_end: }
18166 \cs_generate_variant:Nn \flag.ensure_raised:N { c }

```

(End of definition for `\flag.ensure_raised:N`. This function is documented on page 181.)

## 60.3 Old n-type flag commands

Here we keep the old flag commands since our policy is to no longer delete deprecated functions. The idea is to simply map `\flag_name` to `\l_<flag_name>_flag`. When the debugging code is activated, it checks existence of the N-type flag variables that result.

```

\flag_new:n
\flag_clear:n
\flag_clear_new:n
\flag_if_exist_p:n
\flag_if_exist:nTF
\flag_if_raised_p:n
\flag_if_raised:nTF
    \flag_height:n
    \flag_raise:n
\flag.ensure_raised:n
18167 \cs_new_protected:Npn \flag_new:n #1 { \flag_new:c { l_#1_flag } }
18168 \cs_new_protected:Npn \flag_clear:n #1 { \flag_clear:c { l_#1_flag } }
18169 \cs_new_protected:Npn \flag_clear_new:n #1 { \flag_clear_new:c { l_#1_flag } }
18170 \cs_new:Npn \flag_if_exist_p:n #1 { \flag_if_exist_p:c { l_#1_flag } }
18171 \cs_new:Npn \flag_if_exist:nT #1 { \flag_if_exist:cT { l_#1_flag } }
18172 \cs_new:Npn \flag_if_exist:nF #1 { \flag_if_exist:cF { l_#1_flag } }
18173 \cs_new:Npn \flag_if_exist:nTF #1 { \flag_if_exist:cTF { l_#1_flag } }
18174 \cs_new:Npn \flag_if_raised_p:n #1 { \flag_if_raised_p:c { l_#1_flag } }
18175 \cs_new:Npn \flag_if_raised:nT #1 { \flag_if_raised:cT { l_#1_flag } }
18176 \cs_new:Npn \flag_if_raised:nF #1 { \flag_if_raised:cF { l_#1_flag } }
18177 \cs_new:Npn \flag_if_raised:nTF #1 { \flag_if_raised:cTF { l_#1_flag } }
18178 \cs_new:Npn \flag_height:n #1 { \flag_height:c { l_#1_flag } }

```

```
18179 \cs_new:Npn \flag_raise:n #1 { \flag_raise:c { l_#1_flag } }
18180 \cs_new:Npn \flag_ensure_raised:n #1 { \flag_ensure_raised:c { l_#1_flag } }
```

(End of definition for `\flag_new:n` and others. These functions are documented on page ??.)

`\flag_show:n` To avoid changing the output here we mostly keep the old code.

```
18181 \cs_new_protected:Npn \flag_show:n { \__flag_show:Nn \tl_show:n }
18182 \cs_new_protected:Npn \flag_log:n { \__flag_show:Nn \tl_log:n }
18183 \cs_new_protected:Npn \__flag_show:Nn #1#2
18184 {
18185     \exp_args:Nc \__kernel_chk_defined:NT { l_#2_flag }
18186     {
18187         \exp_args:Ne #1
18188         { \tl_to_str:n { flag~#2~height } = \flag_height:n {#2} }
18189     }
18190 }
```

(End of definition for `\flag_show:n`, `\flag_log:n`, and `\__flag_show:Nn`. These functions are documented on page ??.)

```
18191 </package>
```

# Chapter 61

## I3clist implementation

The following test files are used for this code: *m3clist002*.

18192 ⟨\*package⟩

18193 ⟨@=clist⟩

**\c\_empty\_clist** An empty comma list is simply an empty token list.

18194 \cs\_new\_eq:NN \c\_empty\_clist \c\_empty\_tl

(End of definition for **\c\_empty\_clist**. This variable is documented on page 192.)

**\l\_\_clist\_internal\_clist** Scratch space for various internal uses. This comma list variable cannot be declared as such because it comes before **\clist\_new:N**

18195 \tl\_new:N \l\_\_clist\_internal\_clist

(End of definition for **\l\_\_clist\_internal\_clist**.)
