1. Introduction

The Lua program `xindex` is a unicode aware program for creating an index (`.ind`) file from an `.idx` source file. It is completely compatible to the current `makeindex` program, but can handle UTF-8, 16, 32, and 64. The `LATEX` package `xindex` is a package which provides a `LATEX` command which writes additional text into the index file. This text (comments and/or macros) will be accepted by the program `xindex`.

The general structure of a data element in the Lua table is:

```
data = { Entry = <text>, -- like the input line without command \indexentry
         pages = {
                     { number = <roman/arabic number or text>,
                       special = <macro> }, -- the part after | in the input
                     [...]
                     { number = <roman/arabic number or text>,
                       special = <macro> }
                   },
         sortChar = <unicode codepoint>, -- of the first character of Entry
         Macro    = <TeX macro> -- only useful with LaTeX package xindex
       }
```

After reading the input file the Lua table `pages` has only one element for the number and the so-called special command. When the `pages` are compressed the table will collect all pages which refer to the same entry name.

1.1. Syntax

The syntax is `xindex [...] <file(s)>` where [...] are optional arguments, either in short or long⁷ form which, of course, can be mixed:

```
xindex
  [-q,--quiet ]
  [-h,--help ]
  [-v ]                                verbose
  [-V,--version ]
  [-a,--no_casesensitive ]                default is false
  [-b,--no_labels ]                      default is false
  [-c,--config ]                         default is cfg
  [-e,--escapechar ]                     default is "
  [-f,--fix_hyperref ]                  default is false
  [-g,--no_pagenumber]                  default is false
  [-i,--ignoreSpace ]                   default is false
  [-k,--checklang ]                     default ist false
  [-l,--language ]                      default is en
  [-n,--noheadings ]                    default is false
  [-o,--output ]                        default is <input>.ind
  [-p,--prefix]
```

```
[-s,--use_stdin ]           default is false
[-x,--no_UCA ]             default is false
<files...> (default stdin) file(s)[.idx]  one or more files
```

For example:

 | xindex -q -l fr -b myDoc
xindex -l de -c DIN2 demo1 demo2 demo3
xindex -c norsk -o index.ind demo1 demo2.bdx demo3.adx

1. -q: quiet; -l fr: french language setting; -b: no labels; myDoc: input data myDoc or myDoc.idx
output data will be myDoc.ind and logfile myDoc.ilg
2. -l de: German language setting; -c DIN2: config file xindex-DIN2.lua; demo1 demo2 demo3: input data files with or without extension .idx
output data will be demo1.ind and logfile xindex.ilg
3. -c norsk: config file xindex-norsk.lua; -o index.ind: output file; demo1 demo2.bdx demo3.adx: input data files with or without extension .idx
output data will be xindex.ind and logfile xindex.ilg

It is also possible to use standard input for the index data, which needs the -s parameter:

 | cat myDoc.idx | xindex -q -l fr -b -s xindex -l de -c DIN2 < myDoc.idx

 | The language has to be chosen as an international abbreviation in lower- or uppercase letters, see https://en.wikipedia.org/wiki/ISO_3166-2

1.2. How it works

xindex creates by default an output file <input>.ind which can be read by the L^AT_EX document with the default command \printindex. One can use another output filename, which makes only sense if one doesn't use the \printindex command for typesetting the index. The default sorting is given by the configuration file, which defines replacements for accented characters, like öö.

1.3. The .idx file

There are three (four) characters which must be escaped if used in the command \index: !, @, or | and the current escape character itself. These characters have a special meaning for the index.

 | The default escape character is the double quote ". The braces { and } cannot be used as argument for the command \index. Use \braceLeft and \braceRight instead (defined in the package xindex).

1. Introduction

```
xindex-1.tex
\usepackage{makeidx}\makeindex
\usepackage{xindex}% for \braceLeft|Right

\section{Escaping characters}
\begin{itemize}
\item Exclamation mark ! \index{Exclamation (!)}\index{!}
\item Vertical bar | \index{Vertical bar (|)}\index{|}
\item Doublequote \verb||| \index{""}
\item Double doublequote \verb||"|| \index{"""
\item At character @ \index{At (@)}\index{@}
\item Left paranthesis \{ \index{\braceLeft}
\item Right paranthesis \} \index{\braceRight}
\end{itemize}
\end{itemize}
run \texttt{xindex -l fr <file.idx>}\index{file.idx@\texttt{<file.idx>}|textit}\index{123}
\index{Etage} \index{Étagé}
\twocolumn
\printindex
```

1 Escaping characters

- Exclamation mark !
- Vertical bar |
- Doublequote "
- Double doublequote ""
- At character @
- Left paranthesis {
- Right paranthesis }

run xindex -l fr <file.idx>

Index

| | |
|-----------------|---------------------|
| Symboles | A |
| ”, 1 | At (@), 1 |
| ””, 1 | |
| @, 1 | E |
| !, 1 | Etage, 1 |
| , 1 | Étagé, 1 |
| {, 1 | Exclamation (!), 1 |
| }, 1 | F |
| | <file.idx>, 1 |
| Nombres | V |
| 123, 1 | Vertical bar (), 1 |

It is by design that the braces { and } cannot be used as index entry. The *package* xindex defines the two commands \braceLeft and \braceRight which can be used instead (see examples above and below).

The same example without using unicode sorting (option -x):

```
xindex-2.tex
\usepackage{makeidx}\makeindex
\usepackage{xindex}% for \braceLeft|\braceRight

\section{Escaping characters}
\begin{itemize}
\item Exclamation mark ! \index{Exclamation (!)}\index{!}
\item Vertical bar | \index{Vertical bar (|)}\index{|}
\item Doublequote \verb||| \index{""}
\item Double doublequote \verb||"|| \index{"""
\item At character @ \index{At (@)}\index{@}
\item Left paranthesis \{ \index{\braceLeft}
\item Right paranthesis \} \index{\braceRight}
\end{itemize}
\end{itemize}
```

```
run \texttt{xindex -x <file.idx>}\index{file.idx@\texttt{<file.idx>}|textit}\index{123}
\index{Etage} \index{\`Etag\'e}
\twocolumn
\printindex
```

1 Escaping characters

- Exclamation mark !
- Vertical bar |
- Doublequote "
- Double doublequote ""
- At character @
- Left paranthesis {
- Right paranthesis }

```
run xindex -x <file.idx>
```

Index

| | |
|----------------|---------------------|
| Symbols | A |
| !, 1 | At (@), 1 |
| ”, 1 | E |
| ””, 1 | \`Etag\'e, 1 |
| @, 1 | Etage, 1 |
| {, 1 | Exclamation (!), 1 |
| , 1 | |
| }, 1 | F |
| | <file.idx>, 1 |
| Numbers | V |
| 123, 1 | Vertical bar (), 1 |

For the German language the double quote is an active character and it makes life easier if one chooses another character. The escape character can be changed easily by the optional argument -e "<char>" or --escapechar "<char>". The following example shows how it works for the escape character >><. By default the expression >>< will be a TeX ligature with the output >><.

With the beginning of xindex the escaped chars are converted into the internal strings and later back to the original meaning. The two characters {} cannot be used as {\} inside the argument of \index. The package xindex defines the two helper macros

```
\providecommand\braceLeft{\{}  
\providecommand\braceRight{\}}
```

The following example shows how to use it:

```
\usepackage{xindex}  
\usepackage{makeidx}\makeindex  
  
\section{Escaping characters with >}  
\begin{itemize}  
\item Exclamation mark ! \index{exclaim (>!)}  
\item Vertical bar| \index{Vertical bar (>|)}  
\item Escapechar \verb|>| \index{>>}  
\item Double escapechar \verb|>>| \index{>>>}  
\item At character @ \index{At (>@)}  
\item Group start \{ \index{\braceLeft}  
\item Group end \} \index{\braceRight}  
\end{itemize}  
Run \texttt{xindex} with \texttt{xindex -e ">" -n}\index{<file.idx>}\index{123}  
\newpage  
\printindex
```

xindex-3.tex

2. Language

1 Escaping characters with >

- Exclamation mark !
- Vertical bar |
- Escapechar >
- Double escapechar >>
- At character @
- Group start {
- Group end }

Run xindex with xindex -e ">" -n

Index

- >, 1
- », 1
- {, 1
- }, 1
- <file.idx>, 1
- 123, 1
- At (@), 1
- exclaim (!), 1
- Vertical bar (|), 1

2. Language

The language is only important for the first two headers in the output of the index data. They are by default *Symbols* followed by *Numbers*. In a new version of xindex it will be customizable. The predefined language is »en« and currently the following languages which its alias are defined:

```
<id> = {<symbols>, <numbers>, <alias language name>, ...}
indexheader = {
    cs = {"Symboly", "Čísla", "czech"}, 
    da = {"Symboler", "Tal", "danish"}, 
    de = {"Symbole", "Zahlen", "austrian", "german", "germanb", "ngerman", "naustrian"}, 
    en = {"Symbols", "Numbers", "english", "USenglish", "american", "UKenglish", "british", "canadian", "austrian"}, 
    es = {"Símbolos", "Números", "spanish"}, 
    fr = {"Symboles", "Nombres", "french", "francais", "canadien", "acadian"}, 
    it = {"Simboli", "Numeri", "italian"}, 
    jp = {"シンボル", "番号", "japanese"}, 
    nl = {"Symbolen", "Nummers", "dutch"}, 
    no = {"Symboler", "Tall", "norsk", "nynorsk"}, 
    ru = {"Символы", "Числа", "russian"}, 
}
```

The following example was run with xindex -l it <file>.idx:

xindex-4.tex

```
\usepackage{makeidx}\makeindex

\section{Escaping simboli con >}
\begin{itemize}
\item punto esclamativo ! \index{exclaim (>)!}
\item linea verticale | \index{Vertical bar (>|)}
\item escapechar \verb|>| \index{>>}
\item doppio escapechar \verb|>>| \index{>>>}
\item At siboli @ \index{At (>@)}
\end{itemize}
```

```
Initio \texttt{xindex} con \texttt{xindex -l it -e ">"}\index{123}
\twocolumn \printindex
```

1 Escaping simboli con >

- punto esclamativo !
- linea verticale |
- escapechar >
- doppio escapechar >>
- At simboli @

Initio xindex con xindex -l it -e ">"

Indice analitico

| | |
|----------------|---------------------|
| Simboli | A |
| >, 1 | At (@), 1 |
| », 1 | |
| | E |
| | exclaim (!), 1 |
| Numeri | V |
| 123, 1 | Vertical bar (), 1 |

The following example was run with xindex -k <file>.idx. In this case xindex tries to detect the language from the aux file(s). This is only possible if package babel or polyglossia are used.

```
\usepackage[dutch]{babel} % !!
\usepackage{makeidx}\makeindex

\section{Escaping characters with ?}
\begin{itemize}
\item Exclamation mark ! \index{exclaim (?!)}
\item Vertical bar| \index{Vertical bar (?|)}
\item Escapechar \verb|?| \index{??}
\item Double escapechar \verb|??| \index{????}
\item At character @ \index{At (@)}\index{@}
\end{itemize}
Run \texttt{xindex} with \texttt{xindex -k -e "?"}\index{123}
\twocolumn\index{xindex@\texttt{xindex}}
\printindex
```

xindex-5.tex

1 Escaping characters with ?

- Exclamation mark !
- Vertical bar|
- Escapechar ?
- Double escapechar ??
- At character @

Run xindex with xindex -k -e "?"

Index

| | |
|-----------------|---------------------|
| Symbolen | A |
| ? , 1 | At (@), 1 |
| ??, 1 | |
| @, 1 | E |
| | exclaim (!), 1 |
| Nummers | V |
| 123, 1 | Vertical bar (), 1 |

For the russian language you have to choose the language and the config file. This allows to have different indexes with different language.

```
\usepackage[russian]{babel}
\usepackage{fontspec}
```

2. Language

```
xindex-6.tex
\usepackage[regular]{newcomputermodern}
\defaultfontfeatures{Ligatures=TeX}
\usepackage{xindex}\makeindex % run with xindex -l RU -c RU <file>
\begin{tabular}{ll}
Хвойные: & \verb|\index{Хвойные} | \index{Хвойные} \\
\quad торрея, &
\verb|\index{Хвойные!тисовые!торрея (Torreya)}|%
\index{Хвойные!тисовые!торрея (Torreya) }\\
\quad тис ягодный, &
\verb|\index{Хвойные!тисовые!тис!ягодный (Táxus baccata)}|%
\index{Хвойные!тисовые!тис!ягодный (Táxus baccata) }\\
\quad ливанский кедр, &
\verb|\index{Хвойные!сосновые!кедр!ливанский (Cedrus libani)}|%
\index{Хвойные!сосновые!кедр!ливанский (Cedrus libani) }\\
\quad ель обыкновенная. &
\verb|\index{Хвойные!сосновые!ель!обыкновенная (Pícea ábies)}|%
\index{Хвойные!сосновые!ель!обыкновенная (Pícea ábies)}\[2ex]
Под колючей ежевикой & \verb|\index{Ежевика (Rúbus)}|%
\index{Ежевика (Rúbus)}\\
\end{tabular}
\printindex % xindex -l RU -c RU -n <file>
```

| | |
|----------------------|---|
| Хвойные: | \index{Хвойные} |
| торрея, | \index{Хвойные!тисовые!торрея (Torreya)} |
| тис ягодный, | \index{Хвойные!тисовые!тис!ягодный (Táxus baccata)} |
| ливанский кедр, | \index{Хвойные!сосновые!кедр!ливанский (Cedrus libani)} |
| ель обыкновенная. | \index{Хвойные!сосновые!ель!обыкновенная (Pícea ábies)} |
| Под колючей ежевикой | \index{Ежевика (Rúbus)} |
| жил ушастый ёж. | \index{Ёж!ушастый (Hemiechinus auritus)} |

Предметный указатель

| | |
|------------------------------------|-------------------------------------|
| Ёж | — — — обыкновенная (Pícea ábies), 1 |
| — ушастый (Hemiechinus auritus), 1 | — — — кедр |
| Ежевика (Rúbus), 1 | — — — ливанский (Cedrus libani), 1 |
| | — — — тисовые |
| Хвойные, 1 | — — — тис |
| — сосновые | — — — ягодный (Táxus baccata), 1 |
| — — ель | — — — торрея (Torreya), 1 |

3. Sorting

3.1. Default sorting by the UCA (Unicode Collection Algorithm)

This Lua library from Michal Hoftich is part of TeXLive and is used by default for sorting. The supported languages and variants are listed in the file `lua-uca-languages.lua`:

```
af, am, ar, as, az, be, bg, bn, bs, bs_cyrl, ca, chr, cs, cy, da, de, de_din2, dsb, dz, ee, el, en,
eo, es, et, fa, fi, fil, fo, fr, fr_backward_accents, ga, gl, gu, ha, haw, he, hr, hi, hsb, hu, hy,
id, ig, is, it, ja, ka, kk, kl, km, kn, ko, kok, ky, lb, lkt, ln, lo, lt, lv, mk, ml, mn, mr, ms, mt,
my, nb, ne, nl, nn, no, om, pa, pl, ps, pt, ro, ru, se, si, sk, sl, smn, sq, sr, sr_latn, sv, sw, ta,
te, th, tk, to, tr, ug, uk, ur, uz, vi, vo, wae, wo, yi, yo, zh, zu
```

The sorting order can be easily modified. Read the documentation of the package LUA-UCA on how to do it and what languages are supported so far. Any additional code setting for UCA should be done in the file `xindex-cfg-uca.lua`, which will automatically be read by `xindex`.

If possible, you should use the Unicode sorting by default and only for some special cases where you define your own sorting scheme, you should use the `-x` option.

```
\usepackage{multicol}
\usepackage{makeidx}\makeindex
\def\Index{\#1{\#1\index{\#1}}}

Sorted with \verb|-l cs|
\Index{ahoj} \Index{crha}, \Index{čaj}, \Index{chachar},
\Index{rak}, \Index{řeka}, \Index{srp}, \Index{šutr},
\Index{hudba}, \Index{linux}, \Index{zebra},
\Index{žába}, \Index{7 dubů}
\begin{multicols}{2} \printindex \end{multicols}
```

Sorted with `-l cs` ahoj crha, čaj, chachar,
rak, řeka, srp, šutr, hudba, linux, zebra,
žába, 7 dubů

| Index | | xindex-7.tex |
|-----------|------------|----------------------|
| L | linux, 1 | |
| A | ahoj, 1 | R rak, 1 |
| C | crha, 1 | Ř řeka, 1 |
| Č | čaj, 1 | S srp, 1 |
| H | hudba, 1 | Š šutr, 1 |
| Ch | chachar, 1 | Z zebra, 1 |

Modifications can be done in a config file which is then loaded by the option `-c`. For example: the file `xindex-cfg-uca.lua` has modification for french and norwegian. For french the standard sorting rules `fr_backward_accents`, are a bit special and should be the default also for the language `fr`:

3. Sorting

```
languages.fr = function(collator_obj)
    -- reverse search for accents in French (recommended):
    collator_obj.accents_backward = true
    local tailoring = function(s) collator_obj:tailor_string(s) end
    tailoring("&æ=ae")
    tailoring("&œ=oe")
    tailoring("&th<þ<<þ")      -- Canadian, see SGQRI004.pdf
    return collator_obj
end
```

Add any additional modifications to this file or create an own config file and load it with -c.

3.2. Default sorting by a character table

This sorting is not completely unicode aware. It uses a translation table for accented characters, which should only be used if the standard sorting method with UCA is not possible! This kind of sortierung has to be choosed by the option -x (don't use UCA). The option -u for using UCA is deprecated, because using UCA is the default.

Again, if one wants to use an own transformation table, then use something like:

```
alphabet_lower = { -- for sorting
    { ' ' }, -- only for internal tests
    { 'a', 'á', 'à', 'ä' },
    { 'b' },
    { 'c' },
    { 'd' },
    { 'e', 'é', 'è', 'ë' },
    { 'f' },
    { 'g' },
    { 'h' },
    { 'i', 'í', 'ì', 'ï' },
    { 'j' },
    { 'k' },
    { 'l' },
    { 'm' },
    { 'n', 'ñ' },
    { 'o', 'ó', 'ò', 'ö' },
    { 'p' },
    { 'q' },
    { 'r' },
    { 's' },
    { 't' },
    { 'u', 'ú', 'ù', 'ü' },
    { 'v' },
    { 'w' },
    { 'x' },
    { 'y' },
    { 'z' } }
```

```
}
```

There is also a table for the uppercase letters. If it should be edited or extended then copy first the base configuration file `xindex-cfg.lua` and modify that new file. It can be used by `xindex` with the optional argument `-c newfile` if it is named as `xindex-newfile.lua`. For German there already exists a configuration file `xindex-DIN2.lua` which uses the so-called »Telefonbuchsortierung« which converts the umlauts like öoe:

```
alphabet_upper = { -- for sorting
  { ' ' },
  { 'A', 'Á', 'À', 'Ä' },
  { 'B' },
  { 'C' },
  { 'D' },
  { 'E', 'È', 'È', 'ë' },
  { 'F' },
  { 'G' },
  { 'H' },
  { 'I', 'Í', 'Ì', 'í' },
  { 'J' },
  { 'K' },
  { 'L' },
  { 'M' },
  { 'N', 'Ñ' },
  { 'O', 'Ó', 'Ò', 'Ö' },
  { 'P' },
  { 'Q' },
  { 'R' },
  { 'S' },
  { 'T' },
  { 'U', 'Ú', 'Ù', 'Ü' },
  { 'V' },
  { 'W' },
  { 'X' },
  { 'Y' },
  { 'Z' }
}
```

3. Sorting

3.3. Examples

3.3.1. German language and no UCA

```
xindex-8.tex
\usepackage{makeidx}\makeindex
\newcommand\Index[1]{\index{#1}#1}

Sorted with \verb|-l DE -x|\par
\Index{Österreich} \Index{Öresund}
\Index{Ostern} \Index{Ober}
\Index{Oberin} \Index{Österreich}
\Index{Öresund} \Index{Ostern}
\Index{Ober} \Index{Oberin}
\Index{Obstler} \Index{Öl}
\Index{ölen} \Index{Ödem}
\Index{Oligarch} \Index{Oder}
\Index{oder} \index{Fluss!Oder}
\index{Oder|seealso{Fluss}}
\Index{Göbel} \Index{Goethe}
\Index{Göthe} \Index{Götz}
\Index{Goldmann}

\printindex
```

Index

| | |
|-------------|----------------------------------|
| F | Oberin, 1 |
| Fluss | Obstler, 1 |
| - Oder, 1 | Ödem, 1 |
| G | oder, 1 |
| Göbel, 1 | Oder, 1, <i>siehe auch</i> Fluss |
| Goethe, 1 | Öl, 1 |
| Goldmann, 1 | ölen, 1 |
| Göthe, 1 | Oligarch, 1 |
| Götz, 1 | Öresund, 1 |
| O | Ostern, 1 |
| Ober, 1 | Österreich, 1 |

3.3.2. German language (DIN2) and no UCA

In this case a letter Ö, Ä, Ü, ö, ä, ü is converted to Oe, Ae, Ue, oe, ae, ue before sorting:

```
xindex-9.tex
\usepackage{makeidx}\makeindex
\newcommand\Index[1]{\index{#1}#1}

Sorted with
\verb|--config DIN2 -l DE -x|\par
\Index{Österreich} \Index{Öresund}
\Index{Ostern} \Index{Ober}
\Index{Oberin} \Index{Österreich}
\Index{Öresund} \Index{Ostern}
\Index{Ober} \Index{Oberin}
\Index{Obstler} \Index{Öl}
\Index{ölen} \Index{Ödem}
\Index{Oligarch} \Index{Oder}
\Index{oder} \index{Fluss!Oder}
\index{Oder|seealso{Fluss}}

3. Sorting

3.3.4. German language (DIN2) with UCA

The same sorted with the German DIN variant 2. It uses also the config file with `--config DIN2`, but sets the language internally to `de_din2` for UCA and do not use the character tables:

| xindex-11.tex | Index |
|--|--|
| <pre>\usepackage{makeidx}\makeindex \newcommand\Index[1]{\index{#1}#1}</pre> | F |
| <pre>Sorted with \verb --config DIN2 -l DE </pre> | Fluss - Oder, 1 |
| <pre>\Index{Österreich} \Index{Öresund} \Index{Ostern} \Index{Ober} \Index{Oberin} \Index{Österreich} \Index{Öresund} \Index{Ostern} \Index{Ober} \Index{Oberin} \Index{Obstler} \Index{Öl} \Index{ölen} \Index{Ödem} \Index{Oligarch} \Index{Oder} \Index{oder} \index{Fluss!Oder} \index{Oder seealso{Fluss}} \Index{Göbel} \Index{Goethe} \Index{Göthe} \Index{Götz} \Index{Goldmann}</pre> | G Göbel, 1 Goethe, 1 Goldmann, 1 O Ober, 1 |
| <pre>\printindex</pre> | Oberin, 1 Obstler, 1 Ödem, 1 oder, 1 Oder, <i>siehe auch</i> Fluss, 1 Öl, 1 ölen, 1 Oligarch, 1 Öresund, 1 Ostern, 1 Österreich, 1 |

3.3.5. Japanese language with UCA

The following runs with `xindex -l jp <file>`:

```
\usepackage{fontspec}
\setmainfont{SourceHanSans}
\usepackage[japanese]{babel}
\addto\captionsjapanese{\def\indexname{指數}}
\usepackage{hvindex}% for \Index
\usepackage{makeidx}\makeindex
```

```
\Index{車} \Index{車道} 日本\index{日本\fbox} \Index{病院} \Index{コンピュータ}
\Index{プリント} \Index{印刷} \Index{スイミングプール} \Index{天王} \Index{広島}
\Index{ドイツ} \Index{日本} \Index{ワープロ}
\Index{foo} und \Index{bar} \Index{//}
\newpage\printindex
```

指數

| | |
|--------------|--|
| シンボル | と |
| //, 1 | ドイツ, 1 |
| 番号 | ふ |
| 4711, 1 | プリント, 1 |
| B | わ |
| bar, 1 | ワープロ, 1 |
| F | 印刷, 1 |
| foo, 1 | 天王, 1 |
| こ | 広島, 1 |
| コンピュータ, 1 | 日本, 1, 1 |
| す | 病院, 1 |
| スイミングプール, 1 | 車, 1 |
| xindex-2.tex | 車道, 1 |

3.4. Case sensitive index entries

By default foo and Foo are two different entries and will be handled differently by `xindex`: Foo will be as an own entry *before* foo. Let's see a more complex example. In the index the entry `xindex-DIN2.lua` is the first one of the `xindex-???` series because uppercase letters are sorted before lowercase letters.

3. Sorting

xindex-13.tex

```
\usepackage{makeidx}
\usepackage{hyperref}

foo\newpage
\printindex
```

Index

X

xindex package, 2, 15
xindex program, 4, 13f
xindex-cfg-common.cfg file, 9
xindex-cfg-common.lua file, 14
xindex-cfg.lua file, 6, 10
xindex-DIN2.lua file, 6
xindex-dtk.lua file, 12
xindex-HAdW-eKO.lua file, 10
xindex-newfile.lua file, 6

The same example sorted with the `-a` or `--no_casesensitive` has another output: now `xindex-cfg-common.lua` is the first one of the `xindex-???` series.

xindex-14.tex

```
\usepackage{makeidx}
\usepackage{hyperref}

foo\newpage
\printindex
```

Index

X

xindex package, 2, 15
xindex program, 4, 13f
xindex-cfg-common.cfg file, 9
xindex-cfg-common.lua file, 14
xindex-cfg.lua file, 6, 10
xindex-DIN2.lua file, 6
xindex-dtk.lua file, 12
xindex-HAdW-eKO.lua file, 10
xindex-newfile.lua file, 6

3.5. Ignore space for sorting

By default »alpha sort« will be sorted *before* »alphaA«:

xindex-15.tex

```
\usepackage{makeidx}\makeindex
% default sorting

Test
\index{alpha sort}\index{alphaA}
\newpage
\printindex
```

Index

A

alpha sort, 1
alphaA, 1

This can be changed with the optional argument `-i` or `--ignoreSpace`:

```
\usepackage{makeidx}\makeindex
% sort with xindex -i <file>
```

```
Test
\index{alpha sort}\index{alphaA}
\newpage
\printindex
```

Index

A
alphaA, 1
alpha sort, 1

4. Pagenumbers

4.1. Compressing pagenumber series

By default page sequences of an entry are compressed to

8f page 8 and 9

8ff page 8, 9, and 10

8-12 page 8, 9, ..., 12

The so-called folio abbreviation is language dependent and defined in the file `xindex-cfg-common.cfg`:

```
\usepackage[french]{babel}
\usepackage{makeidx}\makeindex
```

Sorted with `\verb|-l fr|`

```
foobar\index{foobar|()
foo\index{foo}\index{bar}\index{baz}\newpage
foo\index{foo}\index{bar}\index{baz}\newpage
foo\index{bar}\index{baz}\newpage
foo\index{baz}\newpage
foo\index{foo}foobar\index{foobar|)}
\newpage
\printindex
```

Index

B
bar, 1 sqq.
baz, 1–4

F
foo, 1 sq., 5
foobar, 1–5

4.2. Modify Pagenumber

Every page can be combined with an additional macro, like `\index{foo|fbox}`, the page number will be set into a framebox. If we have on the same page the two commands:

```
foo\index{foo} and foo\index{foo|bar}
```

4. Pagenumbers

then we have two *different* index entries which will not be compressed to one entry. In the following example we have four different entries for *foo* which is the reason that we do not get an output like *foo, 1--4*. Only the first two entries are of the same type, so we get *1f* in the output.

xindex-18.tex

```
\usepackage{makeidx}\makeindex
```

```
Ein foo\index{foo} \newpage und \index{foo}  
ein foo\index{foo|textit} \newpage  
und foo\index{foo|textbf} \newpage  
und foo\index{foo|fbox}  
  
\newpage  
\printindex
```

Index

F
foo, 1f, 2, 3, 4

4.3. Suppress Pagenumber

Instead of printing an index in the default way, one can also print a glossary without the pagenumbers. This is possible with the optional argument *-g* which is equivalent to the long form *--no_pagenumber*. The following example uses an own config file for the definition of the *description* environment:

```
itemPageDelimiter = ""  
compressPages      = true  
fCompress         = false  
minCompress       = 2  
rangeSymbol       = "--"  
numericPage       = true  
sublabels          = {"", "\item", "\item", "\item"}  
pageNoPrefixDel   = ""  
idxnewsletter     = "\textbf"  
envStart           = "\begin{description}"  
indexOpening       = "\makeatletter\z  
                      \def\subitem{\@idxitem} \def\subsubitem{\@idxitem}\z  
                      \def\subsubsubitem{\@idxitem}\z  
                      \makeatother\z  
                      \itemsep 0.1ex" -- commands after envStart  
envStop            = "\end{description}"
```

```
\usepackage[english]{babel}  
\usepackage[imakeidx]{xindex}% run xindex internally  
\makeindex  
\makeindex[name=gls, options= -c description -n --no_pagenumber]
```

xindex-19.tex

Abbreviations:

```
XAS,\index{XAS --- X-ray absorption spectroscopy.}
XAFS,\index{XAFS --- Extended x-ray absorption fine structure.}
EXAFS,\index{EXAFS --- Extended x-ray absorption fine structure.}
XANES,\index{XANES --- X-ray absorption near edge structure.}
PES,\index{PES --- Photo emission spectroscopy.}

5. The config file

The main config file is `xindex-cfg.lua` and used by default. A new config file must have the prefix `xindex-` and the file extension `.lua`, for example: `xindex-HAdW-eK0.lua` which can be used with `--config HAdW-eK0`. The file must be saved in the documents directory or in one which is known to kpsewhich, for example¹ `$TEXMFLOCAL/tex/lualatex/xindex/` Do not forget to update the filename database.

A new config file must declare at least the variables which are part of the default config file: the translation tables and

```
itemPageDelimiter = ","      -- Hello, 14
compressPages     = true
-- something like 12--15, instead of 12,13,14,15. the |( ... |) syntax is still valid
fCompress       = true      -- 3f -> page 3, 4 and 3ff -> page 3, 4, 5
minCompress     = 3         -- 14--17
rangeSymbol     = "--"
numericPage     = true      -- for non numerical pagenumbers, like "VI-17"
sublabels       = {"", "-\\-", "--\\-", "---\\-"}
-- for the sub(sub(sub-items, first one is empty
pageNoPrefixDel = ""       -- a delimiter for page numbers like "VI-17" -- not used !!!
indexOpening    = ""       -- commands/text after \begin{theindex}
```

¹The directory `xindex` must be created before saving the file.

The new config file can define own functions for compressing the pagelist for a given entry and for the formatting of the output. They must be called `specialCompressPageList` and `specialGetPageList`.

For example:

```

function specialCompressPageList(pages)
    if (pages[1]["number"] == "") then pages[1]["number"] = " " end
    if (#pages <= 1) then
        pages[1]["number"] = pages[1]["number"]:gsub('-',':~')-- replace "-" with ":~"
        return pages
    end -- only one pageno
    local sortPages = {}
    local roman
    local volume
    local page
    local i
    for i=1,#pages do
        roman = string.gsub(pages[i]["number"],'%U*', '') -- only uppercase to catch VII/1-123f and VII/3-
        123ff (folium pages)
        if romanToNumber(roman) then
            roman = string.format("%05d",tonumber(romanToNumber(roman))) -- only roman part VII
        else
            roman = ""
        end
        volume = string.gsub(pages[i]["number"],'%a*','') -- only the number /2 123 or /2-123
        if volume then volume = volume:gsub('-%d*','') end -- delete - char to get /2
        page = string.gsub(pages[i]["number"],'.*-','')
        page = string.format("%5s",page)
        sortPages[#sortPages+1] = {
            origin = pages[i],
            sort = roman..volume.." "..page } -- no minus between Roman/Volume and first page
    end
    table.sort(sortPages, function(a,b) return a["sort"] < b["sort"] end )
    [...]
    return pages
end
end

```

The above code is a special function which can handle page numbers like VII-17, VIII/2/1-186. Internally exists a function `compressPageList` which is used if no `specialCompressPageList` is defined.

```
\usepackage{makeidx}
\mbox{}\printindex
```

5. The config file

Personenverzeichnis

| | | | |
|---|--------------------------------------|----------------------------|--|
| A | | K | |
| Aachen, Johannes von | VII/1 : 215 | Karl | |
| Aarones | VII/2/1 : 1003, 1012 | - II., Kaiser | VII/1 : 147 |
| Abrahamson | VII/2/1 : 864, 991, 1048, 1067, 1156 | - III., Kaiser | VII/1 : 149 |
| Adamson | VII/2/1 : 1223, IX/1 : 1228 | - IV., Kaiser | VI/1 : 12, VII/1 : 34, 147 |
| Adrian | | - V., Kaiser | VI/1 : 84, 284, 654, VI/2 : 708, 1014, 1043, 1131, 1210, VII/1 : 34 |
| - Hauster | VII/1 : 514, XI/1 : 515 | - VI., Kaiser | VII/1 : 296 |
| Alting | | - IX., Kaiser | VII/1 : 296 |
| - Mensa | VII/1 : 426, 434, 453, 455, 466f. | - X., Kaiser | VII/1 : 149 |
| B | | - der Große, Kaiser | VI/2 : 987, 989, 1028 |
| Braunschweig-Wolfenbüttel | | O | |
| - Karl Viktor von, Herzog | VI/1 : 83 | Osnabrück | |
| Bremen | | - Heinz von, Bischof | see Sachsen-Lauenburg |
| - Heinz von, Erzbischof | see Sachsen-Lauenburg | S | |
| J | | Schleswig-Holstein | |
| Julian | | - Rudolf von, Herzog | VII/2/1 : 758–761, 765 |
| - Apostata, römischer Kaiser | VII/2/1 : 904 | Z | |
| Justinian I., byzantinischer Kaiser | VII/1 : 326, 734, VII/2/1 : 1011 | Zwingl, Haldrich | IX : 479, 692 |

The .idx file of the above example looks like

```
\indexentry{Karl!V., Kaiser}{VI/2-1210}
\indexentry{Braunschweig-Wolfenbüttel!Karl Viktor von, Herzog}{VI/1-83}
\indexentry{Schleswig-Holstein!Rudolf von, Herzog}{VII/2/1-758}
\indexentry{Schleswig-Holstein!Rudolf von, Herzog}{VII/2/1-759}
[...]
```

The config file xindex-dtk.lua defines a special page output:

```
function specialGetPageList(v,hyperpage) -- Entry table, boolean
    local Pages = {}
    [...]
    if (Pages[1]["special"] == nil) or (Pages[1]["number"] == nil) then return "" end
    if #Pages == 1 then
        return "\relax"..Pages[1]["number"].."\\@nil"
    else
        pageNo = "\relax"..Pages[1]["number"]
        for i=2,#Pages do
            if Pages[i]["number"] then
                pageNo = pageNo..", "..Pages[i]["number"].."\\@nil"
                Pages[i] = {}
            end
        end
    end
end
```

```
[...]
end
```

The following example runs `xindex -c dtk -l de -n <input>` and the `.idx` file looks like

```
\indexentry{BährendtsenElke@Elke Bährendtsen!Email {elke"@xyz.de}}{14}
\indexentry{JacekJonasson Jared@Jonasson Jared Jazek!Email {mail"@jones.net}}{20}
[...]
```

xindex-21.tex

```
\usepackage{makeidx}

\mbox{} \label{president}
\printindex
```

The following example fixes a problem with `hyperref` and escaping the | character, e.g. "|". In such a case `hyperref` ignores the vertical bar. With the optional parameter `-f` | `--fix_hyperref`, which is still experimental, `xindex` tries to fix this problem. However, instead of using this problematic vertical character, you can use `\textbar`, which also solves the problem.

```
xindex-24.tex

7. Including L^AT_EX commands into the .idx file

The command `\addtocontents` doesn't work for the index file. With the L^AT_EX package `xindex` (same name as the Lua program `xindex`) defines a macro `\writeidx` which writes its argument into the `.idx` file. This can be useful to insert a pagebreak/columnbreak before a new letter in the output of the index file:

```
\documentclass{article}
\usepackage{makeidx}
\makeindex
\usepackage{xindex}
\begin{document}

\index{foo}foo and
\writeidx{\clearpage}
\index{bar}bar

\printindex
\end{document}
```

Such commands are then taken into account by the program `xindex`. With the often used program `makeindex` such commands are ignored. In the following example we put an horizontal line after the first entry:

```
\usepackage{xindex}
\makeindex

\index{foo}foo and
\writeidx{\item\protect\hrulefill}
\index{bar}bar
\index{gex}gex
\printindex
```

xindex-25.tex

8. Headings

Index

B

bar, 1

F

foo, 1

G

gex, 1

8. Headings

By default the output uses the English headings: *Symbols*, *Numbers*, and *A* ...There are three predefined languages `en`, `de`, and `fr`. The definition is in the file `xindex-cfg-common.lua` (see also section [2 on page 8](#)). It can easily be extended for other languages. Sometimes the headers are not needed, for example in a name list. With the optional argument `-n` or `--noheadings` the created `.ind` file has only the vertical space between different first letters:

`xindex-26.tex`

```
\usepackage{makeidx}\makeindex

Ein foo\index{foo}\index{bar|()}
\newpage und \index{foo}
ein foo\index{foo|textit} \newpage
und foo\index{foo|textbf} \newpage
und foo\index{foo|fbox}
\index{bar|})
\newpage
\verb|xindex -n <file>|
\printindex
```

`xindex -n <file>`

Index

bar, 0–4

The headings are printed by default as `\textbf`. This can be changed in the config file by setting the variable `idxnewsletter`, for example: `idxnewsletter = "\textit"`. If you need some more code here then define an own macro for it, which can be seen in the following example. It has an own config file `xindex-header.lua` which has the line

```
idxnewsletter = "\idxnewsletter"
```

In the documents preamble there is the definition:

```
\newcommand{\idxnewsletter[1]{\textbf{\textit{#1}}}}
```

```
æšžŒŠÝŽ
\usepackage{makeidx}\makeindex
\newcommand{\idxnewsletter[1]{\textbf{\textit{#1}}}}
```

æšžŒŠÝŽ
section{Escaping characters}
begin{itemize}
item Exclamation mark ! \index{exclaim ("!)}
item Vertical bar| \index{Vertical bar ("|)}
item Doublequote \verb|"| \index{""}
item Double doublequote \verb||"|| \index{"""}
item At character @ \index{At ("@)}
end{itemize}
run \verb|xindex -c header <file.idx>|
\index{<file.idx>}@\texttt{<file.idx>}
\index{123}
\newpage \printindex

Index

Symbols

”, 1
””, 1
<file.idx>, 1

Numbers

123, 1

A

At (@), 1

E

exclaim (!), 1

V

Vertical bar (|), 1

xindex-27.tex

9. Automatic index creation

With package `xindex` one can define several different index files, e.g. an index of names. With the optional argument `imakeidx` the package itself loads `imakeidx` and adds the program `xindex` as the default program to `imakeidx`.

xindex-28.tex

```
\usepackage{imakeidx}{xindex}
\makeindex[name=persons,title=Index of names,
           columns=1,options= --noheadings]
\def\ThanhVN{\H{\`a}n Th{\`e}}\protect\llap{%
  \raise 0.5ex\hbox{\{'\}}}}
\begin{document}
foo\index[persons]{Niepraschk,~ Rolf}
foo\index[persons]{Lamport,~ Leslie}
foo\index[persons]{Knuth,~ Donald}
foo\index[persons]{Knuth,~ Donald}
\newpage
foo\index[persons]{Lamport,~ Leslie}
foo\index[persons]{Th{\`a}nh,~ \ThanhVN}
foo\index[persons]{Kew,~ Jonathan}
foo\index[persons]{Kohm,~ Markus}
foo\index[persons]{Preining,~ Norbert}
\newpage
foo\index[persons]{Schenk,~ Christian}
foo\index[persons]{Feuerstack,~ Thomas}
foo\index[persons]{Tobin,~ Geoffrey}
foo\index[persons]{Wilson,~ Peter}
\newpage
foo\index[persons]{Kohm,~ Markus}
foo\index[persons]{Theiling,~ Henrik}
foo\index[persons]{P{\'e}gouri{\'e}-Gonnard,~ Manuel}
foo\index[persons]{Roux,~ {\'E}lie}
\newpage
foo\index[persons]{Mittelbach,~ Frank}
foo\index[persons]{Fairbairns,~ Robin}
foo\index[persons]{Lemberg,~ Werner}
foo\index[persons]{Volovich,~ Vladimir}
\printindex[persons]
\end{document}
```

Index of names

Fairbairns, Robin,
Feuerstack, Thomas,

Kew, Jonathan,
Knuth, Donald,
Kohm, Markus,

Lamport, Leslie,
Lemberg, Werner,

Mittelbach, Frank,

Niepraschk, Rolf,

P{\'e}gouri{\'e}-Gonnard, Manuel,
Preining, Norbert,

Roux, {\'E}lie,

Schenk, Christian,

Th{\`a}nh, H{\`a}n Th{\`e},
Theiling, Henrik,
Tobin, Geoffrey,

Volovich, Vladimir,

Wilson, Peter,

You have to run L^AT_EX with the --shell-escape option to run xindex from within the L^AT_EX document.

10. Labels

By default xindex creates labels in the index for the symbols, numbers, and other parts (letters) to which one can refer. with `\ref{label}`. The labels are named `L-xindex-<name>`. The prefix L can be changed by the config file. <name> maybe symbols, numbers, or A (a letter). For example

```
\begin{theindex}
\par\textrbf{Symbols}\label{L-xindex-symbols}
\nopagebreak[4]
\item @, \hyperpage{3}
\item (, \hyperpage{3}
\item !, \hyperpage{3}

\indexspace
```

```
\textbf{A}\label{L-xindex-A}
[...]
```

The labels can be used to create a reference to a specific part in the index, for example the letter X is in the index on page 35 (`\pageref{L-xindex-X}`).

With the optional argument `-b` for the run of `xindex` one can suppress the creation of the labels, e.g. `xindex -b -l fr ...`

11. Demerits

- For more than 5000 entries in the `.idx` file the internal Lua function for sorting may take some time.
- The `.idx` file is not checked for L^AT_EX errors in the argument of `\indexentry`.

A. Examples

Correct french sorting with UCA:

A. Examples

xindex-29.tex

```
\usepackage[francaise]{babel}
\usepackage[imakeidx]{xindex} \makeindex
\newcommand*{\IND}[1]{\index{#1}\par}

%%% xindex -l fr <file>
