# Package 'synapsis'

October 24, 2025

Type Package

**Title** An R package to automate the analysis of double-strand break repair during meiosis

**Version** 1.15.0

Description Synapsis is a Bioconductor software package for automated (unbiased and reproducible) analysis of meiotic immunofluorescence datasets. The primary functions of the software can i) identify cells in meiotic prophase that are labelled by a synaptonemal complex axis or central element protein, ii) isolate individual synaptonemal complexes and measure their physical length, iii) quantify foci and co-localise them with synaptonemal complexes, iv) measure interference between synaptonemal complex-associated foci. The software has applications that extend to multiple species and to the analysis of other proteins that label meiotic prophase chromosomes. The software converts meiotic immunofluorescence images into R data frames that are compatible with machine learning methods. Given a set of microscopy images of meiotic spread slides, synapsis crops images around individual single cells, counts colocalising foci on strands on a per cell basis, and measures the distance between foci on any given strand.

annotate_foci_counting
 annotate_foci_counting
```

## **Description**

Contains all plotting routines for count foci annotation

```
annotate_foci_counting(
  img_file,
  cell_count,
  img_orig,
  img_orig_foci,
  artificial_amp_factor,
  strands,
  coincident_foci,
```

```
foci_label,
alone_foci,
percent_px,
foci_per_cell
)
```

### **Arguments**

```
cell's file name
img_file
cell_count
                  unique cell counter
img_orig
                  original strand crop
img_orig_foci
                 cropped foci channel
artificial_amp_factor
                  amplification factor
strands
                 black white mask of strand channel
coincident_foci
                  mask of overlap between strand and foci channel
foci_label
                 black and white mask of foci channel
alone_foci
                  estimated number of foci that are NOT on a strand.
                  percentage of foci mask that coincides with strand channel small number indi-
percent_px
                 cates potentially problematic image.
foci_per_cell
                 number of foci counted per cell
```

#### Value

displays key steps from raw image to coincident foci count

## **Description**

Contains all plotting routines for count foci annotation

```
annotate_foci_counting_adjusted(

strands
coincident_foci
                 mask of overlap between strand and foci channel
foci_label
                 black and white mask of foci channel
alone_foci
                  estimated number of foci that are NOT on a strand.
percent_px
                  percentage of foci mask that coincides with strand channel small number indi-
                 cates potentially problematic image.
foci_per_cell
                 number of foci counted per cell
```

### Value

displays key steps from raw image to coincident foci count

```
append_data_frame append_data_frame
```

## Description

applies new row to data frame

```
append_data_frame(
  WT_str,
  KO_str,
  WT_out,
  KO_out,
  img_file,
  foci_areas,
  df_cells,
  cell_count,
```

append\_data\_frame 5

```
stage,
foci_per_cell,
image_mat,
percent_px,
alone_foci,
discrepant_category,
C1
```

## Arguments

WT\_str

string in filename corresponding to knockout genotype. Defaults to -. K0\_str WT\_out string in output csv in genotype column, for knockout. Defaults to +/+. K0\_out string in output csv in genotype column, for knockout. Defaults to -/-. img\_file cell's file name foci\_areas pixel area of each foci df\_cells current data frame cell\_count unique cell counter meiosis stage of interest. Currently count\_foci determines this with thresholdstage ing/object properties in the synaptonemal complex channel by previosly calling the get\_pachytene function. Note that if using this option, the count\_foci function requires that the input directory contains a folder called "pachytene" with the crops in it. foci\_per\_cell foci count for cell image\_mat matrix with all pixel values above zero percentage of foci mask that coincides with strand channel small number indipercent\_px cates potentially problematic image. alone\_foci estimated number of foci that are NOT on a strand.

estimated number of foci that are NOT on a strand.

string in filename corresponding to wildtype genotype. Defaults to ++.

criteria

6 auto\_crop\_fast

auto\_crop\_fast

auto\_crop\_fast

## **Description**

crop an image around each viable cell candidate.

# Usage

```
auto_crop_fast(
  img_path,
 max_cell_area = 20000,
 min_cell_area = 7000,
 mean_pix = 0.08,
  annotation = "off",
  blob_factor = 15,
  bg_blob_factor = 10,
  offset = 0.2,
  final_blob_amp = 10,
  test_amount = 0,
  brush_size_blob = 51,
  sigma_blob = 15,
  channel3_string = "DAPI",
  channel2_string = "SYCP3",
  channel1_string = "MLH3",
  file_ext = "jpeg",
  third_channel = "off",
  cell_aspect_ratio = 2,
  strand_amp = 2,
  path_out = img_path,
  resize_1 = 720,
  crowded_cells = "FALSE",
 watershed_radius = 50,
 watershed_tol = 0.2,
  cropping_factor = 1.3
)
```

# Arguments

img_path	path containing image data to analyse
max_cell_area	Maximum pixel area of a cell candidate
min_cell_area	Minimum pixel area of a cell candidate
mean_pix	Mean pixel intensity of cell crop (in SYCP3 channel) for normalisation
annotation	Choice to output pipeline choices (recommended to knit)
blob_factor	Contrast factor to multiply original image by before smoothing/smudging

auto\_crop\_fast 7

bg\_blob\_factor Contrast factor to multiply original image by to take background. Used prior to

thresholding.

offset Pixel value offset from bg\_blob\_factor. Used in thresholding to make blob mask.

final\_blob\_amp Contrast factor to multiply smoothed/smudged image. Used in thresholding to

make blob mask.

test\_amount Optional number of first N images you want to run function on. For trou-

bleshooting/testing/variable calibration purposes.

brush\_size\_blob

Brush size for smudging the synaptonemal complex channel to make blobs

sigma\_blob Sigma in Gaussian brush for smudging the synaptonemal complex channel to

make blobs

channel3\_string

Optional. String appended to the files showing the channel illuminating cell

structures. Defaults to DAPI, if third channel == "on".

channel2\_string

String appended to the files showing the channel illuminating synaptonemal

complexes. Defaults to SYCP3

channel1\_string

String appended to the files showing the channel illuminating foci. Defaults to

MLH3

file\_ext file extension of your images e.g. tif jpeg or png.

third\_channel Optional, defaults to "off". Set to "on" if you would also like crops of the third

channel.

cell\_aspect\_ratio

Maximum aspect ratio of blob to be defined as a cell

strand\_amp multiplication of strand channel for get\_blobs function.

path\_out user specified output path. Defaults to img\_path

resize\_l length for resized image

crowded\_cells TRUE or FALSE, defaults to FALSE. Set to TRUE if you have many cells in a

frame that almost touch

watershed\_radius

Radius (ext variable) in watershed method used in strand channel. Defaults to 1

(small)

watershed\_tol Intensity tolerance for watershed method. Defaults to 0.05.

cropping\_factor

size of cropping window square, as factor of characteristic blob radius. Defaults

to 1. May need to increase if using watershed.

#### Details

This function takes all images in a directory, and crops around individual cells according to the antibody that stains synaptonemal complexes e.g. SYCP3. First, it increases the brightness and smudges the image with a Gaussian brush, and creates a mask using thresholding (get\_blobs). Then it deletes cell candidates in the mask deemed too large, too small, or too long (keep\_cells). Using the computeFeatures functions from EBImage to locate centre and radius, the cropping area is determined and the original image cropped. These images are saved in either a user specified directory, or a crops folder at the location of the image files.

8 count\_foci

### Value

cropped synaptonemal complex and foci channels around single cells, regardless of stage

#### Author(s)

Lucy McNeill

# **Examples**

```
demo_path = paste0(system.file("extdata",package = "synapsis"))
auto_crop_fast(demo_path, annotation = "on", max_cell_area = 30000,
min_cell_area = 7000, file_ext = "tif",crowded_cells = TRUE)
```

 $count\_foci$ 

count\_foci

# **Description**

Calculates coincident foci in synaptonemal complex and foci channel, per cell

```
count_foci(
  img_path,
  stage = "none",
  offset_px = 0.2,
  offset_factor = 2,
  brush_size = 3,
  brush_sigma = 3,
  foci_norm = 0.01,
  annotation = "off",
  channel2_string = "SYCP3",
  channel1_string = "MLH3",
  file_ext = "jpeg",
  KO_str = "--",
 WT_str = "++"
 KO_{out} = "-/-"
 WT_out = "+/+",
 watershed_stop = "off",
  watershed\_radius = 1,
  watershed_tol = 0.05,
  crowded_foci = TRUE,
  artificial_amp_factor = 1,
  strand_amp = 2,
 min_foci = -1,
  disc_size = 51,
  modify_problematic = "off",
```

count\_foci 9

```
disc_size_foci = 5,
C1 = 0.02,
C2 = 0.46,
C_weigh_foci_number = TRUE)
```

### **Arguments**

img\_path path containing crops to analyse

stage meiosis stage of interest. Currently count\_foci determines this with threshold-

ing/object properties in the synaptonemal complex channel by previously calling the get\_pachytene function. Note that if using this option, the count\_foci function requires that the input directory contains a folder called "pachytene" with

the crops in it.

offset\_px Pixel value offset used in thresholding of synaptonemal complex channel

offset\_factor Pixel value offset used in thresholding of foci channel

brush\_size size of brush to smooth the foci channel. Should be small to avoid erasing foci.

brush\_sigma sigma for Gaussian smooth of foci channel. Should be small to avoid erasing

foci.

foci\_norm Mean intensity to normalise all foci channels to.

annotation Choice to output pipeline choices (recommended to knit)

channel2\_string

String appended to the files showing the channel illuminating synaptonemal

complexes. Defaults to SYCP3

channel1\_string

String appended to the files showing the channel illuminating foci. Defaults to

MLH3

file\_ext file extension of your images e.g. tiff jpeg or png.

KO\_str string in filename corresponding to knockout genotype. Defaults to -.
 WT\_str string in filename corresponding to wildtype genotype. Defaults to ++.
 KO\_out string in output csv in genotype column, for knockout. Defaults to -/-.
 WT\_out string in output csv in genotype column, for knockout. Defaults to +/+.

watershed\_stop Stop default watershed method with "on"

watershed\_radius

Radius (ext variable) in watershed method used in foci channel. Defaults to 1

(small)

watershed\_tol Intensity tolerance for watershed method. Defaults to 0.05.

 $\label{eq:crowded_foci} \textbf{TRUE} \ \text{or} \ \textbf{FALSE}, \ \textbf{defaults} \ \textbf{to} \ \textbf{FALSE}. \ \textbf{Set} \ \textbf{to} \ \textbf{TRUE} \ \textbf{if} \ \textbf{you} \ \textbf{have} \ \textbf{foci} > 100 \ \textbf{or} \ \textbf{so}.$ 

artificial\_amp\_factor

Amplification of foci channel, for annotation only.

strand\_amp multiplication of strand channel to make masks

min\_foci minimum pixel area for a foci. Depends on your dpi etc. Defaults to 4

disc\_size size of disc for local background calculation in synaptonemal complex channel modify\_problematic

option for synapsis to try and "save" images which have likely been counted incorrectly due to a number of reasons. Default settings are optimized for mouse pachytene. Defaults to "off"

disc\_size\_foci size of disc for local background calculation in foci channel

C1 Default crispness criteria = sd(foci\_area)/(mean(foci\_area)+1)

C2 Alternative crisp criteria.

C\_weigh\_foci\_number

choose crispness criteria- defaults to TRUE to use C1 (weighing with number). Otherwise set to FALSE to use C2

#### **Details**

In this function, masks for the synaptonemal complex (SC) and foci channel are created from the saved crops of single/individual cells. These masks are computed using (optional) input parameters related to meiosis stage/ how well spread chromosomes are (for the former) and related to smoothing, thresholding and how "crowded" foci are for the latter. Finally, these two masks are multiplied, and the number of objects found with EBImage's computeFeatures are the colocalizing foci.

The file, cell number, foci count etc. are output as a data frame.

### Value

data frame with foci count per cell

#### Author(s)

Lucy McNeill

#### **Examples**

```
demo_path = paste0(system.file("extdata",package = "synapsis"))
foci_counts <- count_foci(demo_path,offset_factor = 3, brush_size = 3,
brush_sigma = 3, annotation = "on",stage = "pachytene")</pre>
```

## Description

Creates mask for every individual cell candidate in mask

# Usage

```
crop_single_object_fast(
  retained,
  OOI_final,
  counter_final,
  img_orig,
  img_orig_foci,
  img_orig_DAPI = "blank",
  file_sc,
  file_foci,
  file_DAPI = "blank",
  cell_count,
  mean_pix,
  annotation,
  file_base,
  img_path,
  r_max,
  CX,
  су,
  channel3_string,
  channel2_string,
  channel1_string,
  file_ext,
  third_channel,
  path_out,
  img_orig_highres,
  resize_l,
  crowded_cells,
  cropping_factor
)
```

# Arguments

retained	Mask of cell candidates which meet size criteria. After smoothing/smudging and thresholding.
00I_final	Objects of interest count. Total number of cell candidates in retained.
counter_final	Counter for single cell we are focussing on. Remove all other cells where counter_single not equal to counter_final.
img_orig	description
<pre>img_orig_foci</pre>	description
img_orig_DAPI	description
file_sc	filename of synaptonemal complex channel image
file_foci	filename of foci channel image
file_DAPI	filename of DAPI channel image
cell_count	counter for successful crops around cells

12 get\_blobs

mean\_pix Mean pixel intensity of cell crop (in SYCP3 channel) for normalisation

annotation Choice to output pipeline choices (recommended to knit)

file\_base filename base common to all three channels i.e. without -MLH3.jpeg etc.

img\_path path containing image data to analyse r\_max maximum radius of blob for cropping

cx centre of blob x cy centre of blob y

channel3\_string

Optional. String appended to the files showing the channel illuminating cell

structures. Defaults to DAPI, if third channel == "on".

channel2\_string

String appended to the files showing the channel illuminating synaptonemal

complexes. Defaults to SYCP3

channel1\_string

String appended to the files showing the channel illuminating foci. Defaults to

MLH3

file\_ext file extension of your images e.g. tif jpeg or png.

third\_channel Optional, defaults to "off". Set to "on" if you would also like crops of the third

channel.

path\_out user specified output path. Defaults to img\_path

img\_orig\_highres

the original strand image with original resolution

resize\_l length of square to resize original image to.

crowded\_cells TRUE or FALSE, defaults to FALSE. Set to TRUE if you have many cells in a

frame that almost touch

cropping\_factor

size of cropping window square, as factor of characteristic blob radius. Defaults

to 1. May need to increase if using watershed.

#### Value

Crops around all candidates in both channels

get\_blobs get\_blobs

## Description

Makes mask of all objects bright enough to be classified as a cell cadidate

get\_blobs 13

# Usage

```
get_blobs(
  img_orig,
  blob_factor,
  bg_blob_factor,
  offset,
  final_blob_amp,
  brush_size_blob,
  sigma_blob,
  watershed_tol,
  watershed_radius,
  crowded_cells,
  annotation
)
```

# Arguments

img_orig	Original image	
blob_factor	Contrast factor to multiply original image by before smoothing/smudging	
bg_blob_factor	Contrast factor to multiply original image by to take background. Used prior to thresholding.	
offset	Pixel value offset from bg_blob_factor. Used in thresholding to make blob mask.	
final_blob_amp	Contrast factor to multiply smoothed/smudged image. Used in thresholding to make blob mask.	
brush_size_blob		
	Brush size for smudging the synaptonemal complex channel to make blobs	
sigma_blob	Sigma in Gaussian brush for smudging the synaptonemal complex channel to make blobs	
watershed_tol	Intensity tolerance for watershed method. Defaults to 0.05.	
watershed_radius		
	Radius (ext variable) in watershed method used in strand channel. Defaults to 1 (small)	
crowded_cells	TRUE or FALSE, defaults to FALSE. Set to TRUE if you have many cells in a frame that almost touch

img\_orig original strand crop
img\_orig\_foci cropped foci channel

artificial\_amp\_factor

amplification factor

coincident\_foci

mask of coincident foci

## Value

number of foci per cell

get\_overlap\_mask

get\_overlap\_mask

### **Description**

creates mask for coincident foci

```
get_overlap_mask(
    strands,
    foci_label,
    watershed_stop,
    img_orig_foci,
    watershed_radius,
    watershed_tol
)
```

get\_pachytene

## **Arguments**

```
strands black white mask of strand channel

foci_label black and white mask of foci channel

watershed_stop Stop default watershed method with "on"

img_orig_foci cropped foci channel

watershed_radius

Radius (ext variable) in watershed method used in foci channel. Defaults to 1

(small)

watershed_tol Intensity tolerance for watershed method. Defaults to 0.05.
```

## Value

mask with coincident foci on strands

get\_pachytene get\_pachytene

## **Description**

Identifies crops in pachytene

```
get_pachytene(
  img_path,
  species_num = 20,
  offset = 0.2,
  ecc_{thresh} = 0.85,
  area_thresh = 0.06,
  annotation = "off",
  channel2_string = "SYCP3",
  channel1_string = "MLH3",
  file_ext = "jpeg",
  KO_str = "--",
  WT_str = "++",
  KO_{out} = "-/-"
 WT_out = "+/+",
  path_out = img_path,
  artificial_amp_factor = 3,
  strand_amp = 2,
  resize_1 = 120
)
```

get\_pachytene 19

## **Arguments**

img_path	path containing crops analyse	
species_num	number of chromosomes in the species	
offset	Pixel value offset used in therholding for the synaptonemal complex (SYCP3) channel	
ecc_thresh	The minimum average eccentricity of all objects in mask determined by computefeatures, for a cell to be pachytene.	
area_thresh	The minimum ratio of pixels included in mask to total, for a cell to be classified as pachytene.	
annotation	Choice to output pipeline choices (recommended to knit)	
channel2_string		
	String appended to the files showing the channel illuminating synaptonemal complexes. Defaults to SYCP3	
channel1_string		
	String appended to the files showing the channel illuminating foci. Defaults to MLH3	
file_ext	file extension of your images e.g. tiff jpeg or png.	
KO_str	string in filename corresponding to knockout genotype. Defaults to	
WT_str	string in filename corresponding to wildtype genotype. Defaults to ++.	
KO_out	string in output csv in genotype column, for knockout. Defaults to -/	
WT_out	string in output csv in genotype column, for knockout. Defaults to +/+.	
path_out	user specified output path. Defaults to img_path	
artificial_amp_factor		
	Amplification of foci channel, for RGB output files. Deaults to 3.	
strand_amp	multiplication of strand channel.	
resize_l	length of resized square cell image.	

### **Details**

This function takes the crops make by auto\_crop fast, and determines the number of synaptonemal complex candidates by considering the local background and using EBImage functions. In general, very bright objects which contrast highly with the background will be classified as the same object. Dim objects will likely be classified as many different objects. If the number of objects is too high compared to the species number (species\_num) then the cell is determined to not be in pachytene. Note that this function has been optimized for mouse cells which can be very well spread / separated.

# Value

Pairs of foci and synaptonemal channel crops for pachytene

# Author(s)

Lucy McNeill

20 keep\_cells

## **Examples**

```
demo_path = paste0(system.file("extdata",package = "synapsis"))
SYCP3_stats <- get_pachytene(demo_path,ecc_thresh = 0.8, area_thresh = 0.04, annotation = "on")</pre>
```

keep\_cells

keep\_cells

# **Description**

Deletes objects in mask which are too small, large, oblong i.e. unlikely to be a cell

## Usage

```
keep_cells(
   candidate,
   max_cell_area,
   min_cell_area,
   cell_aspect_ratio,
   crowded_cells,
   annotation
)
```

## **Arguments**

# Value

Mask of cell candidates which meet size criteria

make\_foci\_mask 21

make\_foci\_mask

make\_foci\_mask

## Description

creates foci mask for foci channel crop

## Usage

```
make_foci_mask(
   offset_factor,
   bg,
   crowded_foci,
   img_orig_foci,
   brush_size,
   brush_sigma,
   disc_size_foci
)
```

## **Arguments**

offset\_factor Pixel value offset used in thresholding of foci channel

bg background value- currently just mean pixel value of whole image

crowded\_foci TRUE or FALSE, defaults to FALSE. Set to TRUE if you have foci > 100 or so.

img\_orig\_foci cropped foci channel

brush\_size size of brush to smooth the foci channel. Should be small to avoid erasing foci.
brush\_sigma sigma for Gaussian smooth of foci channel. Should be small to avoid erasing

foci.

disc\_size\_foci size of disc for local background calculation in foci channel

## Value

foci mask

make\_strand\_mask

make\_strand\_mask

## **Description**

creates strand mask for strand channel crop

22 remove\_XY

### Usage

```
make_strand_mask(
  offset_px,
  stage,
  img_orig,
  disc_size,
  brush_size,
  brush_sigma
)
```

## Arguments

offset\_px Pixel value offset used in thresholding of synaptonemal complex channel stage meiosis stage of interest. Currently count\_foci determines this with thresholding/object properties in the synaptonemal complex channel by previously calling the get\_pachytene function. Note that if using this option, the count\_foci function requires that the input directory contains a folder called "pachytene" with

the crops in it.

img\_orig original strand crop

disc\_size size of disc for local background calculation in synaptonemal complex channel brush\_size size of brush to smooth the foci channel. Should be small to avoid erasing foci. sigma for Gaussian smooth of foci channel. Should be small to avoid erasing

foci.

### Value

strand mask

remove\_XY remove\_XY

# Description

applies new row to data frame

# Usage

```
remove_XY(foci_label, foci_candidates, foci_areas)
```

# Arguments

foci\_label black and white mask of foci channel

foci\_candidates

computeFeatures data frame of foci channel

foci\_areas the areas of the foci objects

remove\_XY 23

# Value

mask with XY blob removed
