

# Package ‘APFr’

January 20, 2025

**Type** Package

**Title** Multiple Testing Approach using Average Power Function (APF) and Bayes FDR Robust Estimation

**Version** 1.0.2

**Date** 2019-06-14

**Author** Nicolò Margaritella [cre, aut],  
Piero Quatto [aut]

**Maintainer** Nicolò Margaritella <N.Margaritella@sms.ed.ac.uk>

**Depends** R (>= 3.5.0)

**Imports** stats (>= 3.5.2), graphics (>= 3.5.2)

**Description** Implements a multiple testing approach to the choice of a threshold gamma on the p-values using the Average Power Function (APF) and Bayes False Discovery Rate (FDR) robust estimation. Function apf\_fdr() estimates both quantities from either raw data or p-values. Function apf\_plot() produces smooth graphs and tables of the relevant results. Details of the methods can be found in Quatto P, Margaritella N, et al. (2019) [<doi:10.1177/0962280219844288>](https://doi.org/10.1177/0962280219844288).

**License** GPL-3

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 6.1.1

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2019-06-18 12:20:07 UTC

## apf\_fdr

### *Implementation of APF and FDR robust estimation*

---

#### Description

`apf_fdr` returns robust estimates of the Average Power Function (APF) and Bayes False Discovery Rate (FDR) for each value of the threshold Gamma on the p-value and Tau on the correlation coefficient.

#### Usage

```
apf_fdr(data, type = "datf", corr = "spearman", lobs = 0,
        seed = 111, gamm = c(1e-04, 0.1, 0.002))
```

#### Arguments

<code>data</code>	Either a vector, matrix or dataframe.
<code>type</code>	Set "datf" if data is a matrix or dataframe containing the raw data (columns); "pvl" for a vector of p-values.
<code>corr</code>	The type of correlation to use when <code>type = "datf"</code> . It can be set to either "spearman" or "pearson".
<code>lobs</code>	When <code>type = "pvl"</code> , it indicates the number of datapoints used to compute the correlations.
<code>seed</code>	A seed (natural number) for the resampling.
<code>gamm</code>	The threshold gamma on the p-values to explore (typically $\leq 0.05$ or 0.1). A min, max and step length value need to be set.

#### Value

A list with four elements. A vector `APF_gamma` containing the robust estimates of APF (5th quantiles) for all the gamma values set in `gamm`. A vector `FDR_gamma` with the robust estimates of Bayes FDR (95th quantiles). A vector `tau_gamma` with the correlation coefficients `tau` for each gamma value explored and another vector with the relative values gamma (`gammaval`).

#### References

## Examples

```
data("Ex1")
APF_lst <- apf_fdr(Ex1,"pv1",lobs=100)
# The example uses the dataset Ex1 (in the APFr package) which is
# a vector of 100 p-values. The number of datapoints used to
# compute each p-value in this example is set to 100. As a result,
# a list of 4 objects is returned.
```

**apf\_plot**

*Generate smooth graphs for the APF and FDR estimates*

## Description

`apf_plot` returns a graph with Average Power Function (APF), Bayes False Discovery Rate (FDR) and APF vs. FDR. In addition, when `tab = TRUE`, a table containing APF, FDR, tau and gamma values for a selected subset of APF and FDR is printed.

## Usage

```
apf_plot(APF_lst, tab = TRUE, APF_inf = 0.5, FDR_sup = 0.05)
```

## Arguments

<code>APF_lst</code>	The output from the <code>apf_fdr</code> function.
<code>tab</code>	If <code>TRUE</code> , a table with relevant values of APF, FDR, tau and gamma is printed.
<code>APF_inf</code>	Sets the minimum value of APF to appear in the table when <code>tab = TRUE</code> .
<code>FDR_sup</code>	Sets the maximum value of Bayes FDR to appear in the table when <code>tab = TRUE</code> .

## Value

Smooth graphs for APF vs Gamma (left), FDR vs Gamma (centre) and APF vs FDR (right). Regions where  $FDR \leq FDR_{sup}$  and  $APF \geq APF_{inf}$  (if presents) are highlighted in yellow and printed in a table (if `tab = TRUE`) together with the relative values of *gamma* and *tau*.

## Examples

```
data("Ex2")
apf_plot(Ex2)
# Ex2 is an example of output obtained
# from the apf_fdr() function.
```

Ex1

*Example dataset 1***Description**

A dataset containing 100 simulated p-values, 70 from a  $N(2,1)$  and 30 from a  $N(0,1)$ .

**Usage**

Ex1

**Format**

A vector containing 100 p-values.

**References**

**Examples**

data(Ex1)

Ex2

*Example 2***Description**

A list containing 4 vectors. This is an example of output obtained with `apf_fdr()` to use with `apf_plot()`.

**Usage**

Ex2

**Format**

A list containing 4 vectors called APF\_gamma, FDR\_gamma, tau\_gamma, gammaval.
