

# Package ‘FuzzyNumbers’

January 20, 2025

**Title** Tools to Deal with Fuzzy Numbers

**Type** Package

**Description** S4 classes and methods

to deal with fuzzy numbers. They allow for computing any arithmetic operations (e.g., by using the Zadeh extension principle), performing approximation of arbitrary fuzzy numbers by trapezoidal and piecewise linear ones, preparing plots for publications, computing possibility and necessity values for comparisons, etc.

**Version** 0.4-7

**Date** 2021-11-15

**URL** <https://github.com/gagolews/FuzzyNumbers/>

**BugReports** <https://github.com/gagolews/FuzzyNumbers/issues>

**License** LGPL (>= 3)

**ByteCompile** TRUE

**VignetteBuilder** knitr

**Suggests** knitr, digest

**Depends** R (>= 3.0.0), methods, grDevices, graphics, stats

**RoxygenNote** 7.1.2

**Encoding** UTF-8

**NeedsCompilation** no

**Author** Marek Gagolewski [aut, cre] (<<https://orcid.org/0000-0003-0637-6028>>),  
Jan Caha [ctb]

**Maintainer** Marek Gagolewski <[marek@gagolewski.com](mailto:marek@gagolewski.com)>

**Repository** CRAN

FuzzyNumbers-package    *Tools to Deal with Fuzzy Numbers*

---

## Description

**FuzzyNumbers** is an open source (LGPL 3) package for R. It provides S4 classes and methods to deal with fuzzy numbers. The package may be used by researchers in fuzzy numbers theory (e.g., for testing new algorithms, generating numerical examples, preparing figures).

## Details

Fuzzy set theory gives one of many ways (in particular, see Bayesian probabilities) to represent imprecise information. Fuzzy numbers form a particular subclass of fuzzy sets of the real line. The main idea behind this concept is motivated by the observation that people tend to describe their knowledge about objects through vague numbers, e.g., "I'm about 180 cm tall" or "The event happened between 2 and 3 p.m."

For the formal definition of a fuzzy number please refer to the [FuzzyNumber](#) man page. Note that this package also deals with particular types of fuzzy numbers like trapezoidal, piecewise linear, or "parametric" FNs (see [TrapezoidalFuzzyNumber](#) [PiecewiseLinearFuzzyNumber](#), [PowerFuzzyNumber](#), and \*EXPERIMENTAL\* [DiscontinuousFuzzyNumber](#))

The package aims to provide the following functionality:

1. Representation of arbitrary fuzzy numbers (including FNs with discontinuous side functions and/or alpha-cuts), as well as their particular types, e.g. trapezoidal and piecewise linear fuzzy numbers,
2. Defuzzification and approximation by triangular and piecewise linear FNs (see e.g. [expectedValue](#), [value](#), [trapezoidalApproximation](#), [piecewiseLinearApproximation](#)),
3. Visualization of FNs (see [plot](#), [as.character](#)),
4. Basic operations on FNs (see e.g. [fapply](#) and [Arithmetic](#)),
5. etc.

For a complete list of classes and methods call `help(package="FuzzyNumbers")`. Moreover, you will surely be interested in a step-by-step guide to the package usage and features which is available at the project's webpage.

**Keywords:** Fuzzy Numbers, Fuzzy Sets, Shadowed Sets, Trapezoidal Approximation, Piecewise Linear Approximation, Approximate Reasoning, Imprecision, Vagueness, Randomness.

**Acknowledgments:** Many thanks to Jan Caha, Przemysław Grzegorzewski, Lucian Coroianu, and Pablo Villacorta Iglesias for stimulating discussion.

The development of the package in March-June 2013 was partially supported by the European Union from resources of the European Social Fund, Project PO KL “Information technologies: Research and their interdisciplinary applications”, agreement UDA-POKL.04.01.01-00-051/10-00.

**alphacut**

*Compute Alpha-Cuts*

---

## Description

If  $A$  is a fuzzy number, then its  $\alpha$ -cuts are always in form of intervals. Moreover, the  $\alpha$ -cuts form a nonincreasing chain w.r.t.  $\alpha$ .

## Usage

```
## S4 method for signature 'FuzzyNumber,numeric'
alphacut(object, alpha)
```

## Arguments

object	a fuzzy number
alpha	numeric vector with elements in [0,1]

## Value

Returns a matrix with two columns (left and right alpha cut bounds). if some elements in alpha are not in [0,1], then NA is set.

## See Also

Other FuzzyNumber-method: [Arithmetic](#), [Extract](#), [FuzzyNumber-class](#), [FuzzyNumber](#), [alphaInterval\(\)](#), [ambiguity\(\)](#), [as.FuzzyNumber\(\)](#), [as.PiecewiseLinearFuzzyNumber\(\)](#), [as.PowerFuzzyNumber\(\)](#), [as.TrapezoidalFuzzyNumber\(\)](#), [as.character\(\)](#), [core\(\)](#), [distance\(\)](#), [evaluate\(\)](#), [expectedInterval\(\)](#), [expectedValue\(\)](#), [integrateAlpha\(\)](#), [piecewiseLinearApproximation\(\)](#), [plot\(\)](#), [show\(\)](#), [supp\(\)](#), [trapezoidalApproximation\(\)](#), [value\(\)](#), [weightedExpectedValue\(\)](#), [width\(\)](#)

Other alpha\_cuts: [core\(\)](#), [supp\(\)](#)

## Examples

```
A <- TrapezoidalFuzzyNumber(1, 2, 3, 4)
alphacut(A, c(-1, 0.4, 0.2))
```

**alphaInterval**      *Compute the Alpha-Interval of a Fuzzy Number*

## Description

We have  $\alpha - Int(A) := [\int_0^1 \alpha A_L(\alpha) d\alpha, \int_0^1 \alpha A_U(\alpha) d\alpha]$ .

## Usage

```
## S4 method for signature 'FuzzyNumber'
alphaInterval(object, ...)

## S4 method for signature 'TrapezoidalFuzzyNumber'
alphaInterval(object)

## S4 method for signature 'PiecewiseLinearFuzzyNumber'
alphaInterval(object)

## S4 method for signature 'PowerFuzzyNumber'
alphaInterval(object)
```

## Arguments

object	a fuzzy number
...	for FuzzyNumber and DiscontinuousFuzzyNumber - additional arguments passed to <a href="#">integrateAlpha</a>

## Details

Note that if an instance of the FuzzyNumber or DiscontinuousFuzzyNumber class is given, the calculation is performed via numerical integration. Otherwise, the computation is exact.

## Value

Returns numeric vector of length 2.

## See Also

Other PowerFuzzyNumber-method: [Extract](#), [PowerFuzzyNumber-class](#), [PowerFuzzyNumber](#), [as.PowerFuzzyNumber\(\)](#), [as.TrapezoidalFuzzyNumber\(\)](#), [as.character\(\)](#), [expectedInterval\(\)](#)

**ambiguity***Calculate the Ambiguity of a Fuzzy Number***Description**

The ambiguity (Delgado et al, 1998) is a measure of nonspecificity of a fuzzy number.

**Usage**

```
## S4 method for signature 'FuzzyNumber'
ambiguity(object, ...)
```

**Arguments**

object	a fuzzy number
...	additional arguments passed to <a href="#">alphaInterval</a>

**Details**

The ambiguity is defined as  $amb(A) := \int_0^1 \alpha (A_U(\alpha) - A_L(\alpha)) d\alpha$ .

**Value**

Returns a single numeric value.

Other characteristics: [expectedValue\(\)](#), [value\(\)](#), [weightedExpectedValue\(\)](#), [width\(\)](#)

approxInvert	<i>Approximate the Inverse of a Given Function</i>
--------------	----------------------------------------------------

## Description

The function may be used to create side generating functions from alpha-cut generators and inversely.

## Usage

```
approxInvert(f, method = c("monoH.FC", "linear", "hyman"), n = 500)
```

## Arguments

f	a monotonic, continuous function f: [0,1]->[0,1]
method	interpolation method: “monoH.FC”, “hyman” or “linear”
n	number of interpolation points

## Details

The function is a wrapper to [splinefun](#) and [approxfun](#). Thus, interpolation is used.

## Value

Returns a new function, the approximate inverse of the input.

## See Also

[FuzzyNumber](#)

Other auxiliary: [convertAlpha\(\)](#), [convertSide\(\)](#)

arctan2	<i>Arc-tangent</i>
---------	--------------------

## Description

The arc-tangent of two arguments arctan2(y, x) returns the angle between the x-axis and the vector from the origin to (x, y) for PiecewiseLinearFuzzyNumbers.

## Usage

```
## S4 method for signature
## 'PiecewiseLinearFuzzyNumber,PiecewiseLinearFuzzyNumber'
arctan2(y, x)
```

## Arguments

y	a PiecewiseLinearFuzzyNumber
x	a PiecewiseLinearFuzzyNumber

## Details

Note that resulting values are no longer from interval [-pi,pi] but [-1.5pi,pi], in order to provide valid fuzzy numbers as result.

## Value

Returns a fuzzy number of the class [PiecewiseLinearFuzzyNumber](#) indicating the angle specified by the input fuzzy numbers. The range of results is [-1.5pi,pi].

## See Also

Other PiecewiseLinearFuzzyNumber-method: [Arithmetic](#), [Extract](#), [PiecewiseLinearFuzzyNumber-class](#), [PiecewiseLinearFuzzyNumber](#), [^](#), [PiecewiseLinearFuzzyNumber](#), [numeric-method](#), [alphaInterval\(\)](#), [as.PiecewiseLinearFuzzyNumber\(\)](#), [as.PowerFuzzyNumber\(\)](#), [as.TrapezoidalFuzzyNumber\(\)](#), [as.character\(\)](#), [expectedInterval\(\)](#), [fapply\(\)](#), [maximum\(\)](#), [minimum\(\)](#), [necessityExceedance\(\)](#), [necessityStrictExceedance\(\)](#), [necessityStrictUndervaluation\(\)](#), [necessityUndervaluation\(\)](#), [plot\(\)](#), [possibilityExceedance\(\)](#), [possibilityStrictExceedance\(\)](#), [possibilityStrictUndervaluation\(\)](#), [possibilityUndervaluation\(\)](#)

## Examples

```
y = as.PiecewiseLinearFuzzyNumber(TriangularFuzzyNumber(-2, 3, 5), knot.n = 9)
x = as.PiecewiseLinearFuzzyNumber(TriangularFuzzyNumber(-4.8, -4, 1.5), knot.n = 9)
arctan2(y,x)
```

## Description

Applies arithmetic operations using the extension principle and interval-based calculations.

## Usage

```
## S4 method for signature 'numeric,FuzzyNumber'
e1 + e2 # e2 + e1

## S4 method for signature 'TrapezoidalFuzzyNumber,TrapezoidalFuzzyNumber'
e1 + e2

## S4 method for signature

```

## Arguments

- |    |                                        |
|----|----------------------------------------|
| e1 | a fuzzy number or single numeric value |
| e2 | a fuzzy number or single numeric value |

## Details

Implemented operators: +, -, \*, / for piecewise linear fuzzy numbers. Also some versions may be applied on numeric values and trapezoidal fuzzy numbers.

Note that according to the theory the class of PLFNs is not closed under the operations \* and /. However, if you operate on a large number of knots, the results should be satisfactory.

Thanks to Jan Caha for suggestions on PLFN operations.

## Value

Returns a fuzzy number of the class [PiecewiseLinearFuzzyNumber](#) or [TrapezoidalFuzzyNumber](#).

## See Also

**as.character***Get Basic Information on a Fuzzy Number in a String*

## Description

This method is especially useful if you would like to generate LaTeX equations defining a fuzzy numbers.

## Usage

```
## S4 method for signature 'FuzzyNumber'
as.character(x, toLaTeX=FALSE, varnameLaTeX="A")

## S4 method for signature 'TrapezoidalFuzzyNumber'
as.character(x, toLaTeX=FALSE, varnameLaTeX="A")

## S4 method for signature 'PiecewiseLinearFuzzyNumber'
as.character(x, toLaTeX=FALSE, varnameLaTeX="A")

## S4 method for signature 'PowerFuzzyNumber'
as.character(x, toLaTeX=FALSE, varnameLaTeX="A")
```

## Arguments

<code>x</code>	a fuzzy number
<code>toLaTeX</code>	logical; should LaTeX code be output?
<code>varnameLaTeX</code>	character; variable name to be included in equations

## Details

Consider calling the `cat` function on the resulting string.

Thanks to Jan Caha for suggesting the `toLaTeX` arg.

## Value

Returns a character vector.

## See Also

**as.FuzzyNumber***Converts an Object to a Fuzzy Number***Description**

Please note that applying this function on a `FuzzyNumber` child class causes information loss, as it drops all additional slots defined in the child classes. `FuzzyNumber` is the base class for all FNs. Note that some functions for TFNs or PLFNs work much faster and are more precise. This function shouldn't be used in normal computations.

**Usage**

```
## S4 method for signature 'numeric'
as.FuzzyNumber(object)

## S4 method for signature 'FuzzyNumber'
as.FuzzyNumber(object)
```

**Arguments**

object	a fuzzy number or a single numeric value (crisp number) or vector of length two (interval)
--------	--------------------------------------------------------------------------------------------

**Value**

Returns an object of class `FuzzyNumber`.

**See Also**

Other FuzzyNumber-method: `Arithmetic`, `Extract`, `FuzzyNumber-class`, `FuzzyNumber`, `alphaInterval()`, `alphacut()`, `ambiguity()`, `as.PiecewiseLinearFuzzyNumber()`, `as.PowerFuzzyNumber()`, `as.TrapezoidalFuzzyNumber()`, `as.character()`, `core()`, `distance()`, `evaluate()`, `expectedInterval()`, `expectedValue()`, `integrateAlpha()`, `piecewiseLinearApproximation()`, `plot()`, `show()`, `supp()`, `trapezoidalApproximation()`, `value()`, `weightedExpectedValue()`, `width()`

Other conversion: `as.PiecewiseLinearFuzzyNumber()`, `as.PowerFuzzyNumber()`, `as.TrapezoidalFuzzyNumber()`, `as.character()`

`as.PiecewiseLinearFuzzyNumber`

*Converts an Object to a Piecewise Linear Fuzzy Number*

## Description

This method is only for exact conversion. For other cases (e.g. general FNs), use [piecewiseLinearApproximation](#).

## Usage

```
## S4 method for signature 'TrapezoidalFuzzyNumber'
as.PiecewiseLinearFuzzyNumber(object, knot.n=0,
  knot.alpha=seq(0, 1, length.out=knot.n+2)[-c(1,knot.n+2)])  
  

## S4 method for signature 'numeric'
as.PiecewiseLinearFuzzyNumber(object, knot.n=0,
  knot.alpha=seq(0, 1, length.out=knot.n+2)[-c(1,knot.n+2)])  
  

## S4 method for signature 'FuzzyNumber'
as.PiecewiseLinearFuzzyNumber(object, knot.n=0,
  knot.alpha=seq(0, 1, length.out=knot.n+2)[-c(1,knot.n+2)])  
  

## S4 method for signature 'PiecewiseLinearFuzzyNumber'
as.PiecewiseLinearFuzzyNumber(object, knot.n=0,
  knot.alpha=seq(0, 1, length.out=knot.n+2)[-c(1,knot.n+2)])
```

## Arguments

<code>object</code>	a fuzzy number or a single numeric value (crisp number) or vector of length two (interval)
<code>knot.n</code>	the number of knots
<code>knot.alpha</code>	<code>knot.n</code> alpha-cut values at knots, defaults to uniformly distributed knots

## Value

Returns an object of class [PiecewiseLinearFuzzyNumber](#).

`as.PowerFuzzyNumber`     *Converts an Object to a Power Fuzzy Number*

## Description

This method is only for exact conversion.

## Usage

```
## S4 method for signature 'numeric'
as.PowerFuzzyNumber(object)

## S4 method for signature 'FuzzyNumber'
as.PowerFuzzyNumber(object)

## S4 method for signature 'PowerFuzzyNumber'
as.PowerFuzzyNumber(object)

## S4 method for signature 'PiecewiseLinearFuzzyNumber'
as.PowerFuzzyNumber(object)

## S4 method for signature 'TrapezoidalFuzzyNumber'
as.PowerFuzzyNumber(object)
```

## Arguments

<code>object</code>	a fuzzy number or a single numeric value (crisp number) or vector of length two (interval)
---------------------	-----------------------------------------------------------------------------------------------

## Value

Returns an object of class `PowerFuzzyNumber`.

**See Also**

`convertAlpha`

*Convert a Given Upper/Lower Alpha-Cut Function to an Alpha-Cut Generating Function*

**Description**

The resulting function calls the original function and then linearly scales its output.

**Usage**

```
convertAlpha(f, y1, y2)
```

**Arguments**

<code>f</code>	a function into [y1,y2]
<code>y1</code>	numeric vector of length 1
<code>y2</code>	numeric vector of length 1

**Value**

Returns a new function defined on [0,1] (scaled input).

**See Also**

[FuzzyNumber](#)

Other auxiliary: [approxInvert\(\)](#), [convertSide\(\)](#)

---

convertSide

*Convert a Given Side Function to Side Generating Function*

---

**Description**

The resulting function linearly scales the input and passes it to the original function.

**Usage**

`convertSide(f, x1, x2)`

**Arguments**

<code>f</code>	a function defined on [x1,x2]
<code>x1</code>	numeric vector of length 1; if longer, only the first element is used
<code>x2</code>	numeric vector of length 1; if longer, only the first element is used

**Details**

The function works for  $x1 < x2$  and  $x1 > x2$ .

**Value**

Returns a new function defined on [0,1] (scaled input).

**See Also**

[FuzzyNumber](#)

Other auxiliary: [approxInvert\(\)](#), [convertAlpha\(\)](#)

---

core*Calculate the Core of a Fuzzy Number*

---

## Description

We have  $\text{core}(A) := [a_2, a_3]$ . This gives the values that a fuzzy number necessarily represents.

## Usage

```
## S4 method for signature 'FuzzyNumber'  
core(object)
```

## Arguments

object            a fuzzy number

## Value

Returns a numeric vector of length 2.

## See Also

DiscontinuousFuzzyNumber

*Creates a Fuzzy Number with Possibly Discontinuous Side Functions  
or Alpha-Cut Bounds*

---

## Description

For convenience, objects of class [DiscontinuousFuzzyNumber](#) may be created with this function.

**Usage**

```
DiscontinuousFuzzyNumber(
  a1,
  a2,
  a3,
  a4,
  lower = function(a) rep(NA_real_, length(a)),
  upper = function(a) rep(NA_real_, length(a)),
  left = function(x) rep(NA_real_, length(x)),
  right = function(x) rep(NA_real_, length(x)),
  discontinuities.left = numeric(0),
  discontinuities.right = numeric(0),
  discontinuities.lower = numeric(0),
  discontinuities.upper = numeric(0)
)
```

**Arguments**

a1	a number specifying left bound of the support
a2	a number specifying left bound of the core
a3	a number specifying right bound of the core
a4	a number specifying right bound of the support
lower	lower alpha-cut bound generator; a nondecreasing function [0,1]->[0,1] or returning NA_real_
upper	upper alpha-cut bound generator; a nonincreasing function [0,1]->[1,0] or returning NA_real_
left	lower side function generator; a nondecreasing function [0,1]->[0,1] or returning NA_real_
right	upper side function generator; a nonincreasing function [0,1]->[1,0] or returning NA_real_
discontinuities.left	nondecreasingly sorted numeric vector with elements in (0,1), possibly of length 0
discontinuities.right	nondecreasingly sorted numeric vector with elements in (0,1), possibly of length 0
discontinuities.lower	nondecreasingly sorted numeric vector with elements in (0,1), possibly of length 0
discontinuities.upper	nondecreasingly sorted numeric vector with elements in (0,1), possibly of length 0

**Value**

Object of class [DiscontinuousFuzzyNumber](#)

**See Also**

Other DiscontinuousFuzzyNumber-method: [DiscontinuousFuzzyNumber-class](#), [Extract](#), [distance\(\)](#), [integrateAlpha\(\)](#), [plot\(\)](#)

**DiscontinuousFuzzyNumber-class**

*\*\*EXPERIMENTAL\*\* S4 Class Representing a Fuzzy Number with Discontinuous Side Functions or Alpha-Cut Bounds*

**Description**

Discontinuity information increase the precision of some numerical integration-based algorithms, e.g. of [piecewiseLinearApproximation](#). It also allows for making more valid fuzzy number plots.

**Slots**

**a1, a2, a3, a4, lower, upper, left, right:** Inherited from the [FuzzyNumber](#) class.

**discontinuities.left:** nondecreasingly sorted numeric vector with elements in (0,1); discontinuity points for the left side generating function

**discontinuities.right:** nondecreasingly sorted numeric vector with elements in (0,1); discontinuity points for the right side generating function

**discontinuities.lower:** nondecreasingly sorted numeric vector with elements in (0,1); discontinuity points for the lower alpha-cut bound generator

**discontinuities.upper:** nondecreasingly sorted numeric vector with elements in (0,1); discontinuity points for the upper alpha-cut bound generator

**Extends**

Class [FuzzyNumber](#), directly.

**See Also**

[DiscontinuousFuzzyNumber](#) for a convenient constructor

Other DiscontinuousFuzzyNumber-method: [DiscontinuousFuzzyNumber](#), [Extract](#), [distance\(\)](#), [integrateAlpha\(\)](#), [plot\(\)](#)

**Examples**

```
showClass("DiscontinuousFuzzyNumber")
showMethods(classes="DiscontinuousFuzzyNumber")
```

distance

*Calculate the Distance Between Two Fuzzy Numbers***Description**

Currently, only Euclidean distance may be calculated. We have  $d_E^2(A, B) := \int_0^1 (A_L(\alpha) - B_L(\alpha))^2 d\alpha + (A_U(\alpha) - B_U(\alpha))^2 d\alpha$ , see (Grzegorzewski, 1988).

**Usage**

```
## S4 method for signature 'FuzzyNumber,FuzzyNumber'
distance(e1, e2, type=c("Euclidean", "EuclideanSquared"), ...)

## S4 method for signature 'FuzzyNumber,DiscontinuousFuzzyNumber'
distance(e1, e2, type=c("Euclidean", "EuclideanSquared"), ...)

## S4 method for signature 'DiscontinuousFuzzyNumber,FuzzyNumber'
distance(e1, e2, type=c("Euclidean", "EuclideanSquared"), ...)

## S4 method for signature 'DiscontinuousFuzzyNumber,DiscontinuousFuzzyNumber'
distance(e1, e2, type=c("Euclidean", "EuclideanSquared"), ...)
```

**Arguments**

e1	a fuzzy number
e2	a fuzzy number
...	additional arguments passed to <code>integrate</code>
type	one of "Euclidean", "EuclideanSquared"

**Details**

The calculation are done using numerical integration,

**Value**

Returns the calculated distance, i.e. a single numeric value.

**References**

evaluate

*Evaluate the Membership Function***Description**

This function returns the value(s) of the membership function of a fuzzy number at given point(s).

**Usage**

```
## S4 method for signature 'FuzzyNumber,numeric'
evaluate(object, x)
```

**Arguments**

object	a fuzzy numbers
x	numeric vector

**Value**

Returns a numeric vector.

**See Also**

Other FuzzyNumber-method: [Arithmetic](#), [Extract](#), [FuzzyNumber-class](#), [FuzzyNumber](#), [alphaInterval\(\)](#), [alphacut\(\)](#), [ambiguity\(\)](#), [as.FuzzyNumber\(\)](#), [as.PiecewiseLinearFuzzyNumber\(\)](#), [as.PowerFuzzyNumber\(\)](#), [as.TrapezoidalFuzzyNumber\(\)](#), [as.character\(\)](#), [core\(\)](#), [distance\(\)](#), [expectedInterval\(\)](#), [expectedValue\(\)](#), [integrateAlpha\(\)](#), [piecewiseLinearApproximation\(\)](#), [plot\(\)](#), [show\(\)](#), [supp\(\)](#), [trapezoidalApproximation\(\)](#), [value\(\)](#), [weightedExpectedValue\(\)](#), [width\(\)](#)

**Examples**

```
T <- TrapezoidalFuzzyNumber(1,2,3,4)
evaluate(T, seq(0, 5, by=0.5))
```

**expectedInterval***Calculate the Expected Interval of a Fuzzy Number***Description**

We have  $EI(A) := [\int_0^1 A_L(\alpha) d\alpha, \int_0^1 A_U(\alpha) d\alpha]$ , see (Dubois, Prade, 1987).

**Usage**

```
## S4 method for signature 'FuzzyNumber'
expectedInterval(object, ...)

## S4 method for signature 'TrapezoidalFuzzyNumber'
expectedInterval(object)

## S4 method for signature 'PiecewiseLinearFuzzyNumber'
expectedInterval(object)

## S4 method for signature 'PowerFuzzyNumber'
expectedInterval(object)
```

**Arguments**

object	a fuzzy number
...	for <code>FuzzyNumber</code> and <code>DiscontinuousFuzzyNumber</code> - additional arguments passed to <code>integrateAlpha</code>

**Details**

Note that if an instance of the `FuzzyNumber` or `DiscontinuousFuzzyNumber` class is given, the calculation is performed via numerical integration. Otherwise, the computation is exact.

**Value**

Returns a numeric vector of length 2.

**References**

Dubois D., Prade H. (1987), The mean value of a fuzzy number, *Fuzzy Sets and Systems* 24, pp. 279-300.

expectedValue

*Calculate the Expected Value of a Fuzzy Number*

## Description

The calculation of the so-called expected value is one of possible methods to defuzzify a fuzzy number.

## Usage

```
## S4 method for signature 'FuzzyNumber'
expectedValue(object, ...)
```

## Arguments

object	a fuzzy number
...	additional arguments passed to <a href="#">expectedInterval</a>

## Details

The expected value of  $A$  is defined as  $EV(A) := (EI_U(A) + EI_L(A))/2$ , where  $EI$  is the [expectedInterval](#).

## Value

Returns a single numeric value.

```

fapply

*Apply a Function on a Fuzzy Number*

## Description

Applies a given monotonic function using the extension principle (i.e. the function is applied on alpha-cuts).

## Usage

```
## S4 method for signature 'PiecewiseLinearFuzzyNumber,function'
fapply(object, fun, ...)
```

## Arguments

object	a fuzzy number
fun	a monotonic, vectorized R function
...	additional arguments passed to fun

## Details

Currently only a method for the `PiecewiseLinearFuzzyNumber` class has been defined. The computations are exact (up to a numeric error) at knots. So, make sure you have a sufficient number of knots if you want good approximation.

For other types of fuzzy numbers, consider using `piecewiseLinearApproximation`.

## Value

Returns a `PiecewiseLinearFuzzyNumber`.

**See Also**

Other PiecewiseLinearFuzzyNumber-method: [Arithmetic](#), [Extract](#), [PiecewiseLinearFuzzyNumber-class](#), [PiecewiseLinearFuzzyNumber](#), [^](#), [PiecewiseLinearFuzzyNumber](#), [numeric-method](#), [alphaInterval\(\)](#), [arctan2\(\)](#), [as.PiecewiseLinearFuzzyNumber\(\)](#), [as.PowerFuzzyNumber\(\)](#), [as.TrapezoidalFuzzyNumber\(\)](#), [as.character\(\)](#), [expectedInterval\(\)](#), [maximum\(\)](#), [minimum\(\)](#), [necessityExceedance\(\)](#), [necessityStrictExceedance\(\)](#), [necessityStrictUndervaluation\(\)](#), [necessityUndervaluation\(\)](#), [plot\(\)](#), [possibilityExceedance\(\)](#), [possibilityStrictExceedance\(\)](#), [possibilityStrictUndervaluation\(\)](#), [possibilityUndervaluation\(\)](#)

Other extension\_principle: [Arithmetic](#), [^](#), [PiecewiseLinearFuzzyNumber](#), [numeric-method](#)

**FuzzyNumber***Creates a Fuzzy Number***Description**

For convenience, objects of class [FuzzyNumber](#) may be created with this function.

**Usage**

```
FuzzyNumber(
  a1,
  a2,
  a3,
  a4,
  lower = function(a) rep(NA_real_, length(a)),
  upper = function(a) rep(NA_real_, length(a)),
  left = function(x) rep(NA_real_, length(x)),
  right = function(x) rep(NA_real_, length(x))
)
```

**Arguments**

a1	a number specifying left bound of the support
a2	a number specifying left bound of the core
a3	a number specifying right bound of the core
a4	a number specifying right bound of the support
lower	lower alpha-cut bound generator; a nondecreasing function [0,1]->[0,1] or returning NA_real_
upper	upper alpha-cut bound generator; a nonincreasing function [0,1]->[1,0] or returning NA_real_
left	lower side function generator; a nondecreasing function [0,1]->[0,1] or returning NA_real_
right	upper side function generator; a nonincreasing function [0,1]->[1,0] or returning NA_real_

**Value**

Object of class [FuzzyNumber](#)

**See Also**

Other FuzzyNumber-method: [Arithmetic](#), [Extract](#), [FuzzyNumber-class](#), [alphaInterval\(\)](#), [alphacut\(\)](#), [ambiguity\(\)](#), [as.FuzzyNumber\(\)](#), [as.PiecewiseLinearFuzzyNumber\(\)](#), [as.PowerFuzzyNumber\(\)](#), [as.TrapezoidalFuzzyNumber\(\)](#), [as.character\(\)](#), [core\(\)](#), [distance\(\)](#), [evaluate\(\)](#), [expectedInterval\(\)](#), [expectedValue\(\)](#), [integrateAlpha\(\)](#), [piecewiseLinearApproximation\(\)](#), [plot\(\)](#), [show\(\)](#), [supp\(\)](#), [trapezoidalApproximation\(\)](#), [value\(\)](#), [weightedExpectedValue\(\)](#), [width\(\)](#)

**Description**

Formally, a fuzzy number  $A$  (Dubois, Prade, 1987) is a fuzzy subset of the real line  $R$  with membership function  $\mu$  given by:

$$\mu(x) = \begin{cases} 0 & \text{if } x < a_1, \\ \left| \text{left}((x - a_1)/(a_2 - a_1)) \right| & \text{if } a_1 \leq x < a_2, \\ 1 & \text{if } a_2 \leq x \leq a_3, \\ \left| \text{right}((x - a_3)/(a_4 - a_3)) \right| & \text{if } a_3 < x \leq a_4, \\ 0 & \text{if } a_4 < x, \end{cases}$$

where  $a_1, a_2, a_3, a_4 \in R$ ,  $a_1 \leq a_2 \leq a_3 \leq a_4$ ,  $\text{left} : [0, 1] \rightarrow [0, 1]$  is a nondecreasing function called the *left side generator* of  $A$ , and  $\text{right} : [0, 1] \rightarrow [0, 1]$  is a nonincreasing function called the *right side generator* of  $A$ . Note that this is a so-called L-R representation of a fuzzy number.

Alternatively, it may be shown that each fuzzy number  $A$  may be uniquely determined by specifying its  $\alpha$ -cuts,  $A(\alpha)$ . We have  $A(0) = [a_1, a_4]$  and

$$A(\alpha) = [a_1 + (a_2 - a_1) * \text{lower}(\alpha), a_3 + (a_4 - a_3) * \text{upper}(\alpha)]$$

for  $0 < \alpha \leq 1$ , where  $\text{lower} : [0, 1] \rightarrow [0, 1]$  and  $\text{upper} : [0, 1] \rightarrow [0, 1]$  are, respectively, strictly increasing and decreasing functions satisfying  $\text{lower}(\alpha) = \inf\{x : \mu(x) \geq \alpha\}$  and  $\text{upper}(\alpha) = \sup\{x : \mu(x) \geq \alpha\}$ .

**Details**

Please note that many algorithms that deal with fuzzy numbers often use  $\alpha$ -cuts rather than side functions.

Note that the **FuzzyNumbers** package also deals with particular types of fuzzy numbers like trapezoidal, piecewise linear, or “parametric” FNs.

## Slots

- a1: Single numeric value specifying the left bound for the support.
- a2: Single numeric value specifying the left bound for the core.
- a3: Single numeric value specifying the right bound for the core.
- a4: Single numeric value specifying the right bound for the support.
- lower: A nondecreasing function  $[0,1] \rightarrow [0,1]$  that gives the lower alpha-cut bound.
- upper: A nonincreasing function  $[0,1] \rightarrow [1,0]$  that gives the upper alpha-cut bound.
- left: A nondecreasing function  $[0,1] \rightarrow [0,1]$  that gives the left side function.
- right: A nonincreasing function  $[0,1] \rightarrow [1,0]$  that gives the right side function.

## Examples

```
showClass("FuzzyNumber")
showMethods(classes="FuzzyNumber")
```

**integrateAlpha**

*Numerically Integrate Alpha-Cut Bounds*

## Description

Integrates numerically a transformed or weighted lower or upper alpha-cut bound of a fuzzy number.

**Usage**

```
## S4 method for signature 'FuzzyNumber,character,numeric,numeric'
integrateAlpha(object, which=c("lower", "upper"),
               from=0, to=1, weight=NULL, transform=NULL, ...)

## S4 method for signature 'DiscontinuousFuzzyNumber,character,numeric,numeric'
integrateAlpha(object, which=c("lower", "upper"),
               from=0, to=1, weight=NULL, transform=NULL, ...)
```

**Arguments**

object	a fuzzy number
which	one of "lower", "upper"
from	numeric
to	numeric
...	additional arguments passed to <a href="#">integrate</a> or <a href="#">integrate_discont_val</a>
weight	a function or NULL
transform	a function or NULL

**Value**

Returns a single numeric value.

**See Also**

**integrate\_discont\_val** *Integrate a Function with at Most Finite Number of Discontinuities*  
\*EXPERIMENTAL\*

**Description**

The function uses multiple calls to [integrate](#).

**Usage**

```
integrate_discont_val(f, from, to, discontinuities = numeric(0), ...)
```

**Arguments**

<code>f</code>	an R function taking a numeric vector of length 1 as its first argument and returning a numeric vector of length 1
<code>from</code>	the lower limit of integration
<code>to</code>	the upper limit of integration
<code>discontinuities</code>	nondecreasingly sorted numeric vector which indicates the points at which <code>f</code> is discontinuous
<code>...</code>	further arguments to be passed to the <code>integrate</code> function.

**Value**

Returns the estimate of the integral.

`maximum`

*Maximum of fuzzy numbers*

**Description**

Determines maximum fuzzy number based on two inputs.

**Usage**

```
## S4 method for signature
## 'PiecewiseLinearFuzzyNumber,PiecewiseLinearFuzzyNumber'
maximum(e1, e2)
```

**Arguments**

<code>e1</code>	a PiecewiseLinearFuzzyNumber
<code>e2</code>	a PiecewiseLinearFuzzyNumber

**Details**

The resulting PiecewiseLinearFuzzyNumber is only an approximation of the result it might not be very precise for small number of knots (see examples).

**Value**

Returns a PiecewiseLinearFuzzyNumber representing maximal value of the inputs.

**References**

necessityExceedance     *Necessity of exceedance*

## Description

Determines value of necessity of  $e1 \geq e2$ , the result is from range [0,1]. Value 0 indicates no fulfilment of the operator and 1 indicates complete fulfilment.

## Usage

```
## S4 method for signature
## 'PiecewiseLinearFuzzyNumber,PiecewiseLinearFuzzyNumber'
necessityExceedance(e1, e2)
```

## Arguments

e1	a PiecewiseLinearFuzzyNumber
e2	a PiecewiseLinearFuzzyNumber

## Value

Returns a value from range [0,1] indicating the necessity of exceedance of e2 by e1.

## References

```

---

**piecewiseLinearApproximation***Piecewise Linear Approximation of a Fuzzy Number*

---

**Description**

This method finds a piecewise linear approximation  $P(A)$  of a given fuzzy number  $A$  by using the algorithm specified by the `method` parameter.

**Usage**

```
## S4 method for signature 'FuzzyNumber'
piecewiseLinearApproximation(object,
  method=c("NearestEuclidean", "SupportCorePreserving",
  "Naive"),
  knot.n=1, knot.alpha=seq(0, 1, length.out=knot.n+2)[-c(1,knot.n+2)],
  ..., verbose=FALSE)
```

**Arguments**

<code>object</code>	a fuzzy number
<code>...</code>	further arguments passed to <code>integrateAlpha</code> [only "NearestEuclidean" and "SupportCorePreserving"]
<code>method</code>	character; one of: "NearestEuclidean" (default), "SupportCorePreserving", or "Naive"
<code>knot.n</code>	desired number of knots (if missing, then calculated from given <code>knot.alpha</code> )
<code>knot.alpha</code>	alpha-cuts at which knots will be positioned (defaults to equally distributed knots)
<code>verbose</code>	logical; should some technical details on the computations being performed be printed? [only "NearestEuclidean"]

**Details**

'`method`' may be one of:

1. `NearestEuclidean`: see (Coroianu, Gagolewski, Grzegorzewski, 2013 and 2014a); uses numerical integration, see `integrateAlpha`. Slow for large `knot.n`.
2. `SupportCorePreserving`: This method was proposed in (Coroianu et al., 2014b) and is currently only available for `knot.n==1`. It is the L2-nearest piecewise linear approximation with constraints `core(A)==core(P(A))` and `supp(A)==supp(P(A))`; uses numerical integration.
3. `Naive`: We have `core(A)==core(P(A))` and `supp(A)==supp(P(A))` and the knots are taken directly from the specified alpha cuts (linear interpolation).

**Value**

Returns a `PiecewiseLinearFuzzyNumber` object.

```
(A <- FuzzyNumber(-1, 0, 1, 3,
  lower=function(x) sqrt(x), upper=function(x) 1-sqrt(x)))
(PA <- piecewiseLinearApproximation(A, "NearestEuclidean",
  knot.n=1, knot.alpha=0.2))
```

### **PiecewiseLinearFuzzyNumber**

*Creates a Piecewise Linear Fuzzy Number*

## Description

For convenience, objects of class [PiecewiseLinearFuzzyNumber](#) may be created with this function.

## Usage

```
PiecewiseLinearFuzzyNumber(
  a1,
  a2,
  a3,
  a4,
  knot.n = 0,
  knot.alpha = numeric(0),
  knot.left = numeric(0),
  knot.right = numeric(0)
)
```

## Arguments

a1	a number specifying left bound of the support
a2	a number specifying left bound of the core
a3	a number specifying right bound of the core
a4	a number specifying right bound of the support
knot.n	the number of knots
knot.alpha	knot.n alpha-cut values at knots
knot.left	knot.n knots on the left side; a nondecreasingly sorted vector with elements in [a1,a2]
knot.right	knot.n knots on the right side; a nondecreasingly sorted vector with elements in [a3,a4]

## Details

If a1, a2, a3, and a4 are missing, then knot.left and knot.right may be of length knot.n+2. If knot.n is not given, then it is guessed from length(knot.left). If knot.alpha is missing, then the knots will be equally distributed on the interval [0,1].

## Value

An object of class [PiecewiseLinearFuzzyNumber](#).

## See Also

Other PiecewiseLinearFuzzyNumber-methods: [Arithmetic](#), [Extract](#), [PiecewiseLinearFuzzyNumber-class](#), [^](#), [PiecewiseLinearFuzzyNumber](#), [numeric-method](#), [alphaInterval\(\)](#), [arctan2\(\)](#), [as.PiecewiseLinearFuzzyNumber](#), [as.PowerFuzzyNumber\(\)](#), [as.TrapezoidalFuzzyNumber\(\)](#), [as.character\(\)](#), [expectedInterval\(\)](#), [fapply\(\)](#), [maximum\(\)](#), [minimum\(\)](#), [necessityExceedance\(\)](#), [necessityStrictExceedance\(\)](#), [necessityStrictUndervaluation\(\)](#), [necessityUndervaluation\(\)](#), [plot\(\)](#), [possibilityExceedance\(\)](#), [possibilityStrictExceedance\(\)](#), [possibilityStrictUndervaluation\(\)](#), [possibilityUndervaluation\(\)](#)

## Description

A piecewise linear fuzzy number (PLFN) has side functions and alpha-cut bounds that linearly interpolate a given set of points (at fixed alpha-cuts).

## Details

If knot.n is equal to 0 or all left and right knots lie on common lines, then a Piecewise Linear Fuzzy Number reduces to a [TrapezoidalFuzzyNumber](#). Note that, however, the [TrapezoidalFuzzyNumber](#) does not inherit from [PiecewiseLinearFuzzyNumber](#) for efficiency reasons. To convert the former to the latter, call [as.PiecewiseLinearFuzzyNumber](#).

**Slots**

**a1, a2, a3, a4, lower, upper, left, right:** Inherited from the [FuzzyNumber](#) class.  
**knot.n:** number of knots, a single integer value, 0 for a trapezoidal fuzzy number  
**knot.alpha:** alpha-cuts, increasingly sorted vector of length knot.n with elements in [0,1]  
**knot.left:** nondecreasingly sorted vector of length knot.n; defines left alpha-cut bounds at knots  
**knot.right:** nondecreasingly sorted vector of length knot.n; defines right alpha-cut bounds at knots

**Extends**

Class [FuzzyNumber](#), directly.

**See Also**

[PiecewiseLinearFuzzyNumber](#) for a convenient constructor, [as.PiecewiseLinearFuzzyNumber](#) for conversion of objects to this class, and [piecewiseLinearApproximation](#) for approximation routines.

type="l", col=1, lty=1, pch=1, lwd=1,
add=FALSE, ...)
```

## Arguments

x	a fuzzy number
y	not used
from	numeric;
to	numeric;
n	numeric; number of points to probe
at.alpha	numeric vector; give exact alpha-cuts at which linear interpolation should be done
draw.membership.function	logical; you want membership function (TRUE) or alpha-cuts plot (FALSE)?
draw.alphacuts	logical; defaults !draw.membership.function
xlab	character; x-axis label
ylab	character; y-axis label
xlim	numeric;
ylim	numeric;
type	character; defaults "l"; plot type, e.g.~"l" for lines, "p" for points, or "b" for both
col	see <code>plot.default</code>
lty	see <code>plot.default</code>
pch	see <code>plot.default</code>
lwd	see <code>plot.default</code>
shadowdensity	numeric; for shadowed sets;
shadowangle	numeric; for shadowed sets;

shadowcol	color specification, see <a href="#">plot.default</a> ; for shadowed sets;
shadowborder	numeric; for shadowed sets;
add	logical; add another FuzzyNumber to existing plot?
...	further arguments passed to <a href="#">plot.default</a>

## Details

Note that if `from` > `a1` then it is set to `a1`.

## Value

Returns nothing really interesting.

```

`possibilityExceedance` *Possibility of exceedance*

## Description

Determines value of possibility of  $e1 \geq e2$ , the result is from range [0,1]. Value 0 indicates no fulfilment of the operator and 1 indicates complete fulfilment.

## Usage

```
## S4 method for signature
## 'PiecewiseLinearFuzzyNumber,PiecewiseLinearFuzzyNumber'
possibilityExceedance(e1, e2)
```

## Arguments

e1	a PiecewiseLinearFuzzyNumber
e2	a PiecewiseLinearFuzzyNumber

## Value

Returns a value from range [0,1] indicating the possibility of exceedance of e2 by e1.

## References

b <- as.PiecewiseLinearFuzzyNumber(b, knot.n = 9)
possibilityExceedance(a,b)
```

**possibilityStrictExceedance**  
*Possibility of strict exceedance*

## Description

Determines value of possibility of  $e1 > e2$ , the result is from range [0,1]. Value 0 indicates no fulfilment of the operator and 1 indicates complete fulfilment.

## Usage

```
## S4 method for signature
## 'PiecewiseLinearFuzzyNumber,PiecewiseLinearFuzzyNumber'
possibilityStrictExceedance(e1, e2)
```

## Arguments

e1	a PiecewiseLinearFuzzyNumber
e2	a PiecewiseLinearFuzzyNumber

## Value

Returns a value from range [0,1] indicating the strict possibility of exceedance of e2 by e1.

## References

PowerFuzzyNumber*Creates a Fuzzy Number with Sides Given by Power Functions*

---

**Description**

For convenience, objects of class [PowerFuzzyNumber](#) may be created with this function.

**Usage**

```
PowerFuzzyNumber(a1, a2, a3, a4, p.left = 1, p.right = 1)
```

**Arguments**

a1	a number specifying left bound of the support
a2	a number specifying left bound of the core
a3	a number specifying right bound of the core
a4	a number specifying right bound of the support
p.left	a positive number specifying the exponent for the left side
p.right	a positive number specifying the exponent for the right side

**Value**

Object of class [PowerFuzzyNumber](#)

**See Also**

Other PowerFuzzyNumber-method: [Extract, PowerFuzzyNumber-class, alphaInterval\(\)](#), [as.PowerFuzzyNumber\(\)](#), [as.TrapezoidalFuzzyNumber\(\)](#), [as.character\(\)](#), [expectedInterval\(\)](#)

---

**PowerFuzzyNumber-class***S4 class Representing a Fuzzy Number with Sides Given by Power Functions*

---

**Description**

Bodjanova-type fuzzy numbers which sides are given by power functions are defined using four coefficients  $a_1 \leq a_2 \leq a_3 \leq a_4$ , and parameters  $p.left, p.right > 0$ , which determine exponents for the side functions.

**Details**

We have  $\text{left}(x) = x^{p.left}$ , and  $\text{right}(x) = (1 - x)^{p.right}$ .

This class is a natural generalization of trapezoidal FNs. For other see [PiecewiseLinearFuzzyNumber](#).

**Slots**

`a1, a2, a3, a4, lower, upper, left, right`: Inherited from the [FuzzyNumber](#) class.  
`p.left`: single numeric value; 1.0 for a trapezoidal FN.  
`p.right`: single numeric value; 1.0 for a trapezoidal FN.

**Extends**

Class [FuzzyNumber](#), directly.

**References**

*Print Basic Information on a Fuzzy Number*

---

**Description**

See [as.character](#) for more details.

**Usage**

```
## S4 method for signature 'FuzzyNumber'
show(object)
```

**Arguments**

object	a fuzzy number
--------	----------------

**Details**

The method [as.character](#) is called on given fuzzy number object with default arguments. The results are printed on stdout.

**Value**

Does not return anything interesting.

**See Also**

Other FuzzyNumber-method: [Arithmetic](#), [Extract](#), [FuzzyNumber-class](#), [FuzzyNumber](#), [alphaInterval\(\)](#), [alphacut\(\)](#), [ambiguity\(\)](#), [as.FuzzyNumber\(\)](#), [as.PiecewiseLinearFuzzyNumber\(\)](#), [as.PowerFuzzyNumber\(\)](#), [as.TrapezoidalFuzzyNumber\(\)](#), [as.character\(\)](#), [core\(\)](#), [distance\(\)](#), [evaluate\(\)](#), [expectedInterval\(\)](#), [expectedValue\(\)](#), [integrateAlpha\(\)](#), [piecewiseLinearApproximation\(\)](#), [plot\(\)](#), [supp\(\)](#), [trapezoidalApproximation\(\)](#), [value\(\)](#), [weightedExpectedValue\(\)](#), [width\(\)](#)

supp

*Calculate the Support of a Fuzzy Number*

**Description**

We have  $\text{supp}(A) := [a1, a4]$ . This gives the values that a fuzzy number possibly may represent.

**Usage**

```
## S4 method for signature 'FuzzyNumber'
supp(object)
```

**Arguments**

object	a fuzzy number
--------	----------------

**Value**

Returns a numeric vector of length 2.

**See Also**

Other FuzzyNumber-method: [Arithmetic](#), [Extract](#), [FuzzyNumber-class](#), [FuzzyNumber](#), [alphaInterval\(\)](#), [alphacut\(\)](#), [ambiguity\(\)](#), [as.FuzzyNumber\(\)](#), [as.PiecewiseLinearFuzzyNumber\(\)](#), [as.PowerFuzzyNumber\(\)](#), [as.TrapezoidalFuzzyNumber\(\)](#), [as.character\(\)](#), [core\(\)](#), [distance\(\)](#), [evaluate\(\)](#), [expectedInterval\(\)](#), [expectedValue\(\)](#), [integrateAlpha\(\)](#), [piecewiseLinearApproximation\(\)](#), [plot\(\)](#), [show\(\)](#), [trapezoidalApproximation\(\)](#), [value\(\)](#), [weightedExpectedValue\(\)](#), [width\(\)](#)

Other alpha\_cuts: [alphacut\(\)](#), [core\(\)](#)

**trapezoidalApproximation***Trapezoidal Approximation of a Fuzzy Number***Description**

This method finds a trapezoidal approximation  $T(A)$  of a given fuzzy number  $A$  by using the algorithm specified by the `method` parameter.

**Usage**

```
## S4 method for signature 'FuzzyNumber'
trapezoidalApproximation(object,
  method=c("NearestEuclidean", "ExpectedIntervalPreserving",
           "SupportCoreRestricted", "Naive"),
  ..., verbose=FALSE)
```

**Arguments**

<code>object</code>	a fuzzy number
<code>...</code>	further arguments passed to <code>integrateAlpha</code>
<code>method</code>	character; one of: "NearestEuclidean" (default), "ExpectedIntervalPreserving", "SupportCoreRestricted", "Naive"
<code>verbose</code>	logical; should some technical details on the computations being performed be printed?

**Details**

`method` may be one of:

1. `NearestEuclidean`: see (Ban, 2009); uses numerical integration, see `integrateAlpha`
2. `Naive`: We have  $\text{core}(A) == \text{core}(T(A))$  and  $\text{supp}(A) == \text{supp}(T(A))$
3. `ExpectedIntervalPreserving`: L2-nearest trapezoidal approximation preserving the expected interval given in (Grzegorzewski, 2010; Ban, 2008; Yeh, 2008) Unfortunately, for highly skewed membership functions this approximation operator may have quite unfavourable behavior. For example, if  $\text{Val}(A) < \text{EV}_{1/3}(A)$  or  $\text{Val}(A) > \text{EV}_{2/3}(A)$ , then it may happen that the core of the output and the core of the original fuzzy number  $A$  are disjoint (cf. Grzegorzewski, Pasternak-Winiarska, 2011)
4. `SupportCoreRestricted`: This method was proposed in (Grzegorzewski, Pasternak-Winiarska, 2011). L2-nearest trapezoidal approximation with constraints  $\text{core}(A) \subseteq \text{core}(T(A))$  and  $\text{supp}(T(A)) \subseteq \text{supp}(A)$ , i.e. for which each point that surely belongs to  $A$  also belongs to  $T(A)$ , and each point that surely does not belong to  $A$  also does not belong to  $T(A)$ .

**Value**

Returns a `TrapezoidalFuzzyNumber` object.

**TrapezoidalFuzzyNumber-class**

*S4 class Representing a Trapezoidal Fuzzy Number*

**Description**

Trapezoidal Fuzzy Numbers have linear side functions and alpha-cut bounds.

**Details**

Trapezoidal fuzzy numbers are among the simplest FNs. Despite their simplicity, however, they include triangular FNs, “crisp” real intervals, and “crisp” reals. Please note that currently no separate classes for these particular TFNs types are implemented in the package.

**Slots**

a1, a2, a3, a4, lower, upper, left, right: Inherited from the [FuzzyNumber](#) class.

**Extends**

Class [FuzzyNumber](#), directly.

**See Also**

[TrapezoidalFuzzyNumber](#) for a convenient constructor, [as.TrapezoidalFuzzyNumber](#) for conversion of objects to this class, and [trapezoidalApproximation](#) for approximation routines.

---

## Description

For convenience, objects of class [TrapezoidalFuzzyNumber](#) may be created with this function.

## Usage

```
TriangularFuzzyNumber(a1, amid, a4)
```

## Arguments

a1	a number specifying left bound of the support
amid	a number specifying the core
a4	a number specifying right bound of the support

## Details

Currently there is no separate class of a Triangular Fuzzy Number.

## Value

Object of class [TrapezoidalFuzzyNumber](#)

## See Also

Other TrapezoidalFuzzyNumber-method: [Arithmetic](#), [TrapezoidalFuzzyNumber-class](#), [TrapezoidalFuzzyNumber](#), [alphaInterval\(\)](#), [as.PiecewiseLinearFuzzyNumber\(\)](#), [as.PowerFuzzyNumber\(\)](#), [as.TrapezoidalFuzzyNumber\(\)](#), [expectedInterval\(\)](#), [plot\(\)](#)

value	<i>Calculate the Value of a Fuzzy Number</i>
-------	----------------------------------------------

## Description

The calculation of the so-called value is one of possible methods to defuzzify a fuzzy number.

## Usage

```
## S4 method for signature 'FuzzyNumber'
value(object, ...)
```

## Arguments

object	a fuzzy number
...	additional arguments passed to <a href="#">alphaInterval</a>

## Details

The value of  $A$  (Delgado et al, 1998) is defined as  $val(A) := \int_0^1 \alpha (A_L(\alpha) + A_U(\alpha)) d\alpha$ .

## Value

Returns a single numeric value.

## References

---

`weightedExpectedValue` *Calculate the Weighted Expected Value of a Fuzzy Number*

---

## Description

The calculation of the so-called weighted expected value is one of possible methods to defuzzify a fuzzy number.

For  $w = 0.5$  we get the ordinary [expectedValue](#).

## Usage

```
## S4 method for signature 'FuzzyNumber'
weightedExpectedValue(object, w=0.5, ...)
```

## Arguments

object	a fuzzy number
...	additional arguments passed to <a href="#">expectedInterval</a>
w	a single numeric value in [0,1]

## Details

The weighted expected value of  $A$  is defined as  $EV_w(A) := (1 - w)EI_L(A) + wEI_U(A)$ , where  $EI$  is the [expectedInterval](#).

## Value

Returns a single numeric value.

## See Also

Other FuzzyNumber-method: [Arithmetic](#), [Extract](#), [FuzzyNumber-class](#), [FuzzyNumber](#), [alphaInterval\(\)](#), [alphacut\(\)](#), [ambiguity\(\)](#), [as.FuzzyNumber\(\)](#), [as.PiecewiseLinearFuzzyNumber\(\)](#), [as.PowerFuzzyNumber\(\)](#), [as.TrapezoidalFuzzyNumber\(\)](#), [as.character\(\)](#), [core\(\)](#), [distance\(\)](#), [evaluate\(\)](#), [expectedInterval\(\)](#), [expectedValue\(\)](#), [integrateAlpha\(\)](#), [piecewiseLinearApproximation\(\)](#), [plot\(\)](#), [show\(\)](#), [supp\(\)](#), [trapezoidalApproximation\(\)](#), [value\(\)](#), [width\(\)](#)

Other defuzzification: [expectedValue\(\)](#), [value\(\)](#)

Other characteristics: [ambiguity\(\)](#), [expectedValue\(\)](#), [value\(\)](#), [width\(\)](#)

width	<i>Calculate the Width of a Fuzzy Number</i>
-------	----------------------------------------------

## Description

The width (Chanas, 2001) is a measure of nonspecificity of a fuzzy number.

## Usage

```
## S4 method for signature 'FuzzyNumber'
width(object, ...)
```

## Arguments

object	a fuzzy number
...	additional arguments passed to <a href="#">expectedInterval</a>

## Details

The width of  $A$  is defined as  $\text{width}(A) := EI_U(A) - EI_L(A)$ , where  $EI$  is the [expectedInterval](#).

## Value

Returns a single numeric value.

## References

Chanas S. (2001), On the interval approximation of a fuzzy number, *Fuzzy Sets and Systems* 122, pp. 353-356.

---

$\wedge$ , PiecewiseLinearFuzzyNumber, numeric-method  
Integer power of fuzzy number

---

## Description

For fuzzy numbers the equality of  $X*X == X^2$  does not hold.

## Usage

```
## S4 method for signature 'PiecewiseLinearFuzzyNumber,numeric'  
e1 ^ e2
```

## Arguments

e1	a PiecewiseLinearFuzzyNumber
e2	numeric (if it is not integer it will be converted by function as.integer())

## Details

This function calculates integer power of a PiecewiseLinearFuzzyNumber according to the reference below.

## Value

Returns a fuzzy number of the class [PiecewiseLinearFuzzyNumber](#) indicating  $e1^e2$ .
