

Package ‘procmaps’

May 9, 2026

Title Portable Address Space Mapping

Version 0.0.5

Date 2023-01-19

Description Portable '/proc/self/maps' as a data frame.

Determine which library or other region is mapped to a specific address of a process. --

R packages can contain native code, compiled to shared libraries at build or installation time.

When loaded, each shared library occupies a portion of the address space of the main process.

When only a machine instruction pointer is available (e.g. from a backtrace during error inspection or profiling), the address space map determines which library this instruction pointer corresponds to.

Contents

path_is_libr	2
procmap_get	2

Index	4
--------------	----------

path_is_libr	<i>Does a path represent R's main library?</i>
--------------	--

Description

For a vector of paths, checks if the [basename](#) matches libR or R. This is useful to detect the addresses occupied by R itself.

Usage

```
path_is_libr(path)
```

Arguments

path A character vector of paths

Value

A logical vector of the same length as path.

Examples

```
map <- procmap_get()
path_is_libr(map$pathname)
```

procmap_get	<i>Get the address space map of a process</i>
-------------	---

Description

Returns the address space map of a process as a data frame.

Usage

```
procmap_get(..., as_tibble = NULL)
```

Arguments

... Reserved for future extensions, must be empty.

as_tibble When using in a package, set to TRUE to return a [tibble::tibble](#). This requires the tibble package to be installed. The default returns a tibble if the package is installed, otherwise a data frame.

Value

A data frame or tibble, depending on the `as_tibble` argument.

Examples

```
procmmap_get()
```
