

Package ‘IHWpaper’

April 13, 2017

Title Reproduce figures in IHW paper

Version 1.2.0

Description This package conveniently wraps all functions needed to reproduce the figures in the IHW preprint, available on bioRxiv under <http://biorxiv.org/content/early/2016/03/30/034330>. Thus it is a companion package to the Bioconductor IHW package.

Depends R (>= 3.3), IHW

License Artistic-2.0

LazyData true

LinkingTo Rcpp

Imports Rcpp, stats, splines, methods, utils, DESeq2, SummarizedExperiment, fdrtool, genefilter, qvalue, Biobase, BiocGenerics, BiocParallel, dplyr, grid, ggplot2, cowplot

VignetteBuilder knitr

biocViews ReproducibleResearch, ExperimentData, RNASeqData, ExpressionData

analyze_dataset	<i>analyze_dataset: Basically performs preprocessing and then returns analyzed RNASeq dataset (diff. expression) , i.e. the DESeq2 result whose p-values and baseMean statistics can then be used with DDHW</i>
-----------------	---

Description

analyze_dataset: Basically performs preprocessing and then returns analyzed RNASeq dataset (diff. expression) , i.e. the DESeq2 result whose p-values and baseMean statistics can then be used with DDHW

Usage

```
analyze_dataset(dataset = c("pasilla", "airway", "bottomly", "pasilla"),
  res = TRUE)
```

Arguments

dataset	Character, name of dataset to be preprocessed, only 4 choices currently available
res	(default TRUE): return result table, rather than DESeq2 object

Value

Preprocessed dataset

Examples

```
pasilla <- analyze_dataset("pasilla")
```

bh *bh: Wrapper for Benjamini Hochberg*

Description

bh: Wrapper for Benjamini Hochberg

Usage

```
bh(unadj_p, alpha)
```

Arguments

unadj_p	Numeric vector of unadjusted p-values.
alpha	Significance level at which to apply method

Value

BH multiple testing object

Examples

```
sim_df <- du_ttest_sim(20000,0.95, 1.5)
obj <- bh(sim_df$pvalue, .1)
sum(rejected_hypotheses(obj))
```

bonf *bonf: Wrapper for Bonferroni*

Description

bonf: Wrapper for Bonferroni

Usage

```
bonf(unadj_p, alpha)
```

Arguments

unadj_p	Numeric vector of unadjusted p-values.
alpha	Significance level at which to apply method

Value

Bonferroni multiple testing object

Examples

```
sim_df <- du_ttest_sim(20000,0.95, 1.5)
obj <- bonf(sim_df$pvalue, .1)
sum(rejected_hypotheses(obj))
```

clfdr	<i>clfdr: Cai's local fdr based method</i>
-------	--

Description

clfdr: Cai's local fdr based method

Usage

```
clfdr(unadj_p, groups, alpha, lfdr_estimation = "fdrtool")
```

Arguments

unadj_p	Numeric vector of unadjusted p-values.
groups	Factor to which different hypotheses belong
alpha	Significance level at which to apply method
lfdr_estimation	Method used to estimate the local fdr, defaults to "fdrtool"

Value

Clfdr multiple testing object

References

Cai, T. Tony, and Wenguang Sun. "Simultaneous testing of grouped hypotheses: Finding needles in multiple haystacks." *Journal of the American Statistical Association* 104.488 (2009).

Examples

```
sim_df <- du_ttest_sim(20000, 0.95, 1.5)
sim_df$group <- groups_by_filter(sim_df$filterstat, 20)
obj <- clfdr(sim_df$pvalue, sim_df$group, .1)
sum(rejected_hypotheses(obj))
```

continuous_wrap	<i>Benchmarking wrapper: Given a multiple testing method, convert it so that it takes a simulation object (see simulation function) and a nominal level alpha as inputs</i>
-----------------	---

Description

Benchmarking wrapper: Given a multiple testing method, convert it so that it takes a simulation object (see simulation function) and a nominal level alpha as inputs

Usage

```
continuous_wrap(mt_method, nbins = 20)
```

Arguments

mt_method Multiple testing method (e.g. a function such as gbh or ddhf)
 nbins Integer, number of equally sized bins into which to stratify hypotheses

Value

A new multiple testing function which has an interface of the form `f(sim_data_frame, alpha)`

Examples

```
sim_df <- du_ttest_sim(20000, 0.95, 1.5)
sim_df$group <- groups_by_filter(sim_df$filterstat, 20)
obj <- tst_gbh(sim_df$pvalue, sim_df$group, .1)
sum(rejected_hypotheses(obj))

tst_gbh_continuous <- continuous_wrap(tst_gbh)
obj2 <- tst_gbh_continuous(sim_df, .1)
sum(rejected_hypotheses(obj2))
```

 ddhf

ddhf: Greedy independent filtering

Description

ddhf: Greedy independent filtering

Usage

```
ddhf(unadj_p, filterstat, alpha)
```

Arguments

unadj_p Numeric vector of unadjusted p-values.
 filterstat Factor to which different hypotheses belong
 alpha Significance level at which to apply method

Value

DDHF multiple testing object

Examples

```
sim_df <- du_ttest_sim(20000, 0.95, 1.5)
obj <- ddhf(sim_df$pvalue, sim_df$filterstat, .1)
sum(rejected_hypotheses(obj))
```

du_ttest_sim *t-test simulation: Simulate rowwise t-tests*

Description

t-test simulation: Simulate rowwise t-tests

Usage

```
du_ttest_sim(m, pi0, effect_size, n_samples = 10,
             uninformative_filter = FALSE, seed = NULL)
```

```
du_ttest_sim_fun(m, pi0, effect_size, n_samples = 10,
                 uninformative_filter = FALSE)
```

Arguments

m	Integer, total number of hypotheses
pi0	Numeric, proportion of null hypotheses
effect_size	Numeric, the alternative hypotheses will be
n_samples	Integer, number of samples for t-test, i.e. the comparison will be n_samples/2 vs n_samples/2
uninformative_filter	Boolean, if TRUE will generate uniformly distributed filter statistic Otherwise will use the pooled standard deviations
seed	Integer, Random seed to be used for simulation (default: NULL, i.e. RNG state will be used as is)

Value

A data frame containing all information about the simulation experiment

Functions

- du_ttest_sim_fun: Creates a closure function for a given seed

Examples

```
sim_df <- du_ttest_sim(20000,0.95, 1.5)
```

gbh *gbh: Grouped Benjamini Hochberg*

Description

gbh: Grouped Benjamini Hochberg

tst_gbh: wrapper for gbh with method="TST" lsl_gbh: wrapper for gbh with method="LSL"

Usage

```
gbh(unadj_p, groups, alpha, method = "TST", pi0_global = "weighted_average")
```

```
tst_gbh(unadj_p, groups, alpha, ...)
```

```
lsl_gbh(unadj_p, groups, alpha, ...)
```

Arguments

unadj_p	Numeric vector of unadjusted p-values.
groups	Factor to which different hypotheses belong
alpha	Significance level at which to apply method
method	What pi0 estimator should be used (available "TST", "LSL")
pi0_global	GBH requires also a pi0 estimate for the marginal p-value distribution. Can either apply pi0 estimation method to all p-values (pi0_global="global") or use a weighted average (pi0_global="weighted_average") of the pi0 estimates within each stratum. This is not explicitly stated in the paper, but based on a reproduction of their paper figures it seems to be the weighted_average.
...	Additional arguments passed from tst_gbh/lsl_gbh to gbh

Value

GBH multiple testing object

Functions

- `tst_gbh`: Wrapper of GBH with TST pi0 estimator
- `lsl_gbh`: Wrapper of GBH with LSL pi0 estimator

References

Hu, James X., Hongyu Zhao, and Harrison H. Zhou. "False discovery rate control with groups." *Journal of the American Statistical Association* 105.491 (2010).

Examples

```
sim_df <- du_ttest_sim(20000, 0.95, 1.5)
sim_df$group <- groups_by_filter(sim_df$filterstat, 20)
obj <- tst_gbh(sim_df$pvalue, sim_df$group, .1)
sum(rejected_hypotheses(obj))
```

`ihw_naive`*IHW wrappers*

Description

IHW wrappers

Usage

```
ihw_naive(unadj_p, filterstat, alpha)
ihw_ecdf_5fold(unadj_p, filterstat, alpha)
ihw_5fold(unadj_p, filterstat, alpha)
ihw_5fold_reg(unadj_p, filterstat, alpha)
ihw_bonf_5fold_reg(unadj_p, filterstat, alpha)
```

Arguments

<code>unadj_p</code>	Numeric vector of unadjusted p-values.
<code>filterstat</code>	Factor to which different hypotheses belong
<code>alpha</code>	Significance level at which to apply method

Details

These are closures, which apply IHW with custom prespecified parameters. These correspond to interesting settings, for which it is convenient to be able to immediately call the corresponding functions, rather than having to specify parameters each time. Thus they make it easier to benchmark. All of these wrappers are defined in 2 lines of code, so the settings pertaining to each one can be inspected by typing the functions name into the console.

Value

ihwResult multiple testing object

Functions

- `ihw_naive`: IHW naive
- `ihw_ecdf_5fold`: IHW (E2) with 5 folds
- `ihw_5fold`: IHW (E1-E2) with 5 folds
- `ihw_5fold_reg`: IHW (E1-E2-E3) with 5 folds
- `ihw_bonf_5fold_reg`: IHW-Bonferroni (E1-E2-E3) with 5 folds

Examples

```
sim_df <- du_ttest_sim(20000, 0.95, 1.5)
obj <- ihw_5fold(sim_df$pvalue, sim_df$filterstat, .1)
sum(rejected_hypotheses(obj))
```

lsl_pi0_est	<i>LSL (Least-Slope) pi0 estimator</i>
-------------	--

Description

LSL (Least-Slope) pi0 estimator

Usage

```
lsl_pi0_est(pvalue)
```

Arguments

pvalue Numeric vector of unadjusted p-values.

Value

estimated proportion of null hypotheses (pi0)

Examples

```
sim_df <- du_ttest_sim(20000, 0.95, 1.5)
lsl_pi0_est(sim_df$pvalue)
```

null_sim	<i>Null simulation: Generate uniformly distributed p-values and covariates</i>
----------	--

Description

Null simulation: Generate uniformly distributed p-values and covariates

Usage

```
null_sim(m, seed = NULL)
```

```
null_sim_fun(m)
```

Arguments

m Integer, total number of hypotheses

seed Integer, Random seed to be used for simulation (default: NULL, i.e. RNG state will be used as is)

Value

A data frame containing all information about the simulation experiment

Functions

- `null_sim_fun`: Creates a closure function for a given seed

Examples

```
sim_df <- null_sim(20000)
```

```
pretty_legend      helper function to create nice legends
```

Description

helper function to create nice legends

Usage

```
pretty_legend(gg, last_vals, xmin, fontsize = 13)
```

Arguments

<code>gg</code>	ggplot2 object
<code>last_vals</code> ,	data frame with columns label, colour, last_vals (i.e. place label with colour at y-coordinate last_vals)
<code>xmin</code>	Numeric, x axis position at which labels should be placed
<code>fontsize</code>	Integer, fontsize

Value

Another ggplot2 object

This replaces the default legend of a ggplot2 object. In particular, given a ggplot2 object, it removes the existing legend and then places new labels based on the annotation data frame 'last_vals' (see parameter description) at a given x-coordinate of the original plot.

This function can be attributed to and is described in more detail in the following blog post: <http://www.r-bloggers.com/coloring-and-drawing-outside-the-lines-in-ggplot/>

Examples

```
library("ggplot2")
labels <- c("A", "B", "C")
mypoints <- rbind(data.frame(y=1:3, x=1, label=as.factor(labels)),
                 data.frame(y=2:4, x=2, label=as.factor(labels)))
mycolours <- c("#F8766D", "#00BA38", "#619CFF")
gg <- ggplot(mypoints, aes(x=x, y=y, color=label)) +
      geom_line(size=2) +
      scale_color_manual(values=mycolours) +
      xlim(c(0, 2.2))

gg
annotation_df <- data.frame(colour=mycolours, last_vals=2:4, label=labels)
pretty_legend(gg, annotation_df, 2.1)
```

run_evals	<i>run_evals: Main function to benchmark FDR methods on given simulations.</i>
-----------	--

Description

run_evals: Main function to benchmark FDR methods on given simulations.

Usage

```
run_evals(sim_funs, fdr_methods, nreps, alphas, ...)
```

Arguments

sim_funs	List of simulation settings
fdr_methods	List of FDR controlling methods to be benchmarked
nreps	Integer, number of Monte Carlo replicates for the simulations
alphas	Numeric, vector of nominal significance levels at which to apply FDR controlling methods
...	Additional arguments passed to sim_fun_eval

Details

This is the main workhorse function which runs all simulation benchmarks for IHWpaper. It receives input as described above, and the output is a data.frame with the following columns:

- fdr_method: Multiple testing method which was used
- fdr_pars: Custom parameters of the multiple testing method
- alpha: Nominal significance level at which the benchmark was run
- FDR: False Discovery Rate of benchmarked method on simulated dataset
- power: Power of benchmarked method on simulated dataset
- rj_ratio: Average rejections divided by total number of hypotheses
- FPR: False positive rate of benchmarked method on simulated dataset
- FWER: Familywise Error Rate of benchmarked method on simulated dataset
- nsuccessful: Number of successful evaluations of the method
- sim_method: Simulation scenario under which benchmark was run
- m: Total number of hypotheses
- sim_pars: Custom parameters of the simulation scenario

Value

data.frame which summarizes results of numerical experiment

Examples

```

nreps <- 3 # monte carlo replicates
ms <- 5000 # number of hypothesis tests
eff_sizes <- c(2,3)
sim_funs <- lapply(eff_sizes,
function(x) du_ttest_sim_fun(ms,0.95,x, uninformative_filter=FALSE))
continuous_methods_list <- list(bh,
                                lsl_gbh,
                                clfdr,
                                ddhf)
fdr_methods <- lapply(continuous_methods_list, continuous_wrap)
eval_table <- run_evals(sim_funs, fdr_methods, nreps, 0.1, BiocParallel=FALSE)

```

scott_fdrreg	<i>scott_fdrreg: Wrapper for FDR regression</i>
--------------	---

(<https://github.com/jgscott/FDRreg>)

Description

scott_fdrreg: Wrapper for FDR regression (<https://github.com/jgscott/FDRreg>)

Usage

```
scott_fdrreg(unadj_p, filterstat, alpha, df = 3, lambda = 0.01)
```

Arguments

unadj_p	Numeric vector of unadjusted p-values.
filterstat	Factor to which different hypotheses belong
alpha	Significance level at which to apply method
df	Degrees of freedom for B-splines
lambda	Ridge regularization parameter

Value

FDRreg multiple testing object

References

storey_qvalue	<i>storey_qvalue: Wrapper for Storey's qvalue package</i>
---------------	---

Description

storey_qvalue: Wrapper for Storey's qvalue package

Usage

```
storey_qvalue(unadj_p, alpha)
```

Arguments

unadj_p	Numeric vector of unadjusted p-values.
alpha	Significance level at which to apply method

Value

StoreyQValue multiple testing object

Examples

```
sim_df <- du_ttest_sim(20000, 0.95, 1.5)
obj <- storey_qvalue(sim_df$pvalue, .1)
sum(rejected_hypotheses(obj))
```

stratified_bh	<i>stratified_bh: Stratified Benjamini Hochberg</i>
---------------	---

Description

stratified_bh: Stratified Benjamini Hochberg

Usage

```
stratified_bh(unadj_p, groups, alpha)
```

Arguments

unadj_p	Numeric vector of unadjusted p-values.
groups	Factor to which different hypotheses belong
alpha	Significance level at which to apply method

Value

SBH multiple testing object

References

Yoo, Yun J., et al. "Were genome-wide linkage studies a waste of time? Exploiting candidate regions within genome-wide association studies." *Genetic epidemiology* 34.2 (2010): 107-118.

Examples

```
sim_df <- du_ttest_sim(20000,0.95, 1.5)
sim_df$group <- groups_by_filter(sim_df$filterstat, 20)
obj <- stratified_bh(sim_df$pvalue, sim_df$group, .1)
sum(rejected_hypotheses(obj))
```

tst_pi0_est	<i>TST (Two-Step) pi0 estimator</i>
-------------	-------------------------------------

Description

TST (Two-Step) pi0 estimator

Usage

```
tst_pi0_est(pvalue, alpha)
```

Arguments

pvalue	Numeric vector of unadjusted p-values.
alpha	Nominal level for applying the TST procedure

Value

estimated proportion of null hypotheses (π_0)

Examples

```
sim_df <- du_ttest_sim(20000,0.95, 1.5)
tst_pi0_est(sim_df$pvalue, .1)
```

 wasserman_normal_prds_sim

Normal PRDS simulation: Covariate is effect size under alternative, there are latent factors driving PRDS correlations among hypotheses

Description

Normal PRDS simulation: Covariate is effect size under alternative, there are latent factors driving PRDS correlations among hypotheses

Usage

```
wasserman_normal_prds_sim(m, pi0, rho = 0, latent_factors = 1, xi_min = 0,
  xi_max = 2.5, seed = NULL)
```

```
wasserman_normal_prds_sim_fun(m, pi0, rho = 0, latent_factors = 1,
  xi_min = 0, xi_max = 2.5)
```

Arguments

<code>m</code>	Integer, total number of hypotheses
<code>pi0</code>	Numeric, proportion of null hypotheses
<code>rho</code>	Numeric, correlation between z-scores of hypotheses driven by same latent factor
<code>latent_factors</code>	Integer, number of latent factors driving the correlations
<code>xi_min, xi_max</code>	Numeric, covariates are drawn as uniform on <code>xi_min, xi_max</code>
<code>seed</code>	Integer, Random seed to be used for simulation (default: NULL, i.e. RNG state will be used as is)

Value

A data frame containing all information about the simulation experiment

Functions

- `wasserman_normal_prds_sim_fun`: Creates a closure function for a given seed

Examples

```
sim_df <- wasserman_normal_prds_sim(20000, 0.9, rho=0.1)
```

wasserman_normal_sim *Normal simulation: Covariate is effect size under alternative*

Description

Normal simulation: Covariate is effect size under alternative

Usage

```
wasserman_normal_sim(m, pi0, xi_min, xi_max, seed = NULL)
```

```
wasserman_normal_sim_fun(m, pi0, xi_min, xi_max)
```

Arguments

m	Integer, total number of hypotheses
pi0	Numeric, proportion of null hypotheses
xi_min, xi_max	Numeric, covariates are drawn as uniform on xi_min, xi_max
seed	Integer, Random seed to be used for simulation (default: NULL, i.e. RNG state will be used as is)

Value

A data frame containing all information about the simulation experiment

Functions

- wasserman_normal_sim_fun: Creates a closure function for a given seed

Examples

```
sim_df <- wasserman_normal_sim(20000, 0.9, 1, 5)
```
