

Package ‘oligoClasses’

September 24, 2012

Version 1.18.0

Title Classes for high-throughput arrays supported by oligo and crlmm

Author Benilton Carvalho and Robert Scharpf

Maintainer Benilton Carvalho <Benilton.Carvalho@cancer.org.uk> and
Robert Scharpf <rscharpf@jhsphe.edu>

Depends R (>= 2.14)

Imports Biobase (>= 2.15.1), methods, graphics, BiocGenerics (>= 0.1.14), IRanges (>= 1.13.30), Biostrings (>= 2.23.6), affyio (>= 1.23.2), ff, foreach, BiocInstaller, utils

Enhances doMC, doMPI, doSNOW, doParallel, doRedis

Suggests RSQLite, hapmapsnp5, hapmap-snp6, pd.genomewidesnp.6, pd.genomewidesnp.5, pd.mapping50k.hind240, pd.mapping50k.xba240, pd.mapping250k.slaICE, RUnit

Description This package contains class definitions, validity checks, and initialization methods for classes used by the oligo and crlmm packages.

License GPL (>= 2)

affyPlatforms	<i>Available Affymetrix platforms for SNP arrays</i>
---------------	--

Description

Provides a listing of available Affymetrix platforms currently supported by the R package oligo

Usage

```
affyPlatforms()
```

Value

A vector of class character.

Author(s)

R. Scharpf

Examples

```
affyPlatforms()
```

AlleleSet-class *Class "AlleleSet"*

Description

A class for storing the locus-level summaries of the normalized intensities

Objects from the Class

Objects can be created by calls of the form `new("AlleleSet", assayData, phenoData, featureData, experimentData)`

Slots

`assayData`: Object of class "AssayData" ~~
`phenoData`: Object of class "AnnotatedDataFrame" ~~
`featureData`: Object of class "AnnotatedDataFrame" ~~
`experimentData`: Object of class "MIAME" ~~
`annotation`: Object of class "character" ~~
`protocolData`: Object of class "AnnotatedDataFrame" ~~
`__classVersion__`: Object of class "Versions" ~~

Extends

Class "eSet", directly. Class "VersionedBiobase", by class "eSet", distance 2. Class "Versioned", by class "eSet", distance 3.

Methods

allele signature(object = "AlleleSet"): extract allele specific summaries. For 50K (XBA and Hind) and 250K (Sty and Nsp) arrays, an additional argument (strand) must be used (allowed values: 'sense', 'antisense').

bothStrands signature(object = "AlleleSet"): tests if data contains allele summaries on both strands for a given SNP.

bothStrands signature(object = "SnpFeatureSet"): tests if data contains allele summaries on both strands for a given SnpFeatureSet.

db signature(object = "AlleleSet"): link to database connection.

getA signature(object = "AlleleSet"): average intensities (across alleles)

getM signature(object = "AlleleSet"): log-ratio (Allele A vs. Allele B)

Author(s)

R. Scharpf

See Also

[SnpSuperSet](#), [CNSet](#)

Examples

```
showClass("AlleleSet")
## an empty AlleleSet
x <- new("matrix")
new("AlleleSet", senseAlleleA=x, senseAlleleB=x, antisenseAlleleA=x, antisenseAlleleB=x)
##or
new("AlleleSet", alleleA=x, alleleB=x)
```

annotationPackages *Annotation Packages*

Description

annotationPackages will return a character vector of the names of annotation packages.

Usage

```
annotationPackages()
```

Value

a character vector of the names of annotation packages

AssayData-methods *Methods for class AssayData in the oligoClasses package*

Description

Batch statistics used for estimating copy number are stored as AssayData in the 'batchStatistics' slot of the CNSet class. Each element in the AssayData must have the same number of rows and columns. Rows correspond to features and columns correspond to batch.

Objects from the Class

A virtual Class: No objects may be created from it.

Methods

```
batchNames signature(object = "AssayData"): ...
batchNames<- signature(object = "AssayData"): ...
corr signature(object = "AssayData", allele = "character"): ...
nu signature(object = "AssayData", allele = "character"): ...
phi signature(object = "AssayData", allele = "character"): ...
```

Details

lM: Extracts entire list of linear model parameters.

corr: The within-genotype correlation of log₂(A) and log₂(B) intensities.

nu: The intercept for the linear model. The linear model is fit to the A and B alleles independently.

phi: The slope for the linear model. The linear model is fit independently to the A and B alleles.

See Also[CNSet-class](#)**Examples**

```

x <- matrix(runif(250*96*2, 0, 2), 250, 96*2)
test1 <- new("CNSet", alleleA=x, alleleB=x, call=x, callProbability=x,
  batch=as.character(rep(letters[1:2], each=96)))
Biobase::isCurrent(test1)
Biobase::assayDataElementNames(batchStatistics(test1))
## Accessors for linear model parameters
## -- Included here primarily as a check that accessors are working
## -- Values are all NA until CN estimation is performed using the crlmm package
##
## subsetting
test1[1:10, 1:5]
## names of elements in the object
## accessors for parameters
nu(test1, "A")[1:10, ]
nu(test1, "B")[1:10, ]
phi(test1, "A")[1:10, ]
phi(test1, "B")[1:10, ]

```

batch

*The batch variable for the samples.***Description**

Copy number estimates are susceptible to systematic differences between groups of samples that were processed at different times or by different labs. While 'batch' is often unknown, a useful surrogate is often the scan date of the arrays (e.g., the month of the calendar year) or the 96 well chemistry plate on which the samples were arrayed during lab processing.

Usage

```

batch(object)
batchNames(object)
batchNames(object) <- value

```

Arguments

object	An object of class CNSet.
value	For 'batchNames', the value must be a character string corresponding of the unique batch names.

Value

The method 'batch' returns a character vector that has the same length as the number of samples in the CNSet object.

Author(s)

R. Scharpf

See Also[CNSet-class](#)**Examples**

```
a <- matrix(1:25, 5, 5)
colnames(a) <- letters[1:5]
object <- new("CNSet", alleleA=a, batch=rep("batch1", 5))
batch(object)
batchNames(object)
```

batchStatistics	<i>Accessor for batch statistics uses for copy number estimation and storage of model parameters</i>
-----------------	--

Description

The batchStatistics slot contains statistics estimated from each batch that are used to derive copy number estimates.

Usage

```
batchStatistics(object)
batchStatistics(object) <- value
```

Arguments

object	An object of class CNSet
value	An object of class AssayData

Details

An object of class AssayData for slot batchStatistics is initialized automatically when creating a new CNSet instance. Required in the call to new is a factor called batch whose unique values determine the number of columns for each assay data element.

Value

batchStatics is an accessor for the slot batchStatistics that returns an object of class AssayData.

See Also[CNSet-class](#), [batchNames](#), [batch](#)

BeadStudioSet-class *Class "BeadStudioSet"*

Description

A container for log R ratios and B allele frequencies from SNP arrays.

Objects from the Class

Objects can be created by calls of the form `new("BeadStudioSet", assayData, phenoData, featureData, experi`

Slots

featureData: Object of class "GenomeAnnotatedDataFrame" ~~
 assayData: Object of class "AssayData" ~~
 phenoData: Object of class "AnnotatedDataFrame" ~~
 experimentData: Object of class "MIAXE" ~~
 annotation: Object of class "character" ~~
 protocolData: Object of class "AnnotatedDataFrame" ~~
 genomeBuild: Object of class "character" ~~
`..classVersion..`: Object of class "Versions" ~~

Extends

Class "gSet", directly. Class "eSet", by class "gSet", distance 2. Class "VersionedBiobase", by class "gSet", distance 3. Class "Versioned", by class "gSet", distance 4.

Methods

In the methods below, object has class BeadStudioSet.

`baf(object)`: accessor for the matrix of B allele frequencies.

`baf(object) <- value` replacement method for B allele frequencies: value must be a matrix of integers.

`as(object, "data.frame")`: coerce to data.frame with column headers 'lrr', 'baf', 'x' (physical position with unit Mb), 'id', and 'is.snp'. Used for plotting with lattice.

`copyNumber(object)`: accessor for log R ratios.

`copyNumber(object) <- value`: replacement method for the log R ratios

initialize signature(.Object = "BeadStudioSet"): constructs an instance of the class

`lrr(object)`: accessor for matrix of log R ratios

`lrr(object) <- value` replacement method for log R ratios: value should be a matrix or a `ff_matrix`.

`show(object)`: print a short summary of the BeadStudioSet object.

`updateObject(object)`: update a BeadStudioSet object.

Author(s)

R. Scharpf

Examples

```
new("BeadStudioSet")
```

celfileDate	<i>Cel file dates</i>
-------------	-----------------------

Description

Parses cel file dates from the header of .CEL files for the Affymetrix platform

Usage

```
celfileDate(filename)
```

Arguments

filename	Name of cel file
----------	------------------

Value

character string

Author(s)

H. Jaffee

Examples

```
require(hapmapsnp6)
path <- system.file("celFiles", package="hapmapsnp6")
celfiles <- list.celfiles(path, full.names=TRUE)
dts <- sapply(celfiles, celfileDate)
```

checkExists	<i>Checks to see whether an object exists and, if not, executes the appropriate function.</i>
-------------	---

Description

Only loads an object if the object name is not in the global environment. If not in the global environment and the file exists, the object is loaded (by default). If the file does not exist, the function FUN is run.

Usage

```
checkExists(.name, .path = ".", .FUN, .FUN2, .save.it=TRUE, .load.it, ...)
```

Arguments

<code>.name</code>	Character string giving name of object in global environment
<code>.path</code>	Path to where the object is saved.
<code>.FUN</code>	Function to be executed if <code><name></code> is not in the global environment and the file does not exist.
<code>.FUN2</code>	Not currently used.
<code>.save.it</code>	Logical. Whether to save the object to the directory indicated by <code>path</code> . This argument is ignored if the object was loaded from file or already exists in the <code>.GlobalEnv</code> .
<code>.load.it</code>	Logical. If <code>load.it</code> is TRUE, we try to load the object from the indicated path. The returned object will replace the object in the <code>.GlobalEnv</code> unless the object is bound to a different name (symbol) when the function is executed.
<code>...</code>	Additional arguments passed to <code>FUN</code> .

Value

Could be anything – depends on what `FUN`, `FUN2` perform.

Future versions could return a 0 or 1 indicating whether the function performed as expected.

Author(s)

R. Scharpf

Examples

```
path <- tempdir()
dir.create(path)
x <- 3+6
x <- checkExists("x", .path=path, .FUN=function(y, z) y+z, y=3, z=6)
rm(x)
x <- checkExists("x", .path=path, .FUN=function(y, z) y+z, y=3, z=6)
rm(x)
x <- checkExists("x", .path=path, .FUN=function(y, z) y+z, y=3, z=6)
rm(x)
##now there is a file called x.rda in tempdir(). The file will be loaded
x <- checkExists("x", .path=path, .FUN=function(y, z) y+z, y=3, z=6)
rm(x)
unlink(path, recursive=TRUE)
```

checkOrder

Checks whether a eSet-derived class is ordered by chromosome and physical position

Description

Checks whether a eSet-derived class (e.g., a SnpSet or CNSet object) is ordered by chromosome and physical position

Usage

```
checkOrder(object, verbose = FALSE)
chromosomePositionOrder(object, ...)
```

Arguments

object	A SnpSet or CopyNumberSet.
verbose	Logical.
...	additional arguments to order

Details

Checks whether the object is ordered by chromosome and physical position.

Value

Logical

Author(s)

R. Scharpf

See Also

[order](#)

Examples

```
data(oligoSetExample)
if(!checkOrder(oligoSet)){
  oligoSet <- chromosomePositionOrder(oligoSet)
}
checkOrder(oligoSet)
```

chromosome-methods

Methods for function chromosome in package oligoClasses

Description

Methods for function chromosome in package **oligoClasses** ~~

Methods

The methods for chromosome extracts the chromosome (represented as an integer) for each marker in a eSet-derived class or a AnnotatedDataFrame-derived class.

signature(object = "AnnotatedDataFrame") Accessor for chromosome.

signature(object = "eSet") If 'chromosome' is included in fvarLabels(object), the integer representation of the chromosome will be returned. Otherwise, an error is thrown.

signature(object = "GenomeAnnotatedDataFrame") Accessor for chromosome. If annotation was not available due to a missing or non-existent annotation package, the value returned by the accessor will be a vector of zero's.

(chromosome(object) <- value): Assign chromosome to the AnnotatedDataFrame slot of an eSet-derived object.

signature(object = "RangedDataCNV") Accessor for chromosome.

Note

Integer representation: chr X = 23, chr Y = 24, chr XY = 25. Symbols M, Mt, and MT are coded as 26.

See Also

[chromosome2integer](#)

Examples

```
chromosome2integer(c(1:22, "X", "Y", "XY", "M"))
```

chromosome2integer	<i>Converts chromosome to integer</i>
--------------------	---------------------------------------

Description

Coerces character string for chromosome in the pd. annotation packages to integers

Usage

```
chromosome2integer(chrom)
```

Arguments

chrom chromosome'

Details

This is useful when sorting SNPs in an object by chromosome and physical position – ensures that the sorting is done in the same way for different objects.

Value

integer character

Author(s)

R. Scharpf

Examples

```
chromosome2integer(c(1:22, "X", "Y", "XY", "M"))
```

CNSet-class	<i>Class "CNSet"</i>
-------------	----------------------

Description

CNSet is a container for intermediate data and parameters pertaining to allele-specific copy number estimation. Methods for CNSet objects, including accessors for linear model parameters and allele-specific copy number are included here.

Objects from the Class

An object from the class is not generally intended to be initialized by the user, but returned by the `genotype` function in the `cr1mm` package.

The following creates a very basic CNSet with `assayData` containing the required elements.

```
new(CNSet, alleleA=new("matrix"), alleleB=new("matrix"), call=new("matrix"), callProbability=)
```

Slots

```
batch: Object of class "factor" ~~
batchStatistics: Object of class "AssayData" ~~
assayData: Object of class "AssayData" ~~
phenoData: Object of class "AnnotatedDataFrame" ~~
featureData: Object of class "AnnotatedDataFrame" ~~
experimentData: Object of class "MIAME" ~~
annotation: Object of class "character" ~~
protocolData: Object of class "AnnotatedDataFrame" ~~
mixtureParams: Object of class "matrix"~~
.__classVersion__: Object of class "Versions" ~~
```

Methods

The argument object for the following methods is a CNSet.

`object[i, j]`: subset the CNSet object by markers (i) and/or samples (j).

`A(object)`: accessor for the normalized intensities of allele A

`A(object) <- value`: replace intensities for the A allele intensities by value. The object value must be a `matrix`, `ff_matrix`, or `ffdf`.

`allele(object, allele)`: accessor for the normalized intensities for the A or B allele. The argument for `allele` must be either 'A' or 'B'

`B(object)`: accessor for the normalized intensities of allele B

`B(object) <- value`: replace intensities for the B allele intensities by value. The object value must be a `matrix`, `ff_matrix`, or `ffdf`.

`batch(object)`: vector of batch labels for each sample.

`batchNames(object)`: the unique batch names

`batchNames(object) <- value`: relabel the batches

calls(object): accessor for genotype calls coded as 1 (AA), 2 (AB), or 3 (BB). Nonpolymorphic markers are NA.

confs(object): accessor for the genotype confidence scores.

close(object): close any open file connections to ff objects stored in the CNSet object.

as(object, "oligoSnpSet"): coerce a CNSet object to an object of class oligoSnpSet – a container for the total copy number and genotype calls.

corr(object): the correlation of the A and B intensities within each genotype.

flags(object): flags to indicate possible problems with the copy number estimation. Not fully implemented at this point.

new("CNSet"): instantiating a CNSet object.

nu(object, allele): accessor for the intercept (background) for the A and B alleles. The value of allele must be 'A' or 'B'.

open(object) open file connections for all ff objects stored in the CNSet object.

nu(object, allele): accessor for the slope for the A and B alleles. The value of allele must be 'A' or 'B'.

sigma2(object, allele): accessor for the within genotype variance

tau2(object, allele): accessor for background variance

Author(s)

R. Scharpf

Examples

```
new("CNSet")
```

CopyNumberSet-class *Class "CopyNumberSet"*

Description

Container for storing total copy number estimates and confidence scores of the copy number estimates.

Objects from the Class

Objects can be created by calls of the form `new("CopyNumberSet", assayData, phenoData, featureData, experimentData)`.

Slots

assayData: Object of class "AssayData" ~~

phenoData: Object of class "AnnotatedDataFrame" ~~

featureData: Object of class "AnnotatedDataFrame" ~~

experimentData: Object of class "MIAXE" ~~

annotation: Object of class "character" ~~

protocolData: Object of class "AnnotatedDataFrame" ~~

.._classVersion_: Object of class "Versions" ~~

Extends

Class "eSet", directly. Class "VersionedBiobase", by class "eSet", distance 2. Class "Versioned", by class "eSet", distance 3.

Methods

```

cnConfidence signature(object = "CopyNumberSet"): ...
cnConfidence<- signature(object = "CopyNumberSet", value = "matrix"): ...
coerce signature(from = "CNSet", to = "CopyNumberSet"): ...
copyNumber signature(object = "CopyNumberSet"): ...
copyNumber<- signature(object = "CopyNumberSet", value = "matrix"): ...
initialize signature(.Object = "CopyNumberSet"): ...

```

Note

This container is primarily for platforms for which genotypes are unavailable. As oligoSnpsSet extends this class, methods related to total copy number that do not depend on genotypes can be defined at this level.

Author(s)

R. Scharpf

See Also

For genotyping platforms, total copy number estimates and genotype calls can be stored in the [oligoSnpsSet](#) class.

Examples

```

showClass("CopyNumberSet")
cnset <- new("CopyNumberSet")
ls(Biobase::assayData(cnset))

```

CopyNumberSet-methods *Methods for class CopyNumberSet.*

Description

Accessors and CopyNumberSet

Usage

```

copyNumber(object, ...)
cnConfidence(object)
copyNumber(object) <- value
cnConfidence(object) <- value

```

Arguments

object	CopyNumberSet object or derived class
...	Ignored for CopyNumberSet and oligoSnpSet.
value	matrix

Value

copyNumber returns a matrix of copy number estimates. cnConfidence returns a matrix of confidence scores for the copy number estimates.

createFF	<i>Create ff objects.</i>
----------	---------------------------

Description

Creates ff objects (array-like) using settings (path) defined by oligoClasses.

Usage

```
createFF(name, dim, vmode = "double", initdata = NULL)
```

Arguments

name	Prefix for filename.
dim	Dimensions.
vmode	Mode.
initdata	NULL.

Value

ff object.

Note

This function is meant to be used by developers.

See Also

ff

`db`*Get the connection to the SQLite Database*

Description

This function will return the SQLite connection to the database associated to objects used in oligo.

Usage

```
db(object)
```

Arguments

`object` Object of valid class. See methods.

Value

SQLite connection.

Methods

```
object = "FeatureSet" object of class FeatureSet  
object = "SnpCallSet" object of class SnpCallSet  
object = "DBPDInfo" object of class DBPDInfo  
object = "SnpLevelSet" object of class SnpLevelSet
```

Author(s)

Benilton Carvalho

Examples

```
## db(object)
```

`DBPDInfo-class`*Class "DBPDInfo"*

Description

A class for Platform Design Information objects, stored using a database approach

Objects from the Class

Objects can be created by calls of the form `new("DBPDInfo", ...)`.

Slots

getdb: Object of class "function"
tableInfo: Object of class "data.frame"
manufacturer: Object of class "character"
genomebuild: Object of class "character"
geometry: Object of class "integer" with length 2 (rows x columns)

Methods

annotation string describing annotation package associated to object

efsExample	<i>ExpressionFeatureSet Object</i>
------------	------------------------------------

Description

Example of ExpressionFeatureSet Object.

Usage

```
data(efsExample)
```

Format

Object belongs to ExpressionFeatureSet class.

Examples

```
data(efsExample)
class(efsExample)
```

exprs-methods	<i>Accessor for the 'exprs' slot</i>
---------------	--------------------------------------

Description

Accessor for the 'exprs'/'se.exprs' slot of FeatureSet-like objects

Methods

object = "ExpressionSet" Expression matrix for objects of this class. Usually results of preprocessing algorithms, like RMA.
object = "FeatureSet" General container 'exprs' inherited from eSet
object = "SnpSet" General container 'exprs' inherited from eSet, not yet used.

FeatureSet-class *"FeatureSet" and "FeatureSet" Extensions*

Description

Classes to store data from Expression/Exon/SNP/Tiling arrays at the feature level.

Objects from the Class

The FeatureSet class is VIRTUAL. Therefore users are not able to create instances of such class.

Objects for FeatureSet-like classes can be created by calls of the form: `new(CLASSNAME, assayData, manufacturer, ...)`. But the preferred way is using parsers like [read.celfiles](#) and [read.xysfiles](#).

Slots

`manufacturer`: Object of class "character"
`assayData`: Object of class "AssayData"
`phenoData`: Object of class "AnnotatedDataFrame"
`featureData`: Object of class "AnnotatedDataFrame"
`experimentData`: Object of class "MIAME"
`annotation`: Object of class "character"
`.__classVersion__`: Object of class "Versions"

Methods

show signature(.Object = "FeatureSet"): show object contents

bothStrands signature(.Object = "SnpFeatureSet"): checks if object contains data for both strands simultaneously (50K/250K Affymetrix SNP chips - in this case it returns TRUE); if object contains data for one strand at a time (SNP 5.0 and SNP 6.0 - in this case it returns FALSE)

Author(s)

Benilton Carvalho

See Also

[eSet](#), [VersionedBiobase](#), [Versioned](#)

Examples

```
set.seed(1)
tmp <- 2^matrix(rnorm(100), ncol=4)
rownames(tmp) <- 1:25
colnames(tmp) <- paste("sample", 1:4, sep="")
efs <- new("ExpressionFeatureSet", exprs=tmp)
```

featuresInRange	<i>Find feature index in a genomic interval</i>
-----------------	---

Description

Find feature index of a SnpSet object in a RangedDataCNV object.

Usage

```
featuresInRange(object, range, FRAME = 0, FRAME.LEFT, FRAME.RIGHT, ...)
```

Arguments

object	A SnpSet.
range	A RangedDataCNV object.
FRAME	Integer (basepairs). The distance from start and end coordinates of the genomic interval. Useful for retrieving indices that 'frame' the genomic interval of interest.
FRAME.LEFT	Integer. If missing, set equal to FRAME.
FRAME.RIGHT	Integer. If missing, set equal to FRAME.
...	Ignored

Details

Extract marker indices in object that occur within a genomic interval.

Value

Vector of integers.

Author(s)

R. Scharpf

ffdf-class	<i>Class "ffdf"</i>
------------	---------------------

Description

Extended package ff's class definitions for ff to S4.

Objects from the Class

A virtual Class: No objects may be created from it.

Slots

.S3Class: Object of class ffdf ~~

Extends

Class "[oldClass](#)", directly. Class "[list_or_ffdf](#)", directly.

Methods

No methods defined with class "ffdf" in the signature.

ff_matrix-class	Class " ff_matrix "
-----------------	-------------------------------------

Description

~~ A concise (1-5 lines) description of what the class is. ~~

Objects from the Class

A virtual Class: No objects may be created from it.

Slots

.S3Class: Object of class "character" ~~

Extends

Class "[oldClass](#)", directly.

Methods

annotatedDataFrameFrom signature(object = "ff_matrix"): ...

Examples

```
showClass("ff_matrix")
```

ff_or_matrix-class	Class " ff_or_matrix "
--------------------	--

Description

A class union of 'ffdf', 'ff_matrix', and 'matrix'

Objects from the Class

A virtual Class: No objects may be created from it.

Methods

GenomeAnnotatedDataFrameFrom signature(object = "ff_or_matrix"): ...

Author(s)

R. Scharpf

See Also[ff](#), [ffdf](#)**Examples**

```
showClass("ff_or_matrix")
```

`fileConnections`*Open and close methods for matrices and numeric vectors*

Description

CNSet objects can contain ff-derived objects that contain pointers to files on disk, or ordinary matrices. Here we define open and close methods for ordinary matrices and vectors that simply pass back the original matrix/vector.

Usage

```
open(con, ...)  
openff(object)  
closeff(object)
```

Arguments

<code>con</code>	matrix or vector
<code>object</code>	A CNSet object.
<code>...</code>	Ignored

Value

not applicable

Author(s)

R. Scharpf

Examples

```
open(rnorm(15))  
open(matrix(rnorm(15), 5,3))
```

findOverlaps	<i>Find markers that overlap with a query set of ranges</i>
--------------	---

Description

Methods for finding overlapping genomic ranges.

Usage

```
findOverlaps(query, subject, maxgap = 0L, minoverlap = 1L, type = c("any", "start", "end", "with
```

Arguments

query	A RangedDataCNV object.
subject	A SnpSet, a CNSet or the featureData from these classes. The featureData must be an AnnotatedDataFrame.
maxgap	Passed to findOverlaps method for a IRanges query and a IRanges subject.
minoverlap	Passed to findOverlaps method for a IRanges query and a IRanges subject.
type	Passed to findOverlaps method for a IRanges query and a IRanges subject.
select	Passed to findOverlaps method for a IRanges query and a IRanges subject.
...	Passed to findOverlaps method for a IRanges query and a IRanges subject.

Details

When both query and subject are [RangedDataCNV](#) objects, we require that the overlapping ranges have the same chromosome and sample id. If query and subject are [RangedDataHMM](#) objects we additionally require that the state value in the [RangedDataHMM](#) objects match. For example, if the same genomic interval for a subject is called a 'deletion' in query and 'normal' in subject, the interval is not matched. The primary purpose of such queries is to assess the concordance of hidden Markov models applied to the same dataset.

If subject is a [SnpSet](#), [CNSet](#), or [AnnotatedDataFrame](#) with 'chromosome', and 'position' varLabels, the method returns a [RangesMatching](#) object indicating which markers in subject overlap with the query ranges. This method can be useful for finding the set of markers in subject that reside within a given genomic interval in the query.

Value

A RangesMatching object.

Author(s)

R. Scharpf

Examples

```

library2(VanillaICE)
library2(IRanges)
library2(Biobase)
data(hmmResults, package="VanillaICE")
data(oligoSetExample)
## Find markers in a oligoSnpSet object that overlap with the
## 2nd range:
rmatching <- findOverlaps(hmmResults[2, ], Biobase::featureData(oligoSet))
index.in.range <- subjectHits(rmatching)
features.in.range <- featureNames(oligoSet)[index.in.range]
##
## For two RangedDataHMM objects, returns only the ranges
## that have the same sample name, chromosome, and HMM state
## A trivial example:
hmmResults2 <- hmmResults
hmmResults2$state <- rep(3, nrow(hmmResults))
findOverlaps(hmmResults, hmmResults2)

```

 flags

Batch-level summary of SNP flags.

Description

Used to flag SNPs with low minor allele frequencies, or for possible problems during the CN estimation step. Currently, this is primarily more for internal use.

Usage

```
flags(object)
```

Arguments

object An object of class CNSet

Value

A matrix or `ff_matrix` object with rows corresponding to markers and columns corresponding to batch.

See Also

[batchStatistics](#)

Examples

```

x <- matrix(runif(250*96*2, 0, 2), 250, 96*2)
test1 <- new("CNSet", alleleA=x, alleleB=x, call=x, callProbability=x,
            batch=as.character(rep(letters[1:2], each=96)))
dim(flags(test1))

```

generics	<i>Miscellaneous generics. Methods defined in packages that depend on oligoClasses</i>
----------	--

Description

Miscellaneous generics. Methods defined in packages that depend on oligoClasses

Usage

```
baf(object)
lrr(object)
```

Arguments

object A eSet-derived class.

Author(s)

R. Scharpf

GenomeAnnotatedDataFrame-class	<i>Class "GenomeAnnotatedDataFrame"</i>
--------------------------------	---

Description

AnnotatedDataFrame with genomic coordinates (chromosome, position)

Slots

```
varMetadata: Object of class "data.frame" ~~
data: Object of class "data.frame" ~~
dimLabels: Object of class "character" ~~
. __classVersion__: Object of class "Versions" ~~
```

Extends

Class "[AnnotatedDataFrame](#)", directly. Class "[Versioned](#)", by class "AnnotatedDataFrame", distance 2.

Methods

chromosome signature(object = "GenomeAnnotatedDataFrame"): the chromosome (coded as integers)

chromosome<- signature(object = "GenomeAnnotatedDataFrame", value = "integer"): replacement method for chromosome

coerce signature(from = "AnnotatedDataFrame", to = "GenomeAnnotatedDataFrame"): coerce an AnnotatedDataFrame with chromosome, position, and isSnp varLabels to a GenomeAnnotatedDataFrame

initialize signature(.Object = "GenomeAnnotatedDataFrame"): ...

isSnp signature(object = "GenomeAnnotatedDataFrame", pkgname = "ANY"): Many platforms include polymorphic and nonpolymorphic markers. isSnp evaluates to TRUE if the marker is polymorphic.

position signature(object = "GenomeAnnotatedDataFrame"): Physical position in the genome

updateObject signature(object="GenomeAnnotatedDataFrame"): creates a new GenomeAnnotatedDataFrame.

  object <- GenomeAnnotatedDataFrameFrom(locusLevelData[["genotypes"]],
    annotationPkg=locusLevelData[["platform"]])
}
```

GenomeAnnotatedDataFrameFrom-methods

*Methods for Function GenomeAnnotatedDataFrameFrom in Package
oligoClasses*

Description

GenomeAnnotatedDataFrameFrom is a convenience for creating [GenomeAnnotatedDataFrame](#) objects.

Methods

Use the method with GenomeAnnotatedDataFrameFrom(object, annotationPkg, ...); the argument annotationPkg *must* be specified for matrix and AssayData classes.

signature(object="assayData") This method creates an GenomeAnnotatedDataFrame using feature names and dimensions of an [AssayData](#) object as a template.

signature(object="matrix") This method creates an GenomeAnnotatedDataFrame using row names and dimensions of a `matrix` object as a template.

signature(object="NULL") This method (called with 'NULL' as the object) creates an empty GenomeAnnotatedDataFrame.

Author(s)

R Scharpf

genomeBuild

Genome Build Information

Description

Returns the genome build information. This information comes from the annotation package and is given as an argument during the package creation process.

Usage

```
genomeBuild(object)
```

Arguments

object PDInfo or FeatureSet object.

geometry

Array Geometry Information

Description

For a given array, `geometry` returns the physical geometry of it.

Usage

```
geometry(object)
```

Arguments

object PDInfo or FeatureSet object

Examples

```
if (require(pd.mapping50k.xba240))
  geometry(pd.mapping50k.xba240)
```

getA *Compute average log-intensities / log-ratios*

Description

Methods to compute average log-intensities and log-ratios across alleles, within strand.

Usage

```
getA(object)
getM(object)
A(object, ...)
B(object, ...)
```

Arguments

object	SnqQSet, SnpCnvQSet or TilingFeatureSet2 object.
...	arguments to be passed to allele - 'sense' and 'antisense' are valid values if the array is pre-SNP_5.0

Details

For SNP data, SNPRMA summarizes the SNP information into 4 quantities (log₂-scale):

- antisenseThetaAantisense allele A. (Not applicable for Affymetrix 5.0 and 6.0 platforms.)
- antisenseThetaBantisense allele B. (Not applicable for Affymetrix 5.0 and 6.0 platforms.)
- senseThetaAsense allele A. (Not applicable for Affymetrix 5.0 and 6.0 platforms.)
- senseThataBsense allele B. (Not applicable for Affymetrix 5.0 and 6.0 platforms.)
- alleleAAffymetrix 5.0 and 6.0 platforms
- alleleBAffymetrix 5.0 and 6.0 platforms

The average log-intensities are given by: $(\text{antisenseThetaA} + \text{antisenseThetaB}) / 2$ and $(\text{senseThetaA} + \text{senseThetaB}) / 2$

The average log-ratios are given by: $\text{antisenseThetaA} - \text{antisenseThetaB}$ and $\text{senseThetaA} - \text{senseThetaB}$.

For Tiling data, getM and getA return the log-ratio and average log-intensities computed across channels: $M = \log_2(\text{channel1}) - \log_2(\text{channel2})$ $A = (\log_2(\text{channel1}) + \log_2(\text{channel2})) / 2$

When large data support is enabled with the ff package, the AssayData elements of an AlleleSet object can be ff_matrix or ffd, in which case pointers to the ff object are stored in the assay data. The functions open and close can be used to open or close the connection, respectively.

Value

A 3-dimensional array (SNP's x Samples x Strand) with the requested measure, when the input SNP data (50K, 250K).

A 2-dimensional array (SNP's x Samples), when the input is from SNP 5.0 and SNP 6.0 arrays.

A 2-dimensional array if the input is from Tiling arrays.

getBar	<i>Gets a bar of a given length.</i>
--------	--------------------------------------

Description

Gets a bar of a given length.

Usage

```
getBar(width = getOption("width"))
```

Arguments

width desired length of the bar.

Value

character string.

Author(s)

Benilton S Carvalho

Examples

```
message(getBar())
```

gSet-class	<i>Container for objects with genomic annotation on SNPs</i>
------------	--

Description

Container for objects with genomic annotation on SNPs

Objects from the Class

A virtual Class: No objects may be created from it.

Slots

```
featureData: Object of class "GenomeAnnotatedDataFrame" ~~
assayData: Object of class "AssayData" ~~
phenoData: Object of class "AnnotatedDataFrame" ~~
experimentData: Object of class "MIAXE" ~~
annotation: Object of class "character" ~~
protocolData: Object of class "AnnotatedDataFrame" ~~
genomeBuild: Object of class "character" ~~
. . .classVersion__: Object of class "Versions" ~~
```

Extends

Class "eSet", directly. Class "VersionedBiobase", by class "eSet", distance 2. Class "Versioned", by class "eSet", distance 3.

Methods

The object for the below methods is a class that extends the virtual class gSet.

checkOrder(object): checks that the object is ordered by chromosome and physical position.
Returns logical.

chromosome(object): accessor for chromosome in the GenomeAnnotatedDataFrame slot.

chromosome(object) <- value: replacement method for chromosome in the GenomeAnnotatedDataFrame slot. value must be an integer vector.

db signature(object = "gSet"): ...

genomeBuild(object): genome build used to construct the GenomeAnnotatedDataFrame.

isSnp(object): whether the marker is polymorphic. Returns a logical vector.

position(object): integer vector of the genomic position

Author(s)

R. Scharpf

Examples

```
showClass("gSet")
```

i2p

Functions to convert probabilities to integers, or integers to probabilities.

Description

Probabilities estimated in the cr1mm package are often stored as integers to save memory. We provide a few utility functions to go back and forth between the probability and integer representations.

Usage

```
i2p(i)
p2i(p)
```

Arguments

i A matrix or vector of integers.
p A matrix or vector of probabilities.

Value

The value returned by `i2p` is

```
1 - exp(-i/1000)
```

The value returned by `2pi` is

```
as.integer(-1000*log(1-p))
```

See Also

[confs](#)

Examples

```
i2p(693)
p2i(0.5)
i2p(p2i(0.5))
```

`initializeBigMatrix` *Initialize big matrices/vectors.*

Description

Initialize big matrices or vectors appropriately (conditioned on the status of support for large datasets - see Details).

Usage

```
initializeBigMatrix(name=basename(tempfile()), nr=0L, nc=0L, vmode = "integer", initdata = NA)
initializeBigVector(name=basename(tempfile()), n=0L, vmode = "integer",
  initdata = NA)
initializeBigArray(name=basename(tempfile()), dim=c(0L,0L,0L),
  vmode="integer", initdata=NA)
```

Arguments

<code>name</code>	prefix to be used for file stored on disk
<code>nr</code>	number of rows
<code>nc</code>	number of columns
<code>n</code>	length of the vector
<code>vmode</code>	mode - "integer", "double"
<code>initdata</code>	Default is NA
<code>dim</code>	Integer vector indicating the dimensions of the array to initialize

Details

These functions are meant to be used by developers. They provide means to appropriately create big vectors or matrices for packages like `oligo` and `crIimm` (and friends). These objects are created conditioned on the status of support for large datasets.

Value

If the 'ff' package is loaded (in the search path), then an 'ff' object is returned. A regular R vector or array is returned otherwise.

Examples

```
x <- initializeBigVector("test", 10)
class(x)
x
if (isPackageLoaded("ff"))
  finalizer(x) <- "delete"
rm(x)
initializeBigMatrix(nr=5L, nc=5L)
initializeBigArray(dim=c(10, 5, 3))
```

integerMatrix	<i>Coerce numeric matrix (or array) to a matrix (array) of integers, retaining dimnames.</i>
---------------	--

Description

Coerce numeric matrix to matrix of integers, retaining dimnames.

Usage

```
integerMatrix(x, scale = 100)
integerArray(x, scale=100)
```

Arguments

x	a matrix or array
scale	scalar (numeric). If not 1, x is multiplied by scale prior to coercing to a matrix of integers.

Value

A matrix or array of integers.

Author(s)

R. Scharpf

Examples

```
x <- matrix(rnorm(10), 5, 2)
rownames(x) = letters[1:5]
i <- integerMatrix(x, scale=100)
```

is.ffmatrix	<i>Check if object is an ff-matrix object.</i>
-------------	--

Description

Check if object is an ff-matrix object.

Usage

```
is.ffmatrix(object)
```

Arguments

object object to be checked

Value

Logical.

Note

This function is meant to be used by developers.

Examples

```
if (isPackageLoaded("ff")){  
  x1 <- ff(vmode="double", dim=c(10, 2))  
  is.ffmatrix(x1)  
}  
x1 <- matrix(0, nr=10, nc=2)  
is.ffmatrix(x1)
```

isPackageLoaded	<i>Check if package is loaded.</i>
-----------------	------------------------------------

Description

Checks if package is loaded.

Usage

```
isPackageLoaded(pkg)
```

Arguments

pkg Package to be checked.

Details

Checks if package name is in the search path.

Value

Logical.

See Also

search

Examples

```
isPackageLoaded("oligoClasses")
isPackageLoaded("ff")
isPackageLoaded("snow")
```

isSnp-methods

Methods for Function isSnp in package oligoClasses~~

Description

~~ Methods for function isSnp in package **oligoClasses** ~~

Methods

Return an indicator for whether the marker is polymorphic (value 1) or nonpolymorphic (value 0).

Return an indicator for whether the vector of marker identifiers in object is polymorphic. pkgname must be one of the supported annotation packages specific to the platform.

signature(object = "character", pkgname = "character") signature(object = "eSet", pkgname = "ANY")
If 'isSnp' is included in fvarLabels(object), an indicator for polymorphic markers is returned. Otherwise, an error is thrown.

signature(object = "GenomeAnnotatedDataFrame", pkgname = "ANY") Accessor for indicator of whether the marker is polymorphic. If annotation was not available due to a missing or non-existent annotation package, the value returned by the accessor will be a vector of zero's.

kind

Array type

Description

Retrieves the array type.

Usage

```
kind(object)
```

Arguments

object FeatureSet or DBPDInfo object

Value

String: "Expression", "Exon", "SNP" or "Tiling"

Examples

```
if (require(pd.mapping50k.xba240)){
  data(sfsExample)
  Biobase::annotation(sfsExample) <- "pd.mapping50k.xba240"
  kind(sfsExample)
}
```

 ldSetOptions

Set/check large dataset options.

Description

Set/check large dataset options.

Usage

```
ldSetOptions(nsamples=100, nprobesets=20000, path=getwd(), verbose=FALSE)
ldStatus(verbose=FALSE)
ldPath(path)
```

Arguments

nsamples	number of samples to be processed at once.
nprobesets	number of probesets to be processed at once.
path	path where to store large dataset objects.
verbose	verbosity (logical).

Details

Some functions in oligo/crlmm can process data in batches to minimize memory footprint. When using this feature, the 'ff' package resources are used (and possibly combined with cluster resources set in options() via 'snow' package).

Methods that are executed on a sample-by-sample manner can use ocSamples() to automatically define how many samples are processed at once (on a compute node). Similarly, methods applied to probesets can use ocProbesets(). Users should set these options appropriately.

ldStatus checks the support for large datasets.

ldPath checks where ff files are stored.

Author(s)

Benilton S Carvalho

See Also

ocSamples, ocProbesets

Examples

```
ldStatus(TRUE)
```

length-methods	<i>Number of samples for FeatureSet-like objects.</i>

list.celfiles	<i>List CEL files.</i>
---------------	------------------------

Description

Function used to get a list of CEL files.

Usage

```
list.celfiles(..., listGzipped=FALSE)
```

Arguments

...	Passed to list.files
listGzipped	Logical. List .CEL.gz files?

Value

Character vector with filenames.

Note

Quite often users want to use this function to pass filenames to other methods. In this situations, it is safer to use the argument 'full.names=TRUE'.

See Also

[list.files](#)

Examples

```
if (require(hapmapsnp5)){
  path <- system.file("celFiles", package="hapmapsnp5")

  ## only the filenames
  list.celfiles(path)

  ## the filenames with full path...
  ## very useful when genotyping samples not in the working directory
  list.celfiles(path, full.names=TRUE)
}else{
  ## this won't return anything
  ## if in the working directory there isn't any CEL
  list.celfiles(getwd())
}
```

locusLevelData *Basic data elements required for the HMM*

Description

This object is a list containing the basic data elements required for the HMM

Usage

```
data(locusLevelData)
```

Format

A list

Details

The basic assay data elements that can be used for fitting the HMM are:

1. a mapping of platform identifiers to chromosome and physical position
2. (optional) a matrix of copy number estimates
3. (optional) a matrix of confidence scores for the copy number estimates (e.g., inverse standard deviations)
4. (optional) a matrix of genotype calls
5. (optional) CRLMM confidence scores for the genotype calls

At least (2) or (4) is required. The locusLevelData is a list that contains (1), (2), (4), and (5).

Source

A HapMap sample on the Affymetrix 50k platform. Chromosomal alterations were simulated. The last 100 SNPs on chromosome 2 are, in fact, a repeat of the first 100 SNPs on chromosome 1 – this was added for internal use.

Examples

```
data(locusLevelData)
str(locusLevelData)
```

manufacturer-methods *Manufacturer ID for FeatureSet-like objects.*

Description

Manufacturer ID for FeatureSet-like and DBPDInfo-like objects.

Methods

```
object = "FeatureSet" Manufacturer ID
```

```
object = "PDInfo" Manufacturer ID
```

ocLapply	<i>lapply-like function that parallelizes code when possible.</i>
----------	---

Description

ocLapply is an lapply-like function that checks if ff/snow are loaded and if the cluster variable is set to execute FUN on a cluster. If these requirements are not available, then lapply is used.

Usage

```
ocLapply(X, FUN, ..., neededPkgs)
```

Arguments

X	first argument to FUN.
FUN	function to be executed.
...	additional arguments to FUN.
neededPkgs	packages needed to execute FUN on the compute nodes.

Details

neededPkgs is needed when parallel computing is expected to be used. These packages are loaded on the compute nodes before the execution of FUN.

Value

A list of length length(X).

Author(s)

Benilton S Carvalho

See Also

lapply, parStatus

ocSamples	<i>Cluster and large dataset management utilities.</i>
-----------	--

Description

Tools to simplify management of clusters via 'snow' package and large dataset handling through the 'bigmemory' package.

Usage

```
ocSamples(n)  
ocProbesets(n)
```

Arguments

n integer representing the maximum number of samples/probesets to be processed simultaneously on a compute node.

Details

Some methods in the `oligo/crlmm` packages, like `backgroundCorrect`, `normalize`, `summarize` and `rma` can use a cluster (set through the `'foreach'` package). The use of cluster features is conditioned on the availability of the `'ff'` (used to provide shared objects across compute nodes) and `'foreach'` packages.

To use a cluster, `'oligo/crlmm'` checks for three requirements: 1) `'ff'` is loaded; 2) an adaptor for the parallel backend (like `'doMPI'`, `'doSNOW'`, `'doMC'`) is loaded and registered.

If only the `'ff'` package is available and loaded (in addition to the caller package - `'oligo'` or `'crlmm'`), these methods will allow the user to analyze datasets that would not fit in RAM at the expense of performance.

In the situations above (large datasets and cluster), `oligo/crlmm` uses the options `ocSamples` and `ocProbesets` to limit the amount of RAM used by the machine(s). For example, if `ocSamples` is set to 100, steps like background correction and normalization process (in RAM) 100 samples simultaneously on each compute node. If `ocProbesets` is set to 10K, then summarization processes 10K probesets at a time on each machine.

Warning

In both scenarios (large dataset and/or cluster use), there is a penalty in performance because data are written to disk (to either minimize memory footprint or share data across compute nodes).

Author(s)

Benilton Carvalho

Examples

```
if(require(doMC)) {
  registerDoMC()
  ## tasks like summarize()
}
```

`oligoSet`

An example instance of `oligoSnpSet` class

Description

An example instance of the `oligoSnpSet` class

Usage

```
data(oligoSetExample)
```

Source

Created from the simulated `locusLevelData` provided in this package.

See Also[locusLevelData](#)**Examples**

```
## Not run:
## 'oligoSetExample' created by the following
data(locusLevelData)
oligoSet <- new("oligoSnpSet",

```

oligoSnpSet-methods *Methods for oligoSnpSet class*

Description

Methods for oligoSnpSet

parStatus *Checks if oligo/crlmm can use parallel resources.*

Description

Checks if oligo/crlmm can use parallel resources (needs ff and snow package, in addition to options(cluster=makeCluster(...)).

Usage

```
parStatus()
```

Value

logical

Author(s)

Benilton S Carvalho

pdPkgFromBioC *Get packages from BioConductor.*

Description

This function checks if a given package is available on BioConductor and installs it, in case it is.

Usage

```
pdPkgFromBioC(pkgname, lib = .libPaths()[1], verbose = TRUE)
```

Arguments

pkgname	character.	Name of the package to be installed.
lib	character.	Path where to install the package at.
verbose	logical.	Verbosity flag.

Details

Internet connection required.

Value

Logical: TRUE if package was found, downloaded and installed; FALSE otherwise.

Author(s)

Benilton Carvalho

platform-methods *Platform Information*

Description

Platform Information

Methods

object = "FeatureSet" platform information

 pmFragmentLength-methods

Information on Fragment Length

Description

This method will return the fragment length for PM probes.

Methods

object = "AffySNPPDInfo" On AffySNPPDInfo objects, it will return the fragment length that contains the SNP in question.

position-methods

Methods for function position in Package oligoClasses

Description

Methods for function position in package **oligoClasses**

Methods

The methods for position extracts the physical position stored as an integer for each marker in a eSet-derived class or a AnnotatedDataFrame-derived class.

signature(object = "AnnotatedDataFrame") Accessor for physical position.

signature(object = "eSet") If 'position' is included in fvarLabels(object), the physical position will be returned. Otherwise, an error is thrown.

signature(object = "GenomeAnnotatedDataFrame") Accessor for physical position. If annotation was not available due to a missing or non-existent annotation package, the value returned by the accessor will be a vector of zero's.

RangedData-classes

Classes in MinimumDistance for data on ranges

Description

RangedDataCNV is a class extending the virtual class RangedDataCopyNumber. RangedDataCopyNumber extends [RangedData](#).

RangedDataCBS extends [RangedDataCNV](#) and is useful for storing ranges from segmentation algorithms such as circular binary segmentation. In particular, the columns 'chrom', 'id', and 'num.mark' are required for instances of the class.

RangedDataHMM extends [RangedDataHMM](#) and is useful for storing ranges from hidden Markov models such as PennCNV or VanillaICE. A column labeled 'state' is required for the class.

Objects from the Class

See RangedDataCBS and RangedDataHMM constructors.

Slots

ranges: Object of class "RangesList" ~~
 values: Object of class "SplitDataFrameList" ~~
 elementType: Object of class "character" ~~
 elementMetadata: Object of class "DataTableORNULL" ~~
 metadata: Object of class "list" ~~

Extends

Class "[RangedDataCNV](#)", directly. Class "[RangedDataCopyNumber](#)", by class "RangedDataCNV", distance 2.

Class "[RangedData](#)", by class "RangedDataCNV", distance 3. Class "[DataTable](#)", by class "RangedDataCNV", distance 4. Class "[List](#)", by class "RangedDataCNV", distance 4. Class "[DataTableORNULL](#)", by class "RangedDataCNV", distance 5. Class "[Vector](#)", by class "RangedDataCNV", distance 5. Class "[Annotated](#)", by class "RangedDataCNV", distance 6.

Accessors for RangedDataCNV

In the following code descriptions, object is a class derived from RangedData.

as(object, "RangedDataCBS"): coerce an object of class RangedData to RangedDataCBS.

as(object, "RangedDataHMM"): coerce an object of class RangedData to RangedDataHMM.

coverage2(object): numeric vector indicating the number of markers in each range. The length of the vector is the same as nrow(object).

mean(object): returns the mean copy number for each segment in object.

sampleNames(object): character vector of sample ids for each range. The length of the vector is the same as nrow(object).

sampleNames(object) <- value: Assign the character factor value to the sample identifiers in a RangedDataCNV-derived object.

state(object): For objects of class RangedDataHMM derived by fitting a hidden Markov model, the function state returns the index of the hidden state.

Accessors for RangedDataCBS objects

In the following code descriptions, object belongs to class RangedDataCBS

mean(object): numeric vector of segment means

Accessors for RangedDataHMM objects

In the following code descriptions, object belongs to class RangedDataCBS

state(object): character vector of hidden states from the HMM

Coercion methods

In the following code descriptions, object belongs to class

todf(object): coercion to a data.frame

Author(s)

R. Scharpf

See Also

See [RangedData](#) for a detailed description and additional methods. See the constructors [RangedDataCNV](#), [RangedDataCBS](#), and [RangedDataHMM](#) for generating an object of the respective class.

Examples

```
showClass("RangedDataCNV")
```

RangedDataCNV-utils *Utility functions for RangedData extensions for storing ranged data on copy number variants.*

Description

Mostly accessors for extracting data from RangedDataCBS and RangedDataHMM objects.

Usage

```
RangedDataCNV(ranges = IRanges(), values, start, end, chromosome, coverage, sampleId, startIndexInChromosome, ...)
RangedDataCBS(ranges = IRanges(), seg.mean = vector("numeric", length(ranges)), ...)
RangedDataHMM(ranges=IRanges(), state=vector("integer",length(ranges)),...)
```

Arguments

ranges	An instance of IRanges class.
values	A DataFrame object.
start	integer – physical position indicating start of copy number segment
end	integer – physical position indicating end of copy number segment
chromosome	integer indicating chromosome
sampleId	character string
startIndexInChromosome	index of marker within the chromosome for the beginning of the copy number segment. The physical position of this marker is given by 'start'. Optional
endIndexInChromosome	index of marker within the chromosome for the end of the copy number segment. The physical position of this marker is given by 'end'. Optional
seg.mean	Numeric – e.g., the mean copy number of a genomic interval
coverage	number of markers in a segment
state	typically an integer corresponding to the inferred copy number from a hidden markov model
...	Additional covariates that can be accessed by \$ method

Details

RangedDataCNV, RangedDataHMM, and RangedDataCBS are constructors for the corresponding class.

Value

A RangedDataCNV-derived class

Author(s)

R. Scharpf

See Also

See [RangedData](#) for additional details and methods for objects of the class.

[RangedDataHMM](#)

Examples

```
if(require("IRanges")){
  ranges <- IRanges(c(1,2,3),c(4,5,6))
  chrom <- 1:3
  id <- letters[1:3]
  num.mark <- rpois(3, 10)
  seg.mean <- rnorm(3)
  rd <- RangedDataCBS(ranges=ranges,
    chromosome=chrom,
    sampleId=id,
    coverage=num.mark,
    seg.mean=seg.mean)
  ## accessors
  chromosome(rd)
  sampleNames(rd)
  coverage2(rd)

  rd.hmm <- RangedDataHMM(ranges=ranges,
    chromosome=chrom,
    sampleId=id,
    coverage=num.mark,
    state=2L)
  ## accessors
  chromosome(rd.hmm)
  sampleNames(rd.hmm)
  coverage2(rd.hmm)
  state(rd.hmm)
}
```

requireAnnotation *Helper function to load packages.*

Description

This function checks the existence of a given package and loads it if available. If the package is not available, the function checks its availability on BioConductor, downloads it and installs it.

Usage

```
requireAnnotation(pkgname, lib=.libPaths()[1], verbose = TRUE)
```

Arguments

pkgname	character. Package name (usually an annotation package).
lib	character. Path where to install packages at.
verbose	logical. Verbosity flag.

Value

Logical: TRUE if package is available or FALSE if package unavailable for download.

Author(s)

Benilton Carvalho

See Also

install.packages

Examples

```
## Not run:
requirePackage("pd.mapping50k.xba240")

## End(Not run)
```

requireClusterPkgSet *DEPRECATED FUNCTIONS. Package loaders for clusters.*

Description

Package loaders for clusters.

Usage

```
requireClusterPkgSet(packages)
requireClusterPkg(pkg, character.only)
```

Arguments

packages	character vector with the names of the packages to be loaded on the compute nodes.
pkg	name of a package given as a name or literal character string
character.only	a logical indicating whether 'pkg' can be assumed to be a character string

Details

requireClusterPkgSet applies require for a set of packages on the cluster nodes.

requireClusterPkg applies require for *ONE* package on the cluster nodes and accepts every argument taken by require.

Value

Logical.

Author(s)

Benilton S Carvalho

See Also

require

sampleNames-methods *Sample names for FeatureSet-like objects*

Description

Returns sample names for FeatureSet-like objects.

Methods

object = "FeatureSet" Sample names

scqsExample *SnpCnvQSet Example*

Description

Example of SnpCnvQSet object.

Usage

```
data(scqsExample)
```

Format

Object belongs to SnpCnvQSet class.

Examples

```
data(scqsExample)  
class(scqsExample)
```

setCluster	<i>DEPRECATED FUNCTIONS. Cluster and large dataset management utilities.</i>
------------	--

Description

Tools to simplify management of clusters via 'snow' package and large dataset handling through the 'bigmemory' package.

Usage

```
setCluster(...)  
getCluster()  
delCluster()
```

Arguments

... arguments to be passed to makeCluster in the 'snow' package.

Details

Some methods in the oligo/crlmm packages, like backgroundCorrect, normalize, summarize and rma can use a cluster (set through 'snow' package). The use of cluster features is conditioned on the availability of the 'bigmemory' (used to provide shared objects across compute nodes) and 'snow' packages.

To use a cluster, 'oligo/crlmm' checks for three requirements: 1) 'ff' is loaded; 2) 'snow' is loaded; and 3) the 'cluster' option is set (e.g., via options(cluster=makeCluster(...)) or setCluster(...)).

If only the 'ff' package is available and loaded (in addition to the caller package - 'oligo' or 'crlmm'), these methods will allow the user to analyze datasets that would not fit in RAM at the expense of performance.

In the situations above (large datasets and cluster), oligo/crlmm uses the options ocSamples and ocProbesets to limit the amount of RAM used by the machine(s). For example, if ocSamples is set to 100, steps like background correction and normalization process (in RAM) 100 samples simultaneously on each compute node. If ocProbesets is set to 10K, then summarization processes 10K probesets at a time on each machine.

Warning

In both scenarios (large dataset and/or cluster use), there is a penalty in performance because data are written to disk (to either minimize memory footprint or share data across compute nodes).

Author(s)

Benilton Carvalho

`sfsExample`*SnpFeatureSet Example*

Description

Example of SnpFeatureSet object.

Usage

```
data(sfsExample)
```

Format

Object belongs to SnpFeatureSet class

Examples

```
data(sfsExample)
class(sfsExample)
```

`SnpSet-methods`*Accessors and methods for SnpSet objects*

Description

Utility functions for accessing data in SnpSet objects.

Usage

```
calls(object)
calls(object) <- value
confs(object, transform=TRUE)
confs(object) <- value
```

Arguments

<code>object</code>	A SnpSet object.
<code>transform</code>	Logical. Whether to transform the integer representation of the confidence score (for memory efficiency) to a probability. See details.
<code>value</code>	A matrix.

Details

`calls` returns the genotype calls. CRLMM stores genotype calls as integers (1 - AA; 2 - AB; 3 - BB).

`confs` returns the confidences associated with the genotype calls. The current implementation of CRLMM stores the confidences as integers to save memory on disk by using the transformation:

```
round(-1000*log2(1-p)),
```

where 'p' is the posterior probability of the call. `confs` is a convenience function that transforms the integer representation back to a probability. Note that if the `assayData` elements of the `SnpSet` objects are `ff_matrix` or `ffdf`, the `confs` function will return a warning. For such objects, one should first subset the `ff` object and coerce to a matrix, then apply the above conversion. The function `snpCallProbability` for the `callProbability` slot of `SnpSet` objects. See the examples below.

`checkOrder` checks whether the object is ordered by chromosome and physical position, evaluating to `TRUE` or `FALSE`.

Note

Note that the replacement method for `confs<-` expects a matrix of probabilities and will automatically convert the probabilities to an integer representation. See details for the conversion.

The accessor `snpCallProbability` is an accessor for the 'callProbability' element of the `assayData`. The name can be misleading, however, as the accessor will not return a probability if the call probabilities are represented as integers.

See Also

The helper functions `p2i` converts probabilities to integers and `i2p` converts integers to probabilities. See `order` and `checkOrder`.

Examples

```
theCalls <- matrix(sample(1:3, 20, rep=TRUE), nc=2)
p <- matrix(runif(20), nc=2)
integerRepresentation <- matrix(as.integer(round(-1000*log(1-p))), 10, 2)
obj <- new("SnpSet", call=theCalls, callProbability=integerRepresentation)
calls(obj)
  confs(obj) ## coerces to probability scale
  int <- Biobase::snpCallProbability(obj) ## not necessarily a probability
  p3 <- i2p(int) ## to convert back to a probability
```

SnpSuperSet-class *Class "SnpSuperSet"*

Description

A class to store locus-level summaries of the quantile normalized intensities, genotype calls, and genotype confidence scores

Objects from the Class

```
new("SnpSuperSet", alleleA=alleleA, alleleB=alleleB, call=call, callProbability, ...).
```

Slots

```
assayData: Object of class "AssayData" ~~
phenoData: Object of class "AnnotatedDataFrame" ~~
featureData: Object of class "AnnotatedDataFrame" ~~
experimentData: Object of class "MIAME" ~~
annotation: Object of class "character" ~~
protocolData: Object of class "AnnotatedDataFrame" ~~
.__classVersion__: Object of class "Versions" ~~
```

Extends

Class "[AlleleSet](#)", directly. Class "[SnpSet](#)", directly. Class "[eSet](#)", by class "[AlleleSet](#)", distance 2. Class "[VersionedBiobase](#)", by class "[AlleleSet](#)", distance 3. Class "[Versioned](#)", by class "[AlleleSet](#)", distance 4.

Methods

No methods defined with class "SnpSuperSet" in the signature.

Author(s)

R. Scharpf

See Also

[AlleleSet](#)

Examples

```
showClass("SnpSuperSet")
## empty object from the class
x <- new("matrix")
new("SnpSuperSet", alleleA=x, alleleB=x, call=x, callProbability=x)
```

splitIndicesByLength *Tools to distribute objects across nodes or by length.*

Description

Tools to distribute objects across nodes or by length.

Usage

```
splitIndicesByLength(x, lg)
splitIndicesByNode(x)
```

Arguments

x object to be split
lg length

Details

splitIndicesByLength splits x in groups of length lg.

splitIndicesByNode splits x in N groups (where N is the number of compute nodes available).

Value

List.

Author(s)

Benilton S Carvalho

See Also

split

Examples

```
x <- 1:100  
splitIndicesByLength(x, 8)  
splitIndicesByNode(x)
```

sqsExample

SnpQSet Example

Description

Example of SnpQSet instance.

Usage

```
data(sqsExample)
```

Format

Belongs to SnpQSet class.

Examples

```
data(sqsExample)  
class(sqsExample)
```
