

Grouping FTICR-MS data with *xcms*

J. Bargsten

October 14, 2013

Introduction

This document describes how to use *xcms* for aligning multiple MS spectra against each other.

1 Prerequisites

Lots of Preprocessing has to be done before the data is ready for aligning. First of all *xcms* and *MassSpecWavelet* are needed for further processing.

```
> library(xcms)
> library(MassSpecWavelet)
```

This documentation uses raw mzdata files from *msdata* as example data set. Assuming that *msdata* is installed, we locate the path of the package and extract the datafiles.

```
> library(msdata)
> mzdatapath <- system.file("fticr", package = "msdata")
> mzdatafiles <- list.files(mzdatapath, recursive = TRUE, full.names = TRUE)
> cat("Starting xcmsDirect.Rnw")
```

Starting `xcmsDirect.Rnw`

The *xcmsSet*-Constructor parses the given files and applies peakpicking using the *MassSpecWavelet* algorithm, leading to a *xcmsSet* object with 2 sampleclasses, `ham4` and `ham5`, and 5 samples, respectively.

```
> data.mean <- "data.mean"
> xs <- xcmsSet(
+   method="MSW",
+   files=mzdatafiles,
+   scales=c(1,4,9),
```

```

+         nearbyPeak=T,
+         verbose.columns = FALSE,
+         winSize.noise=500,
+         SNR.method="data.mean",
+         snthr=10
+ )

```

2 Calibration

calibrate can be used to correct the m/z values in a `xcmsSet`. It needs a `xcmsSet` and a list of m/z value which should be found in the object. To show this on a example a sample of ham4 is created and discalibrated a bit after getting some m/z:

```

> xs4 <- xcmsSet(
+         method = "MSW",
+         files = mzdatafiles[1],
+         scales = c(1,4, 9),
+         nearbyPeak = T,
+         verbose.columns = FALSE,
+         winSize.noise = 500,
+         SNR.method = "data.mean",
+         snthr = 10)

> masslist <- xs4@peaks[c(1,4,7),"mz"]
> xs4@peaks[,"mz"] <- xs4@peaks[,"mz"] + 0.00001*runif(1,0,0.4)*xs4@peaks[,"mz"] + 0.

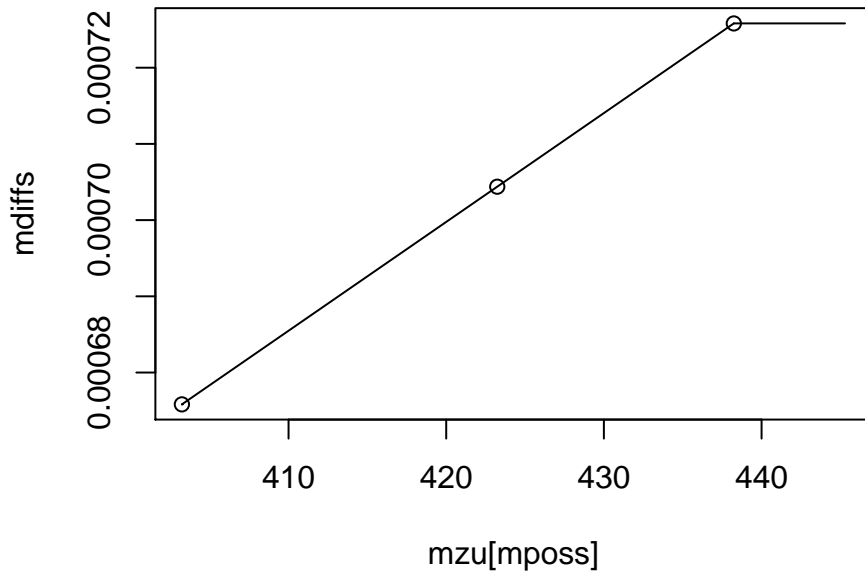

```

The `xcmsSet` now can be calibrated again with the m/z from the `masslist`. The plot shows the reference masses with the distances to the found ones and the regression-line.

```

> xs4c <- calibrate(xs4,
+         calibrants=masslist,
+         method="edgeshift",
+         mzabs=0.0001,
+         mzppm=5,
+         neighbours=3,
+         plotres=TRUE
+ )

```

The method "shift" adds a value to each m/z, "linear" does a regression and edgeshift does a regression but uses a shift before the smallest and after the biggest m/z from the calibrants.

These steps are necessary to create a usable input for *mzClust*. However, if you have already stored the data in a *xcmsSet*, you can skip the steps above.

3 Aligning

Now we can align *xs* with *mzClust*. The result is a clone of *xs* enhanced by the result of *mzClust*. For a description of the arguments *mzClust* takes, see help page of the function.

```
> xsg <- group(xs, method="mzClust")
1.14 6.82 17.05 21.59 27.27 31.82 37.50 38.64 42.05 47.73 53.41 54.55 61.36
> xsg
```

An "xcmsSet" object with 10 samples

```
Time range: -1--1 seconds (0-0 minutes)
Mass range: 400.1046-445.2931 m/z
Peaks: 88 (about 9 per sample)
```

Peak Groups: 18
Sample classes: ham4, ham5

Profile settings: method = bin
step = 0.1

Memory usage: 0.0221 MB

mzClust stores the grouping information like the standard *group* method of *xcms* suited for retrieval via *groups* and *groupidx*. An example is shown below.

```
> groups(xsg)[1:10,]
```

	mzmed	mzmin	mzmax	rtmed	rtmin	rtmax	npeaks	ham4	ham5
[1,]	402.2854	402.2851	402.2859	-1	-1	-1	5	0	5
[2,]	403.2365	403.2357	403.2367	-1	-1	-1	9	5	4
[3,]	405.1089	405.1087	405.1095	-1	-1	-1	4	0	4
[4,]	409.1844	409.1837	409.1845	-1	-1	-1	5	5	0
[5,]	410.1444	410.1440	410.1448	-1	-1	-1	4	0	4
[6,]	413.2672	413.2669	413.2677	-1	-1	-1	5	5	0
[7,]	423.2374	423.2363	423.2398	-1	-1	-1	3	3	0
[8,]	424.1611	424.1606	424.1615	-1	-1	-1	5	0	5
[9,]	425.1346	425.1344	425.1353	-1	-1	-1	5	0	5
[10,]	427.2681	427.2679	427.2681	-1	-1	-1	6	5	1

```
> peaks(xsg)[groupidx(xsg)[[1]]]
```

```
[1] 402.2851 402.2851 402.2851 402.2859 402.2859
```

4 Postprocessing

In most cases not all samples are in one group. This can be the origin of serious problems in code, which is based on e.g. *groupval*. *groupval* sets missing peaks to NA. The solution is *fillPeaks*. It changes all NA values to random noise based on the raw data file.

```
> groupval(xsg)[1,]
```

```

The results are suited for instance for heatmaps, etc.

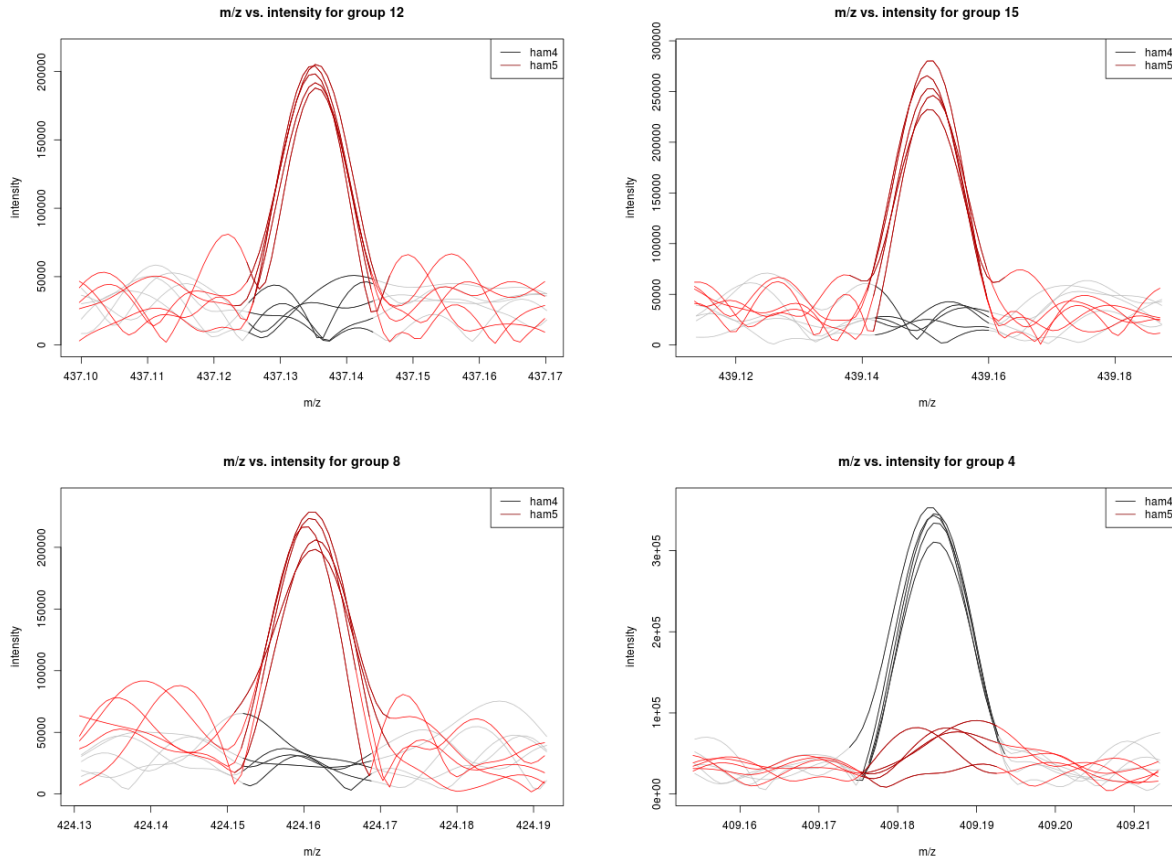

Figure 1: Auto-generated extracted spectra for the top three differentially regulated ions. Darkened lines indicate where the peaks were integrated for quantitation.

5 Analyzing and Visualizing Results

A report showing the most statistically significant differences in analyte intensities can be generated with the *diffreport* method. It will automatically show the superimposed peaks in the spectra for a given number of them, in this case 10. Several of those chromatograms are shown in Figure 1.

```
> reporttab <- diffreport(xsgf, "ham4", "ham5", "example", eicmax=4,
+                          h=480, w=640)
```

```
Processing data from sample:  1  2  3  4  5  6  7  8  9 10
```

```
group:  12 15  8  4
```

```
> reporttab[1:4,]
```
