Package 'Hiiragi2013'

April 4, 2014

Type Package

Title Cell-to-cell expression variability followed by signal reinforcement progressively segregates early mouse lineages

Version 0.99.14

Author Andrzej Oles, Wolfgang Huber

Maintainer Andrzej Oles <andrzej.oles@embl.de>

Description This package contains the experimental data and a complete executable transcript (vignette) of the statistical analysis presented in the paper ``Cell-to-cell expression variability followed by signal reinforcement progressively segregates early mouse lineages" by Y. Ohnishi, W. Huber, A. Tsumura, M. Kang, P. Xenopoulos, K. Kurimoto, A. K. Oles, M. J. Arauzo-Bravo, M. Saitou, A.-K. Hadjantonakis and T. Hiiragi; Nature Cell Biology (2013). doi:10.1038/ncb2881"

a *RAW Microarray Data*

Description

Unprocessed microarray data stored in an AffyBatch object. It contains raw intensity values from the original CEL files arranged in a matrix layout, where each column represents one hybridization, and rows stand for individual array features.

Usage

```
data(a)
```

Format

```
Formal class AffyBatch [package "affy"] with 10 slots
  ..@ cdfName          : chr "Mouse430_2"

`getDifferentialExpressedGenes` *Find Differentially Expressed Genes*

Description

Returns differentially expressed genes between two conditions.

Usage

```
getDifferentialExpressedGenes(x, groups, g1, g2, theta = 0.5, FDRcutoff = 0.05)
```

Arguments

`x`	an `ExpressionSet` containing a matrix of expression values with rows representing features and columns samples
`groups`	list of integer vectors specifying the grouping of samples
`g1`	character string specifying the name of the first tested group from `groups`
`g2`	character string specifying the name of the second tested group from `groups`
`theta`	numeric, probability with values in [0,1] used for quantile filtering of variance
`FDRcutoff`	numeric, p-value cutoff

Details

Differentially expressed features are selected based on a t-test with the adjusted p-value cutoff specified by `FDRcutoff`.

The filtering selects only features whose variance is greater than the quantile defined by the probability `theta`.

Value

Integer vector containing indices of differentially expressed features from `x`.

Author(s)

Wolfgang Huber, 2013

Examples

```
data(x)
groups = with(pData(x), list(
  "E3.25"       = which(genotype=="WT" & Embryonic.day=="E3.25"),
  "E3.5 (EPI)"  = which(genotype=="WT" & Embryonic.day=="E3.5" & lineage=="EPI"),
  "E3.5 (PE)"   = which(genotype=="WT" & Embryonic.day=="E3.5" & lineage=="PE")))

# get a list of differentially expressed genes along the transition from E3.25 to E3.5
de = union(
  getDifferentialExpressedGenes(x, groups, "E3.25", "E3.5 (EPI)"),
  getDifferentialExpressedGenes(x, groups, "E3.25", "E3.5 (PE)"))
fData(x[de,])$symbol
```

`MDSplot` *Multidimensional Scaling Plots*

Description

Visualization of data similarity using non-metric multidimensional scaling.

Usage

```
MDSplot(x, mask, flip = integer(0), rotation = 0, cex = 2, col = x$sampleColour, panellabel, pointlabel)
```

Arguments

`x`	an `ExpressionSet` containing a matrix of expression values with rows representing features and columns samples
`mask`	a logical vector specifying the masking of data points; if missing all points are drawn
`flip`	an integer vector containing indices of columns of the distance matrix whose sign should be flipped
`rotation`	numeric, angle in radians by which the plot should be rotated
`cex`	numeric, the value giving the amount by which text and symbols should be scaled relative to the current setting
`col`	character vector specifing the colors of points
`panellabel`	character, the label of the figure panel
`pointlabel`	character vector containing labels corresponding to samples; if specified labels are drawn instead of points

Value

The result of the function is a plot.

Author(s)

Wolfgang Huber, 2013

Examples

```
## data preparation
data(x)
y = x[, with(pData(x), Embryonic.day=="E3.25")]

## some helper functions
zero2one = function(x) (x-min(x))/diff(range(x))
rgb2col = function(x) {x=x/255; rgb(x[,1], x[,2], x[,3])}

## define colours for plotting
colours = character(nrow(pData(y)))
colours[y$genotype=="FGF4-KO"] = brewer.pal(10, "Paired")[c(7)]
colours[y$genotype=="WT"] = brewer.pal(12, "Paired")[c(9)]

## select 100 most variable genes for plotting
selMDS = order(rowVars(exprs(y)), decreasing=TRUE)[seq_len(100)]
MDSplot(y[selMDS,], col=colours)
```

---

myHeatmap *Plot Heatmaps*

Description

Plots a heatmap with features (rows) and samples (columns) reordered according to hierarchical clustering.

Usage

```
myHeatmap(x, collapseDuplicateFeatures = FALSE, haveColDend = FALSE)
```

Arguments

x	an ExpressionSet containing a matrix of expression values with rows representing features and columns samples
collapseDuplicateFeatures	logical, if TRUE multiple features per gene will be averaged
haveColDend	logical, if TRUE displays the grouping of samples using a dendrogram

Value

The result of the function is a plot.

Author(s)

Wolfgang Huber, 2013

myHeatmap2

Examples

```
data(x)
groups = with(pData(x), list(
  "E3.25"       = which(genotype=="WT" & Embryonic.day=="E3.25"),
  "E3.5 (EPI)"  = which(genotype=="WT" & Embryonic.day=="E3.5" & lineage=="EPI"),
  "E3.5 (PE)"   = which(genotype=="WT" & Embryonic.day=="E3.5" & lineage=="PE")))
samples = unlist(groups)

# heatmap of differentially expressed genes along the transition from E3.25 to E3.5
de = union(
  getDifferentialExpressedGenes(x, groups, "E3.25", "E3.5 (EPI)"),
  getDifferentialExpressedGenes(x, groups, "E3.25", "E3.5 (PE)"))
myHeatmap(x[de, samples], collapseDuplicateFeatures=TRUE)
```

---

myHeatmap2 *Plot Heatmaps*

Description

Plots a heatmap with clustering of rows and columns specified by the rowGroups and colGroups, respectively.

Usage

```
myHeatmap2(x, rowGroups = factor(rep(1, nrow(x))), colGroups = factor(rep(1, ncol(x))), keeprownames =
```

Arguments

x	an ExpressionSet containing a matrix of expression values with rows representing features and columns samples
rowGroups	factor which length aligns with rows of x
colGroups	factor which length aligns with columns of x
keeprownames	logical, if TRUE displays row names
colors	color palette used to plot the heatmap
...	arguments passed to the internal ordermat function

Value

The result of the function is a plot.

Author(s)

Wolfgang Huber, 2013

myHeatmap

Examples

```
## The function is currently defined as
function (x, rowGroups = factor(rep(1, nrow(x))), colGroups = factor(rep(1, ncol(x))),
   keeprownames = TRUE, colors = colorRampPalette(brewer.pal(9, "Blues")[-1])(100), ...) {
    x = ordermat(x, rowGroups, ...)
    x = ordermat(t(x), colGroups, ...)
    if (!keeprownames)
        colnames(x) = NULL
    print(levelplot(x, aspect = "fill", xlab = "", ylab = "",
        scales = list(x = list(rot = 90), raster = TRUE), col.regions = colors,
        colorkey = list(space = "left", height = 0.15, useRaster = TRUE)))
  }
```

---

pamCluster *Clustering of Most Variable Genes*

Description

The function pamCluster selects the ngenes most variable genes and performs their clustering using the partitioning around medoids method pam.

Usage

```
pamCluster(ngenes, x, k = 2)
```

Arguments

ngenes	numeric, the number of most variable genes to select
x	ExpressionSet containing gene expression values
k	positive integer specifying the number of clusters

Value

Integer vector specifying the clustering.

Author(s)

Wolfgang Huber

pam

Examples

```
data("x")
y = x[, x$Embryonic.day=="E3.5"]

## perform the clustering
pc = pamCluster(50, y, k=3)

## display clustering vs. sample lineage
plot(as.factor(pData(y)$lineage), pc, yaxt="n", xlab="lineage", ylab="cluster")
```

`plotProjection` *Overview of the Sample Expression*

Description

Plots a projection of sample expression profiles on the differential expression signature.

Usage

```
plotProjection(projection, label, col, colourMap)
```

Arguments

`projection`	a vector of scalar products between each sample's expression profile and differential expression signature
`label`	character vector of sample names
`col`	sample colour palette
`colourMap`	sample colour map

Value

The result of the function is a plot.

Author(s)

Wolfgang Huber, 2013

Examples

```
## For illustration of use please see the package vignette
```
