

# Package ‘KEGGprofile’

October 8, 2014

**Type** Package

**Title** An annotation and visualization package for multi-types and multi-groups expression data in KEGG pathway

**Version** 1.7.6

**Date** 2014-09-15

**Author** Shilin Zhao, Yu Shyr

**Maintainer** Shilin Zhao <shilin.zhao@vanderbilt.edu>

**Description** KEGGprofile is an annotation and visualization tool which integrated the expression profiles and the function annotation in KEGG pathway maps. The multi-types and multi-groups expression data can be visualized in one pathway map. KEGGprofile facilitated more detailed analysis about the specific function changes inner pathway or temporal correlations in different genes and samples.

**License** GPL (>= 2)

**LazyLoad** yes

**Imports** AnnotationDbi,png,TeachingDemos,XML,KEGG.db,KEGGREST,biomaRt

**biocViews** Pathways

--------------	-----------

---

col_by_value	<i>col_by_value</i>
--------------	---------------------

---

### Description

The function will transfer a numeric matrix into a matrix of colors, in which the colors represent the values of numeric matrix

### Usage

```
col_by_value(x, col, range = NA, breaks = NA, showColorBar = T)
```

### Arguments

x	a numeric matrix
col	colors used to represent the values. (See also 'Details')
range	values out of the range will be modified to in the range.
breaks	a numeric vector of three or more cut points giving the number of intervals into which x is to be cut. See also 'Details'
showColorBar	Logical. Indicates display the colorbar or not. The default value is TURE.

### Details

A colorbar would also be plotted. The returned colors of the function can be used in function plot\_profile. if breaks not equal to NA, col must have the same length with breaks-1.

### Value

a matrix equal to x, but the values were instead by colors.

### Examples

```
data(pho_sites_count)
col<-col_by_value(pho_sites_count,col=colorRampPalette(c(white,khaki2))(4),breaks=c(0,1,4,10,Inf))
```

---

convertId	<i>convertId</i>
-----------	------------------

---

## Description

A function to convert ID based on the biomaRt package.

## Usage

```
convertId(x, dataset = "hsapiens_gene_ensembl",
  filters = "uniprot_swissprot_accession", attributes = c(filters,
  "entrezgene"), genesKept = c("foldchange", "first", "random", "var", "abs"),
  keepNoId = T, keepMultipleId = F, verbose = F)
```

## Arguments

keepMultipleId	Logical. Indicate keep the multiple target IDs related to one source ID or not.
keepNoId	Logical. Indicate keep the source IDs without target IDs or not.
verbose	Logical. Indicate report extra information on progress or not.
filters	Filters (one or more) that should be used in the query. A possible list of filters can be retrieved using the function listFilters.
attributes	Attributes you want to retrieve. A possible list of attributes can be retrieved using the function listAttributes.
dataset	Dataset you want to use. To see the different datasets available within a biomaRt you can e.g. do: mart = useMart('ensembl'), followed by listDatasets(mart).
x	the expression data matrix.
genesKept	The method to select target gene in more than one targets. "var"/"foldchange"/"abs" means selecting the gene with largest variation/fold change/absolute value. "first" means selecting the first target and "random" means randomly selection.

## Details

A function to convert ID based on the biomaRt package..

## Examples

```
temp<-cbind(rnorm(10),rnorm(10))
row.names(temp)<-c("Q04837","P0C0L4","P0C0L5","O75379","Q13068","A2MYD1","P60709","P30462","P30475","P30479")
colnames(temp)<-c("Exp1","Exp2")
convertId(temp,filters="uniprot_swissprot_accession",keepMultipleId=TRUE)
## Not run:
temp<-cbind(rnorm(5000),rnorm(5000),rnorm(5000),rnorm(5000),rnorm(5000),rnorm(5000))
row.names(temp)<-1000:5999
colnames(temp)<-c("Control1","Control2","Control3","Treatment1","Treatment2","Treatment3")
convertId(temp,filters="entrezgene",attributes =c("entrezgene","uniprot_swissprot_accession"),keepNoId=FALSE)

## End(Not run)
```

download\_KEGGfile      *download\_KEGGfile*

---

### Description

The function download XML files and png files from KEGG website to local disk

### Usage

```
download_KEGGfile(pathway_id = "00010", species = "hsa",
  target_dir = getwd())
```

### Arguments

pathway_id	the KEGG pathway id, such as '00010'
species	the species id in KEGG database, 'hsa' means human, 'mmu' means mouse, 'rno' means rat, etc
target_dir	the local directory where the downloaded files are saved

### Details

If pathway\_id is set as 'all', all KEGG pathway ids in KEGG.db package will be used and downloaded from KEGG website

### Examples

```
download_KEGGfile(pathway_id="00010",species=hsa)
```

---

download\_latest\_pathway  
*download\_latest\_pathway*

---

### Description

The function will download the latest pathway gene link from KEGG website.

### Usage

```
download_latest_pathway(species)
```

### Arguments

species	the species id in KEGG database, 'hsa' means human, 'mmu' means mouse, 'rno' means rat, etc
---------	---

**Details**

The function will download the latest pathway gene link from KEGG website.

**Value**

a list with two parts

name keggpathway2gene

description a list with the genes for each pathway

name pathway2name

description a list with the names for each pathway

**Examples**

```
## Not run: download_latest_pathway(species="hsa")
```

---

```
find_enriched_pathway find_enriched_pathway
```

---

**Description**

The function will map the genes in KEGG pathway database, and then hypergeometric tests would be used to estimate the significance of enrichment for each pathway

**Usage**

```
find_enriched_pathway(gene, species = "hsa", returned_pvalue = 0.01,  
  returned_adjpvalue = 0.05, returned_genenumber = 5,  
  download_latest = FALSE)
```

**Arguments**

gene a numeric matrix

returned\_pvalue

the minimum p value for enriched pathways

returned\_adjpvalue

the minimum adjusted p value for enriched pathways

returned\_genenumber

the minimum number of annotated genes for enriched pathways

download\_latest

logical. Indicate if the function will download the latest pathway/gene link from KEGG website. As the KEGG.db package was not updated for a long time due to the KEGG policy change, we provided this parameter so that the users could get the latest KEGG database.

species

the species id in KEGG database, 'hsa' means human, 'mmu' means mouse, 'rno' means rat, etc

**Details**

Only the pathways with p value  $\leq$  returned\_pvalue in hypergeometric tests and number of annotated genes  $\geq$  returned\_genenumber would be taken as enriched and returned.

**Value**

a list with two parts

name stastic	description a matrix containing the pathway IDs of enriched pathways, and their names, p values, number of annotated genes
name detail	description a list with the genes annotated for each pathway

**Examples**

```
data(pho_sites_count)
#the 300 genes with most phosphorylation sites quantified
genes<-names(rev(sort(pho_sites_count[,1]))[1:300])
pho_KEGGresult<-find_enriched_pathway(genes,species=hsa)
```

---

newIdMatrix

*newIdMatrix*

---

**Description**

A function to convert ID.

**Usage**

```
newIdMatrix(x, convertIdTable, genesKept = c("var", "foldchange", "abs",
      "first", "random"))
```

**Arguments**

x	the expression data matrix.
convertIdTable	A vector. The names should be the source IDs, and the values should be the target IDs.
genesKept	The method to select target gene in more than one targets. "var"/"foldchange"/"abs" means selecting the gene with largest variation/fold change/absolute value. "first" means selecting the first target and "random" means randomly selection.

**Details**

A function to convert ID.

## Examples

```
convertIdTable<-paste("New",c(1,2,2,2,1,3,4,4,5,5))
names(convertIdTable)<-paste("Old",1:length(convertIdTable))
temp<-matrix(rnorm(20),ncol=2)
row.names(temp)<-names(convertIdTable)
colnames(temp)<-c("Exp1","Exp2")
newIdMatrix(temp,genesKept="foldchange",convertIdTable)
```

---

parse\_XMLfile

*parse\_XMLfile*

---

## Description

The function parses KEGG XML (KGML) files

## Usage

```
parse_XMLfile(pathway_id, species, database_dir = getwd())
```

## Arguments

database_dir	the directory where the XML files and png files are located
pathway_id	the KEGG pathway id, such as '00010'
species	the species id in KEGG database, 'hsa' means human, 'mmu' means mouse, 'rno' means rat, etc

## Details

This function will parse the KEGG XML (KGML) file. Then a matrix with genes in this pathway and related infomations will be returned. This matrix can be used for plot the expression profiles on the pathway figure.

## Value

a matrix containing genes in this pathway, and their names, locations etc, which could be used in the function plot\_profile as param KEGG\_database

## Examples

```
XML2database<-parse_XMLfile(pathway_id="04110",species="hsa",database_dir=system.file("extdata",package="KEGGp
```

---

pho_sites_count	<i>number of phosphorylation sites quantified for each gene</i>
-----------------	---

---

### Description

This data set is a data.frame with number of phosphorylation sites quantified for each gene in the analysis.

### Usage

```
pho_sites_count
```

### Source

Olsen, J.V., et al. (2010) Quantitative phosphoproteomics reveals widespread full phosphorylation site occupancy during mitosis, *Sci Signal*, 3, ra3.

---

plot_pathway	<i>plot_pathway</i>
--------------	---------------------

---

### Description

A wrapper for function `download_KEGGfile`, `parse_XMLfile` and `plot_profile`

### Usage

```
plot_pathway(gene_expr, line_col, groups, pathway_id = "00010",
             species = "hsa", pathway_min = 5, database_dir = getwd(), ...)
```

### Arguments

...	any other Arguments for function <code>plot_profile</code>
gene_expr	the matrix for gene expression, row.names should be NCBI gene ID, such as 67040, 93683
line_col	line color for expression in different samples in the pathway map, valid when type='lines'
groups	a character used to indicate expression values from different types of samples
species	the species id in KEGG database, 'hsa' means human, 'mmu' means mouse, 'rno' means rat, etc
pathway_min	The pathways with number of annotated genes less than <code>pathway_min</code> would be ignored
database_dir	the directory where the XML files and png files are located
pathway_id	the KEGG pathway id, such as '00010'

## Details

This wrapper function is developed to make the visualization process more easier. Firstly the existence of XML file and png file would be checked, if not, the `download_KEGGfile` function would be used to download the files. Then the `parse_XMLfile` function would be used to parse the XML file. At last the `plot_profile` function would be used to generate the pathway map.

## See Also

## Examples

```
data(pro_pho_expr)
data(pho_sites_count)
#type=lines
col<-col_by_value(pho_sites_count,col=colorRampPalette(c(white,khaki2))(4),breaks=c(0,1,4,10,Inf))
temp<-plot_pathway(pro_pho_expr,bg_col=col,line_col=c("brown1","seagreen3"),groups=c(rep("Proteome",6),rep("P
#type=bg
pho_expr<-pro_pho_expr[,7:12]
temp<-apply(pho_expr,1,function(x) length(which(is.na(x))))
pho_expr<-pho_expr[which(temp==0),]
col<-col_by_value(pho_expr,col=colorRampPalette(c(green,black,red))(1024),range=c(-6,6))
temp<-plot_pathway(pho_expr,type="bg",bg_col=col,text_col="white",magnify=1.2,species=hsa,database_dir=system.
#Compound and gene data
set.seed(124)
testData1<-rbind(rnorm(6),rnorm(6),rnorm(6),rnorm(6),rnorm(6),rnorm(6),rnorm(6),rnorm(6))
row.names(testData1)<-c("4967","55753","1743","8802","47","50","cpd:C15972","cpd:C16255")
colnames(testData1)<-c("Control0","Control2","Control5","Sample0","Sample2","Sample5")
temp<-plot_pathway(testData1,type="lines",line_col=c("brown1","seagreen3"),groups=c(rep("Control",3),rep("Samp
testData2<-testData1[,4:6]-testData1[,1:3]
col<-col_by_value(testData2,col=colorRampPalette(c(green,black,red))(1024),range=c(-2,2))
temp<-plot_pathway(testData2,type="bg",bg_col=col,text_col="white",magnify=1.2,species=hsa,database_dir=system
```

---

plot\_pathway\_cor

*plot\_pathway\_cor*

---

## Description

The function will plot the correlation distributions for each enriched pathway (result from `find_enriched_pathway` function), and then Wilcoxon tests would be used to estimate the significance of correlations distribution between genes in each pathway and all genes.

## Usage

```
plot_pathway_cor(gene_expr, kegg_enriched_pathway, groups = NULL,
  side = c("both", "pos", "neg"), alternative = NULL)
```

**Arguments**

kegg_enriched_pathway	The returned value from find_enriched_pathway function, the enriched pathways.
side	a character string specifying the correlation directions interested, must be one of "both" (default), "pos" or "neg".
alternative	a character string specifying the alternative hypothesis, must be one of "two.sided" (default), "greater" or "less". You can specify just the initial letter.
gene_expr	the matrix for gene expression, row.names should be NCBI gene ID, such as 67040, 93683
groups	a character used to indicate expression values from different types of samples

**Value**

p values for Wilcoxon tests in each pathway

**Examples**

```
data(pro_pho_expr)
data(pho_sites_count)
genes<-row.names(pho_sites_count)[which(pho_sites_count>=10)]
pho_KEGGresult<-find_enriched_pathway(genes, species=hsa)
result<-plot_pathway_cor(gene_expr=pro_pho_expr, kegg_enriched_pathway=pho_KEGGresult)
```

---

plot\_profile

*plot\_profile*

---

**Description**

The function plot gene expression profiles on KEGG pathway maps

**Usage**

```
plot_profile(gene_expr, pathway_name, result_name = paste(pathway_name,
  "_profile_", type, ".png", sep = ""), KEGG_database, groups,
  bg_col = "white", text_col = "black", line_col, border_col = "grey",
  text_cex = 0.25, magnify = 1, type = c("lines", "bg"),
  pathway_min = 5, genes_kept = c("foldchange", "first", "random", "var",
  "abs"), species = "hsa", database_dir = getwd(), max_dist, lwd = 1.2)
```

**Arguments**

gene_expr	the matrix for gene expression, row.names should be NCBI gene ID, such as 67040, 93683
pathway_name	the species id and KEGG pathway id, such as 'hsa00010'

KEGG_database	the matrix returned by function <code>parse_XMLfile</code> , which contains genes in this pathway, and their names, locations etc
result_name	the name of figure file generated by <code>KEGGprofile</code> . The default name is <code>pathway_name+'_profile_'+type+'.png'</code> , such as <code>'hsa04110_profile_lines.png'</code>
groups	a character used to indicate expression values from different types of samples
bg_col	background color for gene rectangles in the pathway map
line_col	line color for expression in different samples in the pathway map, valid when <code>type='lines'</code>
text_col	the colors for text in the pathway map. A color matrix generated by function <code>col_by_value</code> can be used here
border_col	border color for gene rectangles in the pathway map. A color matrix generated by function <code>col_by_value</code> can be used here
text_cex	cex for text in the pathway map. A color matrix generated by function <code>col_by_value</code> can be used here
magnify	the coefficient used to magnify the gene rectangles
type	the type of pathway map visualization, could be <code>'bg'</code> or <code>'lines'</code> . Default is <code>'bg'</code> . See also <code>'Details'</code>
pathway_min	The pathways with number of annotated genes less than <code>pathway_min</code> would be ignored
genes_kept	methods used for choosing genes when several genes corresponding to one location in pathway map. Default is <code>'foldchange'</code> , which kept the gene with largest fold changes. <code>'first'</code> kept the first gene. <code>'random'</code> chose gene random. <code>'var'</code> kept the gene with largest variation. <code>'abs'</code> kept the gene with largest absolute value
max_dist	The expression changes that represented by the distance from the bottom to the top of gene rectangle, valid when <code>type='lines'</code> . This param is used to ensure the dynamic changes of lines in different gene polygon represent equal variation. It would be calculated from the maximum changes of genes in this pathway by default. If <code>max_dist=NA</code> , then the lines would be plotted from top to bottom in each gene rectangle
lwd	The line width when <code>type='lines'</code>
species	the species id in KEGG database, <code>'hsa'</code> means human, <code>'mmu'</code> means mouse, <code>'rno'</code> means rat, etc
database_dir	the directory where the XML files and png files are located

### Details

There are two visualization methods to represent gene expression profiles: `'background'` and `'lines'`. The first one is applicable for analysis with only one sample or one type of data, which divides the gene polygon into several sub-polygons to represent different time points. And each sub-polygon has a specific background color to represent expression changes in that time point. The second method plots lines with different colors in the gene polygon to represent different samples or different types of data. The dynamic changes of lines mean the profiles of genes in different time points.

**Value**

a matrix containing genes mapped in this pathway, and their names, expressions

**Examples**

```
XML2database<-parse_XMLfile(pathway_id="04110",species="hsa",database_dir=system.file("extdata",package="KEGGp  
data(pro_pho_expr)  
temp<-plot_profile(pro_pho_expr,pathway_name="hsa04110",KEGG_database=XML2database,line_col=c("brown1","seagre
```

---

pro\_pho\_expr

*expression profiles in proteome and phosphoproteome*

---

**Description**

This data set is from a previously published data of proteome and phosphoproteome analysis in different cell phase. The column 1-6 are proteome data and column 7-12 are phosphoproteome data in this data.frame. The 6 time points are G1, G1/S, Early S, Late S, G2, Mitosis.

**Usage**

```
pro_pho_expr
```
