`guiEnv` *Accessor to the internal GUI environment*

Description

All state information for the GUI is stored in an internal environment. This function can be used to access this environment.

Usage

```
 ## .guiEnv$list name such as Gate.list, workflowlist
```

Value

The internal gui environment.

Author(s)

Kyongryun Lee

Examples

```
 ## 1. Run iFlow
## Not run:  iflow()
 ## 2. Load data
 ## Not run:  data(GvHD)
 ## 3. Activate data by clicking a data name on Data panel
 ## 4. Create a gate
 ## 5. It is able to access created gate objects or workflow of the data on the command l
 ## The workflow is automatically created whenever the operations of the data are run.

 ## wf.list <- .guiEnv$workflow.list
 ## wf.list

 ## gt.list <-.guiEnv$Gate.list
 ## gt.list

## Not run: iFlow:::guiEnv$Gatelist
```

`iFlow-package` *iFlow*

Description

GUI based visualization for preprocessing of analyzing Flow Cytometry data.

`iflow` *Main function for iFlow*

Description

Main function for iFlow. It calls up the main graphical user interface (GUI) of the iFlow package.

Usage

```
iflow()
```

Details

The GUI Pull-Down Menu consists of "File", "Data", "Graphics", "Gate", "ProbBin", and "Help" selections. The user can start with "File" pull-down menu to load data files of interest. The data file can be in either rda or FCS format. Please see the vignette or tutorial video for more detail (http://bioconductor.fhcrc.org/docs/workflows/flowcytometry/tutorial.mpeg).

Examples

```
## on R console
iflow()
data(ITN)
```
